Alloys The Mond Nickel Co. Ltd. and John McNeil. Brit. 432,484, July 29, 1935. Elec. contacts and electrodes, particularly for spark plugs, are made from an alloy of Al 0.1-8% with Ni or Ni and Cr, Mn and (or) Fe. A low-Ni content, e. g., 15%, should correspond to a low-Al content, e. g., 4%. Suitable proportions are Ni 93, 77; Al 3, 3; Mn 4, 0; Cr 0, 20%. Alloys contg. 80% Fe may be used, the Al in the case of the ferrous alloys being partly replaced by Si. Small quantities of Mo, Ti, Zr, W, V, Ta, Cu, Be, C, Ca, Ba, Sr and Li may be used. The alloys may contain up to 0.25% C.

Alloys Stahlwerke Röchling Buderus A.-G. and Alfred Kropf. Ger. 616,858, Aug. 6, 1935 (Cl. 408 14). An alloy capable of hot or cold working consists of Cr 10-40, Ta 3-50, C 0.1-1.0 and Ni 40-60%. Si, V or Zr in amts. up to 5% may be added as deoxidizing agents.

Hard alloys. Compagnie Lorraine de charbons pour l'électricité. Fr. 785,576, Aug. 13, 1935. A more fusible auxiliary metal or alloy is fixed separately on each of the hard constituents, the fractions thus prep. are united, homogenized and submitted to fritting by the action of heat and pressure.

Hard alloys containing tungsten, etc. Alan R. Powell and Ernest R. Box (to Johnson Matthey & Co. Ltd.). U. S. 2,021,021, Nov. 12. Alloys which are suitable for the points of gold nibs or compass needles, etc., are obtained by melting a mixt. of W 50-75, B 0.5-5.0, Co or Ni 5-25 and Pt, Ru or Os 2-40%, the proportion of B to W being not greater than 11 to 184 and the proportion of Co or Ni to W being at least 9 to 184.

Surface hardening alloys Max Botton. Fr. 785,683, Aug. 16, 1935. Fe alloys are heated in the presence of NH₃ and a solid substance, such as powd. Al, Mg, B, Fe, Cr, Fe-Mo, Fe-W, Ca, Cr and Ni, which does not melt during the treatment and which is capable of forming with NH₃ at least 1 unstable compd. favoring the formation of nitrides of at least 1 of the metals of the alloy. The alloy may be submitted during the treatment to a high-frequency current capable of modifying the cryst. texture of the alloy. The alloy may be tempered before or after the treatment.

Alloys for electric resistances Établissements Driver-Harris. Fr. 785,701, Aug. 17, 1935. Alloys contain Ni 50-90, Cr 9-30, Ca 0.01-0.25, Zr 0.1-1% and Fe the rest if present. Two examples are Ni 78 and 65, Cr 20.5 and 15, Ca 0.06 and 0.06, Zr 0.15 and 0.15 and Fe 0.4 and 16-17%.

Alloys for permanent magnets Soc. industrielle et commerciale des aciers. Fr. 785,732, Aug. 17, 1935. Alloys contain Fe and Pd or Fe and Pt, the metals being present in the ratio approx. corresponding to whole multiples of their at. wts., e. g., Fe 30-40 and Pd 70-60% or Fe 28-18 and Pt 72-82%. The alloys are cooled from a high temp. and reheated to a lower temp. or cooled slowly from a high temp. (600°).

Changing the physical properties of light alloys I. G. Farbenindustrie A.-G. Brit. 432,828, Aug. 2, 1935.

The mech. properties of Mg and other light metal alloys, which have been plastically deformed, e. g., by rolling or pressing, and exhibit in the direction of flow lower tensile strength, elongation, yield point, elastic limit, etc., than in a direction transverse thereto, are modified to destroy the original uniform orientation of the crystal structure and set up therein a twinning of the crystals by subjecting said alloys to a succession of at least 10 straightening operations, each involving several bending or twisting operations.

Aluminum alloys. I. G. Farbenindustrie A.-G. Brit. 432,351, July 22, 1935. This corresponds to Fr. 766,071 (C. A. 28, 7249).

Aluminum alloys. Paul Briske and Viktor Prohl (trading as Briske & Prohl) and Alexander Lusbenowsky Brit. 432,064, Aug. 2, 1935. See Fr. 772,586 (C. A. 29, 1589).

Aluminum alloy. Franz Jordan (Otto Kamps, inventor). Ger. 613,014, May 10, 1935 (Cl. 43, 18). Addn. to 595,531 (C. A. 28, 5635). The Al-Cu-Light metal alloy of 595,531 is varied by replacing the V by 0.1-0.2% of Zr.

Heat-treating aluminum alloys. Horace C. Hall Brit. 432,815, Aug. 2, 1935. To remove internal stresses from an Al alloy piece after solution treatment, i. e., heating to 320° and quenching, but before aging, if carried out, the piece is plunged into, and agitated in, a bath of oil, molten salts or metal, the temp. of which is 190-250°.

Treatment of aluminum-silicon alloys. Metallgesellschaft A.-G. (Abdur Paz, inventor). Ger. 619,409, Oct. 1, 1935 (Cl. 43, 19). Alloys consisting wholly or mainly of Al and Si are improved in their mech. properties by treating the fused alloy first with a small proportion of an alkali metal, e. g., 0.1% of Na, and then with such a proportion of Mg (0.05-0.35%) that 0.045-0.3% of Mg remains in the alloy. The alkali metal may be added as such or as a reagent which liberates it under the conditions of the process. The Mg may be added as such or as an alloy.

Columbium alloys. Electro Metallurgical Co. Fr. 753,667, Aug. 16, 1935. Sn is extd. from Cr alloys by adding Sn in amt. sufficient to produce Cr-Sn and preferably sufficient to obtain a ratio of Sn to Cr of about 1 to 6.5 and then leaching with HCl of about 11° Bé. Cf. C. A. 29, 5004.

Refining copper alloys. Theodor Laible. Ger. 616,914, Aug. 7, 1935 (Cl. 43, 15 01). Al and Fe are removed from Cu alloys by fusing the alloys and adding Na₂SO₃. This causes the Al and Fe to form a removable scum.

Iron alloys. Steepbridge Stokes Centrifugal Castings Co. Ltd. and James B. Hurst. Brit. 432,974, Aug. 7, 1935. The seats and other parts of the valves of internal-combustion engines are made of cast Fe alloyed with 0.5-2% of both Al and Cr, together with 2-3% of both C and Si. A preferred compn. is C 2.65, Si 2.5, Al 1.25 and Cr 1.55%. Mn, S and P may be present in the usual amts. for cast Fe.

Iron alloy. Röhring'sche Eisen- und Stahlwerke A.-G. (Hans Zeller, inventor). Ger. 616,897, Aug. 1, 1935 (Cl. 43, 10). Crude Fe with a high-V content for making Thomas steel and V or V compounds, is obtained by heating converter discharge masses (magnetically sep'd.) rich in untrapped Fe and V, in a blast furnace or other reducing furnace, with or without coke. The converter masses may be mixed with Fe or Fe ore contg. V. Examples are given.

Iron alloys. I. G. Farbenindustrie A.-G. Fr. 784,700, July 22, 1935. Fe alloys contg. more than 12, preferably about 25-30% Cr are found to be resistant to most mixts. of Cl and O.

Nickel-chromium alloys. James M. Lehr (to Driver-Harris Co.). U. S. 2,019,680, Nov. 5. Alloys which are suitable for elec. resistance units contain Ni together with Cr 15-25, Ca 0.01-0.20 and Zr 0.01-0.50%. U. S. 2,019,688 relates to alloys containing Ni together with Cr 7-22, Fe 8-20, Ca 0.01-0.20 and Zr 0.01-0.50%. U. S. 2,019,688 relates to alloys contg. Ni together with Cr 7-22, Fe 8-20 and Zr 0.01-0.50%.

Nickel-chromium-iron alloys. Heraeus-Vacuum-schmelze A.-G. Fr. 783,078, Aug. 1, 1935. Alloys resistant to high temps., particularly 1000-1200°, contg. Ni, Cr 1-50, and Fe up to 50% also contain rare earth metals, 0.02-1.2%. The alloys may also contain Co, Mo or W up to 20% and small amts. of Mn, Mg or Si.

Silver alloys suitable for soldering. Robert H. Leach (to Hander & Harrison). U. S. 2,019,984, Nov. 5. Alloys are used contg. Ag 30-70, Cu 10-35, P 0.5-3.0 and Zn about 10-40%.

Silver-beryllium-copper alloys. Robert H. Leach (to Hander & Harrison). U. S. 2,020,949, Nov. 12. Alloys which are suitable for elec. contacts contain Ag about 5-50 and Be 0.5-2.5%, the remainder being Cu.

Composite bearings. General Motors Corp. Brit. 433,954, Aug. 23, 1935. A composite member for the manufacture of bearings is produced by heating an Fe or steel trav approx. to the m. p. of plastic bronze, pouring molten plastic bronze into the trav and rapidly cooling to below the m. p. thereof. The bronze may contain 50-60% Cu and the rest Pb, with small quantities of Sn, Ni or other metals, the m. p. being approx. 1700°F. A flux, e. g., H₂BO₃, is introduced with the trav into the furnace and the heating is preferably in a neutral or reducing atm. App. is described.

Composite metal product suitable for use in aircraft construction. Fred Keller and George Frederick Saer (to Aluminum Ltd.) Brit. 432,617, July 30, 1935. See U. S. 1,975,105 (C. A. 28, 7241).

Protecting metals. Anciens établissements Soc-born, Lang-Ferrv & Cie. Fr. 741,938, July 30, 1935. Sheets of metal such as Fe are coated in any manner by Zn or Pb and then covered with a varnish which is baked on.

Protecting metals against corrosion by alcohol. L'Etat Français représenté par le Ministre de la Marine. Fr. 783,117, Aug. 2, 1935. NH₄Et or NH₄Et₂, at least 0.03% by wt., is added to EtOH, pure or aq., to prevent corrosion of steel, without, however, giving a soln. which will attack Cu, this being the case when NH₃ is used.

Rust preventing coatings. Metallgesellschaft A.-G. (Hans Weidmann, Gerhard Roemer and Wilhelm Overath, inventors). Ger. 616,982, Aug. 9, 1935 (Cl. 43, 4 01). These coatings are formed on Fe or steel objects by hanging the objects in a bath contg. phosphates of metals. Any Al present in the bath is removed before immersion of the Fe or steel objects. In an example, a bath of phosphate salts contg. Mn, Fe, PbO₂ and Al is used. The Al is removed by adding colloidal Fe(OH)₃. Other examples are given.

Protective coating of carbides such as those of tool cutting edges. John A. Zablum. U. S. 2,021,043, Nov. 12. In attaching a piece of metallic carbide such as W carbide to a metallic body such as a cutting or digging tool, the piece of carbide is coated with substantially pure Ni which protects it against partial decomposition of alloying with the metallic body, and the coated piece is then welded to the body.

Oxide coatings on cathodes for electric discharge devices. Emil Theist (to Egyesült Izzolampas és Villamosági Reszvénytársaság). U. S. 2,019,546, Nov. 5. A "trocen" such as a Ra-Mo bronze is applied as a coating on a core such as one formed of W or Mo and a layer of alk. earth metal oxide is applied to this coating.

Depositing metals. Carl Levst-Kuchnermeister (to Ludwig A. Seimert). Brit. 432,466, July 23, 1935. Metals or nonmetallic substances are coated with metal by exposure to metallic vapor produced by melting the coating metal and evap. it in a high vacuum corresponding to a pressure of 10⁻⁴ to 10⁻⁶ mm. Hg. App. is described.

Coating with metals. Anselmo Ortiz Rodriguez. Brit. 432,212, July 23, 1935. A metallic coating free from pores, spots, etc., is obtained on ferrous metal articles by heating them in an atm. of reducing and decarbonizing gases or vapors in the nascent state, passing the articles through a bath of molten metal the surface of which is not in contact with said gas or vapors and finally cooling and smoothing the coating. App. is described.

Coating metal surfaces Dunlop Plantations Ltd Tr 784,880, July 27, 1935 Substances such as waxes or resins which are fusible are projected as rain onto metals to be coated The powder deposit thus obtained is caused to fuse and to solidify by cooling to give a thin uniform coating

Coating strands of material as in coating wires with tin Carl M Underwood (to Western Elec. Co.). U. S. reissue 19,758, Nov. 12 A reissue of original pat no 1,981,130 (C A 29,440)

Coating aluminum and its alloys Pentall Soc anon Brit 413,367, Aug 13, 1935 See Swiss 175,365 (C A 30,77)

Coloring aluminum and its alloys Siemens & Halske A-G (Nikolai Budiloff and Alexander Jenny, inventors) Ger 619,450, Oct 1, 1935 (Cl 57b, 14 01). Addn to 607,012 (C A 29,1766) An oxide coating on Al or Al alloy is impregnated with a salt of Ag and then exposed either completely or under a negative or a diapositive or a stencil The Ag image is fixed and converted wholly or partly into an Au image by means of a toning bath, and the Au image is dried and then strongly heated, e. g., to 500-600°. The Al alloy is thus colored red. Cf. C A 30,754

Apparatus for coating pipes by dipping into fused metal I G Farbennd A-G (Fritz Steinbach, inventor). Ger 619,321, Sept. 27, 1935 (Cl 48b, 4)

Inhibiting attack of sulfur dioxide on metals. Frank D. Burke U S 2,019,559, Nov. 5. A small amount of an aldehyde such as CH_3CHO is added to SO_2 such that employed in refrigerating systems

Imparting a high luster to cadmium Geo Dubpernell and Karl G Soderberg (to Udyllite Process Co.). U. S. 2,021,592, Nov. 19 The Cd is immersed in a soln of chromic acid and a sulfate radical and the ratio in g per l of chromic acid to sulfate radical is maintained above a crit ratio of about 20 The soln may be formed from CrO_3 and H_2SO_4

Electric system for preventing corrosion of metal surfaces such as condensers used on aircraft Herbert S Polin (to Polin, Inc.). U S 2,021,519, Nov. 19

Preventing corrosion of condensate-return lines of steam-heating systems Robert L Holmes U S 2,020,359, Nov. 12 A portion of the water contained in the boiler is directed into the condensate-return line near a point where the condensate water enters the return line. App is described

Electric arc apparatus for fusing metals as in the manufacture of alloy welding rods John A. Zublin U. S. 2,022,171, Nov. 26 Various structural, elec. and operative details

Arc welding electrode Louis J Larson (to A. O. Smith Corp.). U. S. 2,021,628, Nov. 19 An electrode with a core of ferrous metal has a covering including carbonaceous material such as charcoal and at least one

ingredient which contains O, such as Fe oxide and SiO_2 so proportioned that the ratio of C atoms to effective O atoms is from about 0.54 to about 0.66. Various other ingredients also are used

Welding rods. Oxweld Acetylene Co. Brit 433,097, Aug. 8, 1935. See U. S. 2,010,605 (C. A. 29,6566)

Welding metals Lloyd T. Jones, Harry E. Kennedy and Maynard A. Rotermund (to Union Carbide and Carbon Research Laboratories, Inc.). Brit. 433,723, Aug. 20, 1935

In the elec-fusion welding or deposition of metals with a fusible metal electrode, 1 end of the electrode is placed in contact with or submerged in a mass placed over the joint and consisting of unbonded finely-divided material which is electrically conductive when molten and composed mainly of fusible silicates and contg no uncombined Fe oxide or substances evolving gases, a portion of the mass near the electrode is melted and welding heat is generated by passing an elec. current from the electrode through the mass to the work. In an example, the mass is previously made by melting CaCO_3 50, MgO 9.4 and SiO_2 40.5 lb, cooling, granulating and subsequently adding 1 oz of fluorspar to 1 lb. of product.

Welding steels Frederick M. Decket and Russell Franks (to Electro Metallurgical Co.). Brit. 433,585, Aug. 16, 1935. Cr-Ti steels contg. about 3-30% Cr or Cr-Ni-Ti steels contg. about 3-30% Cr and 5-35% Ni are welded by the oxyacetylene or elec. arc process with the use of a steel welding rod contg. about 3-30% Cr, 5-35% Ni and a substantial amt. of Cb to produce a ductile corrosion-resisting joint. The filler material contains C up to 0.3%, the Cb being preferably 4-10 times the C but not over 5%. The C content of the base metal may be up to about 0.3% with Ti at least twice the C but not over 5%.

Fluxes Hanson-Van Winkle-Munning Co. Brit 432,746, Aug. 1, 1935 A flux for use in galvanizing consists of 1 or more fluxing salts, e. g., NH_4Cl , ZnCl_2 , Zn NH_4 chloride, and 1 or more substances, selected from the glycosides, e. g., licorice root, saponin, soapbark, amygdalin, phloridzin, populin, salicin, soap wort root, tannin and the partly or wholly H_2O -sol carbohydrites, e. g., xylene, dextrose, cane sugar, starch, galactose, lactose, maltose, which will stabilize the froth formed by the gas evolved from the fluxing salt or salts. In 432,747, Aug. 1, 1935, the surface of a metal to be galvanized is prepd by passing the metal through a flux wash comprising a dil aq soln of a fluxing compd., e. g., HCl , NH_4Cl and a froth stabilizer that reduces the surface tension and increases the viscosity of the soln, e. g., glycerol, tallow, oatmeal, bran, a glycoside or a carbohydrite.

Solder-extruding apparatus Arthur S. Berry (to Berry Solder Co.). U. S. 2,021,828, Nov. 19 Various mech features are described of app suitable for extruding solder in the form of strands with a flux core.

10—ORGANIC CHEMISTRY

CHAS. A. ROULLIER AND CLARENCE J. WEST

The mechanism of some important organic reactions. The dissociation of carbon bonds Otto Schmidt *Chem Rev* 17, 137-54 (1935), cf. C. A. 27, 3910—A discussion of the disscion of C bonds in the scission of the sugar mol and in the cracking process L K

Stereochemistry of solid substances Wilhelm Rdtz, *Ber* 68A, 91-103 (1935)—An address J F M.

Characterization of hydrocarbons Ernst Galt, Rudolf Klatt and Walter Friedl *Montan Rundschau* 27, No 18, 14 pp (1935)—To distinguish paraffin from naphthene hydrocarbons phys methods are more convenient than chem methods Differences in fluorescence in ultraviolet light (Fe or Hg arc) appeared in paraffin, ceresin, carnauba wax, montan wax, beeswax, petr. ether, petroleum and mineral oil, but when measured by Ostwald's method were too small to permit the use of this property in the study of mixts No fluorescence was found in cyclohexane (I), C_7H_{14} (II), C_8H_{18} (III), C_9H_{20} (IV) and

low-boiling fractions of Pennsylvania oil (V). On soln in concd H_2SO_4 V gave strong fluorescence, light blue, dark blue, green and yellow-green with increasing b. p. Xylene also gave yellow-green fluorescence in concd. H_2SO_4 . On crystn. from Et_2O the waxes can be distinguished by their cryst form (photomicrographs), which appears the same in either ordinary or ultraviolet light. I and IV on slow crystn give star-shaped crystals which soon change to a blunt needle form. The soly. of II in $[\text{C}(\text{ClH}_3)_3]\text{O}$ at -10° , -17° and -80° was detd by measuring n_D^{20} (graph for known compns). The best sepn. occurs when equal vols. are used. At -80° III is sol in 3 vols of VI and can be sepd. from I, II and V are insol in VI, IV is sol. Quant. data for these mixts are given Paraffin and naphthene oils can be sepd. from aromatic and unsatd. oils, but not from each other, by chlorox (VI). W. F. Bruce

Synthesis of alkyl acetylenes from calcium acetylide.

Thomas H. Vaughn and James P. Danehy. *Proc. Indiana Acad. Sci.* 44, 141 (1931).—Cu acetylides (I) is obtained either by the passage of HCl into Cu-NH_3 solns. or by the addn. of Cu-NH_3 solns. to HC_2CHNH_3 solns., the 2nd scheme being the most rapid. (I), reacts vigorously with I_2 in NH_3 to give a theoretical yield of pure *t*-butyne. AmCl , AmBr and BuBr react with I in NH_3 , producing the corresponding acetylides in yields of 50–31 and 45%, resp.

W. J. Peterson
The choice of optimal pressure of absorption of butadiene. Ya. L. Zhigalin. *Soviet Kauchuk* 1935, No. 5, 22–6.—Detailed calcs. of the power used at different pressures of absorption of butadiene in alc. at 30°, are given. The comparative costs of power used, of desorption of alc., and of rectification of alc. at different pressures are given. The optimal pressure should be 5 atm.

A. Pstöff
The chlorination of propane. II. The heterogeneous reaction. L. H. Meyerson and Samuel Yuster. *J. Phys. Chem.* 39, 1111–23 (1935), cf. *C. A.* 29, 6522.—The reaction of C_3H_8 with Cl_2 was studied under various conditions and a mechanism postulated. High partial pressures of Cl_2 tend to poison the catalyst. Secondary chlorination in part was shown to be due to the addn. of Cl_2 to C_3H_7 formed by the pyrolysis of Pr chlorides. The high percentage of 1,2-dichloropropane in the products supports this view. High Cl_2 partial pressures, high temps. and high rates of flow all favored the formation of more highly chlorinated products. Unsatur. was found in all products collected when the Cl_2 employed was 100%. H_2 was 1.

1,1-Diodoethene or vinylidene iodide. I. The supposed "1,1-diodoethene" of H. P. Kaufmann and Th. Uetzel. Guy I. Mechwiller. *Bull. soc. chim.* [5], 2, 1025–31 (1935), cf. *C. A.* 28, 3000. K and U (cf. *A.* 16, 2302) claim to have prep. 1,1-diodoethene, $\text{C}_2\text{H}_2\text{I}_2$ (I), by the isomerization of ethereal acetylene iodide, $\text{C}_2\text{H}_2\text{I}_2$ (II) in the presence of metallic Na. Repetition of this work has shown that the product is, in reality, a mixt. of *trans*-II and diiodoethine, $\text{C}_2\text{H}_2\text{I}_2$ (III). Finely divided Na (10 g.) was introduced into a soln. of 30 g. of II in 70 cc. of anhyd. I_2O . The mixt. was refluxed on a shaking machine for 21 days. Every 3rd day, 2 g. of Na was added. The product was filtered and the filtrate, combined with the I_2O washings of the Na, was evapd., yielding 3 g. (10%) of white needles, m. 70–5°. Repetition of the exp. over a period of 6 days gave 18 g. of a mixt. of *trans*-II, m. 72°, and a product, III, m. 70–5°, with a characteristic odor. From the m-p curve it was evident that K's product contained 70% of unchanged *trans*-II and 30% of III, converted by the action of ultraviolet light into C and $\text{C}_2\text{H}_2\text{I}_2$, m. 184°. The treatment of 20 g. of II in 50 cc. of abs. I_2O with 10 g. of dry NaOH gave no decomp. on refluxing the mixt. for 7 days but, on the addn. of 5 cc. of abs. alc., 800 cc. of CH_2CH_2 and 8 g. of III were produced. I. identically the NaI produced in K's procedure was hydrolyzed to NaOH by the damp air introduced on opening the flask to admit the Na at intervals with the resulting decomp. of II to CH_2CH_2 and III. I. has not yet been repd. C. R. A.

Ethylene nitriles. R. Vandeweyer. *Bull. soc. chim. Belg.* 44, 376–86 (1935).—Sepn. of the *cis* and *trans* isomers of α -hexene- and α -heptenenitriles has been accomplished by 13 fractionations of the resp. mixts. at atm. pressure. *cis*- α -Hexenenitrile, b. 140–6–8°, d₄ 0.82410, *trans*-, b₁₀ 165.8–0°, d₄ 0.82010. *cis*- α -Heptenenitrile, b₁₀ 127.3–7.6°, d₄ 0.82161; *trans*-, b₁₀ 141.7–4–0°, d₄ 0.82311.

W. J. Peterson
The alkyl and aryl sulfonic esters. P. Carré and D. Liebermann. *Bull. soc. chim.* [5], 2, 1700–3 (1935).—See *C. A.* 29, 6200.

A review on the organic compounds of phosphorus. V. M. Metz. *Uspekhi Khim.* 4, 573–609 (1935).—The prepn., properties, reactions and interrelations of the various classes of org. Ph. compds. with I to several alkyl or aryl groups and with various anionic groups, as halogens, etc., as well as of compds. contg. a P–P, P–N, P–S or P–O bond are discussed. As yet unpublished is the reaction of Ph_3NCl in the presence of Cu with PCl_5 and

PhPCl_2 to give N_2 , I , PhPCl_4 and Ph_2PCl , resp. One hundred and seventy other references. T. H. Rathmann

Optical rotation of configurationally related aldehydes. P. A. Levene, Alexandre Rothien and Martin Kuma. *J. Biol. Chem.* 111, 759–47 (1935). Active AmOH oxidized by the method of I. H. G. gave *1*- $\text{CHMeCH}_2\text{CHO}$, b. 90–2°, $[\alpha]_D^{20}$ 20.5°. *1*- $\text{CHMeCH}_2\text{CH}_2\text{CHO}$ from 31 g. of active AmOH in I_2O (85% cc) was drop. (d) into boiling CHCl_3 (100 g.). Hydrolysis of the product with 5 N H_2SO_4 for 15 min. and purification over the NaHSO_4 compd. gave *1*- $\text{CHMeCH}_2\text{CHO}$, b. 122°, d₄ 0.8010, n_D 1.4001, $[\alpha]_D^{20}$ 8.7°. Similarly *1*- $\text{CHMeC(CH}_3)_2\text{CHO}$, b. 141°, d₄ 0.8112, n_D 1.4081, $[\alpha]_D^{20}$ 12.0°, and *1*- $\text{CHMeC(CH}_3)_2\text{CH}_2\text{CHO}$, b. 72°, d₄ 0.8161, n_D 1.4114, $[\alpha]_D^{20}$ 12.0°, were prepd. Values for $[\alpha]$ are mixt. and taken in heptane. Due to the proximity of the first absorption band in the ultraviolet of aldehydes the analysis of their rotatory dispersion curves can be made with greater rigor than that of the acids. The partial rotation of the CHO group (due to the absorption band at $\lambda 2900$) changes its sign when n passes from 0 to 1 in substances of the type *1*- $\text{CHMeC(CH}_3)_2\text{CHO}$ and the direction of this partial rotation remains constant when $n = 2$ and 3. An unmistakable periodicity does occur, however. The assumption previously made in regard to the configuration relationships of the primary and secondary azides is thus strengthened.

R. C. I. Herfield
Preparation of mixed formal by direct acetalization. H. Wuyts and P. Docquier. *Bull. soc. chim. Belg.* 44, 297–308 (1935), cf. *C. A.* 18, 1970.—A mixt. of 320 g. MeOH , 460 g. PrOH , 300 g. dry paraformaldehyde and 7.8 g. H_2SO_4 is refluxed 12 hrs. with a 0° condenser and CaCl_2 guard tube, washed with NaOH , NaHSO_4 and NaOH in turn, and fractionally distd. The fractions b. 50–61.5° (318.5 g.), mixed with 500 g. CS_2 and refractionated, yield 120.7 g. pure $\text{MeOC}_2\text{H}_4\text{OEt}$ (I), b₁₀ 65.90° (d₇/d₄ = 0.940), d₄ 0.8641, d₂₀ 0.8418. Binary azeotropic mixts. with H_2O , MeOH and I OH contg., resp., about 95.0, 74.7 and 86.7% I , b₁₀ 61.25°, b₁₀ 77.1° and b₁₀ 83.95°, resp.; no ternary mixts. of these are found. $\text{CH}_2(\text{OH})_2$ (II) (60%) with PrOH forms a binary azeotrope, b₁₀ 80.15°, addn. of H_2O does not give a ternary azeotrope. A similar prepn. yields *1*- $\text{OCH}_2\text{CH}_2\text{Pr}$ (III), b₁₀ 113.7°, d₄ 0.8512, d₂₀ 0.8316. The azeotrope of 81.6% I with PrOH b₁₀ 85.9°, that of 59.5% I and 22.9% PrOH with H_2O b₁₀ 83.8°, no others are found.

H. A. B.
New method for the general preparation of *N*-carbethoxyketimines $\text{RR}'\text{C}(\text{NCO})\text{C}_2\text{H}_5$. Joseph Hoch. *Compt. rend.* 201, 660–2 (1935).— $\text{RR}'\text{C}(\text{OH})_2$, treated with $\text{NH}_4\text{CO}_2\text{Et}$ (I) and a trace of PhNH_2 , HCl at 100–100° gave $\text{RR}'\text{C}(\text{NCO})\text{C}_2\text{H}_5$, where R and R' are I , Et , Pr , b , 105–6° (50% yield); Pr , b. 122–4° (80% yield), MeC_2H_5 , b₁₀ 170–2° (45% yield), $(\text{CH}_3)_2\text{CH}$, b₁₀ 135° (76% yield), $\text{CHMeC(CH}_3)_2$, b₁₀ 141–5° (81% yield) and MePh , b₁₀ 162–3° (50% yield). When RR' was Me , $\text{Me}_2\text{C}(\text{NHCO}_2\text{Et})_2$, b₁₀ 145–55°, was obtained and no acetonecarboxyethylamine. All are decomposed by HCl to give the original ketone and I . $\text{MeC}(\text{OH})_2\text{CHCO}_2\text{Et}$, treated with I , gave $\text{MeC}(\text{NHCO}_2\text{Et})_2\text{CHCO}_2\text{Et}$, b₁₀ 137° (85% yield).

Julius White
Molecular compounds in the systems: acid-salt, anhydride-salt and acid ester (acetic acid, butyric acid, phenylacetic acid). Maria Rakunin and T. T. Vitale. *Gazz. chim. ital.* 65, 503–616 (1935).—The present work deals with the thermic analysis of binary systems composed of (I) AcOH with AcONa and AcOK ; (2) PrCO_2H with PrCO_2Na ; (3) $\text{PhCH}_2\text{CO}_2\text{H}$ with its Rb , K , Na , I , Ba , PhNH_4 , and tertiary base salts; (4) $(\text{PhCH}_2\text{CO}_2)_2\text{O}$ with $\text{PhCH}_2\text{CO}_2\text{K}$ and $\text{PhCH}_2\text{CO}_2\text{Na}$; (5) $\text{PhCH}_2\text{CO}_2\text{H}$ with some of its esters and (6) $\text{PhCH}_2\text{CO}_2\text{Na}$ with $\text{PhCH}_2\text{CO}_2\text{Pr}$. The expt. technique is described in detail, and the diagrams of state of each combination are given. The following important results were obtained on the various systems: $\text{PhCH}_2\text{CO}_2\text{H}-\text{PhCH}_2\text{CO}_2\text{Li}$.—No compd. One eutectic around 64° for approx. 19% $\text{PhCH}_2\text{CO}_2\text{Li}$. $(\text{PhCH}_2\text{CO}_2)_2\text{O}-\text{PhCH}_2\text{CO}_2\text{Li}$.—No compd. One eutectic around 67° for approx. 18% $\text{PhCH}_2\text{CO}_2\text{Li}$.

$\text{PhCH}_2\text{CO}_2\text{H}-\text{PhCH}_2\text{CO}_2\text{Na}$ —Two stable *comps.* ($\text{PhCH}_2\text{CO}_2\text{H}$), $\text{PhCH}_2\text{CO}_2\text{Na}$, *m.* approx 95°, and $\text{PhCH}_2\text{CO}_2\text{H}$ ($\text{PhCH}_2\text{CO}_2\text{Na}$), *m.* approx 116°. Three eutectics at approx 67°, 62° and 102° for approx 13, 52 and 71% $\text{PhCH}_2\text{CO}_2\text{Na}$, resp. The diagram also shows in the region of high salt an infection characteristic of a 3rd *compd.*, which *dissoc.* below its *m. p.* and contains over 80% of salt. ($\text{PhCH}_2\text{CO}_2\text{O}-\text{PhCH}_2\text{CO}_2\text{Na}$ —One unstable *compd.*, probably ($\text{PhCH}_2\text{CO}_2\text{O}$) ($\text{PhCH}_2\text{CO}_2\text{Na}$), which *dissoc.* around its *m. p.* at 110°. One definite eutectic around 50° for approx 39% $\text{PhCH}_2\text{CO}_2\text{Na}$, with indications of another eutectic at a higher proportion of salt. $\text{PhCH}_2\text{CO}_2\text{H}-\text{PhCH}_2\text{CO}_2\text{K}$ —One stable *compd.*, $\text{PhCH}_2\text{CO}_2\text{H}$ $\text{PhCH}_2\text{CO}_2\text{K}$, *m.* around 142°. Two eutectics at around 50° and 130° for approx 17 and 64% $\text{PhCH}_2\text{CO}_2\text{K}$, resp. $\text{PhCH}_2\text{CO}_2\text{H}$ $\text{PhCH}_2\text{CO}_2\text{Rb}$ —One stable *compd.*, $\text{PhCH}_2\text{CO}_2\text{H}$ $\text{PhCH}_2\text{CO}_2\text{Rb}$, *m.* around 128°. Two eutectics at 18° and 57° for approx 18 and 68% $\text{PhCH}_2\text{CO}_2\text{Rb}$, resp. $\text{PhCH}_2\text{CO}_2\text{H}-\text{PhCH}_2\text{CO}_2\text{Ba}$ —Mixts *contg.* over 20% of salt showed marked vitrification, and even at low temps *crystn.* could not be induced. $\text{PhCH}_2\text{CO}_2\text{H}-\text{PhCH}_2\text{CO}_2\text{NH}_4\text{Ph}$ —No *compd.* One eutectic at around 46° for approx 36% $\text{PhCH}_2\text{CO}_2\text{NH}_4\text{Ph}$. $\text{PhCH}_2\text{CO}_2\text{H}-\text{PhCH}_2\text{CO}_2\text{NHMe}$ —Up to approx 40% of salt, *crystn.* began around -22°, but at higher concns no *crystn.* could be induced even at -90°, and the mixts became more viscous and ultimately vitreous. $\text{PhCH}_2\text{CO}_2\text{H}-\text{PhCH}_2\text{CO}_2\text{Me}$ —A slight infection, indicating the probable formation of the *compd.* $\text{PhCH}_2\text{CO}_2\text{H}$ $\text{PhCH}_2\text{CO}_2\text{Me}$, dissociable below its *m. p.* One eutectic at approx -67° for approx 91% $\text{PhCH}_2\text{CO}_2\text{Me}$. $\text{PhCH}_2\text{CO}_2\text{H}-\text{PhCH}_2\text{CO}_2\text{Et}$ —A point of infection indicating a *compd.* of the probable *compn.* ($\text{PhCH}_2\text{CO}_2\text{H}$), $\text{PhCH}_2\text{CO}_2\text{Et}$, which *dissoc.* around 46°, below its *m. p.* One eutectic around -45° for approx 20% $\text{PhCH}_2\text{CO}_2\text{Et}$. $\text{PhCH}_2\text{CO}_2\text{Na}-\text{PhCH}_2\text{CO}_2\text{Et}$ —One unstable *compd.*, $\text{PhCH}_2\text{CO}_2\text{Na}$ $\text{PhCH}_2\text{CO}_2\text{Et}$. One eutectic around -60° for approx 5% $\text{PhCH}_2\text{CO}_2\text{Et}$. $\text{PhCH}_2\text{CO}_2\text{H}-\text{PhCH}_2\text{CO}_2\text{CH}_2\text{Ph}$ —No *compd.* One eutectic around -13° for approx 80% $\text{PhCH}_2\text{CO}_2\text{CH}_2\text{Ph}$. $\text{AcOH}-\text{AcONa}$ —One unstable *compd.* of the probable *compn.* (AcOH), AcONa , which *dissoc.* around 93°, below its *m. p.* Two *comps.* were reported by Kendall and Davison (C. A. 15, 2398). One eutectic around 4° for approx 6% AcONa . $\text{AcOH}-\text{AcOK}$ —Two unstable *comps.* of the probable *comps.* AcOH (AcOK), and (AcOH), AcOK , both of which *dissoc.* below their *m. ps.* One eutectic at approx 0° for approx 15% of AcOK . A diagram by Davidson and McAllister (C. A. 24, 5205) is similar but less clearly defined. $\text{PrCO}_2\text{H}-\text{PrCO}_2\text{Na}$ —Two unstable *comps.*, one of which has the *compn.* PrCO_2H PrCO_2Na , and *dissoc.* at approx 48°, the other of which has an uncertain *compn.* but contains several mols of PrCO_2Na per PrCO_2H mol. One eutectic around -30° for approx 25% PrCO_2Na . The behavior of the various *comps.* shows the influence of the cations of a salt on the formation and on the stability of its mol addn *comps.* Among the alk. metal group, the tendency to form addn *comps.* increases with increase in the at. wt. In systems of esters and acids, addn *comps.* are either not formed at all, or they are very unstable. The influence of the addn *comps.* on the Perkin-Ogialoro synthesis (cf. B, loc cit.) have been studied systematically, and will be the object of a later paper. C. C. Davis.

Vinylacetic acid C. Mannich *Arch. Pharm.* 273, 415-17 (1935)—This acid, prep'd by sapon of allyl cyanide with conc'd. HCl and subsequent rectification, *b.p.* 70-2°, the Et ester *b.p.* 119°, it yields on oxidation with Br_2/O β -hydroxybutyrolactone, *b.p.* 110-15°.

W. O. E.

Duturic acid. Ralph W. Clark. *J. Am. Pharm. Assoc.* 24, 843 72 (1935)—The literature regarding duturic (margaric) acid published since 1811 is briefly reviewed. Curves are given of the *m. ps.* of fatty acids having an even no. of C atoms and of those having an odd no. of C atoms, and also of their Me esters. Ftn. of the ground seeds of *Datura stramonium* and treatment of the oil by the methods generally used in the past for the investiga-

tion of the *compn.* of the fatty acids (sapon, sepn. of the solid acids by means of the Pb salt- H_2O method and sepn. of the solid fatty acids by fractional *crystn.* from alc, fractional pptn. of the Mg salts, and vacuum distn. of the Me esters) gave neg. results. It is concluded that studies on the identification of synthetic fatty acids should be carried out by means of other derivs. such as were used by Reid and co-workers, Whitby, etc., and that x-rays could probably be used to advantage in the study of duturic acid, the identity of which is not yet firmly established in the minds of all investigators. A. P. C.

Mechanism of three-carbon tautomerism D. J. G. Ives and H. N. Rydon. *Nature* 136, 476-7 (1935)—Vinyl-acetic (I), crotonic (II) and butyric (III) acids were, resp., treated with 1.05 mol. NaOH in *dist. D₂O* at 100°. No isotopic interchange was detectable with II or III but a marked one in I. These results indicate a parallelism between isotopic interchange and isomerization and hence the theories for the mechanism of 3-C isomerization as being purely an intramol. one are unacceptable. I. W.

The removal of alcohol from ethyl acetate. III. V. Longinov and V. Duzkal. *Trans. Inst. Pure Chem. Reagents (U. S. S. R.)* No. 14, 42-8 (1935)—By distn. of the crude ternary azeotropic mixt. of AcOEt (I), H_2O and alc. with excess H_2O , it has been found possible to obtain a binary azeotropic mixt. of I and H_2O (C. A. 24, 3755). The content of alc. was thus reduced from 8.4 to 4.5%. It is now reported that when such a ternary mixt. is washed in the vapor state with H_2O , a product *contg.* only 0.3% alc. is obtained. Two starting materials were used: (A) A purified *com.* I and (B) a crude *com.* I. A was 94% I, 6% alc. and 0.1% AcOH , B was 71.6% I, 17.7% alc., 7.5% H_2O and 3.2% AcOH . Typical *expt.*—Three I, B, *distd.* at a rate of 558 cc. per hr, the vapors being washed with 2.5 l. of H_2O flowing at a rate of 700 cc. per hr, gave 2 l. condensate (fraction 2, *b.p.* 70-1°) *contg.* 94.4% I, 0.3% alc. and 5.3% H_2O . The proportion of alc. in the condensate was greater if the H_2O /condensate ratio was less than that shown above. The amt. of alc. removed was not inversely proportional to the speed of distn. The yield of pure I was greatest (88%) with the conditions shown. Similar results were obtained with a Barlet still (10 l.), although with the most favorable H_2O /condensate ratio of 1.0 or more, flooding of the app. occurred. Therefore a ratio of 0.85 was employed, giving lower yields of a product *contg.* 0.4-0.5% alc. Fractionation of this to remove H_2O gave alc. I *contg.* 0.1-0.2% alc. in 50% yield based on the I in B. By recovering the head and tail fractions the yield is raised to 75%, and by starting with A it is 80% or more. Lewis W. Butz.

Amino alcohols with secondary alcohol groupings. Jean Matti and Emile Barman. *Bull. soc. chim.* [5], 2, 1742-4 (1935)—3-Diethylamino 2,2-dimethylpropanol (I) reacted with PhMgBr to give 1-dimethylamino-2,2-dimethyl-3-phenyl-3-propanol, *b.p.* 123.5°, *n_D²⁰* 1.5400, *d₄²⁰* 0.96391; HCl salt, *m.* 196°; benzoate-HCl, *m.* 180°. 1-Dimethylamino 2,2-dimethylpropanol (II) and PhMgBr gave dimethylamino-2,2-dimethyl-1-phenyl-3-propanol, *b.p.* 115°, *n_D²⁰* 1.5182, *d₄²⁰* 0.9742, HCl salt, *m.* 181°; benzoate-HCl, *m.* 208°. II and 1-tMgI gave 1-dimethylamino-2,2-dimethyl-3-pentanol, *b.p.* 83°, *n_D²⁰* 1.4789, *d₄²⁰* 0.8610, benzoate-HCl, *m.* 163.5°, *m.* aminobenzoate-HCl, *m.* 184.5°; *p*-aminobenzoate-HCl, *m.* 194°; enniamate-HCl, *m.* 177°. II and BuMgBr gave 1-dimethylamino-2,2-dimethyl-3-heptanol, *b.p.* 119.5°, *n_D²⁰* 1.4418, *d₄²⁰* 0.8417, benzoate-HCl, 115°, *p*-aminobenzoate-HCl, *m.* 182°.

R. Baltzy.

The preparation of ethers of hydroxy aldehydes by oxidation of α ethers of glycerol with lead tetracetate. Mme. S. Sabatay. *Bull. soc. chim.* [5], 2, 1744-6 (1935)— α -Ethers of glycerol were prep'd by warming allyl or aryl halides with $\text{NaOCH}_2\text{CH}(\text{OH})\text{CH}_2\text{OH}$, and the ethers oxidized in benzene soln. by $\text{Pb}(\text{AcO})_4$ in the cold. The prep'n of benzoyloxyacetaldehyde is described. R. D.

Aminolysis of leucine. Emil Baur and G. Schindler. *Helv. Chim. Acta* 18, 1147-9 (1935), cf. Wunderly, C. A. 27, 2136, 3975—In order to show that hydrolytic as well as reductive decarboxylation occurs in nature, leucine (I) was

changed to AmOH (II) by boiling with 10 parts of air-free bone black. From 10 g. of I, 1.5 g. of II was isolated by steam distill. followed by salting out with K_2CO_3 and redistill. II, b.p. 55–65° (0.7 g.), gave the odor of AmOAc with H_2SO_4 and HIO_4 , and in alc. free from fusel oil gave the red-violet color reaction for fusel oil with H_2SO_4 and furfural. The high b.p. is attributed to superheating and the presence of impurities. W. F. Bruce

Combination of thiol acids with methylglyoxal. Maxwell P. Schubert, *J. Biol. Chem.* 111, 671–8 (1935) — Methylglyoxal forms 1:1 addn. products with glutathione and thioglycolic acid and its amide and phenylglyoxal forms similar compds. with these and with cysteine, taurine, thiosalicylic acid and thioacetamide. Both form condensation products with cysteine and pseudohomocysteine which possess a nearby NH_2 group, by elimination of a mole of H_2O . The prepn of cysteine and cysteine betaine is described. Cysteine betaine *farinariae*, m. 230°, cysteine *bovine farinariae*, m. 210°. It has been suggested that in the body glutathione forms a compd. with methylglyoxal and that this compd. yields lactic acid under the influence of glyoxalase. A. P. Lothrop

Synthesis of *l*-ribo-3-ketoheptonic acid lactone (*l*-allo-scorbic acid). Marguerite Steiger *Helv. Chim. Acta* 18, 1252–4 (1935); cf. *C. A.* 29, 6213. — *l*-Allo-scorbic acid treated with HCN and then hydrolyzed gave *l*-allo-scorbic acid, $O=C(OH)C(OH)CHCH(OH)CH(OH)CH_2OH$, m.

176–7°, n_D^{20} 1.50 ± 0.01 (0.01 N HCl). Julius White, *Acetylthymylcarbinol*. James R. Young and Allan M. Wilson, *J. Phys. Chem.* 39, 1135–8 (1935) — Samples of acetylthymylcarbinol (I), m. –72°, prep'd from the polymer (II) by melting or distg., were kept at –10°, room temp., 30°, 100° and 130° and the n was det'd. at intervals. The initial value of n varied with the method of prep'n but the min. may be 1.4175. n increases with time more rapidly at higher temps. The d and viscosities of I kept at 30° varied similarly. By extrapolation freshly dist'd. I would have d_4^{20} 0.9060, n_D^{20} 0.0175. The vapor pressures of I increase from 162 mm. at 0° to 760 at 144°. Crystals of II, d. 1.26, are deposited in 2–9 days at room temp. Although in general it m. about 124°, II has no definite m.p. but passes to liquid above 30°. The transition temp. is 16° (dilatometer) but in the absence of I, II is stable at higher temps. II is monomol. in H_2O , AcOH and paraldehyde. In contact with Zn at –10°–0° I became solid in 24 hrs. The crystals are transparent, flat and monoclinic with angles 127°, 108° and 125° on the chloroformic acid face. Janet E. Austin

Formolins II. P. Karrer and Carlo Muvante *Helv. Chim. Acta* 18, 1140–3 (1935); cf. *C. A.* 29, 5672. — In a study of the effect of *p*-substituted Ph groups on the enolization of benzoylformolins the following amts. of enol were found: benzoylformolin, 57%; *p,p'*-dimethoxybenzoylformolin, 40%; *p,p'*-dichlorobenzoylformolin (I), 100%; *p,p'*-dibromobenzoylformolin, 95–100%. By refluxing *p,p'*-dichlorobenzoylformolin with SeO_2 , *p*-chlorophenylglyoxal was prep'd as the monohydrate, $C_6H_4ClO_2 \cdot H_2O$, m. 122°. With KCN this gave I, $C_6H_4ClO_2 \cdot KCN$, red plates, m. 190°. *p*-Bromophenylglyoxal hydrate, $C_6H_4BrO_2 \cdot H_2O$, m. 125°, similarly prep'd, gave *p,p'*-dibromobenzoylformolin, $C_6H_4BrO_2$, m. 196°. W. F. Bruce

Synthesis with glyoxal semiacetal Nitroaldehyde III. Glyoxal, Hermann O. L. Fischer, Frick Baer and Heinrich Nidecker, *Helv. Chim. Acta* 18, 1079–87 (1935); cf. *C. A.* 29, 5075. — (I) $O_2CCH(OH)CH_2NO_2$, treated with $MeNO_2$, gave (I') $CH(OH)CH_2NO_2$ (I), b.p. 136–38°, d_4^{20} 1.132, n_D^{20} 1.4410. I, warmed with 0.1 N H_2SO_4 at 80–85° for 30 min., gave $O_2NCH_2CH(OH)CH_2NO_2$ (II), m. 160° (decomn.). II, treated with dimedon, gave the dimedon complex, m. 180° (decomn.). II can be depolymerized by heating at 100–50° at 0.01 mm. II, treated with 2,4 (NO_2), $C_6H_3N_2NH_2$, gave the hydrazide, m. 167–68°, osazone, m. 294–7°. I, treated with (CO-H), and reduced with Pd-BaSO₄, gave (I') $CH(OH)CH_2NH_2$ (II'), m. 113–5°. I, treated with activated Al and reduced, gave (I') $CHCH(OH)CH_2NH_2$ (III), m. 43°,

n_D^{20} 1.4463. III on hydrolysis with fuming HCl gave $NH_2CH_2CH(OH)CHO$, m. 143–5°. Julius White

Hydrolysis velocity of cyclic acetals. II. Rudolf Leutner, *Moravsk. 66*, 222–48 (1935), cf. *C. A.* 26, 5820. — The following values are reported for k , (velocity of acid hydrolysis in H_2O at 25°): pinacone formal, $Me_3COC(OH)C(OH)Me_3$, k , 0.000027; 1,3-butylene glycol formal,

$MeCHOCH(OH)CH_2CH_2OH$, b_m 113–14°, k , 0.000048;

1,3-butylene glycol acetal, b_m 118°, k , 0.21; 1,3-butylene glycol acetal, $MeCHOCH(OH)CH_2CH_2OH$, b_m 129–5–

30.5°, k , 338; pinacone acetal, $Me_3COC(OH)C(OH)Me_3$, k , 0.0120. The relative ease of splitting of the 6-membered ring of 1,3-butylene glycol acetals of $HCHO$, $AcOH$ and Me_3CO is about $1.4 \times 10^3 : 7 \times 10^4$.

C. J. West
Anhydrous glyoxylic acid Arvi Talvite *Swen. Kemistillskts 8B*, 32 (1935) (in German) — A preliminary report. A dil. aq. soln. of glyoxylic acid, prep'd by adding the calcd. quantity of oxalic acid to Ca glyoxylate, is evaporated in a vacuum desiccator over H_2SO_4 at room temp. The resulting colorless sirup is treated with abs. ether to remove traces of Ca oxalate and evaporated (about 3 weeks under a pressure of 1 mm. Hg over H_2SO_4). The anhyd. glyoxylic acid is very hygroscopic. F. E. Jukkola

The formation of "triacetylacetic ester" II. F. Seidel, W. Thier, A. Uher and J. Dittmer *Ber.* 68B, 1913 21 (1935), cf. *C. A.* 26, 5075. — It has been reported that in the prep'n of Ac_2CHCO_2Et according to Claissen there is also formed Ac_2CCHCO_2Et (I), since the reaction product gave with NH_3 , a product (II) assumed to be 1,3,5-dimethylpyrazole-4-acetyl-4-carboxylate (III). v. Auwers (*C. A.* 27, 162) doubts the existence of I and the correctness of the structure III for II. It has now been found that II changes above its m.p. into β -(5-hydroxy-3-methyl-4-pyrazolyl)crotonolactone (IV), and hence II is not a condensation product of I with NH_3 , but β -(5-hydroxy-3-methyl-4-pyrazolyl)crotonolactone (V). The NH_3 , first deacetylates the $AcCHCO_2Et$ in the reaction mixt., forming $AcCH_2CO_2Et$ and $AcNHNH_2$ (the greater part of the NH_3 , thus escaping further reaction), and the unchanged NH_3 condenses with a part of the $AcCH_2CO_2Et$ to 5-methyl-5-pyrazolone which combines with the rest of the $AcCH_2CO_2Et$ to form V with loss of water. All attempts to prep. the true III (which is isomeric with IV) were unsuccessful, but they yielded hitherto unknown intermediate products which not only contributed to the knowledge of the reactivity of the pyrazoles and pyrazolones but also helped to establish the structure of V with certainty. 1,3,5-dimethylpyrazolone-4-carboxylate (VI), from $AcCHCO_2Et$ (reacting in the mono-enolic form, of which the equil. mixt. contains 91.85%) and NH_3 , gives with $AcCl$ the 1-acetyl-3,5-dimethylpyrazole (VII) which, after sapon., is decarboxylated to 1-acetyl-3,5-dimethylpyrazole (VIII). The structure of VIII is established: (1) by condensing $AcCH_2$ (76% enol) with NH_3 to 3,5-dimethylpyrazole (IX) and acetylating IX to VIII with $AcCl$ in pyridine; (2) by synthesis of VIII from $AcCH_2$ and NH_2NHAc . Direct replacement of the 4-H atom on the pyrazole nucleus by acyl is not possible; to obtain 3,5-dimethyl-4-acetylpyrazole (X), CH_3CO_2 (88.3% enol at equil.) must be condensed with NH_3 . It reacts with $AcCl$ to form the 1,4-di-*Ac* derivative (XI). It was hoped that IV (or the free acid) might be obtained by sapon. isodihydraetic ester to $HO_2CCH_2CMe_2C(O_2Et)C(OH)Me$ and condensing the latter with NH_3 , but the product was always only 3-methyl-5-pyrazolone, the isodihydraetic ester evidently breaking down into $AcCH_2CO_2Et$ under even the mildest conditions. Definite proof that 3-methyl-5-pyrazolone reacts at the 4-position with $AcCH_2CO_2Et$ to form V was obtained indirectly. Reaction through the NH group is excluded, for 3,4,4-trimethyl-5-pyrazolone does not react with $AcCH_2CO_2Et$ but 1-phenyl-3-methylpyrazolone does, yielding β -(5-hydroxy-1-phenyl-3-methyl-4-pyrazolyl)crotonolactone (XII), which splits off $EtOH$ at 165° to form the lactone

(XIII) Further evidence that the NH group is not involved in the condensation is afforded by the fact that IV forms a Bz deriv. V, obtained in 24 g. yield from a charge of 638 g. $\text{AcCH}_2\text{CO}_2\text{Et}$, 88.6 g. Na and 600 g. AcCl , m 188°, is also obtained readily by Wolff's method (*Ber.* 38, 3038 (1905)), it is stable toward boiling MeOH and alc. NH, but with PhNH_2 and concd. KOH gives 3-methyl-5-pyrazolone, IV, m 246°. Free acid, from IV and 10% NaOH at 15–20°, m 154° (decompn.), regenerates IV on heating *in vacuo* at 15–20° or in hot alc. VII (6.2 g. from 7.0 g. VI), m 69°, free acid, similarly obtained (6.0 g.) from the free acid (5.0 g.) of VI, m 164°. VIII, b₁₀ 70°, b₁₂ 81°. 1-Bz analog, b₁₂ 158°. X, needles with 1 H₂O, m 121° (decompn.) and (anhyd.) 128°. XI, m 50°. XII, m 88°. XIII, light yellow, m. 132°. 1-Bz deriv. of VI, m 181°. C A R

Oxidation of monoethyl dimethylmalonate with potassium persulfate. I. Fichter and Jules Heer. *Helv. Chim. Acta* 18, 1276–80 (1935), cf. C. A. 29, 5077°. $\text{Me}_2\text{C}(\text{CO}_2\text{Et})_2$ (I), partially saponified with KOH, gave after acidification $\text{Me}_2\text{C}(\text{CO}_2\text{Et})\text{CO}_2\text{H}$ (II), b₁₀ 101–2°, b₁₂ 80°. II, heated with 1.5 N KOH and $\text{K}_2\text{S}_2\text{O}_8$ for 30 min. on a water bath, gave I and $(\text{CMe}_2\text{CO}_2\text{Et})_2$ (III), b 218–20° ($\text{CMe}_2\text{CO}_2\text{H}$) (IV), m 188.5°. III, treated with PhNH_2 , gave the phenylimide, m 88°. Similarly $\text{Me}_2\text{CHCO}_2\text{H}$ and $\text{Me}_2\text{CHCO}_2\text{Et}$ gave resp. IV and III.

Parachor and chemical constitution. III. Structure of urea and thiourea. Susil Kumar Ray. *J. Indian Chem. Soc.* 12, 404–9 (1935), cf. C. A. 29, 6227°. The surface tensions of urea (I) and thiourea (II) have been detd. by the method of max. bubble pressure. Xylene was used as the manometric liquid. The compds. decompose on fusion and consequently the surface tension and d were detd. in soln. The parachor values calcd. from the results obtained for I and II in aq. solns. and for I in HCONH_2 agree with the carbamide structure universally accepted. The low parachor value of 125 for I in EtOH and MeOH is supposed to be due to assocn. between the solute mols. or between the solute and solvent mols. This was corroborated by detns. of the mol. wt. of I in MeOH and EtOH by the vapor-pressure-lowering method. The apparent mol. wt. of I in alc. soln. increases rapidly with increasing concn. The required values were obtained by plotting the parachor results against concns. and finding the intersection point of the curve with the parachor axis. C R Addinal

Crystalline hypoxanthine. H. Stendel. *Z. physiol. Chem.* 236, 228–9 (1935). —Hypoxanthine and xanthine, obtained in the usual manner, were purified by repeated recrystn., hypoxanthine as the HCl salt and xanthine as the sulfate and the NH_4 compd. By liberation of the base from its HCl salt by treatment with NaOAc, hypoxanthine was obtained in large rhombic plates, while xanthine yielded only small prisms which did not alter their appearance after 10–12 recrystns. The illustrations of xanthine crystals in numerous textbooks are undoubtedly of hypoxanthine, and the error has been perpetuated for more than 2 decades. A W. Dox

Chromium-bisulfonate complexes. Priyadarshan Ray and Haribabu Saha. *J. Indian Chem. Soc.* 12, 621 (1935). —The constitution of complex compds. of bisulfonate with bivalent Cu, Co and Ni is uncertain. Sol. trivalent Cr-bisulfonate complexes have been prepd. The free base (I), obtained as ruby red crystals, has the compn. $[\text{Cr}(\text{C}_6\text{H}_5\text{SO}_3)_3]\text{H}_2\text{O}$, the bisulfonate mol. acting as a bidentate group and occupying 2 coordinate positions. I is expected to give rise to optically active enantiomers. In aq. solns. it behaves as a triacidic base. Similar compds. with trivalent Cu have also been prepd. C R A

The structure of heterosides from their absorption in the ultraviolet. Mme. Ramart-Lucas and J. Rakaté. *Bull. soc. chim.* [5], 2, 1599–1625 (1935). —Since the common sugars and their alkylsides have no absorption in the ultraviolet for λ less than 2400 Å, the absorption of heterosides in this part of the spectrum should be a function of the prosthetic group, more or less modified by the displacement of the H on the HIO by the sugar. Absorp-

tion spectra were made of the following natural and synthetic heterosides and of most of their prosthetic groups: β -Me glucoside, Me mannose, aucuboside, amygdaloid, benzyl glucoside, benzyl galactoside, amygdalitrile glucoside, phenylethyl glucoside, betuloside, salicyl glucoside, phenol glucoside, α -, m - and p -cresol glucosides, tetraacetyl- p -cresylglucoside, guaiaacil glucoside, resorcinol glucoside and its tetraacetate, arbutoside, Me arbutoside, salcoside, conferside, helicoside, monotroposide, lusitanoside, geoside, picoside, chloropicoside and cinnamyl glucoside. From these it appears that when the prosthetic group is combined with the sugar through an alc. HO the absorption curves of the prosthetic group and of the heteroside are almost, if not entirely, identical. Where the HO of the prosthetic group is phenolic the absorption curves are similar in shape but that of the heteroside is shifted toward the shorter wave lengths and the absorption is usually less intense. This shift is usually 40–90 Å with simple phenols, but is over 200 Å in some cases where the prosthetic group contains aldehyde or other groups strongly affecting the absorption. R. Baltzy

Catalytic oxidation of the carbohydrates and related compounds by oxygen in the presence of iron pyrophosphates. IV. Methyl alcohol, formaldehyde, formic acid, sodium formate, ethyl alcohol, acetaldehyde, acetic acid, sodium acetate, glycol, glycolic acid, sodium glycolate, oxalic acid and sodium oxalate. E. F. Degering. *Proc. Indiana Acad. Sci.* 44, 129–31 (1934); cf. C. A. 28, 7244°. MeOH , CH_2O , HCO_2H , HCO_2Na , EtOH , AcOH , AcONa , $\text{HOCH}_2\text{CH}_2\text{OH}$, $\text{CH}_3(\text{OH})\text{CO}_2\text{H}$, Na glycolate, and Na oxalate are not oxidized to give CO_2 and could therefore be identified as end products in the oxidation of the simple sugars under the conditions of these expts. AcH is oxidized to give CO_2 , but AcOH cannot be an intermediate step in the oxidation of AcH to CO_2 . At 75° (CO_2H), yields CO_2 , but little, if any, at 50°. W. J. P.

Chemical studies on sulfuric acid esters of sugars. I. A rough estimation of proportion of glucose polysulfates in their mixture. Tokuro Soda and Willy Nagai. *J. Chem. Soc. Japan* 56, 1258–62 (1935). —By estg. the velocity const. of the hydrolysis of mono- and poly-sulfates of glucose, an approx. estn. of the mono-, di- or poly-sulfates can be made. K. Katsuta

Cyclohexyl sulfite. W. Voss and W. Wachs. *Zer.* 68B, 1939–41 (1935). —Carré and Liebermann (C. A. 29, 3314) claim that neither the method of Voss and Blanke (C. A. 25, 1797) nor that of Katsuta and Sone (C. A. 25, 3964) gives cyclohexyl sulfite. According to them the product obtained by the V and B method from cyclohexanol and SOCl_2 is only cyclohexene. Thus V. and W. deny unqualifiedly, a repetition of the work has confirmed the earlier results in all respects except as to the yield, which is 45% instead of 54%. The product prepd. by V. and B. 7 yrs. ago showed the same const., after purification, as a freshly prepd. sample. Complete analysis, mol.-wt. detns. and the amt. of cyclohexanol isolated after alk. hydrolysis point to the substance as being the neutral cyclohexyl sulfite, $\text{C}_6\text{H}_{11}\text{O}_3\text{S}$ (I). Special importance is attached to the satisfactory agreement between the observed and calcd. values for mol. refraction. Any possibility of its being cyclohexene is eliminated; the differences as respects α_D , n_D , d_4 , and n are in part considerable. I. b₁₀ 173–3.5°, mol. wt. in benzene 238, n_D^{20} 0.991, n_D^{25} 0.989, d_4^{20} 1.0697, d_4^{25} 1.0690, n_D^{40} 1.48402, 1.48497, 1.49362 for H_α (17.6°), H_β (17.3°) and H_γ (17.5°). Cyclohexene, b₁₀ 85–5–6.5°, n_D^{20} 0.91, d_4^{20} 0.8321, n_D^{40} 1.44655, 1.44680 for H_α (17.3°), H_β (17.3°) and H_γ (17.5°). C A R

Multiplanar cyclohexane rings. R. D. Desai and R. I. Hunter. *Nature* 136, 608–9 (1935), cf. Quadri-Khudi. C. A. 29, 7294°. —D and H conclude that there are only 2 stereoisomeric forms of 4-methylcyclohexane-1-carboxyl- β -acetic acid. They have likewise been able to isolate only 1 form of carboxy-3,3-dimethylcyclohexane-1-acetic acid. E. O. Wug

Isomers and derivatives of hexetone. R. Wegler and W. Frank. *Arch. Pharm.* 273, 408–14 (1935). —In an

attempt to find an ideal substitute for camphor as a heart stimulant—so far negative—certain derivs., notably reduction products of hexetone, and also amines were prep'd. Of more general interest is the manner of specific reduction. Thus with Pd on animal charcoal only the double-bonded C in the nucleus was hydrogenated, leaving the CO group unaffected. Pt, on the other hand, reduces the CO group to an alc., and finally to a hydrocarbon with animal charcoal. This behavior, whereby Pt very frequently reduces more energetically or unspecifically, was likewise observed in the case of Schiff bases of hexetone, which, although unaffected by Pd were readily reduced with Pt. *d*-Hexetone-phenylhydrazine-*p*-sulfonic acid, m. 228°, is split by 10% H_2SO_4 into hexetone and $PhNHNH_2$. The α -phenylethylamine compd. yielded on treatment with tartaric acid 2 antipodes having α_D^{20} -38.7° and α_D^{25} 37.8°. The said ketone, obtained with PdCl₂ and animal charcoal, b₁₁ 96–8°, and possessed a typical menthol odor, as also the corresponding alc. (obtained from the ketone by treatment with Pt and K in aq. MeOH), b₁₁ 152°. The hydrogenated hexetone yielded with ethanolamine the Schiff base b₁₁ 125°, which, reduced with Pd and animal charcoal, gave 1-methyl-3-isopropyl-5-aminocyclohexene, b₁₁ 90°, a strong smelling amine, gives cryst. salts with tartaric, quinic and camphorsulfonic acids, it may be split into its antipodes by recourse to diphenylsuccinic acid; a coramine-like compd., in the form of a bright yellow oil, b₁₁ 230°, on treatment with nicotinic acid-HCl.

W. O. F.

The constitution of the methylketones II Koster *Rieckhoff-Ind.* 10, 150 (1935)—By the condensation of citral with MeCOEt and cyclization of the mixt. of methyl-pseudoionone (V) and isomethylpseudoionone (VI) arises 4 isomers: (I) α -methylionone, b₁₁ 125–6° (semicarbazone, m. 146°), (II) β -methylionone, b₁₁ 133° (semicarbazone, m. 140°), (III) α -isomethylionone, b₁₁ 121–2° (semicarbazone, m. 202°) (IV) β -isomethylionone, b₁₁ 124–5° (semicarbazone, m. 182°). III and VI arise by the condensation of α -cyclocitral with MeCOEt and also as the chief products when the mixt. of V and VI are cyclized with H_2PO_4 . III and IV are valuable in perfumery and known as Iraldein Gamma and Iraldein Delta.

H. M. Buriag.

Anhydrosilmethene (bithione). N. J. Tuovonen, A. Tauno Fjäder and Armas Heikel. *Suomen Kemistilehti* 8B, 32–3 (1935) (in German); cf. *Suomen Kemistilehti* 6A, 72 (1933)—Heating of methone (dimethylcyclohexadione) at 150–70° gives a condensation product, bithione, having the structure

It is formed as a reddish yellow syrup on the surface of an aq. alc. or slightly acid-NH₄Cl soln. of methone on long heating. Metallic K added to methone in benzene gives a deep red K salt. Colorless crystals are formed from the syrup after washing with ether or benzene. The product recrystd. from boiling water m. 155–7°; the mixed m. p. with methone is 145–50°. It is sol in alc., AcOH, acetone and CHCl₃; difficultly sol. in benzene, ether, water and petr. ether. The slightly yellowish aq. soln. gives a deep violet color with FeCl₃. Long boiling in water gives some methone. Analysis gave C 72.90, H 8.51; calcd. for $C_{14}H_{18}O_4$, C 73.24, H 8.51%; mol. wt. 267, calcd. 202.2, 0.2253 g. required 8.66 cc. of 0.1 N NaOH, calcd. 8.61. Analysis of the Ag and Cu salts gave Ag 29.10, calcd. 29.23; Cu 10.93, calcd. 10.85%. The self-condensation of β -diketones in aq. soln. appears to be general. E. E. J.

The self-condensation of acetylacetone. Armas Heikel. *Suomen Kemistilehti* 8B, 33–4 (1935) (in German); cf.

preceding abstr.—Forty g. CH_3CO_2 , 40 ml. 2 N NaOH and 200 ml. water were refluxed for 24 hrs. and then distd. The distillate sepd. into 2 layers, each contg. the condensation product. The lower aq. part was concd. by renewed distn., the dried oily portion distd. and the residue remaining at 145° was crystd. from water. The recrystd. white needles, m. 58°, were sol in the common solvents, also petroleum, gave a yellow soln. with alkalis and concd. H_2SO_4 . The substance was easily brominated, gave a pos. Lieberman reaction and a violet color with aq. FeCl₃. The analysis was C 72.80, H 7.61%, mol. wt. 116.2. The properties check those of 3,5-dimethyl-2-acetylphenol. E. E. Jukkola.

Optical rotation of methyloctylphenylmethane. P. A. Levene and Stanton A. Harris. *J. Biol. Chem.* 111, 735–8 (1935)— $Ph(CH_2)_3CHMeCH_2MgBr$ and CH_3CHO gave $Ph(CH_2)_3CHMeCH_2CH(OH)C_6H_5$, b₁₁ 182–4°, d₂₀ 0.9131, n_D²⁰ 1.4952, [M]_D²⁰ -29.68°. This with anhyd. HCl and reduction with Raney's catalyst gave $Ph(CH_2)_3CHMeC_6H_5$, b₁₁ 143–5°, d₂₀ 0.8590, n_D²⁰ 1.4832, [M]_D²⁰ -12.59° which, reduced with FeO , gave $C_{11}H_{19}(CH_2)_3CHMeC_6H_5$, b₁₁ 147°, d₂₀ 0.8260, n_D²⁰ 1.4553, [M]_D²⁰ -5.27°. From this the cyclohexyl group furnishes a much higher partial rotation than the iso-*Pr* group.

R. C. Elderfield

The preparation of nitrobenzene with a maximum specific resistance. L. Zepalova-Mikhailova. *Trans. Inst. Pure Chem. Reagents* (U. S. S. R.) No. 14, 49, 57 (1935).—Nitrobenzene (I) with a sp. resistance (ρ) of about 10^{11} ohms per cc. was desired for special purposes in television app. A freshly distd. sample of I having phys. consts. as given in the literature had $\rho = 4.29 \times 10^8$ ohms/cc. at a potential of 1035.5 v., 2.23×10^8 (817 v.), and 9.74×10^8 (655 v.), before distn. it had 7.13×10^8 (570 v.) and 3.62×10^8 (665 v.). After treatment with Al_2O_3 , drying over P_2O_5 and distn., it had 1.86×10^8 (722 v.) and 1.27×10^8 (133 v.), after treatment with Ag_2O , drying over $CaCl_2$ and distn., 6.4×10^8 (570 v.) and 1.75×10^8 (133 v.); and this last when redistd. once more, 6.56×10^8 (920 v.) and 4.31×10^8 (190.5 v.). When I was steam-distd. in the presence of N NaOH the sample of I obtained had $\rho 10^9$. However, when $CaH_2(NO_3)_2$ is absent, the passage of an elec. current through I rapidly increased ρ . At 18°, ρ varied from 2.27×10^8 (1358.3 v.) to 2.73×10^8 (90.25 v.). When I was partially frozen, the liquid portion had a higher ρ than the solid (1.15×10^8 and 0.89×10^8 at 1197 v.). On storing for more than 4 days, ρ fell to as low as 10^6 . From I prep'd. from PhH under mild conditions (30°, excess H_2SO_4 (98%), theoretical quantity HNO_3) the numerous samples obtained by various methods of purification were always unstable in that ρ decreased on storage. The use of different types of glass in the app. for the prep'n. did not solve the difficulty. I prep'd. from p -NO₂C_{6H₄NH₂ in boiling AcOH, contg. AcONa equiv. to H_2SO_4 formed by the addn. of $CuSO_4$, had $\rho = 1.06 \times 10^8$ (81.7 v.), 1.95×10^8 (473 v.) and 1.30×10^8 (1371.8 v.). The ρ of this product also decreased on standing.}

Lewis W. Dutz

Nitration. V. Nitration of monohalogenated derivatives of xylenes. Phuldeo Sahay Varmā and K. S. Venkat Raman. *J. Indian Chem. Soc.* 12, 540–1 (1935); cf. *C. A.* 24, 5714.—The O_2N derivs. of the halogenated xylenes have been obtained in good yields by nitrating the resp. monohalogenated deriv. in the presence of nitrosulfonic acid mixt. (I) contg. about 50% of fuming HNO_3 . The addn. of 9 cc. of I to a cooled mixt. of 7 cc. of 4,3-CIMeC₆H₃Me and 5 cc. of Ac_2O , and refluxing of the mixt. for 4 hrs. gave a product which, when washed with H_2O and $NaHCO_3$ and extd. with benzene, yielded 6.8 g. of 4,3,6-CIMeC₆(NO₂)C₆H₃Me, m. 42° after recrystn. from Et_2O . The nitration of 5 cc. of 2,4-CIMeC₆H₃Me gave 5.6 g. of 2,4,5-CIMeC₆(NO₂)C₆H₃Me, m. 78°, and 0.4 g. of 3,4-CIMeC₆H₃CO₂H, m. 200–2°. The following xylenes, 4-bromo-6-nitro-, m. 57°, and 4-iodo-6-nitro-m-xylene, m. 86°, and 2-bromo-5-nitro-, m. 70°, and 2-iodo-5-nitro-*p*-xylene, $C_{10}H_7INO_2$, m. 83°, were similarly obtained. C. R. Addinall

Preparation of *o*-, *m*- and *p*-hydroxyphenoxyalkylamines Jean Druey. *Bull. soc. chim.* [5], 2, 1737-41 (1935).—A soln of 23 g of Na in 350 cc of EtOH and 126.5 g of PhCH₂Cl was added to 110 g. of pyrocatechol (I) in 250 cc of alc. in a N atm., and the mixt. was refluxed in the presence of a current of N. The cold acidified soln. was filtered free from NaCl and, on standing overnight, formed 25 g of *O*-dibenzylpyrocatechol (II). The filtered mother liquor was evapd. and extd. with Et₂O. The washed, dried and evapd. ext. was distd. free from I and gave 84 g of *O*-monobenzylpyrocatechol (III), *b*_p 173-4°, *d*₄²⁰ 1.154, *n*_D²⁰ 1.585, *M* R. 58.31 (theor. 58.20). Crystn. of the residue from alc. gave 30 g of II, *m* 62°. By heating a mixt. of 20 g of II and 56 g of (CH₃Br), in 40 cc. of alc. with 16.5 g of KOH in 140 cc of alc. added dropwise over 1 hr and further heating until neutral, a mixt. was obtained which, on extn. with Et₂O, yielded 64% of *O*-benzyl-*O*-(β-bromoethyl)pyrocatechol (IV), *b*_p 45-6°, *b*₁ 186-7°, and a residue contg. bis(2-benzylphenoxy)glycol ether, *m* 88-9°. A mixt. of 6.2 g. of IV with 3 mols. of Me₂NH was heated in a sealed tube for 12 hrs at 115° and, on working up, yielded 4.35 g (80%) of 1-benzyl-2-dimethylaminoethoxybenzene, *b*_p 153-6°, HCl salt, *m* 142-4°. Similar condensations with Et₂NH and MeNH₂ gave the corresponding *di-Et* deriv., *b*_p 170-2°, and *Me* deriv., *b*_p 152-5° (HCl salt, *m* 102-3°). These amines were almost quant. hydrolyzed by boiling for 2 hrs with alc. G N HCl to the corresponding *o*-hydroxyphenoxyethylamine HCl salts *di-Me*, *m* 215.5-0.5°, *di-Et*, *m* 162-3°, and *Me*, *m* 235-6°. A similar series of transformations was carried out starting with resorcinol and giving successively *O*-monobenzylresorcinol, *b*_p 180-5°, *O*-dibenzylresorcinol, *m* 73-4°, *O*-benzyl-*O*-(β-bromoethyl)resorcinol, *b*_p 180-5°, *O*-benzyl-*O*-(β-dimethylaminoethyl)resorcinol, *b*_p 166-9° (HCl salt, *m* 125-30°); and *m*-hydroxy(β-dimethylaminoethoxy)benzene. The corresponding hydroquinone series was produced *O*-monobenzyl, *m* 121.2°, dibenzyl, *m* 128-9°; benzyl-β-bromoethyl, *m* 84.0-4.5°; (PhCH₂OCH₂CH₂)₂, *m* 172-2.5°, *O*-benzyl-*O*-(β-dimethylaminoethyl), *m* 171-2°, and *p*-β-dimethylaminoethoxyphenol, *m* 174-6°.

C. R. Addinall

β-Substituted ethylamines II. Catalytic hydrogenation of oximes Otto Schales. *Ber.* 68B, 1943-5 (1935), cf. C. A. 28, 1491.—In spite of the many studies which have been made of the question, there is as yet no known method for the smooth reduction of oximes to primary amines. According to V. Braun, et al., as confirmed by Winans and Adkins (C. A. 26, 969), the reduction of oximes proceeds according to the scheme RCH NOH (+ H₂) → RCH₂(NH) (+ H₂) → RCH₂NH₂(A); RCH: NH + RCH₂NH₂ (- NH₃) → RCH NCH₂R (+ H₂) → (RCH₂)₂NH(B). The intermediate aldime of reaction (A), reacting with primary amine already formed, would explain the undesirable formation of secondary amine according to (B). The formation of secondary amine should therefore be hindered or completely prevented if the aldime is not allowed to accumulate at any point and the reaction is carried out in strongly acid medium. This was confirmed experimentally. If, instead of bringing the oxime in contact with the catalyst before the reduction is begun, the oxime soln. is slowly dropped into the reduction chamber on the catalyst, the small amt. present in each drop is quantitatively reduced to the primary amine by the excess of catalyst before the next drop falls. By dropping AcOH solns. of hydroxyphenylacetaldoximes into an AcOH-H₂SO₄ suspension of the Adams Pt catalyst, 80-5% yields of the corresponding β-phenylethylamines were obtained at 20° and 760 mm. Two examples are given: the prepn. of *p*-MeOC₆H₄CH₂CH₂NH₂, *b*_p 136°, and of homopiperonylamine, *b*_p 148°.

Condensation of *o*-bromacetophenone with 1-*o*-amino-phenyl-3-phenylthiocarbamide Kumud Behari Pathak. *J. Indian Chem. Soc.* 12, 463-5 (1935).—The reaction mechanism suggested by Ghosh (C. A. 25, 3001) to explain the formation of well-defined condensation products from the action of BrCH₂Br (I) on *o*-H₂NCH₂HNHC(SNHPh)

(II) is considered as improbable since the Br atom of I is always eliminated as HBr in condensation with a compd. contg. the NHCSNHPh group and the final product is the HBr salt of a S-contg. cyclic base. A repetition of G's expt. in 95% AcOH gave a poor yield of a cryst. product (III), C₁₄H₁₁BrN₂OS, *m* 223° (decompn.), acidic in Me₂CO-H₂O soln. to Congo red, liberating CO₂ on titration with NaHCO₃ and yielding a base (IV), C₁₄H₁₀N₂OS, *m* 164°. III was obtained by condensation in alc. and, on treatment with pyridine, gave IV which may have the

constitution $\begin{array}{c} \text{CH} \quad \text{CH} \quad \text{C} \cdot \text{NH} \cdot \text{CO} \cdot \text{S} \\ | \quad | \quad | \\ \text{CH} \quad \text{CH} \quad \text{C} \cdot \text{NH} \quad \text{C}(\text{NPh}) \quad \text{S} \end{array}$. The elimination of PhNH₂ during the condensation is explained by the formation of an intermediate with the structure $\begin{array}{c} \text{CH} \quad \text{CH} \quad \text{C} \cdot \text{NH} \quad \text{C}(\text{NPh}) \quad \text{S} \\ | \quad | \quad | \\ \text{CH} \quad \text{CH} \quad \text{C} \cdot \text{NH} \quad \text{C}(\text{NPh}) \quad \text{S} \end{array}$.

The non-elimination of allylamine in the condensation of I with *o*-H₂NCH₂HNHC(SNHCH₂CH=CH₂) (V) is attributed to the reaction of V in the isomeric form *o*-H₂NCH₂HN(C(SH)NHCH₂CH=CH₂) in which the allylamine group is attached to the ring by a single bond and in which form no hydrolysis takes place.

C. R. Addinall

The behavior of benzylamine tartrate in acetic acid F. Darmos and I. Peyches. *Bull. soc. chim.* [5], 2, 1656-68 (1935).—The optical rotation of benzylamine tartrate and of *d*-tartaric acid have been detd. in AcOH solns. between 1 and 0.001 *M*. The yellow, green and blue lines of Hg were used. Between 1 and 0.01 *M* the rotation conformed to the law $[\alpha]_D^{25} = 2 + 5.25\sqrt{C}$ (*C* = concn). For lower concns, however, the observed values fell too low. Theoretical considerations showed that reaction with AcOH to liberate tartaric acid could not account for all of the difference between observed and calcd. values, since addn. of tartaric acid to more concd. solns. did not make the necessary reduction of α . The authors conclude that there is formation of amide between AcOH and benzylamine, liberating H₂O which solvates the ions. In evidence they found that addn. of H₂O in small amts. produced the same effect, and that no such phenomenon could be observed with tetramethylamine tartrate.

R. Balzly

The chromium compounds of salicylic acid azo dyes and of *o*-methoxybenzoic acid Kurt Brass and Walter Wittenberger. *Ber.* 68B, 1905-12 (1935).—Preliminary expts. with the azo dye (I) obtained from *m*-O₂NC₆H₄NH₂ and salicylic acid showed that either chromation after dyeing (*Nachchromierung*) or dyeing on wool previously mordanted with Cr salts improves the fastness of the dye to the same extent, and that in both processes bichromate can be completely replaced by chromic salts. In passing from the technical processes, or from the system fiber-dye, to the dye (I) itself, however, it was found that Cr cannot be introduced into I with K₂Cr₂O₇ alone without a reducing agent also being present, but it can be introduced with chromic salts. After the necessary conditions had been established the Cr compd. of I was prepd. with chrome alum (1 atom Cr per mol salicylic acid), the pure dye acid in the theoretical amt. of NaOH being added hot to the chrome alum. The red Cr compd. is composed of 2 mols. dye + 1 atom Cr + 2 mols. H₂O, and its compn. does not alter at 70-130°. Cr compds. of similar compn. were obtained from the corresponding dyes obtained from PhNH₂ (dye II) and *o*-toluidine (dye III) while that of the benzidine dye (IV) contained only 1 mol dye per atom of Cr. The Cr can be removed with boiling AcOH, the unchanged dye acid being recovered in very good yield. In the prepn. of the Cr compd. of II the course of the introduction of the Cr into the yellow dye acid and its dependence on the temp. and time were followed. After 30 min at room temp. the brown product contained hardly 2% Cr, but at the boiling temp. there was rapidly formed a crimson labile precursor with almost 14% Cr, after 1 hr. the ppt. contained 9.57% Cr, but the formation of the light red Cr compd. (9.14% Cr) of the dye was complete only after 3 hrs. The Cr compd. of I, which begins to decompose at 200°, lost the calcd. amt. of H₂O (5.47%)

in 4 hrs. at 190° or in 13 hrs. *in vacuo* when gradually heated to this temp., but the C content of the dehydrated Cr lake was 1-1.5% low, indicating that dehydration cannot be effected without partial decompn. Attempts to replace the 2 mols. H₂O by 2 mols. NH₃ resulted in the addn. of 2 mols. NH₃ (to the Cr compds. of I and II), which were very firmly held; neither with dil nor with concd hot HCl could the products be so broken down that all the NH₃ passed into the filtrate and the NH₃-free Cr compds. remained unchanged. This shows that the Cr compds. can only be complex compds of coordinately 6-valent Cr (8-valent in the NH₃ compds.) of the general type

Morgan and Smith (C. A. 19, 219) assigned an entirely different structure (that of a dichromi-m-nitrobenzenesulfonate) with 2 atoms Cr (10.8%) to 3 mols. dye and no H₂O) to the Cr compd of I, but in a careful repetition of their work it was found that the crude product contained 6.6% Cr and that, while exhaustive extn with benzene removed unchanged I, the residue contained only 8.1% Cr, corresponding to the formula given above. Some expts. were also made to det. the role which the 2 functional groups of the salicylic acid play in the building up of the complex. All attempts to methylate the Cr compd of I with Me₂SO, or to ethylate it with EtBr were unsuccessful, as was the attempt to obtain the methylated dye by coupling *o*-MeOC₆H₄CO₂H with diazotized *m*-ONC₆H₄NH₂. Neither could chromisalicylic acid *O* CO C₆H₄, *O* CRO₂C₆H₄CO₂H 2H₂O (Barbieri, C. A. 9,

2819, gives 3 H₂O), be methylated, as it is decomposed by CH₃N, but *o*-MeOC₆H₄CO₂H gave with chrome alum a complex, corresponding in compn. to the formula *HO*Cr(*O*₂CC₆H₄OMe)₂·H₂O. Similar structures might be ascribed to the Cr compds. of the dyes of type I, but this is not in harmony with their difficult soly. in alkali. Moreover, it has not been det. whether such dyes react in the same way as *o*-MeOC₆H₄CO₂H with chromic salts. The investigation is being continued. C. A. R.

5,5-Diphenylbarbituric acid, 5-phenyl-5-cyclohexylbarbituric acid and 5-phenyl-5-cyclohexenylbarbituric acid. H. J. Morasman. *Helv. Chim. Acta* 18, 1254-61 (1935), cf. C. A. 29, 6522; —Ph₂C(COCl)₂ (I), treated with NH₃, gave Ph₂C(CONH₂)₂ (II), m. 243-4°. II, treated with (COCl)₂, gave 5,5-diphenylbarbituric acid (III), m. 298-9°. III, treated with CH₃N, gave 1,3-dimethyl-5,5-diphenylbarbituric acid (IV), m. 206-7°. IV was also obtained from I and (MeNH)₂CO. PhCH₂(CONH₂)₂, treated with (COCl)₂, gave 5-phenylbarbituric acid, m. 264-6°. PhCH₂(CO₂Me)₂, treated with CH₃I and KOEt, gave PhCH₂C(CO₂Me)₂ (V), m. 70-80°. V on sapon gave PhC₆H₄CH₂(CO₂H)₂ (VI), m. 123-3.5°. PhC₆H₄C(CO₂H)₂ could not be isolated as an intermediate. VI, treated with NH₃, gave PhC₆H₄CH₂CH₂CONH₂, m. 167-8°. V, heated in a sealed tube with NaOEt and urea for 15 hrs. at 105-8° and subsequently acidified, gave phenylcyclohexenylbarbituric acid (VII), m. 209-10°. V, reduced with Pt and H₂, gave PhC₆H₄CH₂(CO₂Me)₂, m. 89-90°. VII gave phenylcyclohexenylbarbituric acid, m. 226°.

Organic magnesium compounds. V. Reaction between the alkyl esters of *p*-toluenesulfonic acid and ROMgX. Kunio Mine. *J. Chem. Soc. Japan* 56, 1112-17 (1935); cf. C. A. 29, 7910°. The reaction between *p*-MeC₆H₄SO₃R' (I, R' = alkyl) and ROMgX (II) proceeds according to the equation: 2I + 2II → (CH₃)₂SO₂·Mg + 2R'X (III) and it does not proceed in 2 steps, R'SO₃R' + ROMgX → ROR' + R'SO₂MgX, R'SO₃R' + R'SO₂MgX → (R'SO₂)₂Mg + II, as indicated by Gilman and Treck (C. A. 22, 3156), for the yield of III reaches 70-90% if III is distd. off from the reaction system in order to allow the reaction to proceed to the right. If

the reaction proceeded in 2 steps, only 0.5 of the ester would change to III and the yield of III should not be over 50% (R is an alkyl or aryl group). The products of the reaction between Ph₂CHOMgI and *p*-MeC₆H₄SO₃R' are Ph₂Br, (C₆H₅)₂SO₂·Mg, (CH₃)₂SO₂ (IV) and Ph₂CO (V). IV and V are not direct reaction products but they may be derived from the thermal decompn. of benzoylhydrol during the distn. K. Kutsuta.

Mineral-ol sulfonic acids. V. Reactions of the mineral ol sulfonic acids with aromatic amines. Jaroslav Sereďa, K. Macura and A. Udrycki. *Ber.* 68B, 1933-9 (1935); cf. C. A. 29, 70577. It had been found that heating the pure mineral ol sulfonic acids with PhNH₂ gave, instead of the PhNH₂ salt or amide, sulfamic acid (I), along with a hydrocarbon, as chief product: RSO₃H + PhNH₂ = H₂NC₆H₄SO₃H + RH. A more thorough study has been made of this reaction, in which the SO₃H group migrates from 1 compd. to another. The formation of I might be due to the splitting off of SO₃H or to the presence of H₂SO, or its esters. To eliminate these possibilities the mineral ol sulfonic acids were set free from their Na salts with H₂SO, free HCl and the purified Na sulfonates were heated a long time with water. The solns of the sep'd sulfonic acids contained no SO₃ ions, even after boiling with alkali, but the acids still reacted with PhNH₂ to form I and hydrocarbons. PhNH₂, H₂SO, was isolated from the mixt. when the reaction was carried out at 160° and I when it was carried out above 160°.

As no H₂SO, or its esters were present, the PhNH₂, H₂SO, can have been formed only secondarily through the aid of water, always present in the hydrophilic mineral ol sulfonic acids. This is possible only on the assumption that there is first formed PhNH₂SO₃H which at higher temps. rearranges into I while heating with water breaks it down into PhNH₂ and H₂SO. The reaction followed the same course with *o*- and *p*-toluidine. The former gave 3,4-Me(C₆H₄)₂N₂C₆H₄SO₃H, whereas the *p*-toluidine does not split off the SO₃H group from the sulfonic acids even on long boiling. Reaction sets in only at 220-30° under pressure. The formation of amine sulfates is a proof, as yet indirect, that the reaction proceeds through the arylsulfamic acids. The isolation of PhNH₂, H₂SO, as an intermediate product in the reaction leading finally to I is also an indirect confirmation of the view that the com. taking place (Backprozess) of prep. I from PhNH₂, H₂SO, also proceeds through PhNH₂SO₃H, although the presence of the latter has not as yet been detected in this process.

Attempts to isolate the arylsulfamic acids in the reaction between mineral ol sulfonic acids and amines have likewise thus far been without success. When dry *p*-toluidine was heated with the absolutely anhyd. sulfonic acids at 220-30°, 5,2-Me(C₆H₄)₂N₂C₆H₄SO₃H was obtained, whence it is to be assumed that when the *p*-position to the NH₂ group is occupied, the SO₃H group is directed to the *o*-position. The evolution of NH₃ was repeatedly observed when the sulfonic acids-amine reaction products were dissolved in alkalis, and in the expts. with *p*-toluidine (NH₃)₂SO, and PhNH₂ were isolated. Study of individual groups of the mineral ol sulfonic acids showed that aromatic amines split out the SO₃H group only from the oil-sol. β - and δ -acids. All the acids, however, split off the SO₃H group when boiled with 20% HCl. C. A. R.

Acylation of *o*-aminophenol. C. E. Sparks and R. L. Nelson. *Proc. Indiana Acad. Sci.* 44, 132-4 (1931). Acylation of *o*-hydroxynonylaminophenol (I) with ClCO₂Me yields a diacyl compd (II), m. 10.8-61.5°. Acylation of *o*-hydroxymethyl carbanilate with hydrocyanic chloride gives a diacyl compd identical with II, indicating that a rearrangement occurs during acylation. Sapon. of II gives I, m. 130.5-1°. Similarly *o*-isovalerylaminophenol (III), acylated with ClCO₂Me, gives a diacyl compd. (IV), m. 68.9°, also readily obtained by acylation of *o*-hydroxymethyl carbanilate. Sapon. of IV gives III. W. J. Peterson.

Condensation of alcohols with aromatic hydrocarbons in the presence of anhydrous aluminum chloride. II. Condensation of secondary alcohols with benzene and toluene. I. Tzukunftnik and K. Tokareva. *J. Gen. Chem.*

(U S S R) 5, 764-6(1935), cf. C. A. 29, 4746⁴—Condensation of Me_2CHOH (I) and $\text{EtCH}(\text{OH})\text{Me}$ (II) with C_6H_6 and PhMe by the method previously described gave up to 70% of alkylated hydrocarbons. An excess of AlCl_3 results in the formation of some dialkyl derivs. PhMe gave only β -substituted derivs. A mixt. of 30 g I, 150 cc C_6H_6 and 43 g AlCl_3 gave 35 g of a fraction, b. 147-200°, consisting of cumene, b. 150-4°, d₄ 0.8738, n_D 1.4946, and $\text{C}_{11}\text{H}_{14}(\text{CHMe})_2$, b. 205-10°. β -Cymene, b. 173-5°, d₄ 0.8597, n_D 1.4948, was obtained in 35 g yield from 30 g I, 100 cc PhMe and 43 g AlCl_3 . PhCH_3 (I), b. 182-5°, d₄ 0.8625, n_D 1.487, resulted from 20 g II, 100 cc C_6H_6 and 30 g AlCl_3 . $\text{MeC}_6\text{H}_4\text{CH}_2\text{CHMe}$, b. 193-7°, d₄ 0.8611, n_D 1.4903, was obtained from 20 g II, 100 cc PhMe and 25 g AlCl_3 . Chas. Blanc.

New method of alkylation of phenols. I. Tzankrevanik and Z. Nazarova. *J. Gen. Chem. (U. S. S. R.)* 5, 767-70 (1935), cf. preceding abstr.—The method of alkylation of aromatic hydrocarbons in the ring by condensation with secondary and tertiary alcs. in the presence of AlCl_3 was applied to the alkylation of phenols. The condensation of Me_2COH and $\text{Me}_2\text{C}(\text{OH})\text{Et}$ with PhOH proceeds analogously to that with C_6H_6 and PhMe , giving 60-70% of alkyl phenols. As by-products there are obtained alkylated hydrocarbons (PhCMe_2 and $\text{MeC}_6\text{H}_4\text{CMe}_2\text{Me}$) formed evidently as secondary products of the reaction of alkyl phenols with the excess of AlCl_3 . The condensation of secondary alcs. (Me_2CHOH and $\text{EtCH}(\text{OH})\text{Me}$) with PhOH produced only insignificant amts of alkyl phenols. The chief products of condensation were simple esters of alkylated phenols. $\text{C}_6\text{H}_5\text{CH}_2\text{OC}_2\text{H}_5$ and $\text{C}_6\text{H}_5\text{CH}_2\text{OC}_2\text{H}_5$. Similar results were obtained by Dains and Bathrock by condensation of secondary alcs. with phenols in the presence of ZnCl_2 . In general, the mechanism of the condensation of secondary and tertiary alcs. with phenols is different. The secondary alcs. in distinction from tertiary alcs. do not give considerable amts of olefins and alkyl halides. The condensation proceeds evidently according to the scheme $\text{ROH} + \text{AlCl}_3 \rightarrow \text{AlCl}_2(\text{OR}) + \text{HCl}$, $\text{PhOH} + 2\text{AlCl}_3(\text{OR}) \rightarrow \text{RC}_6\text{H}_4\text{OR} + 2\text{AlCl}_3\text{OH}$. This is confirmed by the normal reaction of condensation of Me_2CHOH with anisole, giving 70% of a mixt. of *o*- and *p*-isopropylanisole. A mixt. of 22 g $\text{Me}_2\text{C}(\text{OH})\text{Et}$, 23 g PhOH and 40 cc of petr. ether was treated with 25 g AlCl_3 on a water bath for 3-4 hrs. The reaction mixt. was decompd. with ice and extd. with Et_2O . The Et_2O extn. was treated with 10% NaOH , giving 70% of $\text{HOC}_6\text{H}_4\text{CMe}_2\text{Me}$, b. 91.5-2°. From the nonphenolic fraction was isolated PhCMe_2Me , b. 188°. Condensation of 22 g Me_2COH , 20 g PhOH in 50 cc of petr. ether with 20 g AlCl_3 gave 34 g (75.5%) of $\text{HOC}_6\text{H}_4\text{CMe}_2\text{Me}$, b. 99°. With increased addn. of AlCl_3 in the reaction, the formation of alkylated hydrocarbons increases. Of these PhCMe_2 , b. 165-7°, and $\text{C}_6\text{H}_5\text{CH}_2\text{CMe}_2$, b. 78°, were isolated. The condensation of 27 g anisole, 15 g Me_2CHOH and 33 g AlCl_3 produced a little $\text{HOC}_6\text{H}_4\text{CMe}_2\text{Me}$, b. 210-15°, and 25 g of a mixt. of *o*- $\text{MeOC}_6\text{H}_4\text{CMe}_2\text{Me}$, b. 198-200°, and *p*- $\text{MeOC}_6\text{H}_4\text{CMe}_2\text{Me}$, b. 222-15°, and $\text{MeOC}_6\text{H}_4\text{CMe}_2\text{Me}$, b. 220-3°. Chas. Blanc.

Methylenepyrocatechol. Marcel Mottier. *Arch. sci. phys. nat.* 17, 280-91(1935)—A 20% yield of methylene-pyrocatechol is obtained by heating a suspension of 55 g pyrocatechol in 200 cc of H_2O , 40 g KOH , 140 g CH_2Cl_2 and 125 cc EtOH in an autoclave at 120° for 24 hrs, b₁ 57°, d₄ 1.185, n_D 1.53867. W. J. Peterson.

2,6-Dibenzoylhydroquinone. Otto Dschendorfer and August Verdino. *Monatsh.* 66, 255-84(1935); cf. Doerner, *Ber.* 12, 661(1879); *Ann.* 210, 264(1881); Bogert and Howells, C. A. 24, 1630—While the compd. has not actually been synthesized, the evidence is definitely in favor of the fact that the compd. from *m*- $\text{C}_6\text{H}_4(\text{OBz})_2$ and BzCl with AlCl_3 is 2,6-dibenzoylhydroquinone (I) and not the 2,5-isomer. I, m. 210°, results in 12% yield, diacetate, m. 146° (72% yield); dibenzoate, m. 146°, β -Br deriv., yellow, m. 140-1°. I with alk. Me_2SO , gives a mono-Me ether (2-hydroxy-5-methoxy-1,3-dibenzoylbenzene), light yellow, m. 101° (*Ac deriv.*, m. 105°). Oxidation

of I gives 2,6-dibenzoylquinone, orange-yellow, m. 162°. Ph_3CO and BzCl with AlCl_3 at 200-20° give a poor yield of 1,3-dibenzoylbenzene (II), m. 100° (with a very small amt. of 1,3,5- $\text{C}_6\text{H}_3\text{Bz}_3$, m. 118°). Isophthalic acid (III) was transformed into the 5- NO_2 deriv., the acid chloride of which yields with C_6H_5 and AlCl_3 the 5- NO_2 deriv. of II, m. 130° (75% yield, based on III); MeONa gives 3,5,3',5'-tetrahydroxydibenzoylbenzene, bright red, m. 202° and 210° (liquid crystals). SnCl_4 and HCl in AcOH give 80% of the 5- NH_2 deriv. (IV) of II, yellow, m. 129-30°, soly in boiling H_2O about 1 g/100; HCl salt, m. 185°; sulfate, benzylidene deriv. (V), pale yellow, m. 124° (92% yield), *Ac deriv.*, m. 147°, *Bz deriv.*, m. 152°; 2,4,6-tri-Bz deriv., m. 235° (81% yield) (*Ac deriv.*, m. 215°). Nitration of V in concd H_2SO_4 gives 31% of the 2,4(or 4,6)-di- NO_2 deriv. of IV, orange-yellow, m. 197°. IV through the diazo reaction yields the 5- IO deriv. (VI) of II, m. 135°; *Ac deriv.*, m. 139-9°, 2,4,6-tri-Bz deriv., m. 216°. Oxidation of α -cresotic acid with $\text{K}_2\text{S}_2\text{O}_8$ yields 3,2,5-Me(OH), $\text{C}_6\text{H}_3\text{CO}_2\text{H}$ (diacetate, m. 150°); VI gives 2,6-dibenzoylquinone, m. 164°. 2,5-HO(MeO) $\text{C}_6\text{H}_3\text{Bz}_2$ and $\text{PhCH}(\text{OH})\text{Bz}$ with 75% H_2SO_4 give 27% of 4-methoxy-6-benzoyl-1,2-diphenylcoumarone (VII), m. 155°, and about 10.5% of 2-hydroxy-5-methoxy-4(or 6)-dibenzoylbenzene, m. 232° (*Ac deriv.*, m. 168°). CrO_3 in AcOH oxidizes VII to 2-benzoyl-5-methoxy-1,3-dibenzoylbenzene, m. 121° (75% yield); hydrolysis gives the mono-Me ether of Doelner's compd. (I, e, I).

C. J. West. Certain bases derived from pyrogallol ethers. Mme. Y. de Lestrang. *Bull. soc. chim.* [5], 2, 1078-84(1935)—Pyrogallol reacted with Et_2SO and NaOH to give the 4 possible mono- and di-Et ethers which were sep'd by vacuum distn. and identified largely by color reactions (in comparison with resorcinol and pyrocatechol). The 1,2-di-Et ether (I) b₁ 120°; the 1,3-di-Et ether (II) m. 80°. The 1-Et ether (III) b₁ 95.5° and its diacetate m. 75°. The 2-Et ether (IV) m. 102° and its diacetate m. 77°. These and the corresponding Me ethers or their acetates reacted with glycerol dichlorohydrin and alkali to give benzodioxan derivatives or linear ethers. The following were prep'd: 2-(and 3)-Hydroxymethyl-8-methoxybenzodioxan, from the Me analog of III. The compds. were not sep'd, they b₁ 193° 2-(and 3)-Chloromethyl-8-methoxybenzodioxan, b₁ 167° 2-(and 3)-Diethylaminomethyl-8-methoxybenzodioxan, b₁ 172-5° 2-(and 3)-Hydroxymethyl-8-ethoxybenzodioxan, b₁ 190-3° 2-(and 3)-Chloromethyl-8-ethoxybenzodioxan, b₁ 173° 2-(and 3)-Diethylaminomethyl-8-ethoxybenzodioxan, b₁ 188-80°. I yielded $\text{C}_6\text{H}_3(\text{OEt})_2\text{OCH}_2\text{CH}_2\text{CH}_2\text{Cl}$, *o*, b₁ 172°, which

reacted with NH_4Et to form 2,3-(EtO) $\text{C}_6\text{H}_3\text{OCH}_2\text{CH}_2\text{CH}_2\text{OH}$ (OH) CH_2NHEt , b₁ 198°. HCl salt, m. 78-80°. II yields analogous compounds; the oxide b₁ 172°, and the base b₁ 193°. II was also treated with $\text{CICH}_2\text{CH}_2\text{NHEt}$ to form 2-diethylaminomethoxy-1,3-diethoxybenzene; HCl salt, m. 134-5°. I with $\text{CICH}_2\text{CH}_2\text{NHEt}$ gave 3-diethylaminomethoxy-1,2-diethoxybenzene, b₁ 180°; HCl salt, m. 112-13°. R. Baltzly.

Contact changes of safrole. Yasuji Fujita. *J. Chem. Soc. Japan* 56, 1205-9(1935)—Passing safrole (I) with water through a Cu tube contg. active C at 450-500° gives the following products: I \rightarrow isosafrole (II), II \rightarrow pyrocatechol, 4-propylpyrocatechol and cresol. Or I \rightarrow ethylpyrocatechol methylene ether \rightarrow *p*-ethylphenol. For obtaining II from I, use of CaO or other alkalies gives better results than active C. K. Katsuta.

Contact changes of camphor. Yasuji Fujita. *J. Chem. Soc. Japan* 56, 1210-12(1935)—Passing camphor with water through a Cu tube contg. active C at 450-500°

gave carvenone (I). Subsequent changes are: I \rightarrow carvacrol \rightarrow *o*-cresol. Or I \rightarrow *p*-cymene \rightarrow cumene.

The molecular constitution of qumhydrone. J. Palacios and O. R. Fox. *Anales soc. esp. fis. quim.* 33,

627-42(1935), cf. *C. A.* 26, 4517.—Further work by magnetochem methods shows that the constitution of *p*-benzoquinhydrone does not correspond to the hypothesis of free radicals, but to the classical hypothesis of additive combination of quinone and hydroquinone. E. M. S.

Unsaturated chromophores II. The effect of the ketovinyl chain on the color of the metal salts of hydroxyvinyl ketones 1. Salts of dialcylalacetone. Angelo Mangini. *Gazz. chim. ital.* 65, 474-86(1935); cf. *C. A.* 29, 6682¹.—A review of the literature shows that in spite of some knowledge of the behavior of unsatd ketones toward acids and their halochromism, there have been no systematic researches on the bathochromic effect of the salification of unsatd. HO ketones other than the work of Vorländer (*C. A.* 19, 1413); Pfeiffer, (*Org. Molekulverbindungen*, Stuttgart 1927, p. 91, *C. A.* 21, 3625). The past work indicates that the greater the no. of vinyl groups the more intense is the color of compds of vinyl ketones (salts, acids, metal salts). For this reason it was of interest to study the bathochromic effect produced by salification of the OH of unsatd phenolic ketones, to what extent this bathochromism, i. e., the true halochromism of Vorländer, is preserved, whether the nature of the substituent cation of the hydroxy I influences the effect, and if it is possible to obtain 2 forms of salts, a colored salt and a colorless salt. The present work deals with dialcylalacetone (I), and shows that salification gives 2 series of salts. (1) yellow salts, corresponding to the color of I and its ethers, and (2) red salts, like the Na salts of analogous unsatd phenolic ketones, i. e., like the halochromes —CO HX . The stability of the 2 forms depends on the particular cation, e. g., some salts which ppt. in red forms change to stable yellow forms, indicating that the red form is stable only in the case of certain cations. The red forms are stable in the case of cations with pronounced metallic character, e. g., alkalis, alk. earths, Pb, Cd, NH_4 -Cu, etc., whereas with most other metals the initial red forms change to the yellow forms, e. g., with Co, Ni and with still weaker cations, e. g., Al, Cr, ferric Fe, etc., the original ppts. are yellow. These red and yellow forms probably have some isomeric relation, and may be considered analogous to "Addukt A" and "Addukt B" of Vorländer (*loc. cit.*). In this case the red and yellow salts would correspond to the activation or the non-activation of the unsatd chromophores in the salified HO ketone mols., so that the red forms correspond to the halochrome "Addukt A" compds and the yellow forms to the colorless "Addukt B" compds. The constitutions of the 2 forms are represented thus.

The first corresponds to complex internal salts of the ordinary kind; the 2nd to the probable structure of "intramol. ionides." These structures conform to the development of a dipole ketovinyl chain, thus: —CH

resultant effects are complex, and this interpretation, though in harmony with exptl results, is tentative. The salts were prepd from the alc. Na salt of I (cf. Decker

and Felsner, *C. A.* 3, 61) and an excess of metal salt, or from I in benzene and moist metal hydrosulfide. Three types were obtained: (1) ppts. stable in the red form; (2) ppts. stable in the yellow form, and (3) red ppts. not stable in this form. The change in group (3) does not depend on hydrolysis or on a change in the degree of hydration. All salts are very stable in air, but with dil. acids they decompose with formation of I, while decomposition leads to formation of the halochromes and thence to closing of the nucleus

The action of alkalis and NH_4OH is complicated; these do not decompose the salts completely when cold. With respect to optical behavior, the yellow salts show the same absorption, regardless of the nature of the cation and of the solvent, absorption is complete up to 570μ . The red salts also show identical spectra, which are practically independent of the metal and the solvent; they absorb completely up to 500μ , a little less in green-yellow than do the yellow salts. The absorption of I in various solvents is the same as that of the yellow salts, that of solns. of I in acids the same as that of the red salts. Probably therefore I, its acid derivs and its red and yellow salts, have the same constitution or are related isomerically. With the exception of the Ag salt, all salts contain H_2O of crystn. (dependent perhaps on the coordinate unsatd of the ketodiviny chain), and the dehydration curves and the high temps. of completion ($180\text{--}200^\circ$) indicate that at least some of the H_2O mols. are bound coordinatively to the complexes. There seems to be no relation between the H_2O of crystn and the colors, as with the already known Na salt (cf. *Orient. Pharm. Post* 36, 101; Fabiny, *German pat.* 110,521). *Group (1)*— Mg salt , $\text{C}_7\text{H}_5\text{O}_2\text{Mg} \cdot 4\text{H}_2\text{O}$, dark pomegranate-red, dehydrated at 210° to the anhyd. salt, chocolate color; its cold $\text{C}_2\text{H}_5\text{N soln.}$ give when boiled a violet-red ppt. and yellow mother liquor. *Ca salt*, $\text{C}_7\text{H}_5\text{O}_2\text{Ca} \cdot 6\text{H}_2\text{O}$ (II), intense carmine-red with metallic reflection. *anhyd. salt*, maroon. *Sr salt*, $\text{C}_7\text{H}_5\text{O}_2\text{Sr} \cdot 7\text{H}_2\text{O}$ (III), wine-red; *anhyd. salt*, maroon. *Ba salt*, $\text{C}_7\text{H}_5\text{O}_2\text{Ba} \cdot 5\text{H}_2\text{O}$ (IV), scarlet with golden reflection. *anhyd. salt*, wine-red. $\text{C}_2\text{H}_5\text{N solns.}$ of II, III and IV are violet-red, but turn yellow, perhaps because of chromoisomerism. *Cd salt*, $\text{C}_7\text{H}_5\text{O}_2\text{Cd} \cdot 2\text{H}_2\text{O}$, red, *anhyd. salt*, maroon. *Pb salt*, $\text{C}_7\text{H}_5\text{O}_2\text{Pb} \cdot 2\text{H}_2\text{O}$, carmine, when pptd. from basic Pb acetate it is violet-red. *Ammoniacal cupric salt*, $\text{C}_7\text{H}_5\text{O}_2\text{Cu} \cdot 5\text{H}_2\text{O}$, NH_4 carmine, decomposes at $90\text{--}100^\circ$. *Ag salt*, $\text{C}_7\text{H}_5\text{O}_2\text{Ag}$, gray-black with golden yellow reflection. *Li salt*, from very concd. solns. purple-red. *Rb salt*, from very concd. solns., purple-red. *NH₄ salt*, from I in NH_4OH and NH_4Cl , bright red. *Thallous salt*, maroon-black with lustrous reddish green reflection. *Group (2)*.—*Cupric salt*, $\text{C}_7\text{H}_5\text{O}_2\text{Cu} \cdot \text{H}_2\text{O}$, silky yellow; *anhyd. salt*, greenish yellow. *Zn salt*, $\text{C}_7\text{H}_5\text{O}_2\text{Zn} \cdot 2\text{H}_2\text{O}$, chrome-yellow; *anhyd. salt*, greenish yellow. *Mercuric salt*, $\text{C}_7\text{H}_5\text{O}_2\text{Hg} \cdot \text{H}_2\text{O}$, greenish yellow, *anhyd. salt*, olive color. *Ferric salt*, $(\text{C}_7\text{H}_5\text{O}_2)_3\text{Fe} \cdot 6\text{H}_2\text{O}$, dirty yellow; *anhyd. salt*, dark maroon. *Al salt*, $(\text{C}_7\text{H}_5\text{O}_2)_3\text{Al} \cdot 6\text{H}_2\text{O}$, yellow; *anhyd. salt*, yellowish green. *Be salt*, yellow. *Cr salt*, yellow. *Group (3)*.—*Mn salt*, $\text{C}_7\text{H}_5\text{O}_2\text{Mn} \cdot \text{H}_2\text{O}$, hyper-red when moist, greenish yellow or brown when dry; *anhyd. salt*, maroon-yellow. *Ferrous salt*, $\text{C}_7\text{H}_5\text{O}_2\text{Fe} \cdot 3\text{H}_2\text{O}$, brilliant dark red when pptd., but turns maroon-yellow, and when dry is dirty yellow; *anhyd. salt*, maroon. *Ni salt*, $\text{C}_7\text{H}_5\text{O}_2\text{Ni} \cdot 3\text{H}_2\text{O}$, bright scarlet when pptd., but turns yellow, and when dry is intense yellow; *anhyd. salt*, greenish maroon. *Co salt*, $\text{C}_7\text{H}_5\text{O}_2\text{Co} \cdot 2\text{H}_2\text{O}$, dark red when pptd., brick-orange when dry, remains red when kept in water; its $\text{C}_2\text{H}_5\text{N solns.}$ are red. *Mercurous salt*, $\text{C}_7\text{H}_5\text{O}_2\text{Hg}_2 \cdot 6\text{H}_2\text{O}$, dark red when pptd., maroon when dry, *anhyd. salt*.

C. C. Davis

Preparation of acetoanthranil derivatives Mosuke Hayashi, Ikuro Morikawa and Hirochika Namikawa. *J. Chem. Soc. Japan* 56, 1102-5(1935) — 6-Methyl-2-anthranil and its 2,3-isomer, 5-methyl-2-acetoanthranil and 4-methyl-2-acetoanthranil are prepd. K. Katsuta

Condensation of acetoanthranil derivatives with benzene Mosuke Hayashi, Hirochika Namikawa and Ikuro Morikawa. *J. Chem. Soc. Japan* 56, 1106-11(1935) — Condensation of acetoanthranil and C_6H_6 with $AlCl_3$ gives 2-aminodiphenyl ketone, m 109-10°, and 2-phenylamino-diphenylketone, m 121.5-2°, 3-methyl-2-acetoanthranil, in a similar manner, gives a small amt of 2-phenylamino-3-methyldiphenyl ketone, m 123-3.5°; 5-methyl-2-acetoanthranil gives 2-amino-5-methyldiphenyl ketone, m 64-4.5°, and 2-phenylamino-5-methyldiphenyl ketone, m 163.5° K. Katsuta

New synthesis of ephedrine derivatives V Bruckner and A. Kraml. *Arch. Pharm.* 273, 372-84(1935) — In a former communication (C. A. 29, 5825⁵) it is shown that from the ν -nitrosites of methyl isoeugenol and -isosalfore the acetates of α -(3,4-dimethoxyphenyl)- β -nitropropanol (I) and α -(3,4-methylenedioxyphenyl)- β -nitropropanol (II), resp, can be prepd. in good yield. Both nitro compds can be electrolytically reduced to the corresponding hydroxylamine derivs, $RCH(OAc)CH(NHOH)Me$ (III and IV). These bases are stable only in the form of their salts (i. e., hydrochlorides), since, when liberated therefrom, an alkyl migration immediately occurs from O to N, thus leading to the alkali-sol., very well cryst. N-Ac derivs, $RCH(OH)CH(N(OH)Ac)Me$ (V and VI). On treatment with dil. HCl, however, the alkyl migration occurs in the opposite direction, in other words, the HCl salts of the O-acetylated bases (III and IV) are again recovered. Since the prepn of the hydroxylamine bases (V and VI) can be effected in good yield, the authors have undertaken, by the aid of Bamberger's reaction—involving interaction of hydroxylamine bases with aldehydes—to prep. through the nitrones various ephedrine derivs. by further reduction of the former. In the last 2 phases of the synthesis the procedure of Nagai and Kanoo (C. A. 23, 3629) was followed. In order to do this it is above all necessary in reducing the NO_2 compds (I and II) to isolate the hydroxylamine derivs as N-Ac compds. If the formation of nitrones is desired the Ac group must first migrate from N to O. Furthermore, it should be noted that only the free hydroxylamine bases, not their salts, are able to react with aldehydes. The problem then to prep. nitrones from the reduction products (V and VI) was nevertheless practically solved in 1 phase, since the alkyl migration from O to N is apparently not immediate. E. g., on treating the acetoxyhydroxylamine compds (III and IV) in concd aq. solns. with an aldehyde and thereupon liberating the hydroxylamine bases by addn of Na_2CO_3 , nitrone formation follows immediately. Naturally, in the case of many aldehydes the rapidity of nitrone formation cannot reach the rapidity of the alkyl migration from O to N, so that in such, by no means infrequent, cases, the reaction product consists predominantly of the original N-acetylhydroxylamine compd (V, resp., VI). In accordance with the above-described principle there have been prepd. from the 2 hydroxylamine compds. (V and VI) the corresponding methylene-, benzylidene-, m-nitrobenzylidene-, salicylidene-, veratrylidene- and piperonylidene nitrones. During these expts. it developed that the adherence of the Ac group is markedly influenced on the one hand by substituents of the α -aryl group, on the other hand by the character of the radical in combination with the nitrone ring. It was observed among other things that as a rule the adherence of the Ac group in methylisoeugenol derivs is much less than in the corresponding isosalfore derivs; certain substituents of the nitrone ring weaken the ester union in such cases so much that it is split during the nitrone formation by the action of the Na_2CO_3 as applied in slight excess. In the series of methylisoeugenol derivs only in the case of the methylenenitronone, $(MeO)_2C_6H_4CH(OH)CHMe-N-O-CH_3$ (VII) and m-nitrobenzylidenenitronone (VIII) did

the AcO group remain unchanged, while with veratrylidene-nitronone, $(MeO)_2C_6H_4CH(OH)CHMe-N-O-CH_2C_6H_4(OMe)_2$

(IX), salicylidene-nitronone (X) and benzylidenenitronone (XI) it was saponid. to a HIO group by the action of Na_2CO_3 . On the other hand it developed that all isosalfore derivs, i. e., in the methylene- (XII), benzylidene- (XIII), salicylidene- (XIV), m-nitrobenzylidene- (XV) and piperonylidene-nitronone (XVI), the AcO group remained unchanged. That the AcO group of certain nitrones of the methylisoeugenol type is actually saponid. during the formation can be proved by a somewhat modified synthesis of the des-acetylated nitrones. Thus, on boiling the N-acetylated hydroxylamine derivs. (V and VI) and with aq. H_2SO_4 , the Ac group after migration from N to O is smoothly split off. If one thereupon suspends in a thus prepd. H_2SO_4 soln. of α -(3,4-dimethoxyphenyl)- β -hydroxylaminopropanol (XVII) either BiH_3 , salicylaldehyde, veratraldehyde or m- $O_2NC_6H_4CHO$, there are formed in the 1st 3 cases the same nitrones, which were also previously obtained from the hydroxylamine compd (V). Similarly, it could be shown that the dil. H_2SO_4 soln. of α -(3,4-methylenedioxyphenyl)- β -hydroxylaminopropanol (XIX), which was prepd. by the acidic sapon. of VI, yielded with the corresponding aldehydes in weakly alk. soln. products as benzylidene- (XX), m-nitrobenzylidene- (XXI), piperonylidene- (XXII) or salicylidene-nitrones (XXIII), resp., not identical with the compds XIII, XIV, XV and XVI. Notable differences are apparent in the soly. of the various nitrones in acids. Very striking is the fact that many desacetylated nitrones slowly dissolve in dil. HCl, while the acetylated nitrones possess no observable soly. in this acid. In this connection it should be noted that the nitrones of both types are almost completely insol. in H_2O . Accordingly, the supposition arises that the des-acetylated nitrones, in contrast to their Ac derivs, possess a weakly basic character, which may possibly find explanation in a radically different constitution of the 2 types. If one formulates the acetylated nitrones in accordance with the general formula $RCH(OAc)CHMe-N-O-CH_2R$ (XXIV) in the strictest sense of the word as

nitrones, the desacetylated compds, however, as dihydro-oxazoline derivs, $RCHCHMe-N(OH)CH_2R$ O (XXV),

then the neutral character of the acetylated derivs. and the basic character of the desacetylated products would not be easily intelligible. The final decision of this question could not for the present be adduced; further investigations will be necessary to assure more definite insight. Accordingly the present nomenclature of the desacetylated nitrones has been retained. Benzylidenenitronone (XI) of XVII, leaflets from $C_{11}H_9$ -ligron, m 160°. Salicylidene-nitronone (X), yellowish white fine needles, m 148-50°. m-Nitrobenzylidenenitronone (VIII) of III, yellow needles from alc., m 196°. m-Nitrobenzylidenenitronone (XVIII) of XVII, yellow microscopic prisms from alc., m 174°. Benzylidenenitronone (XIII) of IV, prisms, m 158-9°. Benzylidenenitronone (XX), of XIX, leaflets from alc., m 140°. Salicylidene-nitronone (XIV) of IV, yellow needles, m 140°. Salicylidene-nitronone (XXIII) of XIX, faintly yellow cryst. powder, unstable in the air and daylight, m 117-18°. m-Nitrobenzylidenenitronone (XV) of IV, lemon yellow needles, m 190°. m-Nitrobenzylidenenitronone (XXI) of XIX, lemon yellow microscopic crystals, m 171°. Piperonylidene-nitronone (XVI) of IV, prisms, m 158-60°. 3,4-Dimethoxy-N-benzylideneephedrine (XXVI), feily needles, m 162-3.5°. 3,4-Dimethoxy-N-homoveratrylideneephedrine (XXVII), leaflets, m 127-7°. 3,4-Methylenedioxy-N-benzylideneephedrine (XXVIII), feily needles, m 117.6-19.5°. 3,4-Methylenedioxy-N-homopiperonylideneephedrine (XXIX), $C_{11}H_9ON$, leaflets, m 123.5-125°. W. O. E.

New derivatives of dihydrodivanillin and method for the catalytic reduction of nitrostyrenes Kurt Maurer and Bruno Schiedt. *J. prakt. Chem.* 144, 41-8(1935) — Divanillin (I) (20 g.), Ac_2O and H_2SO_4 give 25-7 g. of the hexaacetate, m 160°, on hydrolysis there results

60% I. I (30 g), 12 g. NaOH, 80 cc. H₂O and 60 g. Me₂SO₄ (added in portions) give 25–30 g. dimeric aldehyde (II), m. 138° (dioxime, m. 184°). II (10 g) with MeNO₂ in MeOH-KOH gives 6 g. bis-3,4-dimethoxy-nitrostyrene, yellow, m. 206°; this is catalytically reduced in AcOH-H₂SO₄ at 3 atm. pressure to dihomoveratrylamine (35% yield), a pale yellow thick oil, whose *Ac deriv.* m. 78°. 3,4-Methylenedioxy-nitrostyrene gives 70% homopiperonylamine (*Ac deriv.*, m. 101°); with (CO₂Et)₂ this gives *Et homopiperonyloxamate*, m. 131°. 3,4-Dimethoxy-piperonylnitrostyrene gives 23% of homoveratrylamine (the remainder consists of polymerization products). The *Me ether* of α -(3,4-dimethoxyphenyl)- ω -nitroethanol gives 74% of the corresponding amine. C. J. West

Dehydrogenation of phenols Holger Erdtman *Swensk Kem. Tids.* 47, 223–20 (1935) (in German), cf. C. A. 28, 1337; 29, 2938. Some expts. were made to det. the optimum acidity for dehydrogenation, the following gave the best yield: 20 g. ferulic acid in 120 cc EtOH and 160 cc. 12% aq. FeCl₃ were let stand 30 min then 40 cc. concd. HCl was added. Dlg. this to 90 cc and filtering after 12 hrs. gave 1.8 g. dehydrogenation product, m. 202–5°. Vanillic acid ester oxidized with Na₂S₂O₈ gave the corresponding dehydro compd., m. 231°. Improved method for prep. 5-iodovanillin 3 g. vanillin in 10 cc. 0.2 N NaOH is dild. to 25 cc, 50 cc 10% I soln is added very slowly. This soln. contains the least amt KI to hold the I. Add a little NaHSO₃ and wash the ppt. which forms with water. Recrystallize from AcOH. Yield, 4 g., m. 180°. It is less easily methylated than vanillin. 5-Iodo-veratraldehyde, m. 73°, is oxidized with KMnO₄ to the acid, m. 185°. The acid, boiled 10 hrs. under a reflux with 10% MeOH, gives the ester, m. 106°, which, heated 5 min at 220° and extd with boiling acetone and the acetone dild with H₂O, gives dimeric di-Me ester, m. 130.2°, the same m. p. as that of dehydrodivanillin. Dehydrodivanillin in alk. soln. was treated with NH₄OH HCl for 3 hrs on the water bath. The oxime heated 6 hrs. with Ac₂O gave dehydrodivanillonitrile diacetate, m. 220°. This last compd. was also made by treating vanillin oxime with FeCl₃ and Na₂S₂O₈ and from vanillonitrile in the same way. Five g. *o*-xym-xenol in alc. dehydrogenated with 200 cc. 4.5% FeCl₃ by agitating with a strong current of air gave 3.1 g. dehydrodi-*o*-xym-xenol, m. 137°. The acetylated product, m. 109°. *Me gallate* in MeOH made alk. with a satd. Ba(OH)₂ soln. gives a copious ppt. which after air current agitation for 2.5 hrs. and acidification with dil. HCl gives 30% of ellagic acid. Gallic acid did not give ellagic acid and Ba(OH)₂ is more effective than other alkalis. A. R. R.

Maximum rotations of carboxylic acids containing a phenethyl group. P. A. Levene and Stanton A. Harris *J. Biol. Chem.* 111, 725–33 (1935) — $\text{Ph}(\text{CH}_2)_n\text{CHMeEt}$ (I) can be prepd. from active AmOH without racemization and, on the basis of the max. rotation of I, the max. rotations of other members of the phenethyl series can be calcd. Using this data as a basis, substances of the type $\text{Me}(\text{Ph}(\text{CH}_2)_n\text{CH}(\text{CH}_2)_m\text{CO}_2\text{H})_n$, where $n = 0$ or an integer, were prepd. Periodic fluctuations of the rotatory values as n increased were noted, thus paralleling the observations with the analogous Ph series and with carboxylic acids of the normal series. $\text{Ph}(\text{CH}_2)_n\text{CHMeCO}_2\text{H}$, [M]_D²⁰ = 51.20°, was prepd by the $\text{CH}_2(\text{CO}_2\text{Et})_2$ (II) method and resolved by the cinchonidine salt from Me₂CO. $\text{Ph}(\text{CH}_2)_n\text{CHMe}(\text{CH}_2)_m\text{OH}$ and anhyd. HI followed by reduction with Raney's catalyst in alk. MeOH gave I, b₁ 66–7°, b₂ 96°, d₁ 0.8563, n_D²⁰ 1.4860, [M]_D²⁰ = 17.2°. I was also prepd. from BrH and active Am-MgBr via the intermediate $\text{PACH}(\text{OH})(\text{CH}_2)_n\text{CHMeEt}$, b₁ 90°, d₁ 0.9623, n_D²⁰ 1.5097, [M]_D²⁰ = 5.09°, which with anhyd HI overnight at –70° and 48 hrs. at room temp. gave I, [M]_D²⁰ = 35.1°. The values for [M] of the following compds are based on the parent AcOH, and values based on the parent hydrocarbon are found by using the factor 1.981 obtained from the above. $\text{Ph}(\text{CH}_2)_n\text{CHMe}(\text{CH}_2)_m\text{MgBr}$ and CO_2H gave $\text{Ph}(\text{CH}_2)_n\text{CHMe}(\text{CH}_2)_m\text{CO}_2\text{H}$ (III), b₁ 162–4°. III was also prepd. from $\text{Ph}(\text{CH}_2)_n\text{CHMe}(\text{CH}_2)_m\text{Br}$ and II via the intermediate $\text{Ph}(\text{CH}_2)_n\text{CHMe}(\text{CH}_2)_m\text{CH}(\text{CO}_2\text{H})_2$, m. 96–8°, which on heating at 180° gave III, b₁ 162°, d₁ 1.018, n_D²⁰ 1.5666, [M]_D²⁰ = 3.29°. *Et ester* (IV), b₁ 122°, d₁ 0.965, n_D²⁰ 1.4872, [M]_D²⁰ = 17.20°. IV with Na and EtOH gave $\text{Ph}(\text{CH}_2)_n\text{CHMe}(\text{CH}_2)_m\text{OH}$, b₁ 155°, d₁ 0.9477, n_D²⁰ 1.5080, [M]_D²⁰ = 10.13°. Similarly $\text{Ph}(\text{CH}_2)_n\text{CHMe}(\text{CH}_2)_m\text{CO}_2\text{H}$ (V), b₁ 172°, d₁ 1.0014, n_D²⁰ 1.5039, [M]_D²⁰ = 7.20°, was prepd. III reduced with FeO₃ in AcOH gave $\text{C}_6\text{H}_5(\text{CH}_2)_n\text{CHMe}(\text{CH}_2)_m\text{CO}_2\text{H}$, b₁ 180°, d₁ 0.9523, n_D²⁰ 1.4657, [M]_D²⁰ = 2.51°. V and V gave $\text{C}_6\text{H}_5(\text{CH}_2)_n\text{CHMe}(\text{CH}_2)_m\text{CO}_2\text{H}$, b₁ 136–40°, d₁ 0.9455, n_D²⁰ 1.4635, [M]_D²⁰ = 3.18°. All values for [M] are max and for the homogeneous substance. R. C. Elderfield

cis-Cinnamic acid Julius Meyer. *Z. physik. Chem.* A174, 77–8 (1935) — The theory that the 3 *cis*-cinnamic acids are chem. isomers is supported inadequately and has been abandoned by most workers. Everything points to chem. identity and polymorphism. R. H. B.

Chemistry of β -arylglutamic acids. G. R. Gogte. *Proc. Indian Acad. Sci.* 2A, 185–98 (1935), cf. C. A. 29, 1795. — A yield of 47 g. of crude acids (I) was obtained by the addn of 65 cc. of *p*-MeC₆H₄OEt (II) to the cooled reaction mixt. of 200 g. of citric acid and 240 cc. of concd. H₂SO₄ and 80 cc. fuming H₂SO₄. The H₂O-sol. portion of I contained β -(2-ethoxy-5-methylphenyl)glutamic acid (III), m. 153° (decompn.); HO anhydride, m. 112°; semianilide, m. 136°; HO anil, m. 163°. III with H₂SO₄ gave β -methylcoumarin- α -acetic acid (IV), m. 180° (decompn.). The H₂O-insol. residue of I on recrystn. from alc. m. 190–200° and gave 2 *Et* esters, m. 124° (V) and 110–15° (VI). Hydrolysis of 15 g. of V gave 8 g. of the monolactone of β , β' -(2,2'-diethoxy-5,5'-dimethyldiphenyl)glutamic acid (VII), m. 205°. Hydrolysis of VI gave 2 g. of 2,2'-diethoxy-5,5'-dimethylchalcone- α -acetic acid (VIII), m. 232°, *Et ester*, m. 133°, semicarbazone, m. 264° (decompn.); semicarbazone of *Et ester*, m. 171°. III (10 g) in 50 cc. cold 80% H₂SO₄ gave with 20 cc. of II 3.5 g. mixed acids (IX). On esterification IX gave 2 g. of VII, 1 g. of VIII and IV. H₂SO₄ (80%), allowed to act on 2.5 g. VIII at room temp., yielded 1 g. 7-ethoxy-4-methyl-3-ketodienacetic acid (X), m. 216° (decompn.); *Et ester*, m. 169°; semicarbazone, m. 247° (decompn.); semicarbazone of *Et ester*, m. 208° (decompn.). X could not be obtained from III. Concd. H₂SO₄ (10 cc.) reacting at 60° with 2 g. VIII gave 1.5 g. of a neutral compd., m. 165°; semicarbazone, m. 245° (decompn.). VII (5 g), heated at 60° for 1 hr. in 20 cc. concd. H₂SO₄ gave 1 g. IV and 3 g. of the neutral dilactone (XI), m. 184°, of β , β' -(2,2'-diethoxy-5,5'-dimethyldiphenyl)glutamic acid. XI could not be obtained by the treatment of VII with H₂SO₄. XI (1.5 g) on hydrolysis and ethylation gave 1.7 g. of the di-*Et ester*, m. 82°, which on hydrolysis gave β , β' -(2,2'-diethoxy-5,5'-dimethyldiphenyl)glutamic acid (XII), m. 219° (decompn.); di-Me ester, m. 105°; anhydride, m. 189°; acid anilide, m. 193° (decompn.); anil, m. 216°. XII, warmed with H₂SO₄ gave IV and a small amt. of VII. The di-Me and di-*Et* esters of XII did not condense with aromatic aldehydes. β , β' -(2,2'-Dimethoxy-5,5'-dimethyldiphenyl)glutamic acid was prepd. by the hydrolysis and methylation of XI. A yield of 52 g. of mixed acids (XIII) was obtained by the addn of 80 cc. *p*-MeC₆H₄OMe (XIV) to a reaction mixt. of 200 g. citric acid, 200 cc. concd. H₂SO₄ and 120 cc. fuming H₂SO₄. The HOAc-insol. portion of XIII gave β -(2-methoxy-5-methylphenyl)glutamic acid (XV), m. 167° (decompn.). The HOAc-insol. portion of XIII on recrystn. from alc. gave 12 g. 2,2'-dimethoxy-5,5'-dimethylchalcone- α -acetic acid (XVI), m. 252°; *Et ester*, m. 122°; semicarbazone, m. 277° (decompn.); semicarbazone of Me ester, m. 219° (decompn.). XV (5 g) in 4 cc. 80% H₂SO₄, treated with 10 cc. XIV, gave 1.5 g. XVI and IV. XVI (2 g) in 15 cc. 80% H₂SO₄ at room temp. for overnight gave 1.1 g. of the indoneacetic acid (XVII), m. 218° (decompn.). Concd. H₂SO₄ (10 cc.), acting for 1 hr. at 60° on XV, gave 0.6 g. of XVII and 0.8 g. of a neutral compd., m. 214°; semicarbazone, m. 263° (decompn.); benzylidene deriv., m. 174° (de-

compn) The Et ester of XVI with concd. H_2SO_4 gave the Et ester of XVII, m 158°, and some XVIII. Conc'd. HNO_3 transformed XVI to XVII and the phthalic anhydride, m 186°. Since XV by the action of H_2SO_4 produces XVII as well as IV, whereas III gives only IV and no trace of an indone acid, and both XVI and VIII give only the indone acids and no IV, it appears that in III, XVI and VIII there is a restricted rotation round the bond joining the β C atom of the glutaric acid to the phenolic ester. The formulas are represented by:

In the case of condensation with II, III must have rearranged to

since it alone is capable of producing X. The difference in reactivity between II and XIV is noteworthy

Rachel Brown
The tyrosine tyrosinase reaction in the presence of l ascorbic acid Fritz Schaaf *Helv. Chim. Acta* 18, 1017-21(1935); cf. *C. A.* 29, 5903^a—The addn. of ascorbic acid to the tyrosine-tyrosinase reaction has very little effect on the formation of 3,4-dihydroxyphenylalanine (I). Ascorbic acid in the presence of tyrosine with no tyrosinase will cause the formation of I but to a smaller degree.

Julius White
Ozone as an oxidation catalyst IX Ozonization of anisaldehyde, vanillin and heliotropin F. Bruner and A. Gelbert. *Helv. Chim. Acta* 18, 1239-42(1935); cf. *C. A.* 27, 17—The amt. of O_3 consumed was compared with the amt. of O_2 fixed, less that used in autooxidation, in a study of the oxidation in CCl_4 of anisaldehyde, vanillin and heliotropin (piperonal), of which the last 2 were prepd by the ozonization of isoeugenol and isosafrole, resp. The less the concn of O_3 , the less was the mobilizing effect of O_3 on O_2 , and the greater the concn of O_3 the greater was the mobilizing effect of O_2 . The catalytic effect of O_3 on O_2 in the oxidation of vanillin and its Me and Et derivs. does not appear until the concn of O_3 is less than 2%. This study shows that prolonged ozonization leads to the formation of acids because O_3 catalyzes oxidation by O_2 .

W. F. Bruce
Substitution synthesis of mellitic acid, and the replaceability of chlorine in the benzene nucleus Franz Feist. *Ber.* 68B, 1941-3(1935)—The Rosenmund and Struck method of replacing nucleus halogen with CO_2H by heating with $KCN + CuCN +$ water under pressure is not universally applicable, as claimed by them (*C. A.* 14, 1446; Ger pat 327,049). While it gives satisfactory results with brominated aromatic compds., the replacement of Cl is already tedious in $PhCl$ and the yield of $BzOH$ is moderate, and with polychlorobenzenes the method fails completely. Neither 1,2,4- $C_6H_3Cl_3$ nor C_6Cl_6 can be converted into the corresponding tri- and hexacarboxylic acid, even when the conditions are modified in the most varied manner. A loosening of the Cl atoms is made possible only by the presence of neg o-substituents, mellitic acid can be obtained (in 60% yield) by their method from tetrachloro-o- or p-phthalic acid.

C. A. R.
Anomalous rotatory dispersion of l- β -pinene. I. R. Padmanabhan and S. K. Kulkarni *J. Indian Chem. Soc.* 12, 518-26(1935); cf. *C. A.* 29, 1708^a—The only substances among the optically active hydrocarbons known to have anomalous rotatory dispersion are d-cabinene and l- β -pinene (I). The optical rotatory

power of I is neg in the visible region of the spectrum, becomes zero at about λ 3700 and attains high pos values with shorter wave lengths. The anomaly is not due to the Cotton effect since an examn. of alc I by the Hartley-Baly method shows no absorption in the anomalous region. The proximity of the double bond to an asym C atom is not responsible for the anomaly since camphene with the same characteristics shows no anomalous rotatory dispersion up to λ 3100. The anomaly is not due to the presence of nempene but the necessary expns showed that elaborate purification is necessary to free I from assoc impurities. After drying over anhyd. $MgSO_4$, 500 g. of I, n_D^{20} -16.8, n_D^{25} -17.1, n_D^{30} -18.2, n_D^{35} -18.8, was fractionated over Na at 21 mm, using a Widmer-Schenck column. The first 8 fractions were redistd in order, a fraction being added when nearly half the previous fraction had distd over. The sepn, though gradual, was quite perceptible by measurement of the rotation for λ 5780, 5461 and 4358. The rotatory dispersions of a pure sample and of head and tail fractions were measured up to λ 2780 by a modification of the usual photographic method. This was found necessary on account of the smallness of the rotatory dispersion in the visible and near ultraviolet regions of the spectrum. The anomaly at λ 2800 (*C. A.* 26, 3185) is due to a closely assoc impurity which is separable from I only with great difficulty. A Darbous diagram of the various fractions showed, however, that anomalous dispersion in the near ultraviolet still remains a characteristic of I. This conclusion was supported by Raman effect data of the various fractions. The anomalous dispersion is due to a superposition caused by a 2nd rotation of opposite sign and having a different dispersion. This 2nd rotation cannot be attributed to the "induced dissymmetry" of the semicyclic double bond since the similarly constituted camphor has normal dispersion.

C. R. Addinall
The slow combustion of pinane D. Shochet *Bull. soc. chim. Belg.* 44, 387-94(1935).—Oxidation of 1052 g. of pinane with 150 l. of O_2 gas at 110° and subsequent neutralization with $Ba(OH)_2$ yields 612 g. of a ketone product (I), $C_{15}H_{24}O$ upon distn. I gives a semicarbazone m 196°, which is not identical with the semicarbazone of tetrahydrocarvone, m 185°. The formula $MeCOCH(CMe)_2CHEt$ is suggested for I. W. J. Peterson

Metallic uranium in organic synthesis I. Jagaraj Behari Lal and Sukhbihushan Dutt *J. Indian Chem. Soc.* 12, 389-94(1935)—Friedel and Crafts reaction with U powder gave small yields of biphenyl from C_6H_6 and $PhBr$, $PhCl$ and PhI . No reaction took place between $CHCl_3$ and C_6H_6 , but 0.9 g. of Ph_3CH was produced by refluxing 30 g. of C_6H_6 with 12 g. of $PhCHCl_2$ in the presence of 4 g. of U dust for 8 hrs. By heating a mixt. of 15 g. of $PhCCl_2$ and 50 g. of C_6H_6 with U for 8.5 hrs. at 115-23° and distg. the reaction mixt. 4.2 g. of Ph_2CCl_2 and 1.2 g. of Ph_3CCl were isolated. Similarly from C_6H_6 with $AcCl$ and $BzCl$ small yields of $AcPh$ and $BzPh$ were recovered. The reaction was unsuccessful with mixts. of CCl_4 and C_6H_6 and PhI and $PhNH_2$. Attempts to carry out Ullmann's reaction in the presence of U were not very encouraging. No result was obtained with CCl_4 and only small yields resulted on refluxing $PhBr$, $PhCl$, PhI , $ICH_2CH_2CO_2H$, mixts. of $BrCH_2CO_2H$ and $AcOEt$, $PhOH$ and $PhBr$, and $ClCH_2CO_2Na$ and anhyd $AcONa$ with U powder. More satisfactory results were obtained in Zincke's reaction. By the action of $PhCH_2Cl$ on C_6H_6 dried over Na, in the presence of U, 40% of pure Ph_3CH was formed in addn to sym triphenylmethane and a mixt. of o- and p-dibenzylbenzenes. A small amt. of a S-yellow hydrocarbon, m 71°, was also recovered. Treatment of $PhOFt$ and $PhOMe$ with $PhCH_2Cl$ gave 80% yields of p-ethoxydiphenylmethane and 55% anisylphenylmethane, together with some dibenzylanisole. Reformatsky's reaction with a mixt. of 12 g. of $AcPh$, 17 g. of $BrCH_2CO_2Et$ and 70 cc. of dry C_6H_6 in the presence of 35 g. of U dust gave a feeble reaction on warming. A crystal of I was added, and, after refluxing for 10 hrs. over an oil bath at 120-30°, the

reaction mixt. was decompd. with ice-cold dil. HCl. The washed and dried CaH_2 layer was fractionally distilled at reduced pressure and yielded 2.4 g. of phenylmethyl-hydroxypropionic ester, b_p 118–21°. An unsuccessful attempt was made to make a Grignard reagent from U and PhBr. II. Jagaraj Behari Lal. *Ibid.* 616 21.—The action of PhCH_2Cl (I) on MePh , PhOH , $p\text{-MeO-C}_6\text{H}_4\text{OMe}$ and on the higher hydrocarbons, such as $\text{C}_{10}\text{H}_{18}$, acenaphthene and Ph_2 , in the presence of metallic U has been investigated and the various isomeric mono- and dibenzyl derivs have been isolated and characterized. Attempts were also made to prep. hexanitrophenyl from picryl chloride and 4,4-dinitrobiphenyl from $p\text{-O}_2\text{NC}_6\text{H}_4\text{Cl}$. It was found that U cannot be used as a neutral reducing agent in either aq. or aq. alc. solns. since attempts to reduce Ph_2CO , $p\text{-O}_2\text{NC}_6\text{H}_4\text{Me}$ and 2,4,6-(O_2N) $_3\text{C}_6\text{H}_2\text{OH}$ were unsuccessful. A mixt. of $p\text{-MeOC}_6\text{H}_4\text{OMe}$ (16 g.), I (10 g.) and U (3 g.) was gradually heated to 70°. After the vigorous evolution of HCl the product was heated at 110–20° for 4 hrs. The material was extd. with *tert*-ene and the filtered, washed, dried and evapd. ext. was fractionated, yielding 12 g. (66.3%) of benzylsulfinyl di-*Me* ether, b_p 353–5°, and 0.8 g. of rhombic crystals, m 104.5°. Similar condensation of I (16 g.) with PhOH (21 g.) gave α - and β -benzylphenols (3 g. and 18.7 g.), together with 2.2 g. of p -benzylphenol benzyl ether, b_p 367–7°. A mixt. of 25 g. of I, 46 g. of MePh and 4 g. of U yielded 20 g. of $p\text{-PhCH}_2\text{C}_6\text{H}_4\text{Me}$ and 11 g. of dibenzyltoluene but no bibenzyl was formed. Condensation of I with $\text{C}_{10}\text{H}_{18}$ gave α - and β -benzylacenaphthalene. None of the α -, β - and γ -dibenzylacenaphthalenes could be isolated from the higher-boiling fractions. Acenaphthene gave 5-benzylacenaphthalene together with β -benzylacenaphthalene, m 45–6°; picrate, m 101–2°. The α - and β -benzylbiphenyls, m 44–5° and 51–6° (isobenzylbiphenyl, m 54°; cf. Goldschmidt, *Monatsh.* 2, 472 (1881)).

C. R. Addinall

Biphenyl series. I. Synthesis of unsymmetrical derivatives of biphenyl. Narendranath Chatterjee *J. Indian Chem. Soc.* 12, 410–17 (1935).—An extension and modification of Hirsch's method (*Ber.* 23, 3705 (1890)) for the synthesis of Ph_2 derivs. is described. The method involves the reaction of an aromatic diazonium salt with a phenol under conditions in which N is eliminated to yield a Ph_2 deriv. and a *ch-Ph* ether as a by-product. Treatment of a cold soln. of 40 g. of PhNH_2 in 80 g. of H_2SO_4 and 40 cc. of H_2O with a soln. of 36 g. of NaNO_2 in 80 cc. of H_2O gave a soln. of $\text{PhN}::\text{NSO}_2\text{H}$ which was gradually added with const. shaking to 50 g. of $\alpha\text{-MeC}_6\text{H}_4\text{OH}$ heated to about 95°. The black oil produced was steam-distd., yielding Ph_2O and 4-hydroxy-3-methylbiphenyl, $\text{C}_{12}\text{H}_{10}\text{O}$, m 114.1°. MeO deriv., m 76°, oxidized by KMnO_4 to the corresponding acid, m 172°, decarboxylated by heating with Ca(OH)_2 to 4- $\text{MeO-C}_6\text{H}_4\text{Ph}$. A series of 9-hydroxydimethylbiphenyls in 10–15% yields and the oxidation products of their MeO derivs. were similarly obtained from the diazonium salts of α -, m - and p - $\text{MeC}_6\text{H}_4\text{NH}_2$ and α -, m - and p - $\text{MeC}_6\text{H}_4\text{OH}$. The yields of the dimethylbiphenyl ethers is high and this method is equally suitable for their prepn. The hydroxy-methylbiphenyls are described for the 1st time and 3 of the Ph ethers are new. Though these Ph_2 derivs. throw little light on the stereochem. of the biphenyls they should be more easily resolvable since the p,p' -positions are definitely known to be occupied in some of them and these, on nitration or halogenation, would attach these groups only in the α,α' -positions. **Dimethylbiphenyl ethers.** $\text{C}_{12}\text{H}_{10}\text{O}$, 2,3', b_p 170°; 2,4', b_p 180°; 3,4', b_p 175°. **Hydroxydimethylbiphenyls.** $\text{C}_{12}\text{H}_{10}\text{O}$, 4,3,2', b_p 160° (Ac deriv., b_p 130°; MeO deriv., b_p 125°, oxidized to 4-methoxy-3,2-dicarboxybiphenyl, $\text{C}_{12}\text{H}_8\text{O}_4$, m 210°); 4,3,3', b_p 175° (Ac deriv., b_p 158°; MeO deriv., b_p 160°, oxidized to the diacid, m 232°); 4,3,4', b_p 136° (Ac deriv., m 74°; MeO deriv., m 80°, oxidized to the diacid, m 275°); 4,2,2', b_p 185° (Ac deriv., b_p 175°; MeO deriv., b_p 170°, and diacid, m 210°); 4,2,1', b_p 193° (Ac deriv., b_p 186°; MeO deriv., b_p 185°, and diacid, m 240°); 4,2,4', b_p 225° (Ac deriv., b_p 210°; MeO

deriv., b_p 205°, and diacid, m 280°); 2,2,5', b_p 195° (Ac deriv., b_p 186°; MeO deriv., b_p 185°, and diacid, m above 300°); 2,5,3', b_p 210° (Ac deriv., 201°; MeO deriv., b_p 200°, and diacid, m above 300°); 2,5,4', b_p 225° (Ac deriv., b_p 215°; MeO deriv., b_p 205°, and diacid, m above 300°), and from PhNH_2 and $m\text{-MeC}_6\text{H}_4\text{OH}$, 1-hydroxy-2-methylbiphenyl, $\text{C}_{12}\text{H}_{10}\text{O}$, b_p 180° (Ac deriv., b_p 164°; MeO deriv., b_p 164°, oxidized to 4-methoxy-2-carboxybiphenyl, $\text{C}_{12}\text{H}_8\text{O}_4$, m 135°). II. New method for the synthesis of 9-hydroxyphenanthrene. *Ibid.* 418–20.—A method of synthesis of phenanthrenes from Ph_2 derivs. which is capable of considerable extension is described. To a mechanically stirred soln. of 40 g. of diphenic anhydride in 100 cc. of alc., Na-Hg (5%) was added portionwise for 24 hrs. The soln. was kept acidic by addn. of a slight excess of dil. H_2SO_4 . The final alc. soln. was filtered, and by fractional pptn. with a.c. extn. with dil. NaHCO_3 and fractional crystn. from 1 t c crystalline needles of the pure lactone of 2-hydroxyethyl-2'-carboxybiphenyl (I), $\text{C}_{12}\text{H}_{10}\text{O}_2$, m 136°, were obtained in 5–6% yield, free from α,α' -diphenic acid and the monomer. By heating 0.5 g. of I with 0.3 g. of KCN for 3–4 hrs. in an oil bath, digesting the product with H_2O and extg. with Et_2O , filtering, acidifying the aq. layer and recrystg. the free acid from benzene, light brown needles of 2'-cyanomethyl-2-carboxybiphenyl (II), $\text{C}_{12}\text{H}_8\text{N}_2\text{O}_2$, m 210°, were obtained. Boiling in 30% KOH, filtering and acidifying gave 2'-carboxymethyl-2-carboxybiphenyl (III), $\text{C}_{12}\text{H}_8\text{O}_4$, m 295°. The Ca salt of III was distd. and a satd. soln. of picric acid was added to the alc. soln. of the distillate. Recrystn. of the red picrate from alc. gave a cryst. compd., m 185°, from which pure 9-hydroxyphenanthrene, m 153°, was regenerated. III. A new route to phenanthrene. *Ibid.* 691–4.—The Na salt from a mixt. of 25 g. of 1 t cyclohexanone-2-carboxylate and 3.4 g. of Na in 31 cc. of EtOH was heated under reflux for 6 hrs. with 10 g. of $\text{C}_2\text{H}_5\text{CO}_2\text{Et}$ and, after diln. and extn. with Et_2O , gave 18 g. of di- Et cyclohexanone-2-carboxylate-2-acetate (I), $\text{C}_{12}\text{H}_{20}\text{O}_4$, b_p 168–75°, hydrolyzed by boiling with concd. HCl for 7 hrs. to cyclohexanone-2-acetic acid (II), $\text{C}_{11}\text{H}_{16}\text{O}_3$, b_p 163°; Et ester (III), b_p 122° (semicarbazone, $\text{C}_{11}\text{H}_{16}\text{N}_2\text{O}_2$, m 190–7°). The action of PhMgBr on III produced 1 t 1-hydroxyhexahydrobiphenyl-2-acetate (IV), $\text{C}_{12}\text{H}_{18}\text{O}_2$, b_p 170–80°, hydrolyzed to the corresponding acid, $\text{C}_{12}\text{H}_{16}\text{O}_3$, m 129°. Dehydrogenation of IV by means of S yielded Et biphenyl-2-acetate, $\text{C}_{12}\text{H}_{10}\text{O}_2$, b_p 165–75° which, on hydrolysis with alc. KOH, yielded crude 9-hydroxyphenanthrene, b_p 220–60°, purified through the picrate, m 185°, to give a product, m 153°, from which phenanthrene can be obtained by heating with Se . Treatment of I with PhMgBr gave the Et ester of a lactone, $\text{C}_{12}\text{H}_{18}\text{O}_4$, m 97°, which on hydrolysis yielded the free lactic acid, 1-hydroxyhexahydrobiphenyl-2-carboxy-2-acetic acid, $\text{C}_{12}\text{H}_{16}\text{O}_5$, m 141°, which may be utilized for the synthesis of phenanthrene.

C. J. West

The synthesis of pyrrole alcohols. Quintino Mingos. *Gazz. chim. ital.* 65, 459-61 (1935).—In view of a paper by Taggart and Richter (C. A. 28, 4415') in which the synthesis of *N*-pyrrolylcarbinol is described, earlier work by M. (cf. C. A. 27, 503) is discussed, and it is shown that in the reaction of magnesiumpyrrole and HCHO there is formed, besides *N*-pyrrolylcarbinol, 2,3- or 2,5 pyrrole glycol. Under the proper exptl. conditions, *N*-pyrrolylcarbinol may even be only a secondary product.

C. C. Davis

Synthesis of hexahydro- α -coumaranone. Ranajit Ghosh. *J. Indian Chem. Soc.* 12, 601-3 (1935).—To provide material for a study of the Friedel-Crafts reaction of aromatic hydrocarbons, phenols, phenol ethers, etc., with bicyclic γ -lactones with a view to the conversion of the products to phenanthrene derivs., hexahydro- α -coumaranone (I) has been prepd. Di-Et cyclohexanone-2-acetate-2-carboxylate, $C_{12}H_{18}O_4$, b₁ 161-2°, obtained by the action of $ClCH_2CO_2Et$ on Et cyclohexanone-2-carboxylate (*Ann.* 350, 210 (1906)), was hydrolyzed by heating with concd. HCl for 7 hrs to cyclohexanone-2-acetic acid, $C_6H_{10}O_3$, b₁ 169-70° (semicarbazone, m. 199-200°); Et ester (from Na salt and EtBr), b₁ 130° (semicarbazone, m. 196°). Reduction of 20 g. of the acid with 400 g. of 30% NaHg and dehydration of the product with H_2SO_4 gave 10 g. of hexahydro- α -coumaranone, b₁ 137°, identical with the lactone obtained by the treatment of 1,2-cyclohexeneacetic acid (C. A. 1, 1006) according to the method of Linstead and Meade (C. A. 28, 6115').

C. R. Addams

Reaction products of indoles with diazo esters. R. W. Jackson and R. H. Manske. *Can. J. Research* 13, 170-4 (1935).—In conformity with findings of previous work on indoles and in contradistinction to more recent work on pyrroles, the action of diazo esters on indole leads to 3-substituted as well as a small amt. of 1,3-disubstituted derivs. The formation of 2-substituted derivs. could not be demonstrated. The reaction discussed is a convenient one for the synthesis of a wide diversity of indole compds. Indole and N -CHCO₂Et in dry Et₂O with a trace of Cu powder yield a product which on hydrolysis gives indolyl-3-acetic acid (I) and indolene-1,3-diacetic acid (II), m. 242°. II on heating at 240° under reduced pressure gives CO₂ and 3-methylindolyl-1-acetic acid, m. 178°. Di-Et diazo-succinate in dry Et₂O with indole and Cu powder gives a product which on hydrolysis yields indolyl-3-succinic acid (III), m. 199°; di-Et ester, m. 79-80°. III on heating by itself gives β -3-indolylpropionic acid. The prepn of I from $CN(CH_3)CH(OEt)_2$ is described. R. B. Sandin

Action of the chloride of acetylsalicylic acid on magnesiumindoles. II. Cesco Toffoli. *Gazz. chim. ital.* 65, 487-97 (1935); cf. C. A. 28, 6437'.— α -AcOC₆H₄COCl (I) and magnesiumindole (II) (2 mols.) in anhyd. Et₂O, let stand overnight, heated 4 hrs at 100°, decomposed with ice, acidified with H_2SO_4 , filtered, the Et₂O layer extd with concd. aq. Na₂CO₃ and the ext. acidified, ppts α -HOC₆H₄CO₂H, while the Et₂O evapd., the residue washed with petr. ether and boiling water, yields, after purification with C_6H_6 , α -hydroxyphenyl β -indolyl ketone (β -salicylsalicylindole) (III), yellow, m. 171°, insol in dil. and concd. HCl, alk. carbonates and alk. bicarbonates; its solns in concd. H_2SO_4 are intense yellow; it is sol in alk. hydroxides (repptd. by bicarbonates and acids), with alk. FeCl₃ it gives an intense brown color which disappears on diln with water; it is stable on prolonged boiling in 0.5 N NaOH. III in cold anhyd. Et₂O treated with HCl gas ppts the HCl salt, $C_{12}H_{11}O_3N$ HCl, intense

yellow, m. around 170° (in a sealed tube), hydrolyzed immediately by water. In boiling Ac₂O with AcONa, III forms the di-Et deriv, $C_{14}H_{19}O_4N$, m. 60°, insol in aq. alkalis; in boiling concd. alkalis it reverts to III. By the method of Schotten-Baumann, III gives a di-Et deriv, $C_{14}H_{19}O_4N$, lustrous, m. 182°, shows a distinct superfusion phenomenon; with alkalis it forms III. By ordinary methods, including alk. PhNH₂ (IV), IV in AcOH, aq. alc. alk. NH₂OH, etc., III does not react but III and IV (1.5 parts) in boiling dil. EtOH for 50 hrs yield the phenylhydrazones, $C_{14}H_{17}O_3N_2$, m. 166°.

The mother liquor from the crystn. of III in its prepn. evapd., extd with 10% aq. NaOH, and the ext. treated with CO₂ yields α -salicylsalicylindole (V), light yellow, m. 142°, insol in hot HCl, sol in aq. alk. hydroxides (repptd. by bicarbonates), not saponif. by concd. alkalis. The part insol in 10% NaOH treated with picric acid (VI) in C_6H_6 yields the picrate, $C_{14}H_{11}O_8N$, $C_6H_5O_7N_2$, of VII (see later), brown-red, m. 150-5° (decompn.), decomposed by NH₄OH into VI and anhydrosalicylsalicylindolyl- α -hydroxyphenylmethane (VII), dark cocoa color, m. 145-50° (to a thick black liquid), insol. in aq. alkalis.

The petr. ether wash liquor from the prepn. of III yields a little III, and an acetylsalicylsalicylindole, $C_{14}H_{17}O_4N$, light yellow, m. 148° (to an intensely red liquid), sol in aq. alkalis (repptd. by bicarbonates), insol in concd. HCl, gives yellow solns in concd. H_2SO_4 . The boiling aq. wash liquor from the prepn. of III yields β -acetylsalicylindole, m. 187-9° (cf. Oddo and Sessa, C. A. 5, 2638). On repeating the reaction of I and II, but with equimol. parts, the same products were obtained, and also an unidentified black resinous substance, m. around 200°, probably formed by the condensation of V with itself by the action of excess I. The same reaction with I and magnesyalsalicylindole (VIII) (2 mols.) yields N -salicylsalicylindole (IX), m. 151°, sol in aq. alk. hydroxides (repptd. by bicarbonates); its solns in H_2SO_4 are yellow when cold and intensely red-violet when hot; it is decomposed by boiling alk. hydroxides into skatole and α -HOC₆H₄CO₂H. Mono-Bz deriv., $C_{14}H_{15}O_3N$, m. 89° (shows superfusion phenomenon). The mother liquor from IX yields on distn. *in vacuo* N -acetylsalicylindole (cf. Oddo, C. A. 8, 85). To obtain the deriv. corresponding to III, I and VIII were made to react under the conditions described by Oddo (*loc. cit.*) for prepn. α -acetylsalicylindole. By then steam-distg. the Et₂O-insol. product, extg. the new residue with 10% aq. NaOH, and satg. the ext. with CO₂, there was obtained α -salicylsalicylindole, yellow, m. 124°, sol in aq. alk. hydroxides (repptd. by bicarbonates), insol in concd. HCl; its solns in concd. H_2SO_4 are orange when cold and violet-red when hot. The product insol in aq. NaOH yields an unidentified compd., dark brown-gray, m. around 200°; it probably has a high mol. wt. and is formed by condensation of the primary products. The reactions between I and magnesyalsalicylindoles throw light on the influence of the phenolic OH group on the course of the reaction. When the C_6H_4OMgBr group first formed does not participate in subsequent reactions, the product is that of the normal reaction, i.e., the α -acyl or N -acyl deriv. When, however, the C_6H_4OMgBr does react, there are 2 courses to the reaction. If the temp. is not high, the products are of relatively simple constitutions, and are formed thus: $C_6H_4OMgBr + HN \rightarrow C_6H_4N + MgBrOH$. On the other hand when the Et₂O is eliminated and the temp. is increased, more complex products are formed, which are dark, difficult to crystallize and have high mol. wts. The traces of Cu in the Grignard reagent probably facilitate the entrance into the reactions of the OMgBr group.

C. C. Davis

Preparation of α -nitrophenyl aryl ketones. Max

Boëtius. *Ber.* 68B, 1924-32(1935).—In spite of the inability of earlier workers to obtain *o*-nitrophenyl aryl ketones from o - $\text{O}_2\text{NC}_6\text{H}_4\text{COCl}$ (I) by the Friedel-Crafts reaction, they can be prep'd. by this method if the AlCl_3 is replaced by FeCl_3 and the condensation is effected in an appropriate medium. (CHCl_3), at 30 – 40° is especially well adapted to the purpose. PhNO_2 can also be used but the yields are lower. In CHCl_3 and especially in benzene, the yields are still further decreased. CS_2 and CCl_4 are not suitable for the prep'n of o - $\text{O}_2\text{NC}_6\text{H}_4\text{COH}$ (II), even with anhyd. FeCl_3 , whereas o -nitrophenyl *m*-xylol ketone (III) was successfully prep'd in CS_2 but with lower yield than in CHCl_3 . With FeCl_3 in CS_2 or CCl_4 , I and benzene gave, not the expected II but a small amt. of a cryst. comp'd (IV), contg. halogen and nitrogen, whose comp'n. has not yet been definitely established by the analyses and mol. wt. detns. For best yields, the FeCl_3 must be used in an amt. equiv. to that of the acid chloride. II was prep'd in this way in faultlessly pure state. The influence of solvents, proportions of reagents, time, and temp. on the yield was studied chiefly with II. A no. of other *o*-nitrophenyl aryl ketones were prep'd. in the same way, the variations in the yield point to a distinct dependence on the nature of the aryl hydrocarbon (yields of aryl ketones: Ph (II) 20-3, *p*-tolyl 17, *m*-xylol (III) 22, *p*-xylol 45, mesityl 7, *p*-MeOC₆H₄ (I, 5%). Along with the nitro ketones there are also obtained, in greater yields than those of the ketones themselves, black amorphous products, sep'd. with Na_2CO_3 into alkali-sol. and -insol. fractions. No homogeneous product could be obtained from the alkali-sol. fractions by reduction, acetylation or benzoylation. Zn dust dist'n. in test tubes gave an unmistakable odor of acridine o - $\text{O}_2\text{NC}_6\text{H}_4\text{CO}_2\text{H}$ was obtained in 95% yield by oxidation of o - $\text{O}_2\text{NC}_6\text{H}_4\text{Me}$ with boiling aq. KMnO_4 . The chloride (I) was best prep'd. with SOCl_2 ; yield, quant. II, m. 105° , was obtained in 20% yield from 10 g. I and 4 g. thiophene-free benzene in 50 cc. (CHCl_3), treated in the course of about 45 min. with 9.8 g. anhyd. sublimed FeCl_3 at about 45° , allowed to stand until the evolution of HCl ceased (about 2 hrs.), and heated another 5 min. at 50° . IV, m. 163° , leaflets rapidly turning yellow, then brownish, in the light, insol. in cold dil. NaOH , sol. on warming with red-yellow color, reprecip. by acids, analysis, C 53.92, H 2.52, N 8.85, Cl 13.49%; mol. wt. in camphor, 391. *o*-Nitrophenyl *p*-tolyl ketone, m. 155° . *m*-Xylol homolog (III), m. 81.5° . *p*-Xylol isomer, m. 94° , reduced by Sn-HCl in alc. to *o*-aminophenyl *p*-xylol ketone, m. 101° (Schaarschmidt and Herzenberg, C. A. 15, 75, report a m. p. of 70 – 80° (turbid) and 89 – 90° (clear)). *o*-Nitrophenyl mesityl ketone, m. 146° . *o*-Nitrophenyl *p*-methoxyphenyl ketone, m. 105° . C. A. R.

Nitro derivatives of fluorene. 2-Nitrofluorene. Constantin Candea and Eugen Macovski. *Bull. soc. chim.* [5], 2, 1703–9(1935).—Sols. of 2-nitrofluorene (I) in acetone give an intense red color with 10% KOH , in alc. soln. the color is weaker. I is condensed with BzH and vanillin in the presence of piperidine at 140 – 60° . 9-Benzal-2-nitrofluorene (II), yellow, m. 155 – 6° , was prep'd., and its dibromide m. (decomp.) 152° . 9-Vanillin-2-nitrofluorene (III), m. 175 – 6° ; benzoate, m. 258 – 60° . The yields in the condensations were about 80% III in acetone or alc. reacts with aq. alkali to give a deep red color that disappears on acidification and is reformed on making alk. again. II and the benzoate of III give this reaction only slowly and to a small extent.

R. Baltzly

Alkyl methylphthalates Mosuke Hayashi and Shinzo Tsuruoka. *J. Chem. Soc. Japan* 56, 999–1007(1935).—1-Me 3-methylphthalate, m. 114 – 5° , and 1-Et 3-methylphthalate, m. 86 – 7° , are prep'd. and their oxidation or condensation products with C_6H_5 are studied. K. K.

The reducing action of halo-cyclohexadienylmagnesium derivatives. Tests on the preparation of optically active triarylcarbinols. A. Garcia Banus and J. Monche. *Annales chim. appl. fis. quim.* 33, 655–70(1935); cf. *ibid.* 11, 78(1913).—Several triarylcarbinols, some belonging to the group of diphenylindanols, whose CH_2 C atom is asym., were

prep'd. by the reaction of various arylmagnesium halides and aromatic ketones. In many cases these ketones formed reduction products, with appearance of halo-magnesium ketyl and subsequent formation of the corresponding pinacones. In this way, the reaction, heretofore suitable only for compds. of the type Ar_2CMgX , was extended. The properties of several substituted methyl radicals are described. The ethers of active ArOH and of phenylphenyl-*o*-naphthylcarbinol were decomp'd. into optically active isomers, but attempts to prep. the corresponding active carbinols gave the *dl*-isomers. E. M. S.

Inhibition in the benzoin reaction. B. F. Ferriera and T. S. Wheeler. *Current Sci.* 4, 94–5(1935).—Solid BzH and KCN contg. 1 part in 10^1 of quinone or 1 in 5×10^4 of 1 or 1 in 2×10^4 of S caused a fall in the rate of reaction, H_2O and certain alcs. accelerated the reaction.

Julius White

Condensation of benzoin and hydroquinone. Otto Dieckendorfer. *Monatsh.* 66, 201–17(1935), cf. C. A. 28, 758¹.— p - $\text{C}_6\text{H}_4(\text{OH})_2$ (I) (16.5 g.) and $\text{PhCH}(\text{OH})\text{Bz}$ (II) (10 g.), melted and then heated with 40 g. 73% H_2SO_4 at 150° for 15 min., dild. with H_2O , the ppt. ext'd. with H_2O and then with 2% aq. NaOH , give 3.5 g. of 1,2-diphenyl-4-hydroxycoumarone (III), m. 163° (Japp and Meldrum, *J. Chem. Soc.* 75, 1035(1899)). *Ac. deriv.* m. 139° . *Bz. deriv.* m. 122° , with 1 mol. H_2O . III (1.75 g.) with CrO_3 in AcOH gives 1.5 g. 2,5-dibenzoyl-oxycoumarone, m. 118° ; hydrolysis gives 2,5-(HO)- C_6H_3 (10 g.) and 20 g. II give 18% of *lin-p*-berzotetraphenylidyluran (IV), sep'd. from VII by crystn. from C_6H_6 , m. 231° . Oxidation of IV gives 65% of the *di-Bz. deriv.* (V), m. 220 – 1° , of 2,5-dihydroxy-1,4-dibenzoylbenzene (VI), golden yellow, m. 203° (*di-Ac. deriv.* m. 215°). IV forms a *di-Bz. deriv.* m. 388° (90% yield), also prep'd. from II and the 2,5-di-Bz. deriv. of I, oxidation gives the 3,6-di-Bz. deriv. of V, m. 317° , and of VI, m. 288° . The mother liquor of IV gives the *ang-isomer* (VII) of IV, m. 264 – 5° , oxidation gives the *di-Bz. deriv.* m. 276° , of 3,6-dihydroxy-1,2-dibenzoylbenzene, m. 188° ; with $\text{N}_2\text{H}_4 \cdot \text{H}_2\text{O}$ this yields 1,4-diphenyl-3,6-dihydroxyphthalazine, bright yellow, m. 315° (decompn.).

C. J. West

Polymerization I. Formation, properties and constitution of the polyindenes, in particular of "trundene." J. Riva and D. Gauvin. *Can. J. Research* 13B, 228–55(1935).—Improved methods for the prep'n. of unsat'd. dundene and of "trundene" are described. "Trundene" was found not to be a homogeneous body but a mixt. of polymers corresponding on the av. to the formula $(\text{C}_9\text{H}_6)_n$. "Trundene" is formed directly from indene by polymerization under the influence of heat without the formation of unsat'd. dundene. On bromination "trundene" behaves as a sat'd. comp'd. It does not react with BzH , p - $\text{Me}_2\text{N}-\text{C}_6\text{H}_4\text{CHO}$, AmONO , or NOCl , neither does it undergo polymerization. KMnO_4 and H_2CrO_4 do not oxidize the polyindenes. HNO_3 reacts but without breakdown of the mols. Catalytic dehydrogenation gave neg. results. Depolymerization of "trundene" when subjected to heat began at about 325° . The mol. refraction of the indenes and polyindenes were observed but no conclusions were drawn from the data as to their degree of sat'n. A new formula is proposed for the polyindenes. J. W. S.

Perkin's reaction. III Condensation of acid chlorides with benzaldehyde. Hattusala Kato. *Science Repts. Tokyo Bunrika Daigaku* 2, 237–65(1935); cf. C. A. 28, 2697¹.—K. states that the tendency of acid derivs. to take part in the Perkin reaction depends on the negativity of the group attached to the acyl radical and that acid chlorides should therefore react (C. Bertagnini, *Ann.* 100, 126). Condensation of the following acid chlorides with BzH in the presence of Et_3N in closed tubes at the temps. and times listed gave the products indicated: AcCl , 170 – 80° , 8.5 hrs., 11.86% yield of $\text{PhCH}(\text{CHCO}_2\text{H})\text{Ph}$; PrCOCl , 170 – 80° , 9.5 hrs., 6.63% yield of $\text{PhCH}(\text{CH}_2\text{CO}_2\text{H})\text{Ph}$; PhCH_2COCl , 170 – 80° , 8.5 hrs., 43.78% yield of $\text{PhCH}(\text{CH}_2\text{CO}_2\text{H})\text{Ph}$ (almost entirely *trans*); $\text{Me}_3\text{C}-\text{CH}_2\text{COCl}$, 170 – 80° , 8.5 hrs., 6.2% yield of *o*-isopropenylcinnamic acid, m. 129° ; $\text{AcCH}_2\text{CH}_2\text{COCl}$, 130 – 40° , 4 hrs.,

10.53% yield of α -benzallacetic acid (proved to be α , and not β or δ by mixed m-p depts with authentic samples); PhMeC₂CHCOCl, 140-50°, 3.5 hrs in a closed tube or 4 days at 50°, then 0.5 hr. at 100-110° in a stoppered flask, failed to yield a condensation product. To det. the effect of catalysts on the reaction, 1.5 g. of AlCl₃ and 2 g. of BzH were allowed to react 8 hrs in closed tubes at 170-80° with 1.5 mol equivs of the following bases, with yields of PhCH₂CHCO₂H as listed: no catalyst, trace, C₂H₅N, 0.72%, quinoline, 0.14%, piperidine, 1.79%, Et₃NH, 2.15%, m-C₆H₄(NH₂), none (7 hrs at 140-50°), PhNH₂, 0.11% (6 hrs at 130-40°). AcOH and BzH as above gave no reaction product; AlCl₃ and BzH treated similarly, followed by 3 hrs heating with a 20% MeOH soln. of KOH, gave no PhCH₂CHCO₂H, but BzOH instead. G. R. Yohe

Citronellal terpene. I. Existence of a new terpene C₁₅H₂₄O (Hiroshi Otsuka, J. Chem. Soc. Japan 56, 1213-20 (1935)).—Shaking of citronellal with 10 vols. 50% H₂SO₄ for 12 hrs. at room temp. and distn. gives a new terpene, monogene (I), C₁₅H₂₄, b_m 184-6°, d₄²⁰ 0.8624, n_D²⁰ 1.5026, [α]_D²⁰ 49.11°. Nitrosate of I, m. 154.5-5°. The structure of I seems to be most close to Δ⁴(10)-p-menthadiene. The lower-boiling fraction gives α-terpinene. K. Kutsuta

Reactivity of carbonyl group in γ-pyrones and in γ-pyridones. D. N. Bedekar, R. P. Kaushal and S. S. Deshpande, J. Indian Chem. Soc. 12, 465-9 (1935).—In general the γ-pyrones and γ-pyridones do not form oximes or phenylhydrazones but the more reactive p-O₂NCH₂NHNH₂ (I) acts on Et chelidonate (II) to give the nitrophenylhydrazone (III), C₁₅H₁₂N₂O₄, m. 216°, hydrolyzed by HCl in AcOH to II. The nitrophenylhydrazone of Et 3,5-dibromochelidonate, C₁₅H₁₀Br₂N₂O₄, m. 120°, was similarly prepd. On heating equimol proportions of I and Et xanthochelidonate in abs. alc. for a short time the main product is the pyridone (III)

m. 146°, together with some of its nitrophenylhydrazone (IV), m. 210°. The yield of IV increases with the duration of heating to totality in 1 hr. Similarly equimol. proportions of (AcCH₂)₂CO and I yielded a pyridone, C₁₅H₁₂N₂O₄, m. 136°, which on treatment with excess I gave the nitrophenylhydrazone, m. 215°. The reaction of 2 mols of I with pyrone produced a product C₁₅H₁₂N₂O₄, m. 242°, in which both O atoms have reacted. Chelidonic acid and Et comanate similarly reacted with 2 mols. of I to give pyridone nitrophenylhydrazones, C₁₅H₁₂N₂O₄, m. 210°, and C₁₅H₁₂N₂O₄, m. 220°. In no case could any definite product of the reaction of 1 mol of I be isolated. C. R. Addinall

Constitution of fustun. V. Synthesis of 4'-methoxy-3-hydroxyflavanone. Taichiro Oyama, J. Chem. Soc. Japan 56, 980-3 (1935), cf. C. A. 29, 762¹—4'-Methoxy-3-hydroxyflavanone made by synthesis showed all the characteristics of methylflutun. K. Kutsuta

Chemical examination of *Cuscuta reflexa*, Roxb. I. The constituents. Radha Raman Agarwal and Sukh-hushan Dutt, J. Indian Chem. Soc. 12, 384-8 (1935).—*Cuscuta reflexa* (Roxb.), the Hindustani *akashbel*, is a golden yellow parasitic plant, common throughout India, considered to have purgative properties by native writers. Extn. of 2.5 kg. of sun-dried material from 30 kg. of the freshly collected plant, with boiling alc. gave 25 g. of crude dry cryst. substance contg. a small amt. of yellowish brown wax. Recrystn. from large vols. of EtOH produced white cryst. flakes of *cuscutalin* (I), C₁₅H₁₆O₄, m. 68°, sol. in caustic alkalis. It reduces Tollen's reagent slowly, gives a reddish brown color with alk. K₂Fe(CN)₆/NO. It has no aldehydic or ketone groups and is evidently an α,β-unsatd lactone (C. A. 21, 99). Pharmacologically, I appears to be a potent drug. After the removal of I, the combined alc. exts. were concd. to a greenish red syrup which was extd. with benzene. The ext. was evapd. to dryness and, after washing with cold alc., was crystd.

from boiling alc., yielding white flakes of I. The residue was extd. with AcOH and was then extd. with ice-cold H₂O with const. stirring. The brown, difficultly sol. residue was filtered off and dissolved in H₂O at room temp. to a golden yellow soln. from which yellow crystals of *cuscutin* (II), C₁₅H₁₆O₄, m. 208-9° (decompn.), sep'd. II is sol. in NaHCO₃ and forms a Pb salt, and a *di-Ac deriv.*, m. 140°. By treatment with ClCO₂Et in pyridine and by methylation with Me₂SO₄ in the presence of concd. NaOH, *dicarboethoxycuscutin*, m. 151° (decompn.), and *dimethoxycuscutin*, m. 193°, were prep'd. II gives a neg. test for flavones and is completely decolorized on boiling with Ni(OH)₂ and Zn dust. It is not glucosidic in character. The above aq. ext. was concd. and was found to contain a large amt. of reducing sugars. II. Constitution of *cuscutalin*. Ibid. 586-80.—The white cryst. lactone-like material isolated in 1.5% yields from *Cuscuta reflexa* gave, on recrystn. from MeOH and EtOH, colorless flakes of *cuscutalin* (I), C₁₅H₁₆O₄, m. 68°, [α]_D²⁰ 8° (Ac deriv., C₁₅H₁₆O₄, m. 74°, *carboethoxy deriv.*, C₁₅H₁₆O₄, m. 105°). Methylation of I with alk. Me₂SO₄ produced *dimethoxycuscutin mono-Me ester*, C₁₅H₁₆O₄, m. 78°, and warming with concd. HCl transformed I into *anhydrocuscutalin* (II), m. 71-2°. Bromination and reduction with Zn and AcOH formed *dibromocuscutalin bromide*, C₁₅H₁₂Br₂O₄, m. 64°, and *dihydrocuscutalin*, m. 91°, resp. Volumetric estn. of the unsatn. of I showed the presence of 2 double bonds in I. Although I has no CO or CHO groups, it gradually reduces Tollen's reagent. It dissolves in alc. KOH and gives a reddish brown color with alk. K₂Fe(NO₃)(CN), I is probably an α,β-unsatd. lactone (C. A. 21, 99), and of the 4 O atoms 2 are in the lactone ring and 1 in the OH group. In the formation of II the OH group is lost since II gives no Ac deriv. I dissolved in boiling alc. KOH and on acidification liberated an *isomeric acid lactone*, m. 103°. Fusion of I with KOH gave HCO₂H, PhCH₂CHCO₂H and an aromatic unsatd. hydrocarbon, m. 82°. I was oxidized by 3% alk. KMnO₄ to produce some (CO₂H) and BzH (probably due to the oxidation of the intermediate PhCH₂CHCO₂H). Dry distn. of I gave unchanged material, some II and unidentified hydrocarbons. C. R. Addinall

Anthocyanins from the red and violet flowers of *Pharbitis nil* Choisy. Takeo Kataoka, J. Chem. Soc. Japan 56, 1037-42 (1935).—Ext. 1 part dried red morning-glory flowers with 10-12 parts MeOH contg. 2% HCl for 2 hrs., filter through cloth and ext. the residue twice with 6-6 parts solvent for 2 hrs. Unite the exts., pass through the filter paper, keep the filtrate at 55-60° for 3 hrs. and distil *in vacuo* at 60° to 1/3-1/4 of the original vol. After addn. of 0.5 vol. of alc. and 3-4 vols. of ether to obtain a red ppt., let stand for several days. Decant the clear soln., treat the residue with MeOH contg. 1% HCl, filter off the crystals and wash with MeOH contg. 2% HCl. Recrystn. from MeOH contg. 2% HCl gives fine red needles of pelargonium chloride, C₁₅H₁₀O₄Cl₂ 5H₂O. The sugar obtained by hydrolysis is glucose. Similar treatment of pinkish violet flowers gives picein chloride, needles, C₁₅H₁₀O₄Cl₂ 5H₂O, m. 163° (anhyd, m. 174°). K. Kutsuta

Anthocyanin pigment of the flowers of deep-blue *hyacinth* Kozo Hayashi, J. Chem. Soc. Japan 56, 1050-4 (1935).—The pigment consists of delphinidin diglycoside. K. Kutsuta

Constitution of the anthocyanins. L. F. Levy, J. S. African Chem. Inst. 18, 27-35 (1935).—A review of the literature, with 32 references. B. E. Anderson

Arylated pyridines. IX. W. Diltbey and H. Dienrich, J. prakt. Chem. 144, 1-31 (1935); cf. C. A. 19, 989—2,4,6-Triphenylpyridium perchlorate and PhNH₂, heated a short time on the water bath, MeOH added and then refluxed 1 hr., give a nearly quant. yield of 1,2,4,6-tetraphenylpyridinium perchlorate (I), m. 200°; p-MeC₆H₄NH₂ gives the 1-(4-methylphenyl) analog (II), pale yellow, m. 243-4°; with NH₂OH II (after refluxing 1.5 hrs in dil. EtOH) gives the comp'd. PhC(NH₂OH)(CH₂)C₆H₄NH₂CH₂C(O)Ph 1H₂O, m. 163°. The 1-(2-methylphenyl) analog of I m. 254-5°; 1-(4-ethoxyphenyl)

analog, m. 274°; 1-(2-methoxyphenyl) analog, m. 242-3°; 4 MeO isomer (III), m. 243° (sodium, yellow, m. 300-10°), III and NH₄OH give the compd. PhC(CH₃)CHPh(NO₂)CH PhNHCH₃OMe, m. 145-6°. The 1-(4-hydroxyphenyl) analog (IV) of I m. 170°, then 245°, the salt is about 23% assoc. (mol. wt. 307); this also results from III with HCl, HBr or HI; chloride, m. 350-1°, bromide, m. 382-3°; periodate, brown; iodide, yellow, m. about 340°; nitrate, pale yellow, m. 323-4° (decompn.), picrate, yellow, m. 214-15°. The Ac deriv. of IV m. 288° (periodate, red, m. 185°). The red base from IV and H₂O₂ give 1-(4-hydroxyphenyl)-2,4,6-triphenylpyridinium hydroperoxide (V), m. 201° (decompn.), HClO₄ gives IV. The above salts with MeOH-KOH give yellow solids in the cold, becoming deep red on heating and yellow again on cooling IV gives a deep red color in the cold. In CHCl₃ or C₆H₅N, cold MeOH-KOH gives a deep blue color, becoming red on further addition of alkali. AcOH gives with the chloride from IV a red compd., sol. in MeOH, changing to the blue base on addn of H₂O IV (1 g.) in 70 cc. MeOH, treated with 10 cc. MeOH-KOH (1:4), boiled 30-45 min and filtered into 200 cc. 10% NaOH or KOH, gives 0.8-1 g. of VI, red, with 12 mols. H₂O; drying over CaCl₂ or P₂O₅ gives the blue-violet anhydro base (VII). VI may be recrystd. from H₂O, from MeOH-Et₂O, VI contains MeOH of crystn, which is lost in the air, giving VII, 100 cc. H₂O at 18° dissolves 0.080 g. VI VI with HClO₄ gives 91-9% IV, excess of nitrate gives the nitrate from IV; H₂O₂ gives V. VII, on standing in the air some weeks, is oxidized and cannot be regenerated on drying. Reduction of VI gives PhOH and triphenylpyridine. A soln of VII in piperidine is also oxidized in the air. VII gives only 0.02% active H₂ VI loses 11 mols. H₂O over P₂O₅ in *vacuo*; the last mol. is lost in a PhMe bath at 2-3 mm., VI from MeOH-Et₂O contains 2 mols. H₂O. VII takes up 4 mols. H₂O in the air in 12 hrs. The perchlorate of VI, red, m. 225°, with 1.5 mols. H₂O; picrate, with 1 mol. H₂O, red, m. 240°; nitrate, with 3 mols. H₂O, m. 222-3°, chloride, with 3 mols. H₂O, dark red, m. 214-15°, bromide, with 4 mols. H₂O, dark red, m. 225-8°, iodide, with 3 mols. H₂O, dark red, m. 220°.

2-Methyl-4-hydroxyquinoline and its derivatives. Madeline Maun. *Ann. chim.* [11], 4, 301-63 (1935).—4-Hydroxyquinoline is 2-methyl-4-hydroxyquinoline and is prepd. by mixing at ordinary temp. equal mol. proportions of PhNH₂ and AcCH₂CO₂Et. By heating this compd.

C. J. West

1 rapidly to 240°, EtOH is evolved and I remains. It loses 2 H₂O of crystn. at 110°, m. 210°, is sol. in EtOH, boiling H₂O, and insol. in Et₂O, C₆H₆, and CHCl₃. (C₆H₅NO₂), H₂SO₄ is pptd. from H₂SO₄ solus. by Et₂O. The 2% aq. solns. of this salt is 2:4. On reduction by Na in abs. EtOH, II is obtained. The picrate m. 153-4°. The azo compd. III was prepd. by coupling I with diazonium salts. 2,4-Dihydroxyquinoline yields an azo compd. which is tautomeric as follows (IV ⇌ V). By reaction with phthalic anhydride, 1 of the compds. VI or VII results. Studies were made of the reaction of hydroxyquinoline with aldehydes, and aromatic nitrosamines. Methoxyquinoline-MeI and p-ONC₆H₄NMe₂ gave VIII.

H. E. Messmore

3,6-Dialkoxy-10-alkylacridinium derivatives with various kinds of amino groups on the 9-carbon atom. XV. Synthesis of 3,6-diethoxy-9-alkylamino-10-ethylacridinium derivatives. Kiyoyuki Ishihara. *J. Chem. Soc. Japan* 56, 1164-73 (1935); cf. C. A. 29, 7984¹².—Consts. of 3,6-diethoxy-9-alkylamino-10-ethylacridinium iodides: The alkyl groups are Me, Et, Pr, iso-Bu and iso-Am in the order named. (n) is the no. of mols. of HCl and (m) that of mols. H₂O per mol. (n): 1, 1 1/2, 0.5, 1, 0.5. (n) after drying at 120°: 1, 1, 0.5, 0.5, 0.5. M. ps. (decompn.): 227°, 224°, 223-5° (m. 207°), 230°, 227°. Soly. (vol. %) in H₂O at 15°: 0.012, 0.006, 0.008, 0.006, 0.002. 3,6-Diethoxy-9-alkylamino-10-ethylacridinium hydroxides: (m): 0, 0, 0, 1, 1. K. Kutsuta

Biacridyl and its derived radicals and luminescent salts, luzigenin salts. Herman Decker and Werner Petsch. *J. prakt. Chem.* 143, 211-35 (1935).—The chemoluminescent reactions of N,N'-dimethylbiacridylum (luzigenin) salts (I), of related compds. and of the derived free radicals are described and discussed in relation to structure and nomenclature (used below) is suggested. N,N'-Dimethylbiacridylum nitrate (II) and excess concd. aq. KBr give the bromide (III), yellow, sol. in H₂O with green fluorescence, which splits off MeBr at 230°, giving biacridyl. KCN gives 9,9'-dicyanobiacridan (biacridan

$= 9,10,9',10'$ -tetrahydrobiacridyl). The action of Zn on III or of Zn-AcOH on *N*-methylacridone gives dimethylbiacridene, $[\text{MeN}(\text{C}_6\text{H}_4)_2\text{C}]_2$ (IV), m. 385°, decomp. 390° (cor.), which is stable to air or to reduction in acid or alk. soln. IV is an en-onium conjugated pseudo-base, converted, with loss of fluorescence, by $\text{HCl-C}_6\text{H}_5$ into methylacridone-acridinium methochloride, $\text{MeN}(\text{C}_6\text{H}_4)_2\text{CH-}$

$\begin{array}{c} \text{C}_6\text{H}_5 \\ \diagup \quad \diagdown \\ \text{C} \quad \text{C} \\ \diagdown \quad \diagup \\ \text{C}_6\text{H}_5 \end{array} \text{NMeCl}$, oxidized to I with chemiluminescence.

Its aq. soln., shaken with C_6H_6 , gives a rose color due to the formation of the dimethylbiacridanyl radical, $\text{MeN}(\text{C}_6\text{H}_4)_2\text{CH}(\text{C}_6\text{H}_4)_2\text{NMe}$; addn. of NaOH does not regenerate IV but gives the colorless carbinol base, $\text{MeN}(\text{C}_6\text{H}_4)_2\text{C}(\text{OH})\text{CH}(\text{C}_6\text{H}_4)_2\text{NMe}$; a picrate, m. 280°, decomp. 295°, is isolated from the C_6H_5 soln.; the aq. NaOH is colored violet due to the radical $\text{MeN}(\text{C}_6\text{H}_4)_2\text{C-}$

$\begin{array}{c} \text{C}_6\text{H}_5 \\ \diagup \quad \diagdown \\ \text{C} \quad \text{C} \\ \diagdown \quad \diagup \\ \text{C}_6\text{H}_5 \end{array} \text{NMeX}$ (destroyed by O_2). Addn. of Br to a

C_6H_5 soln. of IV gives III. With Me_2SO , in hot PhMe biacridyl (V) gives only the *mono-Me* sulfate, yellow, m. above 350°, aq. KBr gives 10-*N*-methylbiacridylum bromide (VI), yellow, m. above 350°; picrate, m. 305° (decomp.); iodide, dark red; ferricyanide, yellow, m. 250° (decomp.); with hot $\text{K}_2\text{Fe}(\text{CN})_6$, VI gives a compd. $(\text{C}_6\text{H}_5)_2\text{N}_2\text{O}$, m. 345°, probably an internal ether. VI, shaken with Zn- C_6H_5 gives a violet soln., stable to O_2 ,

due to the radical $\text{MeN}(\text{C}_6\text{H}_4)_2\text{C-}$ $\begin{array}{c} \text{C}_6\text{H}_5 \\ \diagup \quad \diagdown \\ \text{C} \quad \text{C} \\ \diagdown \quad \diagup \\ \text{C}_6\text{H}_5 \end{array} \text{N}$ (VIII)

(picrate, yellow, m. 220°), but in $\text{HCl-C}_6\text{H}_5$ with exclusion of O_2 , monomethylbiacridene is obtained; it is readily oxidized by air to VIII and is converted by I to VII. V is similarly converted into biacridene, m. 392°, which reacts in a similar manner to its *Me* deriv. V must be heated with Me_2SO , without solvent to give I. The final product of the chemiluminescent reaction of $\text{KOH-H}_2\text{O}_2$ on I is *N*-methylacridone C. J. West

Racemization of diethylaminomethylbenzodioxan J. Tréfiou, Mme. J. Tréfiou and Y. Dumant. *Bull. sci. pharm.* 42, 459-66(1935).—Prepn. of hydroxymethylbenzodioxan monohydrate (I): boil for 3 hrs. 25 g. hydroxymethylbenzodioxan (m. p. 83°), 22 g. $\text{C}_6\text{H}_5(\text{CO})_2\text{O}$ and 80 cc. xylene. Keep overnight at 0°, wash first with 50 cc. PhH and crystallize twice from PhH . It m. 116°; yield 25g. Prepn. of the racemic salt with *d*-ephedrine: Mix the hot solns. of 37.74 g. I in 300 cc. PhH and 22 g. *d*-ephedrine in 200 cc. PhH . Cool and filter off the crystals. Sepn. of *d*- and *l*-isomers: Boil 51 g. of the salt with 604 cc. PhH for 10-12 min. Filter by suction and wash with cold PhH . Repeat this treatment. Recrystallize twice from MeOH and then twice from EtOH , finally again from MeOH . Yield 7 g. of the *l*-salt, $[\alpha]_D^{25} -1.56^\circ$. The free *l*-I is obtained by removal of the ephedrine with NaOH soln. and Et_2O and decompn. of the Na salt with HCl . The free ester is sepd. with Et_2O . Sapon. with NaOH at 100° gives needles of 1-hydroxymethylbenzodioxan (II), m. 80°, $[\alpha]_D^{25} -1.90^\circ$. The use of *l*-ephedrine gives the corresponding *d*-compds. Treatment of II in pyridine with SOCl_2 at 100°, addn. of H_2O and extn. with Et_2O gives 1-chloromethylbenzodioxan. Heat 2.85 g. of the latter with 3.38 g. HNEt_3 in a closed tube to 175° for 2 hrs., take up with Et_2O , ext. with HCl , add NaOH and distil. Yield, 1.44 g. 1-dimethylaminomethylbenzodioxan, b.p. 164°, $[\alpha]_D^{25} -29.10^\circ$. The HCl salt m. 123-30°. A. E. Meyer

Vasicine. Mohan Lal Beri, Kartar Singh Narang and Jnanendra Nath Ray. *J. Indian Chem. Soc.* 12, 395-9 (1935).—Attempts to synthesize vasicine (I) have been made on the basis of a structure previously proposed (C. A. 27, 510) on the grounds that I gave 4-quinazoline (II) by oxidation and anthranilic acid by KOH fusion. A mixt. of 5.4 g. of II, 1.5 mol. of allyl iodide and 1.2 mols. of 10% KOH in 54 cc. alc. was refluxed on the steam bath for 3 hrs. After concn. to 15 cc. and treatment with excess KOH an oil sepd. which, on extn. with Et_2O and crystn. from petr. ether, gave 3-allyl-4-hydroxyquinazoline,

$\text{C}_{11}\text{H}_{10}\text{N}_2\text{O}$, m. 67°, stable to steam distn. and heating with HCl , reduced by Na in AmOH to a liquid, b.p. 105-8°, which is not identical with the base obtained by Späth (C. A. 29, 4015). Unsuccessful attempts were made to condense EtCHBrCONHPh (III) with H_2NCOEt to form a quinazoline but hot PhNMe_2 converted III into crotonanilide in poor yields. The action of alc. KOH transformed III into delicate colorless needles of β -ethylindolenone, $\text{C}_{10}\text{H}_8\text{NO}$, m. 254-5°. By refluxing an Me_2CO soln. of III with Ag_2O for 9 hrs., $\text{EtCH}(\text{OH})\text{CONHPh}$, m. 89-90°, was formed, which could not be condensed with H_2NCOEt . Treatment of *o*- $\text{O}_2\text{NC}_6\text{H}_4\text{COCl}$ (6 g.) with 16 g. of $(\text{NH}_4)_2\text{CO}_3$ gave 5 g. of the amide, m. 178°, which was reduced by SnCl_2 in HCl to *o*- $\text{H}_2\text{NC}_6\text{H}_4\text{CONH}_2$ (IV), m. 110°. Condensation of IV with PrCHBrCOBr gave $\text{C}_{11}\text{H}_{10}\text{BrN}_2\text{O}$, m. 144°, which on treatment with NaOH and acidification with AcOH yielded 2-bromopropyl-4-hydroxyquinazoline, m. 218°, reduced by Zn dust in NaOH to 2-propyl-4-hydroxyquinazoline, m. 200°. Condensation of IV with itaconic anhydride gave a colorless substance, $\text{C}_{11}\text{H}_{10}\text{N}_2\text{O}_4$, m. 174-6°, which was cyclized by treatment with NaOH and subsequent acidification with AcOH to a cyclic carboxylic compd., $\text{C}_{11}\text{H}_{10}\text{N}_2\text{O}_5$, m. 197-8°, but whose decarboxylation to the required substance with the proposed structure for I did not proceed satisfactorily. C. R. Addinall

Synthesis of lactoflavin (vitamin B₂) Richard Kuhn, Karl Reinmund, Friedrich Weygand and Rudolf Sträbele. *Ber.* 68B, 1765-74(1935); cf. C. A. 29, 37077.—The condensation of 1,2-dimethyl-4-amino-5-(*d*-1'-ribitylamino)benzene (I) with alloxan (III) gives a flavin identical with lactoflavin. By carrying out this condensation in AcOH in the presence of H_2BO_3 at 15-20° the yield of cryst. material can be increased to 90-95% since the necessity of purification by adsorption and elution is eliminated. The degradation of 2 kg. of Ca *d*-gluconate (C. A. 28, 5047) with H_2O_2 and $\text{Fe}_2(\text{SO}_4)_3$ in the presence of $(\text{AcO})_2\text{Ba}$ gave 520 g. of pure *d*-arabinose of which 500 g. was converted into 320 g. of acetobromo-*d*-arabinose, 140 g. of diacetyl-*d*-arabinal, 80 g. of *d*-arabinal and, finally, into 53 g. of *d*-(-)-ribose (III), m. 87°, $[\alpha]_D^{25} 23.7^\circ$; oxime (IV), m. 141°, $[\alpha]_D^{25} 6.3^\circ$ (final value after mutarotation from 54° (after 10 min.)). Reduction of IV with Na-Hg gave *d*-ribanose which was condensed with 1,2-dimethyl-4,5-dinitrobenzene (V), m. 115-16°, by heating in 80% alc. for 6 hrs. at 130° to 1,2-dimethyl-4-nitro-5-(*d*-1'-ribitylamino)benzene (VI), $\text{C}_{18}\text{H}_{18}\text{N}_4\text{O}_6$, m. 127°. A soln. of 0.60 g. of VI in 75 cc. of 80% alc. was shaken with 0.20 g. PtO_2 and H_2 (3 mols.) for 20 min. The filtered colorless soln. was evaporated, taken up in 30 cc. of AcOH and was run into a soln. prepd. by heating 0.46 g. of alloxan tetrahydrate and 0.90 g. of H_2BO_3 with 30 cc. AcOH and cooling to 30°. After shaking to complete soln., crystals sepd. which were extd. with abs. alc. and produced 91% yields of felled, golden yellow fine needles of 6,7-dimethyl-9-*d*-riboflavin, m. 231-2° (tetra-Ac deriv., m. 242°), identical in all its chem., phys., and physiol. properties with the naturally occurring vitamin. Lactoflavin is related therefore to 4 different classes of org. compds. whose various properties it combines; to the sugars through its pentose chain, to the pyrimidines through its alkali labile ring, to the azine dyes to which belong the natural dyestuffs, chlorophyll and pyocyanine, and finally to the benzene derivs. in which the α -position of the 2 Me groups in natural products is a new phenomenon. The nonglucoside attachment of the pentose chain differentiates the vitamin from the nucleosides and may account for its stability to heat and dil. mineral acids. It is suggested that the flavin may be produced in plants by the reduction of a glucoside intermediate, a true *d*-ribose. The diamine from 50 mg. of VI was added dropwise to a soln. of 100 mg. of methylalloxan, NaHSO_4 , and 200 mg. of H_2BO_3 in 10 cc. AcOH and the mixt. was shaken 1 hr. at 20-5°. Working up by the usual procedure gave 25 mg. (38%) of 3,6,7-trimethyl-9-*d*-riboflavin, m. 272° (decomp.). The specificity of the lactoflavins was further demonstrated by the lack of activity of this 3-methyl lactoflavin. The free NH group

in the 3 position, together with the stereometric arrangement of the pentose chain, is of significance for the vitamin activity of the flavin. I was also prepd. in 2 other ways. V was transformed by treatment with NH_4OH to NH_4^+ 1,2-dimethyl-4-nitro-5-aminobenzoate (VII) (Ber. 35, 628 (1902)) and converted by the addn of 20% COCl_2 in toluene to 2-nitro-4,5-dimethylphenyl isocyanate, $\text{C}_{11}\text{H}_{10}\text{N}_2\text{O}_2$, m. 87.5°, which, by heating with alc., gave an almost theoretical yield of 1,2-dimethyl-4-nitro-5-(carbethoxymino)benzene, $\text{C}_{11}\text{H}_{10}\text{N}_2\text{O}_4$, m. 55°. This was catalytically hydrogenated to the aminourethan which was condensed with III in the presence of Pd and H_2 (C. A. 22, 4502) to 1,2-dimethyl-4-(carbethoxymino)-5-(d-1'-ribitylamino)benzene, m. 169°, and hydrolyzed to I by NaOH and $\text{Ba}(\text{OH})_2$ (C. A. 29, 21007). The simplest synthesis of I was carried out by heating 0.5 g. of l-arabinose and 2.2 g. of VII with 30 cc. abs. alc. for 6 hrs. at 110–20°. The cooled orange-red soln. was absorbed through a pillar of Al_2O_3 . The excess VII was removed with abs. alc. and then the broad orange zone was eluted with a mixt. of 4 parts of MeOH and 1 of H_2O . The recovered condensation product, m. 166°, was hydrolyzed and on condensation with II and H_2BO_3 gave lactoflavin. This simple 2-step process is of general application and will lend itself to the conversion of esters of reduced sugars into flavin esters since there is no step involving alk. hydrolysis.

C. R. Addinall

Heterocyclic compounds containing arsenic in the ring. Preliminary note. Hirendra Nath Das-Gupta, *J. Indian Chem. Soc.* 12, 627–8 (1935), cf. C. A. 27, 408—Mannich (C. A. 29, 4764) has prep'd a comp'd designated as 2-(diethylaminomethyl)-1,3-dichloroarsindole. In an attempt to prep. an As analog of indole, D.-G. prep'd 1-chloroarsindole (I) by direct synthesis in an investigation undertaken in November, 1933. The formula assigned to the product resulting from the action of $\text{CICH}_3\text{CHAsCl}$ on C_6H_5 in the presence of AlCl_3 has been proved by a synthesis which is outlined. Compds. of the type $(\text{PhCH}:\text{CH})_2\text{AsCl}$, $\text{PhCH}:\text{CHAsCl}$ and $(\text{PhCH}:\text{CH})_2\text{As}$ have been prep'd. as intermediates for the prep'n of I.

C. R. Addinall

γ-Triazines. XXIV. Melamine. Adriano Ostrogovich, *Gazz. chim. ital.* 65, 866–88 (1935); cf. O. and Median, C. A. 29, 2167°.—Though various hydrocarbon derivs. of melamine (I) have been described, no acyl derivs. have been reported, and, moreover, part of the earlier literature is erroneous, as shown by the present expts. Pure I, m. 347° (354° corr.) (decompn.) (cf. *J. prakt. Chem.* [2], 3, 332 (1876)). The following new salts were prep'd. Picrate, $\text{C}_{11}\text{H}_{10}\text{N}_4\text{O}_7$, when first ppt'd. it is gelatinous, and must be heated to become cryst., light yellow, m. 316–7°. Triflate, $\text{C}_{11}\text{H}_{10}\text{N}_4(\text{HCO}_2\text{H})$ (II), from I and glacial HCO_2H (III), does not fuse, but loses all its HCO_2H when heated; over soda lime or in conc'd aq. soln. it forms the monoformate (cf. Ann. 10, 22 (1834)). Triacetate, $\text{C}_{11}\text{H}_{10}\text{N}_4(\text{AcOH})$ (IV), from I and glacial AcOH , does not fuse but volatilizes completely, over soda lime, or on long standing it forms the monoacetate (cf. Ann. 10, 23 (1834)). Tetrachloroarsinate, $\text{C}_{11}\text{H}_{10}\text{N}_4\text{O}_7\text{AsCl}_4$, from I-HCl and conc'd aq. HAsCl_4 , yellow or orange-ochre, m. 285–6 (uncor.) (to a red liquid). Bis(tetrachloroarsinate), $\text{C}_{11}\text{H}_{10}\text{N}_4(\text{HAsCl}_4)_2$, 4H O , from I-HCl and a great excess of conc'd HAsCl_4 , yellow, m. 290–1° (uncor.) (decompn.). Under different conditions there is obtained another bis(tetrachloroarsinate), $\text{C}_{11}\text{H}_{10}\text{N}_4\text{O}_7\text{AsCl}_4$, 2H O , yellow, m. 271–2° (uncor.) (decompn.). Semioxalate, $(\text{C}_{11}\text{H}_{10}\text{N}_4)(\text{CO}_2\text{H})_2$, already known (cf. Ann. 10, 23 (1834)). Monooxalate, $\text{C}_{11}\text{H}_{10}\text{N}_4(\text{CO}_2\text{H})$ (V), from cold aq. I and aq. $(\text{CO}_2\text{H})_2$. If instead of filtering V from the conc'd. $(\text{CO}_2\text{H})_2$ soln. in which it is ppt'd., it is dissolved by heating and then cooled, there rapidly ppt's a dioxalate, $\text{C}_{11}\text{H}_{10}\text{N}_4(\text{CO}_2\text{H})_2$ (VI), needles, whereas when cooled slowly there ppt's a dioxalate (VII) in lustrous platelets. IV and V form II when recrystd. from water. In boiling water VI is transformed into VII. Acyl derivs. I and HCONH_2 (8 parts), heated up to 160–5°, evolve NH_3 , and the product purified with 20% AcOH ,

1 EtOH and water, yields 80% of monoformylmelamine, $\text{C}_{11}\text{H}_{10}\text{N}_4\text{CHO}$ (VIII), does not fuse, insol. in hot glacial AcOH , sol. in glacial HCO_2H with formation of II. It also hydrolyzes in mineral acids, with formation of the corresponding I salts; alkalis also hydrolyze it. I (1 g.) and HCO_2Et (5–6 cc.), heated in a sealed tube for 8 hrs. at 230–5°, yield 10–15% of VIII. I and glacial HCO_2H form not even a trace of VIII but only II, which conforms with the fact that VIII and IV form II directly. I (1 g.) and Ac_2O (35 cc.), boiled 2 min., yields 1.60 g. of diacetylmelamine, $\text{C}_{11}\text{H}_{10}\text{N}_4(\text{OAc})_2$ (IX), m. 298–9° (decompn.) (with a short thermometer the m. p. was 305–6°), sol. in aq. alk. hydroxides (repp'd. unchanged by AcOH). IX and aq. picric acid (X) and a little $(\text{CO}_2\text{H})_2$ (which facilitates the reaction) form the picrate $\text{C}_{11}\text{H}_{10}\text{N}_4\text{O}_7\text{AsCl}_4$, dark yellow, m. 209–10° (uncor.) (decompn.). IX in aq. HCl forms with HAsCl_4 the tetrachloroarsinate, $\text{C}_{11}\text{H}_{10}\text{N}_4(\text{OAc})(\text{HAsCl}_4)$, light yellow, decomposes without fusion. IX in aq. NaOH, a little NH_3 and excess AgNO_3 , gives a gelatinous ppt of the di-acyl deriv., $\text{C}_{11}\text{H}_{10}\text{N}_4\text{Ag}_2(\text{OAc})_2$, grayish, turns brown when exposed to light. I (1 g.) and MeCOSiH (15–20 cc.), refluxed 2 hrs. (H_2S is evolved), yields IX, and when only 5 cc. of MeCOSiH in AcOH is used, no mono acyl deriv. (XI) is formed but only a little IX and a trace of IV. Even with the calc'd. proportion of Ac_2O , no XI was obtained, but only IV. 4 With an excess of Ac_2O , the chief product is IV, with a little IX, but no XI. Though the reaction between HCO_2NH_2 and I goes easily, AcNH_2 and I do not react on prolonged heating, even with excess AcNH_2 (1.05 g.) and Ac_2O (100 cc.), refluxed until all IX is formed (loc. cit.), then with more Ac_2O (100–120 cc.), yield triacetyl-melamine, $\text{C}_{11}\text{H}_{10}\text{N}_4(\text{OAc})_3$ (XII), m. 289–91° (long thermometer and 298–300° (short thermometer) (decompn.), sol. in cold dil. aq. alkalis (with slow hydrolysis). The 3rd acyl group is less stable than the other acyl groups, and the picrate, tetrachloroarsinate and tri-acyl salt could not be prep'd. by the Baumann-Schotten reaction, I gives no trace of any Bz deriv., even in $\text{C}_6\text{H}_5\text{N}$, nor was any Bz deriv. obtained by heating with BzCl or fusion with BzNH_2 . On the other hand, I (2 g.) and Bz_2O (10 g.), heated at 130–5° for 4 hrs., the difficultly removable BzOH eliminated with Et_2O -petr. ether or petr. ether alone, yield almost 100% of tribenzoylmelamine (XIII), m. 142–3°, rhombic prisms from AcOEt or Me_2CO under certain conditions, needles of the same m. p. under other conditions, crystallizes from PrOH as the comp'd. $\text{C}_{11}\text{H}_{10}\text{N}_4\text{O}_7\text{AsCl}_4$ 2PrOH (XIV), which gives up its PrOH slowly at room temp. and completely in *vacuo* at 85–90°. XIII is repp'd. from its cold alk. hydroxide solns. by CO_2 . In boiling 95% EtOH contg. H_2SO_4 , XIII forms BzOEt , BzOH and I semisaltate. Hot alc. NH_3 also decomposes XIII to I. XIII and PhOH, heated at 130° and ext'd. with Et O -petr. ether, leaves the comp'd. $\text{C}_{11}\text{H}_{10}\text{N}_4\text{O}_7\text{AsCl}_4$ 3PhOH (XV), m. 192.5–3.5°; in AcOEt it decomposes to XIII. By the usual methods of prep. picrates, XIII does not react, showing that the 3 Bz groups destroy its basicity, but in boiling PhMe with excess X (8–9 mols.) it forms the picrate, $\text{C}_{11}\text{H}_{10}\text{N}_4\text{O}_7\text{AsCl}_4$, dark yellow, m. 222–3° (long thermometer), and 223–9° (short thermometer). No higher picrate was obtained at 180°. A soln. of XIII in a min. of cold aq. dil. NaOH or KOH contg. an excess of NH_4OH poured into aq. AgNO_3 or NH_4AgNO_3 ppt's the di-acyl deriv., $\text{C}_{11}\text{H}_{10}\text{N}_4\text{O}_7\text{AsCl}_4$ 2H O . Even with a great excess of AgNO_3 , it is formed exclusively. Mulder (Ber. 7, 1632 (1874)) prep'd. from $(\text{CO}_2\text{Et})_2$ and NCNH_2 , a comp'd. which he thought was VIII, but his evidence was dubious and description meager, and a repetition of his expts. by O. gave a yellowish comp'd. (XVI) which gave no I salts on hydrolysis. With hot conc'd. H_2SO_4 it gave a little CO. It was partially sol. in hot dil. NaOH, from which an unidentified gelatinous comp'd. was ppt'd. by HNO_3 . Unlike VIII, a soln. of XVI in hot III ppt's a gelatinous comp'd. on cooling, and with X a picrate, different from that of VIII, is formed. The product of Mulder is probably a mixt. of ammeline and ammellides, perhaps with small proportions of other compds. Gerlich (cf. *J. prakt. Chem.* [2], 13, 280 (1876)) prep'd. from NCN .

Na_2 and BzCl a compd. which he thought was XIII, but the present work shows that it was not XIII, as is also indicated by the work of Buddéus (*J. prakt. Chem.*, 42, 99 (1890)). The m. p. of XIII prepd. by O is the same as that of NCNH_2Bz (XVII), not 126° as reported by Buddéus (loc. cit.), but a mixt of XIII and XVII m. several degrees lower, and XIII fuses without decompn whereas XVII decomposes at its m. p. From PrOH and from PhOH XIII crystallizes as XIV and XV, resp., whereas XVII crystallizes without PrOH or PhOH . XVII can be heated with alc. NH_3 in a sealed tube at 100° with only partial decompn, approx $1/3$ of the XVII being recovered as the NH_3 salt, whereas XIII decomposes completely into I and BzNH_2 . XIII also decomposes in aq. alc. NH_3 at 50° . Other minor differences between XIII and XVII are noted. The various new salts of I show that it can function either as a bivalent or as a trivalent base. This is further supported by the series of HCl salts of Barnett (*C. A.* 24, 4508). However the tetracyclic formula of B is unnecessary, for the stepwise addn. of HCl can as readily be explained by the 2 old tautomeric formulas (triaminotriazine and triaminotriazine). It is assumed that free I has the iso structure, or more probably an

intermediate mono-amino form $\text{HN} \cdot \text{C}(\cdot\text{NH}_2) \cdot \text{N} \cdot \text{C}(\text{NH}_2) \cdot$

$\text{NH} \cdot \text{C} \cdot \text{NH}_2$, and that when the NH_2 is shifted, a 2nd group is transformed into an NH_2 group, and similarly a further transformation takes place. The tetranuclear formula of B. fails also to explain the 2 isomeric series of alkyl melamines and their hydrolysis with acids (cf. *Ber.* 6, 1372(1873)), and the soly. of the new acyl melamines in alkalies and the formation of Ag salts. C. C. Davis

The optical activity of lactoflavin. P. Karrer and H. Fritzsche *Helv. Chim. Acta* 18, 1026-7(1935); cf. *C. A.* 29, 3679¹, 4363¹.

Methylalloxazine. P. Karrer and Carlo Musante. *Helv. Chim. Acta* 18, 1134-40(1935); cf. *C. A.* 29, 1089¹.—The effect of Me groups on the fluorescence of lumichrome was studied by prep. tri- and tetra-methylalloxazines (cf. Kuhnig, *Ber.* 28, 1968(1895)). From 2,4,5-trimethyl-6-nitroaniline, m. 40° (cf. Elder, *Ber.* 18, 620(1891)) the diamine was formed by catalytic reduction in alc. and was condensed with alloxan (II) to give 5,7,8-trimethylalloxazine, $\text{C}_{12}\text{H}_{12}\text{N}_6\text{O}_2$ (possibly 5,6,8-trimethylalloxazine), decomp. at 290° and giving yellow fluorescence. From 3,4,5-Me₃C₆H₃NH₂ (cf. Noeltling and Forst, *Ber.* 18, 620(1891)) the diamine was likewise obtained and condensed with I to give 6,7,8-trimethylalloxazine, $\text{C}_{12}\text{H}_{12}\text{N}_6\text{O}_2$, with greenish yellow fluorescence. From 1,2,3,4-tetramethyl-5,6-dinitrobenzene, $\text{C}_{10}\text{H}_8\text{N}_2\text{O}_4$, m. 171° (cf. Jacobsen, *Ber.* 19, 1214(1892)) the diamine was similarly prepd. and condensed with I to give 5,6,7,8-tetramethylalloxazine, $\text{C}_{12}\text{H}_{12}\text{N}_6\text{O}_2$, with purplish yellow fluorescence. From 2-amino-3-nitrotoluene (II) (cf. Cohen and Dakin, *J. Chem. Soc.* 79, 1127(1901)) 2-chloro-3-nitrotoluene was prepd. and condensed with ethanolaniline to give 2-hydroxyethylamino-3-nitrotoluene which upon reduction to the amine was condensed with I, giving 8-methyl-9-hydroxyethylalloxazine, $\text{C}_{12}\text{H}_{12}\text{N}_6\text{O}_2$ (III), m. 294° . Photodecompn. of III in 75% MeOH readily gave 8-methylalloxazine, $\text{C}_{12}\text{H}_{12}\text{N}_6\text{O}_2$ (IV), with green blue fluorescence. By reduction of II to 2,3-diaminotoluene and condensation with I either 8- or 5-methylalloxazine or a mixt of the 2 with the same fluorescence as IV was prepd.

W. F. Bruce
Synthetic flavins. VII. P. Karrer, H. Salomon, K. Schöpf and F. Benz. *Helv. Chim. Acta* 18, 1143-6 (1935); cf. *C. A.* 29, 5847¹.—Because both lactoflavin and yeast nucleic acid contain d-ribose, and because thymus-nucleic acid contains d-2-ribose (I), the flavin contg. I was prepd. to be tested for its triamin B_2 action. I was condensed with 1-amino-2-carbethoxyamino-4,5-dimethylbenzene with N_2 and H_2 at 25 atm to give 4,5-dimethyl-2-carbethoxyaminophenyl-d-desoxyriboside, $\text{C}_{21}\text{H}_{28}\text{N}_6\text{O}_5$ (II), m. 115° , $[\alpha]_D^{25} -21$ (H_2O), in quant. yield. Hydrolysis of II by KOH and condensation with alloxan (III) gave 6,7-dimethyl-9-(d-1'-desoxy-

ribityl)isalloxazine, $\text{C}_{21}\text{H}_{28}\text{N}_6\text{O}_4$, m. 283° , $[\alpha]_D^{25} -78^\circ$. From d-ribose and 1-amino-2-carbethoxyaminobenzene was prepd. 2-carbethoxyaminophenyl-d-araboside, $\text{C}_{21}\text{H}_{28}\text{N}_6\text{O}_5$, m. 158° . By hydrolysis, condensation with III and acetylation 9-(d-1'-ribityl)isalloxazine tetraacetate, $\text{C}_{21}\text{H}_{28}\text{N}_6\text{O}_{10}$, m. 237° , was obtained. Upon hydrolysis this gave 9-(d-1'-ribityl)isalloxazine, $\text{C}_{21}\text{H}_{28}\text{N}_6\text{O}_4$, m. 283° . Condensation of d-ribose and 1-amino-2-carbethoxyamino-5-methylbenzene gave 5-methyl-2-carbethoxyaminophenyl-d-riboside, $\text{C}_{21}\text{H}_{28}\text{N}_6\text{O}_5$, m. 150° . Upon hydrolysis and condensation with III this gave 7-methyl-9-(d-1'-ribityl)isalloxazine, $\text{C}_{21}\text{H}_{28}\text{N}_6\text{O}_4$, m. $285-6^\circ$, tetraacetate, $\text{C}_{21}\text{H}_{28}\text{N}_6\text{O}_{10}$, m. 215° . W. F. Bruce

A modified flavin synthesis. P. Karrer and Hans F. Meerwein *Helv. Chim. Acta* 18, 1130-4(1935); cf. *C. A.* 29, 5347¹, 6237¹.—A new synthesis of flavins is accomplished by coupling the condensation product of a sugar and 3,4-dimethylamine (I) obtained under reducing conditions, with a diazonium salt to form an azo dye in quant. yields. On reduction the dye yields a 3,4-dimethyl-6-aminophenyl sugar deriv. which can be transformed to a flavin. This synthesis is particularly suited to the prepn. of flavins which contain readily hydrolyzable groups. From I and l-araboside by this procedure 3,4-dimethylphenyl-l-araboside, $\text{C}_{21}\text{H}_{28}\text{N}_6\text{O}_5$ (II), m. 123° , was obtained (yield 60-70%). From diazotized p-nitroaniline and II an azo dye mixt. resulted which contained (3,4-dimethyl-6-p-nitrophenylazo)phenyl-l-araboside, $\text{C}_{21}\text{H}_{28}\text{N}_6\text{O}_5$. Reduction by Zn and HIOAc gave 6,7-dimethyl-9-(l-1'-arabityl)isalloxazine, m. 299° . By a similar synthesis with ribose the following compds. were obtained in nearly quant. yield: 3,4-dimethylphenyl-d-riboside, m. 143° (yield 80-90%), $\text{C}_{21}\text{H}_{28}\text{N}_6\text{O}_5$, and 6,7-dimethyl-9-(d-1'-ribityl)isalloxazine (lactoflavin), m. 280° .

W. F. Bruce
γ-Triazines. XXIX. The passage from some alkyl, aryl and aralkylaminotriazines to derivatives of the corresponding aminohydroxytriazines. General considerations and a description of two new alkyl homologs ethylaminohydroxytriazine and propylaminohydroxytriazine. Adnarno Ostrogovich and Virgil Galea *Gazz. chim. ital.* 65, 349-56(1935); cf. *C. A.* 29, 5449¹.—Method of prepn.—Add to the alk. aminotriazine (I g in 25 cc of 10% NaOH or KOH) water (5 cc) and perhydrol (5 cc) dropwise (in some cases the solns become intensely yellow and then colorless), let stand overnight, acidify with dil. AcOH, let stand, and wash the ppt. with cold water. Ethylaminohydroxytriazine, $\text{C}_4\text{H}_8\text{ON}_3$, 311⁰ (II), m. $277-8^\circ$ (all m. ps. uncor.) (decompn.), loses water of crystn. at room temp. with formation of $\text{C}_4\text{H}_6\text{ON}_3$, $2\text{H}_2\text{O}$, sol in mineral acids. I and concd. HCl yield on evapn. the HCl salt, $\text{C}_4\text{H}_8\text{ON}_3\text{HCl}$, m. $214-16^\circ$ (decompn.), hydrolyzes immediately in water. Picrate, $\text{C}_{12}\text{H}_{10}\text{N}_4\text{O}_7$, $\text{C}_{12}\text{H}_{10}\text{N}_4\text{O}_7$, H_2O , of I, dark yellow, loses its H_2O of crystn. *in vacuo* at 100° , with formation of the anhyd. salt, which is paler yellow, and m. around $191-2^\circ$ (decompn.). In hot dil. NH_4OH , I ppts with excess AgNO_3 the Ag salt, $\text{C}_4\text{H}_8\text{ON}_3\text{Ag}$, H_2O , turns brown around 240° , chars at $265-70^\circ$, sensitive to light, sol. in HNO_3 . The H_2O of crystals is eliminated *in vacuo* at $135-40^\circ$. Propylaminohydroxytriazine (II), m. $274-5^\circ$, sol in mineral acids, with formation of the resp. salts, which hydrolyze easily, sol in alk. hydroxides and NH_4OH (reppd. by CO_2). Picrate, $\text{C}_{12}\text{H}_{10}\text{N}_4\text{O}_7$, $\text{C}_{12}\text{H}_{10}\text{N}_4\text{O}_7$, H_2O , of II, golden yellow, loses its H_2O of crystn. *in vacuo* at 100° , with formation of the much lighter yellow anhyd. salt, m. $195-6^\circ$ (decompn.). Like other aminohydroxytriazines, I and II are amphoteric, and all members of

the group can be represented by the formulas: $\text{N} \cdot \text{CR} \cdot \text{N} \cdot \text{C}(\text{OH}) \cdot \text{N} \cdot \text{CNH}_2$ (amino-enolic form) and $\text{N} \cdot \text{CR} \cdot$

$\text{NH} \cdot \text{CO} \cdot \text{NH} \cdot \text{C} \cdot \text{NH}$ (imino-carbonyl form), or by one of the 2 intermediate aminocarbonyl or imino-enolic forms. The imino-carbonyl form is the most probable in all cases. XXX. Some arylaminohydroxytriazines. *Ibid.* 357-65. Three new arylaminohydroxytriazines were prepd. in

almost 100% yields by oxidation of the corresponding arylaminobenzotriazines. Since phenylaminobenzotriazine and phenylaminohydroxytriazine (I) are easily prepd. in high yield (cf. *C. A.* 25, 1531), I was studied further and various salts were prepd. Hot concd. HCl and I form the *mono-HCl salt*, $C_{10}H_8ON_4 \cdot HCl \cdot 2H_2O$, of I, m. 295-6° (decompn.), hydrolyzes in water, is stable in hot EtOH, loses HCl slowly on standing in air, loses its H_2O of crystn. *in vacuo* at 105-10°. Hot 2 N H_2SO_4 and I form the *monosulfate*, $(C_{10}H_8ON_4)_2 \cdot H_2SO_4 \cdot 4H_2O$, of I, m. 238-40° (decompn.), loses its H_2O of crystn. *in vacuo* at 100°, hydrolyzes in water and in EtOH. The picrate of I, already prepd. (cf. *O. C. A.* 24, 5752), m. 295-7° (decompn.), or 300-7° (cor.), has the compn. $C_{10}H_8ON_4 \cdot C_8H_5O_6N_3 \cdot 2H_2O$, loses its H_2O of crystn. *in vacuo* at 170°, sol. in cold aq. alk. hydroxides and NH_4OH (reprecip. by dil. AcOH or by satg. with CO_2). The alkali salts absorb atm. CO_2 and they were not analyzed. With hot aq. NH_4AgNO_3 , I ppt. the *Ag salt*, $C_{10}H_8ON_4 \cdot Ag \cdot H_2O$, does not fuse, but carbonizes at an elevated temp. (residue of Ag), more stable to light in a wet than in a dry state. Prepd. like I, almost a 100% yield of *o*-tolylaminohydroxytriazine (II) was obtained, m. 212-3° to a viscous orange-brown liquid, sol. in hot glacial AcOH with formation of its *acetate*, which on standing or in contact with water loses AcOH, sol. in mineral acids with formation of the corresponding *hydrohalide salts*, which are easily hydrolyzable. With aq. alkali salts, it forms the corresponding *alkali salts*, which absorb atm. CO_2 . *Ag salt* *Picrate*, $C_{10}H_8ON_4 \cdot C_8H_5O_6N_3 \cdot H_2O$, S-yellow, m. 275-6° (decompn.), loses its H_2O of crystn. *in vacuo* at 140°. Prepd. like I and II, the yield of *m*-tolylaminohydroxytriazine is almost 100%, m. 217-10° (decompn.), in boiling glacial AcOH it forms an easily hydrolyzable *acetate*. *Alkali salts*. *Ag salt*. With aq. mineral acids it forms the corresponding *hydrohalide salts* *Picrate*, $C_{10}H_8ON_4 \cdot C_8H_5O_6N_3 \cdot H_2O$, lemon-yellow, m. 297-8° (decompn.). The yield of *p*-tolylaminohydroxytriazine, $C_{10}H_8ON_4 \cdot H_2O$ (III), is almost 100%, m. 333-4° (decompn.); in boiling glacial AcOH it forms the *acetate*. In aq. alk. hydroxides III forms the corresponding *alkali salts*, which are decomposed by CO_2 and it is sol. in hot NH_4OH . In aq. HCl (2.1) III forms the *HCl salt*, $C_{10}H_8ON_4 \cdot HCl \cdot H_2O$, m. 291-6°, hydrolyzes in water and in EtOH, loses its H_2O of crystn. *in vacuo* at 140-6°. *Picrate*, $C_{10}H_8ON_4 \cdot C_8H_5O_6N_3$, light greenish yellow, m. 301-5°. *Ag salt*, $C_{10}H_8ON_4 \cdot Ag \cdot H_2O$, sol. in NH_4OH and more so in HNO_3 , its H_2O of crystn. cannot be eliminated without further decompn. *Amidylaminohydroxytriazine*, $C_{10}H_8ON_4$ (IV), m. 327-8°, is amphoteric, and forms salts with bases and with acids. It crystallizes in 2 monoclinic forms, an acicular prismatic form and a tabular prismatic form. *HCl salt*, $C_{10}H_8ON_4 \cdot HCl$, m. 290-1°, hydrolyzed by water and by concd. EtOH. *Picrate*, $C_{10}H_8ON_4 \cdot C_8H_5O_6N_3$, dark yellow, m. 304-5°. *Alkali salts* of IV absorb in water atm. CO_2 . *Ag salt*, $C_{10}H_8ON_4 \cdot Ag \cdot H_2O$, very sensitive to light, decomposes before its H_2O of crystn. is eliminated. XXI. Benzylaminohydroxytriazine and styrylaminohydroxytriazine. *Ibid.* 367-70.—By the same method used for the previous amidylaminohydroxytriazines, benzylaminobenzotriazine (I) yields benzylaminohydroxytriazine (II), prep. otherwise as phenylacetoguanide by Flaznowski (Thesis, Freiburg, Switzerland, 1898), m. 277-8° (decompn.) (cf. "above 300°" of Flaznowski). Evapd. with concd. HCl, II gives the *HCl salt*, $C_{10}H_8ON_4 \cdot HCl$, hydrolyzes rapidly in water. *Picrate*, $C_{10}H_8ON_4 \cdot C_8H_5O_6N_3 \cdot H_2O$, yellow, m. 208-10° (decompn.), loses its H_2O of crystn. *in vacuo* at 110°. In hot dil. NH_4OH with $AgNO_3$, II forms a *Ag salt*, $C_{10}H_8ON_4 \cdot Ag$, slightly sensitive to light, especially when dry, m. 270-60° (decompn.), sol. in NH_4OH and HNO_3 . Prepd. similarly from styrylaminobenzotriazine (III), styrylaminohydroxytriazine, $(C_{10}H_8ON_4) \cdot C_6H_5CH=CH_2 \cdot H_2O$ (IV), m. 304-5° (decompn.), decolorizes rapidly Br-water and aq. $KMnO_4$, sol. in hot NH_4OH and in alk. hydroxides with formation of *alkali salts*, which are reprecip. by CO_2 or by AcOH. *Picrate*, $C_{10}H_8ON_4 \cdot C_8H_5O_6N_3 \cdot H_2O$, of IV, S-yellow, m. 271-3° (decompn.), loses its H_2O of crystn. *in vacuo*

at 100-5°. The formation of IV and II from III and I, resp., would with the very high yields appear to be an excellent method for prepn., but the prepn. of large quantities of I and of III offers great difficulties because of the instability of phenylthiolacetic acid and especially of thiocinnamic acid. This prevented a more extensive study of the properties and behavior of II and IV. It should be preferable to treat guanyllurea acetate with phenacetyl chloride or cinnamyl chloride, then to pass to the aminohydroxytriazine by treatment with NH_3 or other aq. base. C. C. Davis

Curare alkaloids I Tubocurarine. Harold King. *J. Chem. Soc.* 1935, 1381-9.—Details are given of the isolation of *d*-tubocurarine chloride (I) from tubocurarine (II), a South American arrow poison II (25 g.) in 625 cc. 1% warm aq. tartaric acid, made alk. with 250 cc. cold aq. $NaHCO_3$ and extd. with EtO and $CHCl_3$, gives about 4 g. curine (III); the aq. soln. was made

acid with 2 N H_2SO_4 , basic $Pb(OAc)_2$ added, the Pb removed from the filtrate and ppt., and I pptd. by phos-

photungstic acid and HgCl_2 . I, $\text{C}_{11}\text{H}_{14}\text{O}_2\text{N}_2\text{Cl}_2 \cdot 5\text{H}_2\text{O}$, m. $274-5^\circ$ (decompn.), $[\alpha]_D^{25}$, 204.8° (H_2O , c 0.97) (anhyd. salt). FeCl_3 gives a weak green color; I reduces $\text{Ni}(\text{OH})_2\text{Ag}_2\text{O}$ on warming and gives amorphous ppts with Au and Pt compds., KI, KBr, KCNO , HgCl_2 , NH_4NO_3 , and HClO_4 . I with MeI and MeOH-KOH yields *O*-methylbucurarine iodide (IV), with 3 mols H_2O , m. 267° (decompn.), $[\alpha]_{\text{MeI}}^{202.1^\circ}$ (H_2O , c 1.01, anhyd. salt). I and I-III MeCl are isomeric but not enantiomorphous. Hofmann degradation of the chloride from IV gives methine bases, characterized as their MeI derivs. *O*-Methylbucurarinemethine methiodide B (V), with 2.5 mols H_2O , m. 230° , the *A*-isomer (VI), with 2.5 mols H_2O , m. 234° , *d*-Methylbucurarinemethine-MeI (VII), with 5 mols H_2O , m. 190° , $[\alpha]_{\text{MeI}}^{105^\circ}$ (MeOH , c 0.22); the *I* isomer (VIII), with 4 mols H_2O , needles, m. $171-2^\circ$ or plates, m. $178-80^\circ$, $[\alpha]_{\text{MeI}}^{100^\circ}$ (MeOH). Degradation of the methylation product of *d*-beberine (identical with I III, except for rotation), gives V, VI and VII. VIII was not found. At the 2nd stage of the Hofmann degradation of the mixed *O*-methylbucurarinemethine-MeCl there results MeCN and *O*-methylbeberine, m. $198-9^\circ$, identical with that obtained from *O*-methylbeberine-MeCl (IX). The chloride (X) from IV and IX are both represented by formula XI, with 2 asym. C atoms adjacent to the N atoms. The assumption is made that in IX each center of asymmetry is *d*-rotatory, whereas in X 1 center is *d*- and the other *l*-rotatory. Since the same *d*-methine-MeI, m. 190° , is formed from both alkaloids, VII can only have retained the common *d*-center of asymmetry and should have the structure of a dimethiodide based on XII or XIII; VIII is obtained only from X and is therefore probably represented by XIII or XII, in which only the *l*-center of asymmetry has survived. Although IX and X are diastereoisomers, it is probable that the parent phenolic substances, although isomeric, differ in the orientation of H and MeO groups. I produces complete "curare" paralysis of the frog in doses of 0.5 mg. per kg. The isomeric *d*-beberine-MeCl has about $1/10$ of the activity.

C. J. West

The alkaloids of the Chinese drug, mu fang-chi T. Q. Chou *Chinese J. Physiol.* 9, 267-74 (1935).—Two alkaloids, menisidine and menisidine, have been isolated. Menisidine crystallizes with 1 mol of H_2O in fine needles, m. 127° . The anhyd. compd has the formula $\text{C}_{19}\text{H}_{21}\text{NO}_4$ (?), m. 152° , $[\alpha]_D^{20}$, 290° . It is a tertiary base, contains 2 MeO groups and forms the following salts: hydrochloride, amorphous powder, m. about 260° ; acid phosphate, rhombic prisms, m. 280° ; methiodide, rhombic prisms, m. 263° (decompn.). Menisidine crystallizes from alc in prismatic needles, m. 176° . It has the formula, $\text{C}_{20}\text{H}_{23}\text{NO}_4$ (?), $[\alpha]_D^{20}$, 260° , and contains 3 MeO groups. With acetone it forms a diacetone compd. It is also a tertiary base, and forms the following salts: hydrochloride, a cryst. powder, m. about 265° when anhyd., acid phosphate, minute rhombic prisms, m. about 290° , softening at about 210° ; dimethiodide, amorphous powder with no definite m. p.

L. A. Maynard

Constitution of matrine XVII Hsiaoaburo Kondo, Eiju Ochias and Kyosuke Tsuda. *Ber.* 68B, 1899-1904 (1935), cf. *C. A.* 29, 4015¹.—It had been established that 11 of the C atoms and the 2 N atoms of matrine (I) are present in the form of the skeleton II; it was presumed that the other 4 C atoms constitute a lactam ring which, by further condensation with the norpinane nucleus, forms a 3rd heterogeneous ring. When I is hydrolyzed with alc. KOH the lactam ring is ruptured, with formation of matricinic acid, which is methylated to Me methylmatrine. This ester is degraded by the Hofmann method to decarbonylmethylmatrinyl alc. and its anhydride, decarbonylmethylmatrine, P and HI reduce the anhydride to a secondary tertiary amine $\text{C}_{11}\text{H}_{15}\text{N}$ (decarboxylated matricinic acid) which is dehydrogenated by heating with Pd asbestos to the same base, $\text{C}_{11}\text{H}_{15}\text{N}$ (III), as had been obtained by catalytic dehydrogenation of I. The methoxyhydroxide of III gives PrCO_2H with KMnO_4 , and hence contains a Pr side chain, as I MeOH gives no PrCO_2H

under the same conditions, the Pr side chain must be formed by degradation of the lactam ring. Of the 2 possible formulas (IV and V) for the lactam ring, only IV can account for the formation of the C_{11} base (VI) from K matrine with loss of 3 C atoms. Moreover, since the oxidation of the compd. $\text{C}_{11}\text{H}_{15}\text{N}$, obtained by BrCN degradation of dihydro- α -matrinidine (VII) and subsequent dehydrogenation gives only quinolinic and no α -picolinic or pyridimetricarboxylic acid, the structure of VII is best represented by the formula VIII or IX. Nucleus C in matrinidine (X) would then be a Δ^4 -tetrahydro- α -picoline, which agrees with the chem. properties of the base. X is quite unstable in the air; on acetylation it simultaneously adds 1 mol. H_2O more and on dehydrogenation changes, with loss of 2 mols. H_2 , to the more stable dehydro- α -matrinidine (XI). According to these formulas XI has an α -methylpyridine nucleus which should condense with aldehydes, and as a matter of fact a benzal deriv. (XII) was obtained from XI. If there is no ring shifting in the formation of X, the structure of I may be represented by the formula XIII or XIV. Further studies will be made to decide, if possible, between these 2 structures and also to explain earlier observations which are apparently not in harmony with them. The base $\text{C}_{11}\text{H}_{15}\text{N}$, b, 130° (methiodide, m. 213°); 1 g. with 1 g. of 42%

(II)

(IV)

(V)

(VI)

(VIII)

(IX)

(XIII)

(XIV)

Pd-asbestos at $270-80^\circ$ gives 0.6 g. III, b, $195-205^\circ$ (HCl salt, m. $208-9^\circ$, $[\alpha]_D^{20}$ 0.81¹ (alc.); the m. p. of the methiodide, previously given as $128-9^\circ$, is raised to $139-40^\circ$ by repeated crystn. from acetone). With Pt oxide in AcOH and H under 35 lbs., the base $\text{C}_{11}\text{H}_{15}\text{N}$ yields the base $\text{C}_{11}\text{H}_{15}\text{N}$, m. $189-90^\circ$, XI, b, 176° (HCl salt, decompn. 282° , $[\alpha]_D^{20}$ 0.57¹ (alc.); XII, m. $109-74^\circ$, is reduced by Pt oxide in dil. HCl and H to a base isolated as the chloroplatinate, $(\text{C}_{11}\text{H}_{15}\text{N})_2(\text{HCl})_2\text{PtCl}_4$, decompn. 190° . I and lupanine (XV) are not stereoisomers, as shown by the nonformation of octadehydromatrine in the dehydrogenation of XV with Pd-asbestos at $320-30^\circ$ and by the fact that XV MeOH gives glutaric acid with KMnO_4 , while I MeOH does not. The glutaric acid is certainly not formed from the norpinane but from the α -piperidine nucleus, for it is not obtained in the analogous oxidation of sparteine.

C. A. R.

Cotarnine series. II. The reactivity of the aldehyde group in cotarnine and benzoylcotarnines. D. B. Dey and P. Lakshmi Kantam. *J. Indian Chem. Soc.* 12, 421-9 (1935), cf. *C. A.* 29, 2981¹.—To a suspension of 2 g. of cotarnine (I) in 20 cc. of H_2O were added 1 g. of $\text{H}_2\text{NOH} \cdot \text{HCl}$ and 2 g. of AcONa and the mixt. was warmed to a clear soln. which was concd. and made alk. with Na_2CO_3 . The almost quant. yield of crystals which sepd. was

recrystd. from alc. and gave cotarnine oxime (II), *m.* 157°; di-Ac deriv., $C_{11}H_{11}N_2O_4$, *m.* 113°; di-Bz deriv. (III), $C_{17}H_{15}N_2O_4$, *m.* 158°. II reacted smoothly with 2 mols. of PhNCO to produce cotarnomethylphenylurea oxime phenylurethane, *m.* 161°, identical with the compd. obtained by the action of PhNCO on cotarnomethylphenylurea oxime. PhNCS reacted with II in C_6H_6 to give cotarnomethylphenylthiourea oxime, *m.* 142°, previously prepd. by the oxidation of cotarnomethylphenylthiourea. As previously observed, PhNCS does not react with the NOH group. The *c* reactions clearly indicate the simultaneous presence of the NOH group and of the rec. imino-II atom in II and rule out the carbinal form. Reduction of II with Na and abs. alc. gave hydrocotarnine with evolution of NH_3 , because of the reduction of NOH to NH_2 and elimination of NH_3 consequent on the closure of the isoquinoline ring. I condenses readily with aromatic amines to form unstable salts which are decomposed quickly by alkalis but dissolve unchanged in cold acids. Attempts to prep. the Bz deriv. of cotarno-*p*-toluidid gave benzotoluidid, *m.* 158°. The trituration of 2 g. of I with 1 cc. of BzCl and 20 cc. of 10 *N* NaOH for 15 min. gave a quant. yield of benzoylcotarnine (IV), *m.* 121°, oxime, *m.* 165°, benzoylated to III, Ac deriv., $C_{11}H_{11}N_2O_4$, *m.* 162°; azine, $C_{11}H_{11}N_4O_4$, *m.* 220°, anil., *m.* 161°, *o*-, *m*- and *p*-toluidids, *m.* 160°, 113° and 111°, resp. *p*-phenetidid, *m.* 135°. IV was oxidized by alk. $KMnO_4$ to benzoylcotarninic acid, *m.* 160°, which formed an analyzable Ag salt. The condensation of I with *o*- $O_2NC_6H_4COCl$ gave excellent yields of *o*-nitrobenzoylcotarnine (V), *m.* 138°; oxime, *m.* 193-4°; anil., *m.* 164°. These benzoylated products are insol. in dil. acids, form cryst. mono-oximes sol. in cold alkali which, in turn, give mono-Ac and Bz derivs. insol. in alkali, are oxidized by alk. $KMnO_4$ and condense easily with aromatic amines to form stable anils. The stability of these compds. as well as of the anils and toluidids derived from cotarnomethylphenylurea is in striking contrast with the instability of the corresponding derivs. of I and is attributed to the presence of the mobile imino II atom. The elimination of this active II atom seems to activate the otherwise bound CHO group. Products of condensation of I with compds. contg. an active CH_2 group should be represented either as derivs. of 1- β -*N*-methylaminoethyl-2-benzaldehyde or as substituted *N*-methyltetrahydroisoquinoline derivs. according as to whether I reacts in the aldehyde or carbinal form. Such condensations are usually carried out in the presence of alc., which has been shown to favor the shift from the aldehyde to the carbinal modification. Condensation of 1 g. of I with 0.6 g. of *p*- $H_2NC_6H_4Ac$ in 12 cc. of alc. at 40° for 15 mins. gave 1.2 g. of anhydrotarnino-*p*-aminocetophenone (VI), $C_{11}H_{11}N_2O_4$, *m.* 100-1°; mono-Ac deriv., *m.* 105°, sol. in cold dil. acids, indicating that VI should be regarded as a tetrahydroisoquinoline deriv. formed by the reaction of I in the carbinal form. Condensation of I with $(NH_4)_2CO_3$ oxaloxide, resorcinol mono-Ac ether and 2-nitroresorcinol gave the corresponding anhydrotarninoacetamide, *m.* 182°, phthalimidine, *m.* 147-4°, resorcinol *Me ether*, *m.* 221-2°, and 2-nitroresorcinol, *m.* 201°, as a result of condensation in the carbinal form. Similar condensations with *o*-, *m*- and *p*-cresols and *o*- and *p*-naphthols were tried without success. III. Isomeric biscotarninoacetones. *Ibid.* 430-5.—Reinvestigation of the condensation of cotarnine (I) with Me_2CO has made possible the isolation of both isomeric forms of the product. The condensation of I with Me_2CO contg. Na_2CO_3 gave biscotarninyldiacetone, *m.* 83° (identical with the anhydrotarninoacetone of Liebermann and Kropf (*Ber.* 37, 211 (1904))); HCl salt, *m.* 171°; Bz deriv., *m.* 124°; MeI deriv. (II), *m.* 168° (L. and K. designated this deriv. as anhydrotarninyldiacetone methylate and found the *m.* 144°). Decompos. of II with boiling alkali gave NMe_2 and biscotarnindiacetone. Condensation of II with Me_2CO in the presence of alc., with Na_2CO_3 as condensing agent yields an isomeric product, biscotarninoacetone (III), $C_{11}H_{11}N_2O_4$, *m.* 150-1°; HCl salt, *m.* 167° (decompn.); MeI deriv., *m.* 210°, which is decomposed with alkali to *N*-methylbiscotarninyldiacetone

(*HCl* salt, *m.* 181-2° (decompn.)); MeI deriv., *m.* 168°, identical with II. A cyclic structure is assigned to III and the view that the change from the aldehyde to the carbinal form is brought about by the effect of the solvent is supported by the quant. conversion of the unsatd. compds. *m.* 83°, into III by crystn. from hot alc. This transformation is also brought about in attempts at acetylation and the reaction is explained by the assumption of the formation of an intermediate Ac compd., its hydrolysis and the closure of the isoquinoline ring by migration of the imino-II atom. The proposed mechanism renders intelligible the condensation of I with compds. capable of ketonal tautomerism and others contg. reactive CH_2 groups. In the presence of non-ionizing solvents the condensation takes place with the CHO group but in most cases a shift takes place which produces tetrahydroisoquinoline derivs. Only with Me_2CO is the unsatd. compd. first formed sufficiently stable to permit of its isolation and study. IV. 5-Bromocotarnine, 5-bromocotarnine, 5-bromohydrocotarnine and 5-bromocotarnine and their derivatives. B. B. Dey and T. K. Srinivasan. *Ibid.* 626-30.—A soln. of 5 g. of nitroline (I) in 20 cc. of H_2O contg. 2 cc. of 48% HBr was cooled and treated with satd. Br soln. until the yellowish-white ppt. became permanent. The turbid soln. was satd. with H_2S and the filtered soln. was made basic with NH_4OH , producing 5.6 g. of 5-bromocotarnine (II), $C_{11}H_{11}BrNO_4$, *m.* 176°, $[\alpha]_D^{25} -95^\circ$, HCl salt, *m.* 120°, HBr salt, *m.* 168°, picrate, *m.* 107°; MeI deriv. (III), *m.* 220°, chloroplatinate. Bromination of I in HBr (0.5 g.) gave 0.7 g. of 5-bromocotarnine perbromide- HBr (IV), $C_{11}H_{11}Br_3NO_4$, HBr , *m.* 220° (decompn.), which was reduced completely by H_2S to II. The oxidation of II with HNO_3 gave 5-bromocotarnine (V), $C_{11}H_{11}BrNO_4$, *m.* 175°, HCl salt, *m.* 170° (decompn.), picrate, *m.* 170°, chloroplatinate. This prepn. is preferable to the direct bromination of cotarnine to 5-bromocotarnine perbromide- HBr , $C_{11}H_{11}Br_3NO_4$, HBr , and subsequent reduction with H_2S . On heating under pressure with MeI , V gave 5-bromocotarnomethine methiodide (VI), $C_{11}H_{11}BrNO_4$, *m.* 179°. V forms a Bz deriv., $C_{11}H_{11}BrNO_4$, *m.* 101°, and on treatment with $HONH_2$, HCl and $AcONa$ yielded the oxime- HCl , *m.* 169°, converted by NH_4OH into the free oxime, *m.* 178°. Steam distn. of 2 g. of VI in 20 cc. of 10% NaOH produced 5-bromocotarnone, *m.* 101°, oxidized by $KMnO_4$ in alk. Me_2CO to 5-bromocotarnolactone, $C_{11}H_{11}BrO_4$, *m.* 172°, further oxidized by alk. $KMnO_4$ to 5-bromocotarnic acid, $C_{11}H_{11}BrNO_4$, *m.* 185°; anhydride, *m.* 225°. Treatment of V with PhNCO, H_2NOH , $ONMe$ and Ac_2O gave 5-bromocotarnomethylphenylurea, $C_{11}H_{11}BrNO_4$, *m.* 140°; oxime, *m.* 168°; anhydrotarnocotarnino-nitromethane, $C_{11}H_{11}BrN_2O_4$, *m.* 118° (HCl salt, *m.* 166°); and *N*-acetyl-5-bromocotarnindiacetic acid, $C_{11}H_{11}BrNO_4$, *m.* 211°, resp. The reduction of V with 4% $Na-Hg$ in N HCl yielded 5-bromohydrocotarnine, $C_{11}H_{11}BrNO_4$ (VII), *m.* 80°, HBr salt, *m.* 212°; perbromide- HBr , *m.* 168° (decompn.), which could not be reduced to V but invariably gave unchanged VII on treatment with H_2S . VII was also obtained in good yields by brominating hydrocotarnine in acid soln. by Wright's method (*J. Chem. Soc.* 32, 626 (1877)). Steam distn. of a mixt. of 5 g. of II with 4 g. of *p*- $MeC_6H_4SO_3Me$ and NaOH (*C. A.* 20, 1795) produced 2.7 g. of soft colorless needles of 5-bromocotarnine, $C_{11}H_{11}BrNO_4$, *m.* 193°, HCl salt, *m.* 211°; HBr salt, *m.* 225°; picrate, *m.* 151°; chloroplatinate, *m.* 198° (decompn.); Me ester, *m.* 111°. The position of the Br atom in all these derivs. follows from the conversion of V to 2-methoxy-3,4-methylenedioxy-5-bromophthalic acid. The observation that neither V nor II condenses with $HCHO$, which is known to attack only the free β -position in these bases, supports the argument for the assigning of this position. V. Condensation of cotarnine with aromatic nitro aldehydes. B. B. Dey and P. Kakshini Kantam. *Ibid.* 601-7.—The reaction of cotarnine (I) with 2 mols. of aromatic nitroaldehydes (*C. A.* 18, 2161) has been found to be general. A soln. of 1 g. of I and 1.28 g. of *o*- $O_2NC_6H_4CHO$ in 12 cc. of alc. was warmed to 60° and exposed to direct sunlight for 7-8 hrs., yielding 0.8 g. of cryst. 5-*o*-nitrobenzaldehydyl-1-*o*-nitrobenzoylhydrocotarnine (II),

$C_{10}H_{11}N_7O_8$, m. 153°; *HCl* salt, m. 172° (decompn.); *HBr* salt, m. 177° (decompn.); *nitrate*, m. 181° (decompn.); *sulfate*, m. 191-2° (decompn.); *picrate*, m. 175-6°. II was reduced by $SnCl_4$ in *HCl* to the corresponding amino compd., m. 122° (*di-Ac* deriv., m. 126°), which, on diazotizing, coupled with β - $C_{10}H_7O_2H$ to a deep-red dyestuff. The *m*-nitro deriv. corresponding to II was similarly prep'd., yielding a cryst. material, m. 146° (*HCl* salt, m. 188°), reduced to the *m*-amino compd., m. 113°. I condensed with nitrovanillin *Me* ether to give yellow crystals of 5-(6-nitro-3,4-dimethoxybenzaldehyde)-1-(6-nitro-7,8-dimethoxybenzoyl)hydrocotarnine, $C_{20}H_{19}N_5O_{11}$, m. 168°; *HCl* salt, m. 193° (decompn.). Condensation with 6-nitropiperonal similarly gave 5-(6-nitropiperonyl)-1-(6-nitropiperonyl)hydrocotarnine, m. 168°; *HBr* salt, m. 180° (decompn.). The observation has been made that if position 5 in the cotarnine mol. be blocked, the reaction occurs only with 1 mol. of the nitro aldehyde. Thus 5-bromocotarnine condensed with $O_2NC_6H_4CHO$ and 6 nitropiperonal to give 1-(*o*-nitrobenzoyl)-3-bromohydrocotarnine, $C_{15}H_{13}BrN_2O_4$, m. 120° (*HBr* salt, m. 162° (decompn.)), and 1-(6-nitropiperonyl)-3-bromohydrocotarnine, $C_{15}H_{13}BrN_2O_4$, m. 125° (*HBr* salt, m. 172°). On attempting the condensation of *o*-nitro aldehydes with hydrocotarnine and narcotine in alc. media in exactly the same way, only unchanged materials were recovered.

C. R. Addinall

Phenobarbiturate of papaverine (pavamal). Antonio Mossini and Giovanni Recordati. *Boll. chim. farm.* 74, 638-9 (1935).—Alc. solns of 0.1 *M* phenobarbital and 0.1 *M* papaverine, heated on a water bath for several min. and cooled, give crystals composed of 1 mol. of each substance. This compd. (pavamal) m. 145-6° and is insol. in cold H_2O and ether; it is sol. in hot alc., benzene, petr. ether, $AcOEt$ and in the cold in $CHCl_3$, acetone, and is slightly sol. in hot glycerol, vaseline oil and olive oil.

Helen Lee Gruel

Condensation of cotarnine and *o*-nitrobenzaldehyde. K. N. Kaul and G. S. Ahluwalia. *J. Indian Chem. Soc.* 12, 610 (1935); cf. *C. A.* 27, 4804.—K. and A. desired to correct their formulation of the condensation product and bring it in line with the later formula of Robinson and Robinson (*C. A.* 18, 2161).

C. R. Addinall

Resin acid in the oleoresin of *Pinus sylvestris*. I. P. S. Pishchumka. *J. Gen. Chem.* (U. S. S. R.) 5, 738-51 (1935). II. Product of nitration of resin acid from *Pinus sylvestris*. P. S. Pishchumka. *Ibid.* 752-63; cf. *C. A.* 29, 6038.—Solid or solvated resin acid (I) on heating is isomerized, changing gradually from a strongly l-rotatory to d-rotatory compd. After reaching a max. of $[\alpha]_D^{25}$ 62° the rotation begins to decrease and becomes stable at $[\alpha]_D^{25}$ 8-9°. The isomerizing action of atm. O_2 , if any, is considered purely catalytic. The following reactions of I (and of abietic acid (II)) do not accord with the structural formula of II proposed by Ruzicka (*C. A.* 25, 3657), an easy oxidation by atm. O_2 and resistance to the action of oxidizing agents; the cleavage of 1 C atom as $HCO-H$ by oxidation of I with atm. O_2 as CH_3 on heating with Ni -pumice, and as $MeSH$ on heating with S ; the existence of the tricozone and hexaoxidic of II. The formula III explains satisfactorily all these reactions. An acid of this structure when polymerized (by the action of O_3 , atm. O_2 and probably some other agents) is capable of the conversion into the phenanthrene system with 1 unsatd. side chain (with 3 C atoms):

This formulation does not disagree with the formation of

retene and octahydroretene from II, because these reactions are accompanied by reducing processes which result in the conversion of the unsatd. side chain into the satd. one (iso-Pr). On the basis of this assumption the empirical formula of I (and II) is $C_{19}H_{26}O_2$ and not $C_{19}H_{24}O_2$. The nitration of I, with and without the use of a solvent (ligroin), results in the addn. of the elements of HNO_3 at 1 of the 2 bonds with the formation of hydroxynitrosous acid (hydroxynitrosobietic acid), $C_{19}H_{25}N_2O_4$ ($C_{19}H_{24}O_2 + NO_2 + NO_2 + O_2$), m. 125°, which in the presence of an excess of concd. HNO_3 forms N ethers of the nitro acids. The nitro ether absorbs from air 1 mol. of O_2 (probably at the other double bond, since the 3rd one is generally considered as a passive one), giving an amorphous peroxide compd. (I with HNO_3 is probably first converted into II). These peroxides act as dibasic acids, giving stable, H_2O -sol. red salts of NH_4 , alkalis and all-earth metals. Evidently the nitrate ether of the nitro acid is isomerized by the action of inorg. bases into a dibasic pseudonitro acid (the acid groups CO_2H and NO_2H). The nitro product adsorbs energetically some gases and vapors (HCl , Et_2O , CS_2 , C_6H_6 , etc.), which can be explained by its amorphous state.

Chas. Blanc

The original acids in American pine resins. Kurt Kraft. *Ann.* 520, 133-43 (1935).—Sapinic acid obtained from the resin of *Pinus polastris* which was collected during the summer has $[\alpha]_D^{25}$ -70°, while the common acid has $[\alpha]_D^{25}$ -123°. Hydrogenation of the former yields 20% of dehydro-d-pimelic acid. Rearrangement of the sapinic acid by boiling with $AcOH$ gives 80% of abietic acid, the remainder being d-pimelic acid. Ozonization expts. confirmed these results. The sapinic acid mixt. with $[\alpha]_D^{25}$ -110° to -130° obtained from resin collected during the spring could be sep'd. by repeated crys. on a l-pimelic acid, $[\alpha]_D^{25}$ -280.4°, and a d-acid, $[\alpha]_D^{25}$ 52.9°.

C. J. West

Constitution of mataresinol. L. H. Briggs, D. A. Peak and J. L. D. Woolloxall. *J. Proc. Roy. Soc. N. S. Wales* 69, 61-7 (reprint) (1935).—Mataresinol, $C_{19}H_{26}O_2$ (I), occurs in the heart shakes of the wood of *Podocarpus spicatus* as a resinous or cryst. deposit. Recryst. from $EtOH$ yields a product contg. alc. of crysln, m. 78°. Recryst. from 60% $AcOH$ yields large, anhyd rhombic crystals of I, m. 119°. I in $AcOH$ in the presence of Pd -nortite did not absorb H_2 . I dissolved in just enough 5% $NaOH$ soln. and then treated with 1.3 $AcOH$ until faintly acid, yielded hexagonal plates of mataresinic acid, $C_{19}H_{24}O_4$, m. 78-81°. Dibenzoylmataresinol, prep'd. by shaking together 5 g. I, 7 mols. $NaOH$ and 5 mols. $BzCl$, m. 134.5°, and was ppt'd. from alk. soln. with the lactone group intact. Dimethylmataresinol (II) was prep'd. by shaking together 1 g. I dissolved in 25 cc. 10% $NaOH$ and 5.3 g. Me_2SO , and finally heating the mixt. for 5 mins. at 100°. Acidification of the cooled mixt. with HCl produced a sticky ppt., m. 126.5-7°, after 3 recrystns. from $EtOH$. The product was a lactone, neutral to litmus, and produced no color with $FeCl_3$ or concd. H_2SO_4 . Neutralization of a soln. of II in excess $NaOH$ yielded a colorless, cryst. ppt. of dimethylmataresinic acid, m. 80-4° due to lactone formation. The ester could not be prep'd. The slow addn. of 120 cc. 3% $KMnO_4$ to a soln. contg. 1 g. II in 20 cc. 1% $NaOH$ yielded, after satn. of the mixt. with SO_2 , 0.51 g. (over 50%) of clusters of homogeneous needles of veratric acid, m. 173.5-4.5°. No trace of veratroylformic acid was detected. Gradual addn. of 1.77 g. Br in 35 cc. $CHCl_3$ to 2 g. of I in 20 cc. $CHCl_3$ produced, after 36 hrs., a nearly theoretical yield of tetra bromomataresinol, m. 169-9.5° (from $CHCl_3$) or 171° (from $EtOH$). The foregoing chem. evidence supported by phytochem. considerations indicates that I may be formulated as $RCH_2CH(CH_2CH_2)CH_2CO_2CO$ ($R =$

4,3-HO(MeO) C_6H_3). The C skeleton of I is the same as that of guaretic acid, olivil, podophyllotoxin, and probably pinoresinol.

W. A. LaLande, Jr.

Synthesis of tetrahydroharman (4-carbolone) derivatives under physiological conditions. II. G. Hahn, L. Borkwardt, O. Schales and H. Werner. *Ann.* 520, 107-2.

(1935); cf. *C. A.* 29, 1820'.—Tryptamine-HCl (I) (0.190 g.) and 1.2 g. homopiperonal in 8 cc. H_2O and 4 cc. acetate buffer (pH 5.2) at 23° give, after 8 days, 5% (15% with a phosphate buffer of pH 6.2) of 3-(3,4-methylenedioxybenzyl)-3,4,5,6-tetrahydro-4-carboline (II), m. 107°, *HCl* salt, decomp. 273°. I and 3,4,5-(MeO) $_3$ C $_6$ H $_2$ CHO at pH 6.2 for 10 days at 25° give 16% of the 3,4,5-trimethoxybenzyl analog, m. 84°; the yield is 20% at pH 3.8 and 6% at pH 4.6. I and BuH at pH 5.2 give after 3 weeks at 25° 48% of the 3-Ph analog, m. 168-68° (*HCl* salt, m. 253° (decompn.)). *o*- and *p*-HO-C $_6$ H $_4$ CHO, piperonal, vanillin and citral do not react; AcCHO is oxidized to the acid, AcCO $_2$ H; furfural gives 10% of a compd., m. 122°. I and AcCO $_2$ H at pH 3.4, 4.6, 5.2 and 6.2 give, resp., 47, 50, 67 and 93% yields (in 2 days) of 3-methyl-3,4,5,6-tetrahydro-4-carboline-3-carboxylic acid (III), decomp. 220°; Me ester, m. 138° (*HCl* salt, decomp. 268°). PhCl $_3$ /COCO $_2$ H and I at 25° and pH 3.8, 4.6, 5.2 and 6.2 give, resp., 74, 32, 18.5 and 0.6% (after 13 days) (50, 19, 11 and 49.5% after 7 days) of the 3-benzyl analog, decomp. 253° (CO $_2$ evolution), attempts to prep the Me ester with MeOH and HCl resulted in the splitting off of CO $_2$. 3-(3,4-Methylenedioxybenzyl) analog, decomp. 250°, results in 59, 61 and 63.6% yields (after 7 days) at pH 4.6, 5.3 and 6.2. MeOH-HCl gives II 3-(3-Alethoxy-4-hydroxybenzyl) analog of III, decomp. 230-40°, results in 49.3, 39.9 and 58.8% yield (after 15 days) at pH 4.2, 4.9 and 6.2. MeOH-HCl gives 65.9% of the 3-(3-methoxy-4-hydroxybenzyl) analog of II, as the *HCl* salt, decomp. 252-4°. 3-(3,4-Dimethoxybenzyl) analog of III, decomp. 230-2°, yield after 15 days, 49.4, 32.5 and 44.4% at pH 4.2, 4.9 and 6.2. The 3-(3,4-dimethoxybenzyl) analog of II, as the *HCl* salt, decomp. 230° (about 50% yield) 3-(3,4,5-Trimethoxybenzyl) analog of III, decomp. 191°, yields after 11 days at pH 4.4, 5.3 and 6.2 are 32.2, 43.1 and 35.5%. The 3-(3,4,5-trimethoxybenzyl) analog of II, m. 85° (73% yield). The azlactone from vanillin and hippuric acid, refluxed with 20% NaOH for 6 hrs., give 43% of 3-methoxy-4-hydroxyphenylpyruvic acid, m. 161°. III Syntheses of yohimbine skeleton: Georg Hahn and Heinrich Werner. *Ibid.* 123-33.—*m*-Hydroxyphenylpyruvic acid, decomp. 165°, results in 33.7% yield from the azlactone of *m*-HO-C $_6$ H $_4$ CHO and hippuric acid. With tryptamine-HCl this gives in 10 days at pH 4.2 and 25° 87.4% of 3-(*m*-hydroxybenzyl)-3,4,5,6-tetrahydro-4-carboline-3-carboxylic acid (I), m. 225-7° (decompn.); MeOH-HCl gives 87.6% of 3-(*m*-hydroxybenzyl)-3,4,5,6-tetrahydro-4-carboline (II), whose *HCl* salt decomposes 245-5°; *HCl*HO at pH 4.4 gives 87.8% of the 3-hydroxy-6-hydroxyphenylbenzyl analog, whose *HCl* salt decomposes 283-5°; pptn. of the hot aq. soln. of this salt with Na $_2$ CO $_3$ gives 88.3% of a hexahydro-yohimbol, C $_{21}$ H $_{21}$ N $_2$ O $_2$, decomp. 267-8°; this also results from the cold soln. with NH $_4$ OH or with a buffered soln. of pH 8. The *p*-HO isomer of I decomposes 240-1°; in the light the yield is 74% after 10 days at 25° and pH 4.2; the yield is decreased in diffused daylight. The *p*-HO isomer of II (*HCl* salt) decomposes 246-7° (63.5% yield).

C. J. West

Constitution of aromatic transformation products of picrotoxin. Karl Tetweiler and Irmgard Drilhaus. *Ann.* 520, 163-84 (1935); cf. Mercer, Robertson and Cahn, *C. A.* 29, 6003'.—The lactone acid (I) from picrotoxin with alk. KMnO $_4$ gives the acid (II), m. 194° (decompn.); the KOH melt yields Me $_2$ CO, (CO $_2$ H), and *m*-Cl $_2$ (CO $_2$ H) $_2$. Acid KMnO $_4$ with I gives the acid (III), m. 284°, which with KOH yields 1,2,3-C $_6$ H $_3$ (CO $_2$ H) $_3$ and on heating with Naturkupper C in quinoline for 1 hr. yields dimethylphthalide. I and KOH give 2,6-(HO-C $_6$ H $_4$)(CH $_3$) $_2$ CO $_2$ H, oxidized by alk. KMnO $_4$ to 2,6-(HO-C $_6$ H $_4$) $_2$ CO $_2$ H, m. 235° (decompn.). Distn. of I with Ac $_2$ O gives IV, m. 154° (semicarbazone, m. 315° (decompn.)). The distn. of 2,6-Me $_2$ (HO-C $_6$ H $_4$)(CH $_3$) $_2$ CO $_2$ H (V) with Ac $_2$ O yields 5-keto-1-methyl-5,6,7,8-tetrahydronaphthalene, m. 63° (semicarbazone, m. 242° (decompn.)); *p*-nitrophenylhydrazide, red, m. 203° (decompn.); the same compd. results by the dry distn. of the Ca salt of V. The isomeric deriv. of picrotoxin ketone is rearranged by SOCl $_2$ to the nitride (VI), m. 208°,

which is hydrolyzed to the acid (VII), m. 149°, and in the KOH melt yields *o*-MeC $_6$ H $_4$ (CO $_2$ H) $_2$. VII with KMnO $_4$ yields III. Picrotin ketol (VIII) with HCl in AcOH yields an α -Cl ketone (IX), also formed from picrotoxin ketone and HOCl. The action of KOH upon VIII or IX yields the same di-Me deriv. of dimethylphthalide, oxidized by KMnO $_4$ to III.

A new reaction of lignin and vanillin. Pierre Fourment and Henry Roques. *Bull. sci. pharm.* 41, 449-51 (1935).—Vanillin gives with diphenylenediamine in AcOH a red color which disappears after a few sec. The color remains stable when the vanillin is covered with liquid petrolatum and shaken with diphenylenediamine acetate. It is supposed that the color produced by the latter substance with lignin is caused by the presence of a vanillin nucleus in wood.

A. E. Meyer

Chemistry of jute lignin. VII. Behavior of organic compounds toward ClO $_2$ and its significance on the constitution of lignin. Pulin Behari Sarkar. *J. Indian Chem. Soc.* 12, 470-5 (1933); cf. *C. A.* 29, 5852'.—ClO $_2$ (I) was prep. by warming an intimate mixt. of (CO $_2$ H) $_2$ (20 g.) and KClO $_4$ (25 g.) with 80 cc. of dil. H $_2$ SO $_4$ (100 cc. H $_2$ SO $_4$, 225 cc. H $_2$ O) in an all-glass app. and absorbing the gas in H $_2$ O. The soln. was dild. to 0.25 N and was preserved in a dark bottle with a gas-tight ground-glass stopper. By shaking 10 cc. of I with 0.5 g. of the finely divided material and titrating after 12-48 hrs., the action of I on a large no. of org. compds. has been tried. All phenolic compds. are readily oxidized and, although not resistant, MeO and AcO derivs. are more stable. Since lignin contains more than 1 MeO group attached to the benzene ring, its reactivity with I does not prove the presence of a free phenolic OH group in the mol. Cl-, Br- and NO $_2$ -substituted phenols are more resistant to the attack of I and it is inferred that these groups enter the benzene ring in lignin since chloro-, bromo- and nitro-lignin behave similarly. The methylenedioxy group is stable toward I, as are also CO $_2$ H groups attached directly to the ring. I oxidizes side chains to CO $_2$ H groups. From the behavior of methylated or acetylated aliphatic compds. and that of delignified jute it is concluded that jute-pectin is aliphatic in nature. Small amts. of chlorolignin (II) are formed by the action of I on lignin and II is evidently responsible for the slight yellow color of the delignified fiber. II prep. by the action of I is identical with that obtained in the usual way by the use of Cl $_2$. VIII. Methylation of lignin. Pulin Behari Sarkar. *Ibid.* 542-6.—Jute-lignin (I), sep. in the ordinary way, was methylated with Me $_2$ SO and KOH by Urban's method (*C. A.* 20, 3080) at 20-25°, the amt. of KOH being increased 3-fold to facilitate stirring. The highest MeO value that could be reached (35-6%) was not in any simple ratio with its

original MeO content, reckoning 830 as the mol. wt. of I. Lignin (II), isolated at low temps. (C. A. 28, 75219), gave a const. final MeO value (34.51%), an increase of 5 added OMe groups over the 5 groups actually found in II. As the reducing lignin no longer reduces Fehling soln. after methylation it is concluded that I contains no CHO group. This corroborates the finding that the reducing action is due to 2 OH groups in the *o*-position in the benzene ring, formed as a result of the cleavage of the $-\text{OCH}_2\text{O}-$ group and the splitting-out of HCHO. From the temp. at which MeI first appears in the Zeisel esters, it is inferred that the OMe groups are linked to the benzene ring in natural lignin. All the MeO groups in I are of the ether type as are also those entering the mol. on methylation. Methylated II was oxidized with 5 N HNO₃ (C. A. 27, 4779) but no asinic acid could be detected in the product, which contained a small amt. of (CO₂H). The tarry mass obtained after methylation could not be purified without recourse to boiling with alkali and thus no information regarding the CO₂H group could be obtained. IX. Acetylation of lignin. Pulin Behari Sarkar. *Ibid.* 547-51. —To confirm the results obtained by the methylation of jute lignin (I) samples prepd. in the usual way and by the modified method have been acetylated by heating 2 g. of very finely powd. I (dried at 105°) on a water bath for 2-3 hrs. with 25 cc. of a mixt. of Ac₂O (12 cc.) and pyridine (88 cc.) and, after washing and drying the product at 105°, repeating the acetylation process. The highest AcOH content found was 26.45% (calcd. 28.83%), corresponding to 5 OH groups, a result in good agreement with methylation data. As the acetylated lignin (II) has no longer a reducing action and does not absorb II in the presence of metallic Pd, it has no CHO group or ethylene linkage. The slight absorption of IBr or ICl by I does not prove the presence of a double bond in the side chain. After the expulsion of HCHO from I the black product was treated with Me₂CO in the presence of P₂O₅ below 10°. The light gray material was no longer sol. in dil. NaOH and is probably a cyclic compd. (C. A. 27, 3457). The formation of this Me₂CO addn. compd. proves the presence of 2 OH groups in the *o*-position formed by the cleavage of the $-\text{OCH}_2\text{O}-$ group present in lignin. C. R. Addinall

Aldol condensations III. Synthesis of carotenoid chains by condensation with 3-methyl 2-buten-1-ol F. G. Fischer and K. Hultsch. *Ber.* 68B, 1726-34 (1935); cf. C. A. 29, 1386. —Any attempt at synthesis of the typical carotenoid chain must provide for the branched Me group and the necessary conjugated linkages. It seemed that Me₃C CHCHO (I) was adapted to this type of synthesis through a linear condensation. Under the influence of weak alkali in aq. soln. the Me group of I mol. reacts with the CO group of a 2nd mol. to give dehydrocitra (II), b. 81-4°, which could only be recovered from the reaction mixt. by conversion into tetrahydrocitra and its semicarbazone, m. 223°. In the presence of NaNH₂, Et₂O solns. of I undergo a diene synthesis and yield 2,2,4-trimethyl-4,6-cyclohexadienal, b. 85-6°; semicarbazone, m. 213°. Under definite conditions (to be published) the linear condensation of I takes place smoothly with satisfactory yields of II and 3,7,11-trimethyl-2,4,6,8,10-dodecapental (III), formed from 3 mols. of I. The direct distn. in the absence of air of the reaction product from 70 g. of I gave 23 g. of distillable condensate which, in turn, was fractionally distd. to give 5 fractions. Fraction 1 consisted mainly of the above-mentioned cyclic aldehyde. The repeated distn. of fractions 2 and 3 yielded II, C₁₀H₁₆O, m. 40.5-41°; oxime, m. 123°; phenylhydrazone, m. 141-2°; *p*-nitrophenylhydrazone, m. 103-4°. II was oxidized by Ag₂O to dehydrogeranic acid, m. 187°. The *O*-sensitive II contained in fraction 3 was reduced with (iso-PrO)₂Al and iso-PrOH, according to the procedure of Ponnoroff (C. A. 20, 1611), to the corresponding unsatd. alc., 3,7-dimethyl 2,4,6-octatrienol, C₁₀H₁₈O, m. 46-7°. Fraction 4 contained a monocyclic C₁₀-aldehyde, b. 130° in *vacuo*, which could not be crystd. Fraction 5 yielded golden yellow prismatic needles of III (larnesinal), C₁₅H₂₄O, m. 120-1°; oxime, m. 192° (de-

compn.); semicarbazone, m. 236° (decompn.). A Ponnoroff reduction of III yielded farnesinol, 3,7,11-trimethyl-2,4,6,8,10-dodecapentenol, C₁₅H₂₆O, m. 136-7°, whose reaction with SbCl₅ in CHCl₃ is extremely sensitive, yielding an intense blue color, in shade very like that of vitamin A. Coloring matters of Acanthodiptomus yamanacensis Brehm. Harusada Sugimoto, Kiyoshi Ueno and Sigeto Watanabe. *J. Chem. Soc. Japan* 56, 1199-1204 (1935). —Ascarin (I), β -carotene (II) and a new pigment (III) were isolated. I was also found in *Combroses japonicus* Haan II and III were found in free or in combination with wax. K. Kitsuta

Chemical interrelationships in the cholane group. H. Jensen. *J. Chem. Education* 12, 559-64 (1935). —A review. E. H.

Bromination of 3-ketobisnorcholanic acid and 3-ketobisnorcholanic acid, 3-ketobisnor-4-cholanic acid and 3-ketobisnorcholalo-1-cholanic acid Adolf Butenandt and Luigi Mamoli. *Ber.* 68B, 1854-9 (1935); cf. C. A. 29, 1469. —Bromination of pregnanedione takes place at C atom 4 and the Br atom is easily removed as HBr whereas the Br atom which enters at C atom 2 in allopregnanedione is eliminated with difficulty. The behavior of other members of the normal (cis) and allo (trans) series of 3-hydroxysterol derivatives is being investigated to det. whether a general fundamental law governs substitution in these structural isomers, and the bromination of 3-hydroxybisnorcholanic acid (I) and 3-hydroxybisnorcholanic acid (II) is described. A suspension of 5 g. of 3-hydroxybisnorcholanic acid, prepd. from stigmasterol (C. A. 29, 1831), in 50 cc. AcOH was treated with 25 cc. of Br in AcOH (contg. 1 mol. Br calcd. on the cholanic acid) and the clear soln. of the dibromide was oxidized with CrO₃ in AcOH over a period of 16 hrs. at 20°. The clear reaction mixt. was extd. with Et₂O, the ext. was taken up in 100 cc. AcOH, heated for 10 min. with 5 g. of Zn dust, pptd. with H₂O and shaken out with Et₂O. The evapd. residue was crystd. from AcOH and gave large prisms of 3-ketobisnor-4-cholanic acid (III), C₂₇H₄₆O₂, m. 268° (decompn.), [α]_D²⁰ 60° (in CHCl₃), showing an absorption max. at 240 mμ, and reduced catalytically in the presence of Pd black to 3-ketobisnorcholanic acid (IV), C₂₇H₄₆O, m. 184°, [α]_D²⁰ 4.55° (in CHCl₃), and 3-ketobisnorcholanic acid (V), m. 244° (C. A. 29, 1831). The bromination of 500 mg. of IV in 10 cc. AcOH with 10 drops of HBr in AcOH and 0.75 cc. of Br in AcOH (0.9 mol. Br) gave 487 mg. of crude cryst. material from which 125 mg. of pure 4-bromo-3-ketobisnorcholanic acid, m. 221°, was recovered. Cleavage of 110 mg. of VI by heating with anhyd. pyridine for 13 hrs. gave 38 mg. of III. The bromination of V yielded needles of 2-bromo-3-ketobisnorcholanic acid, m. 230° (decompn.), which, on heating with a 21% soln. of AcOK in AcOH for 5 hrs. at 175-83°, cleaved with difficulty to give a poor yield of 3-ketobisnorcholanic acid, m. 235° (decompn.), with an absorption max. at 240 mμ. Although III is so similar to progesterone it shows no physiol. activity either in the Clauberg test (25 mg.) or in the capon-comb test (6 mg.), a result which again demonstrates the highly specific nature of the corpus luteum effect. The behavior of IV and its allo isomer V toward bromination and cleavage of the resulting products is identical with that noted with pregnanedione and its allomer. Similar results have been previously noted, particularly in the bromination of dehydrocholanic acid (C. A. 29, 1411) and the chlorination of *trans*- β -decalone (C. A. 25, 2151). A parallel to this behavior of stereoisomers is found in the oxidative cleavage of the ring of the cis-steroids between the 3- and 4-positions whereas the *trans*-dehydrocholesterols rupture between the 2- and 3-C atoms. C. R. Addinall

Allo-1-pregnene-3,20-dione, a further contribution to the specificity of corpus luteum activity. Adolf Butenandt and Luigi Mamoli. *Ber.* 68B, 1850-4 (1935); cf. C. A. 29, 1469. —A soln. of 850 mg. of allopregnanedione (I) (C. A. 28, 6893) in 32 cc. of AcOH was treated, at 29°, with 10 drops of AcOH-HBr and 1.27 cc. of a Br-AcOH soln. contg. 1 mol. of Br (reckoned on I). The ppt.

formed on the addn. of H_2O crystd. from alc. and dil. Me_2CO to give 660 mg. of needles of a brominated compd (II), $C_{27}H_{44}BrO_2$, m. 199° (decompn.), which was stable to heating for 3 hrs. with $AgOAc$ in $AcOH$ and to the action of 10% $NaOH$ on its benzene soln. at 20°. By heating with $BzOK$ in $BzOH$ at 205°, II was converted into 2-hydroxyprogesterone-3,20-dione benzoate, m. 235°. On heating 150 mg. of II with 5 cc. of 21% $AcOK$ in $AcOH$ for 5 hrs. at 175–85°, treating the product with H_2O and shaking out with Et_2O , a neutral product was obtained. Sublimation at 0.001 mm. Hg and 80° gave 13 mg. of *allo-1-pregnene-3,20-dione* (III), $C_{27}H_{44}O_2$, m. 140°, $[\alpha]_D^{25}$ 68° (in alc.). III shows the absorption in the ultraviolet at 235 m μ characteristic for α,β -unsaturated ketones. The behavior of II shows that, contrary to the course of the bromination of pregnanedione (C. A. 29, 1754), the Br atom has, in all probability, entered the 2-position. III is not identical with progesterone but is an isomer, differing only in the position of a double bond in conjugation with the CO group. It is physiologically inactive, a further proof of the extreme specificity of the action of the corpus luteum.

An isomeric *allopregnan-3-ol-20-one*. Adolf Butenandt and Luigi Mamoli. *Ber.* 68B, 1847–50 (1935); cf. C. A. 29, 1469°.—Corpus luteum exts. contain progesterone and its tetrahydro deriv., *allopregnan-3-ol-20-one* (I), $C_{27}H_{46}O_2$, m. 194°, $[\alpha]_D^{25}$ 90.8°, acetate (II), m. 144.5°. The addn. of H_2O to a product formed by heating 3.6 g. of I with 5% KOH in $MeOH$ for 1 hr. gave 2 g. of I and 1 g. of crude material which on fractional sublimation at 0.001 mm. Hg yielded 0.5 g. of cryst. *isoolopregnanolone* (III), m. 148°, $[\alpha]_D^{25}$ 6.05 (in alc.). Similarly, by heating 245 mg. of I with 5% KOH in $MeOH$ for 2 hrs. and acidifying the product, 163 mg. of I and 63 mg. of III were isolated. III forms an acetate (IV), m. 101°, which on sapon. as above liberates 50% of I and 27% of III. The CrO_3 oxidation of I produced *allopregnanedione* (V) (C. A. 28, 6803), m. 200.5°, $[\alpha]_D^{25}$ 126.9°, whereas that of III under the same conditions gave *isoolopregnanedione* (VI), m. 134–5°, $[\alpha]_D^{25}$ –14.56°, together with a small amt. of the normal dione. Both I and III gave immediately difficulty sol. addn. compds. with digitonin. In the presence of alkali there seems to be an equil. between the forms I and III which favors the former. The isomerism can only reside in the stereochem. arrangement around the 17-C atom at which a tertiary H atom is adjacent to a CO group. A similar isomerism must be present in pregnanedione and progesterone, the other known types of the progesterone series. I and III correspond to cholesterol and stigmasterol in the location of a OH group on the 3-C atom. Thus the formation of digitonin addn. compds. was predictable. However, II and V (but not IV and VI) also gave addn. compds. on standing for 2–4 hrs. after the addn. of the reagent. Consequently the generally valid conception that the presence of a free OH group in the 3-C position presupposes the formation of a difficulty sol. digitonide must be modified within the above limitation.

C. R. Addinall

Systematic degradation of 3-hydroxyallocholic acid to androsterone. O. Dalmer, F. v. Werder, H. Honigsmann and K. Heyns. *Ber.* 68B, 1814–25 (1935).—A systematic degradation of the side-chain of 3-hydroxycholehanic acid (I) has been successfully carried out and, since I can be obtained from hydoxycholeic acid, this method is the first devised for the transformation of a natural bile acid into androsterone (II). A soln. of 3.8 g. of the *Me* ester of I (C. A. 19, 2818) in 160 cc. of abs. Et_2O was run into a Grignard reagent consisting of 3 g. Mg and 23 g. $PhBr$ in 70 cc. abs. Et_2O . After 3 hrs. refluxing, the mixt. was evapd. and the residue was heated for 2 hrs. at 100°. The product was decompd. with cold dil. H_2SO_4 and freed from Ph by steam distn. The unchanged ester was sapond. and the carbinol was extd. with Et_2O . The ext. was worked up and yielded 5 g. of crude material which on recrystn. from cyclohexane gave (3-hydroxynerallocholic)-diphenyl carbinol (III), $C_{27}H_{46}O_2$, m. 150°, $[\alpha]_D^{25}$ 20° (in abs. alc.). To avoid ring cleavage in the process of shortening the chain, the 3-OH group was blocked by

acetylation. A mixt. of 50 g. of III in 15 cc. of Ac_2O was heated for 30 min. and the residue after vacuum distn. was dissolved in 100 cc. of $AcOH$. The soln. was heated to 100° and a soln. of 5 g. of CrO_3 in 5 cc. H_2O and 50 cc. $AcOH$ was introduced, with continuous stirring over a period of 1.25 hrs. The soln. was stirred for 2 more hrs. and after distn. was shaken out with H_2O and Et_2O . The washed Et_2O layer was shaken out with 10% KOH and the insol salt formed was centrifuged. The salt was decompd. with H_2SO_4 in the presence of Et_2O and the evapd. ext. gave 2.2 g. of 3-acetoxynerallocholic acid (IV), $C_{27}H_{44}O_4$, m. 235°, $[\alpha]_D^{25}$ 26° (in $CHCl_3$); *Me* ester (V), m. 189–90°, $[\alpha]_D^{25}$ 26°. Treatment of IV with alc. KOH produced 3-hydroxynerallocholic acid (VI), m. 205–7°, $[\alpha]_D^{25}$ 21° (in abs. alc.), *Me* ester, m. 169–70°, $[\alpha]_D^{25}$ 21° (in $CHCl_3$). A soln. of 18 g. of V in 350 cc. abs. Et_2O and 150 cc. benzene was poured into a Grignard reagent prepd. from 15.9 g. Mg and 103 g. $PhBr$ in 300 cc. abs. Et_2O . A processing analogous to that for III gave 1 g. of VI (after 8 hrs. sapon.) and 27 g. of a yellow resinous (3-hydroxynerallocholic)-diphenyl carbinol, which was acetylated. The product was dissolved in 500 cc. $AcOH$, and, after the introduction of 30 g. of CrO_3 in 200 cc. H_2O and 150 cc. $AcOH$ at 100–105° with stirring over a period of 3 hrs., and a further 5 hrs. stirring of the reaction mixt., gave, on working up through the K salt, 7.8 g. of 3-acetoxynerallocholic acid (VII), $C_{27}H_{44}O_4$, m. 225–7°, $[\alpha]_D^{25}$ 2° (in $CHCl_3$); *Me* ester (VIII), m. 128–9°, $[\alpha]_D^{25}$ 10°; 3-hydroxynerallocholic acid, m. 220°, $[\alpha]_D^{25}$ 17°, *Me* ester, m. 162–3°, $[\alpha]_D^{25}$ 12°. By the action of a Grignard reagent contg. 8.5 g. Mg and 55 g. of $PhBr$ in 200 cc. abs. Et_2O on a soln. of 8.6 g. of VIII in 150 cc. abs. Et_2O and 150 cc. benzene, a yield of 12.2 g. of (3-hydroxynerallocholic)-diphenyl carbinol was obtained. The acetate was oxidized with CrO_3 in $AcOH$ to 1.5 g. (19.5%) of 3-acetoxyisovallocholic acid, converted by CH_3MgI in $MeOH$ to the *Me* ester (IX), m. 201–2°, $[\alpha]_D^{25}$ 56° (in $CHCl_3$). Treatment of IX with $PhMgBr$ gave 1.8 g. of carbinol which was heated in an evacuated retort at 1 mm. to 150° until H_2O ceased to be evolved. The temp. was then slowly raised to 200°. Distn. at 0.0001 mm. and 260° gave 1.1 g. of distillate which was acetylated. The evapd. product was dissolved in $CHCl_3$ and satd. with O_3 for 25 min. at 0°. The $CHCl_3$ -free product was heated with 50 cc. $AcOH$ for 1 hr. at 95° and, after removal of the $AcOH$ in *vacuo*, was taken up in Et_2O and freed from acid substances by a 5-fold shaking with 2 N KOH . The evapd. ext. gave 1 g. of neutral material which on heating with semicarbazide acetate for 8 hrs. yielded 3-epiacetoxynerallocholan-17-one semicarbazone (X), $C_{27}H_{44}N_2O_4$, m. 272–3° (decompn.), which on hydrolysis with alc. H_2SO_4 and recrystn. of the product from cyclohexane gave androsterone, m. 179–80°, $[\alpha]_D^{25}$ 94°, showing in 150–200 daily doses the cock's comb reaction of Butenandt. X was also recovered from the collected neutral oxidation products of the degradation. The hydrogenation of 83 g. of sitostanone (C. A. 13, 130) in 2 l. of $AcOH$ in the presence of 30 cc. of 48% HBr and 4 g. of PtO_2 at 60° gave, on sapon., 58 g. of the previously unknown satd. sterol, *epistostanol*, $C_{27}H_{48}O$, m. 203°, $[\alpha]_D^{25}$ 26° (in $CHCl_3$); acetate (XI), m. 88°, $[\alpha]_D^{25}$ 28°. The oxidation of XI with CrO_3 in $AcOH$ and *conca* in *vacuo* gave a product which was taken up in Et_2O . The ext. was shaken out with 2 N $NaOH$ and the insol salt was centrifuged from the Et_2O soln. of the neutral oxidation product (XII). The salt was decompd. with dil. H_2SO_4 and the free acid was converted into V. The evapd. residue from XII was taken up in $MeOH$ and after recrystn. of 11.8 g. of XI and filtering, the soln. was evapd., steam-distd., extd. with Et_2O , evapd. and taken up in alc. Refluxing with semicarbazide acetate gave X, hydrolyzed to androsterone. CrO_3 oxidation of 35 g. of stigmasterol at 55° gave colorless leaflets of *stigmasterone hydrate* (XIII), $C_{27}H_{46}O_2.H_2O$, m. 81–2°, $[\alpha]_D^{25}$ 23° (in $CHCl_3$) (*oxime*, m. 219°, $[\alpha]_D^{25}$ 30°), converted by treatment with $BzCl$ in pyridine into the H_2O -free ketone (XIV), m. 157°, $[\alpha]_D^{25}$ 42°. The catalytic hydrogenation of XIV in a manner similar to that of sitostanone gave *epistigmasteranol*, m. 200°, $[\alpha]_D^{25}$ 25°; acetate, m. 85°, $[\alpha]_D^{25}$

27°, oxidized to a free acid from which V was isolated. The neutral oxidation product yielded, on treatment with semicarbazide acetate, X, m. 273°. The oxidation of 120 g. of epicholesterol acetate (C. A. 29, 810¹) gave 12 g. of I, m. 209°, [α]_D²⁵ 29°; Me ester, m. 164-5° (acetate, m. 147-8°, [α]_D²⁵ 21°).

C. R. Addinall

A comparison between sitostanol and stigmasterol. B. E. Bengtsson. *Z. physiol. Chem.* 237, 46-51 (1935) — On the basis of m. p., mixed m. p. and optical rotation of their various derivs., sitostanol and stigmasterol are believed to be identical. Close agreement is shown in the acetates, benzoates and *m*-dimethylbenzoates of the 2 hydrogenated sterols, in the ketones sitostanone and stigmasterone, and in the hydrocarbons sitostane and stigmasterane. The slight differences decrease in the order alc., ketone, hydrocarbon, due to progressive removal of minimal impurities. Corresponding mixts with cholesterol and cholestane, on the contrary, showed decrease of lowering of m. p.

A. W. Dox

Actinasterol, a new sterol of the animal kingdom. E. Klenk and W. Diebold. *Z. physiol. Chem.* 236, 141-4 (1935) — Extrn. of the sea anemone (*Anemone sulcata*), collected in the Bay of Naples, with MeAc and Et₂O yielded an oil which on cooling to 0° deposited crystals of a new sterol, actinasterol, C₂₇H₄₆O, m. 145-6°, [α]_D²⁵ -42.5°. The substance has the same m. p. as cholesterol but its acetate m. 12° higher than cholesterol acetate, and it contains an addnl double bond. Actinasterol acetate, m. 126-6.5°, was obtained by esterification with Ac₂O at 100°. Hydrogenation of this with PtO₂ yielded tetrahydroactinasterol acetate, m. 120°, from which tetrahydroactinasterol, m. 139-40°, was obtained by sapon.

Sex hormones VII. Synthetic preparation of the testicular hormone, testosterone (androsten-3-on-17-ol). L. Ruzicka and A. Wettstein. *Helv. Chim. Acta* 18, 1264-75 (1935), cf. C. A. 29, 6988¹. —trans-Dehydroandrosterone, reduced with Na and PrOH or H and Ni in EtOH, gave Δ⁴-trans-androstene-3,17-diol (II), m. 182-3°. Δ⁴-Acetoxyandrosten-17-one, hydrogenated over Ni, gave Δ⁴-3-acetoxyandrosten-17-ol, m. 147-8°. I, heated with Ac₂O, gave Δ⁴-trans-androstene-3,17-diol diacetate (III), m. 165-6°. II on sapon, with KOH in MeOH gave Δ⁴-17-acetoxyandrosten-3-ol (III), m. 148.5-8.5°. III, brominated, oxidized and then debrominated, gave Δ⁴-17-acetoxyandrosten-3-one (IV), m. 139-41°. IV on sapon gave Δ⁴-17-hydroxyandrosten-3-one, m. 154.5-5.5°; oxime, m. 222-3°. III has a much greater physiol. activity than androstene-3,17-dione (V), androsterone (VI) and trans-dehydroandrosterone (VII). 10 γ of III had a greater activity than 50, 200 and 500 γ of V, VI and VII, resp.

Julius White

Sex hormones and related substances V. The preparation of epidihydrocholesterol and its oxidation to 3-epidihydrocholesterol-17-one (androsterone). Wilhelm Dürschel. *Z. physiol. Chem.* 237, 52-6 (1935); cf. C. A. 29, 8079¹. —Dihydrocholesterol (I), m. 145-6°, [α]_D²⁵ 22° (in CHCl₃), was prep. by sapon of its acetate, and oxidized in AcOH with CrO₃ to dihydrocholesterol, m. 163°, [α]_D²⁵ 42° (in CHCl₃). The latter was hydrogenated at 65-70° in Bu₂O contg. HBr with PtO₂ catalyst to epidihydrocholesterol (II), m. 206°, [α]_D²⁵ 26°. II was obtained also in 20% yield by rearrangement of I by heating 15 hrs at 215° with NaOEt and removal of unchanged I by digestion pptn. It was converted into the *Ac* deriv., m. 90°, [α]_D²⁵ 28.4°, and the latter oxidized by CrO₃ to androsterone, m. 182-3°, [α]_D²⁵ 94.4°, which was purified by decomp. with semicarbazone, m. 284-5°, with C₂H₅O, and extrg. with CCl₄. The androsterone thus obtained showed no lowering of m. p. when mixed with androsterone from epidihydrocholesterol. In the capon comb. test its activity was 1 unit per 1-2 γ.

A. W. Dox

C₂O₃ (Vol'kenshtein) 6 Constitution of nucleic acid (Makino) 11A Org. mineral substances (Treibs) 8 Magnetochem. investigations of org. substances (Muller) 2 Titration curves and dissociation constants of L-ascorbic

1 acid and diethyl dihydroxymaleate (Kumler, Daniels) 2. Photolytic and thermal decomposition products of azomethane (Heidt, Forbes) 2 Oxidation of sugars by air in the presence of Ce(OH)₃, sol and Ce(OH)₃ gel (Ghosh, Ralshit) 2 App. for effecting exothermic or endothermic reactions between fluids [manuf. of acetone] (Ger. pat. 619,295) 1 Effecting reactions [MeOH synthesis] (Brit. pat. 432,574) 13.

2 Separating liquid hydrocarbons. I. G. Farbenind. A.-G. Fr. 785,974, Aug. 23, 1935. Mixts of liquid hydrocarbons are sep'd into fractions of different compns by dissolving I under pressure in the mixt. at a temp. below that of decomn and preferably with the addn of a solvent such as liquefied propane. The layers which form are sep'd.

3 Separating aromatic mono- and polychloro hydrocarbons. Chemische Fabrik von Heyden A.-G. (Kurt Buchheim, inventor). Ger. 616,596, Aug. 1, 1935 (Cl. 12a 2 01). The hydrocarbons are sep'd by azeotropic distn., water being used as the auxiliary substance. Thus, a crude mixt. obtained by chlorinating C₆H₆, contg. 15 parts of polychloro compds and the rest C₆H₆Cl is mixed with water to give an azeotropic b. p. of 91°. The mixt. is dist'd, the C₆H₆Cl going over and the polychloro compds. remaining. Other examples are given.

4 Catalytic dehydrogenation of hydrogenated heterocyclic compounds. Carl Wulff and Wilhelm Breuers (to I. G. Farbenind. A.-G.). U. S. 2,019,833, Nov. 5. A compd., such as piperidine from which pyridine is to be formed, is brought into contact (suitably at a temp. of about 410°) with a catalyst essentially comprising a heavy metal of the left subgroup of the 6th group of the periodic system or a heat-resistant compd. of such a metal such as WO₃. Several examples are given.

5 Oxidation of hydrocarbons. I. G. Farbenind. A.-G. (Max Harder and Wilhelm Dietrich, inventors). Ger. 619,113, Sept. 21, 1935 (Cl. 12a 11). The manuf. of fatty acids and alcs. by treating higher paraffin hydrocarbons with air is improved by first refining the hydrocarbons with H₂SO₄ in the presence of a small proportion of an oxide of N. The conditions during the refining treatment must be sufficiently mild to avoid reaction of the hydrocarbon. Sp. processes are described.

6 Oxygenated compounds from normally gaseous paraffinic hydrocarbons. Henry Dreyfus U. S. 2,020,671, Nov. 12. Hydrocarbons such as CH₄ and C₂H₆ are caused to react with steam under a pressure of at least 50 atm. and at a temp. below 700° (suitably about 200-500°) in the presence of an oxide-free catalyst mass such as the chromate of Mg, Zn or Al, forming products such as alcs., acids, aldehydes and ketones. Cf. C. A. 29, 3349¹.

7 Hydrocarbons and alcohols. Jean J. Pung and Rafael Sunen-Benedict. Fr. 784,742, July 23, 1935. An alkali, alk., earth or earth carbonate or bicarbonate is partially reduced by a metal or carbonaceous reducing agent to obtain a gas rich in CO, which is caused to react with H₂ in the presence of catalysts to produce hydrocarbons or alcs. as desired. The H₂ may be obtained by reduction of steam with a part of the CO formed.

8 Olefins. E. I. du Pont de Nemours & Co. Brit. 432,430, July 26, 1935. Olefins contg. less than 10 C atoms, e. g., C₂H₄, C₃H₆, industrial gas mixts. rich in C₂H₄ and C₃H₆, are converted into higher olefins, e. g., C₄H₈, C₅H₁₀, C₆H₁₂, by heating to 400-700°, preferably less than 2 sec., in presence of a small amt., e. g., 0.5-1% and not more than 5%, of O.

9 Converting normally gaseous olefins into hydrocarbon liquids. Vladimir Ipatieff (to Universal Oil Products Co.). U. S. 2,020,649, Nov. 12. Olefins such as C₂H₄, C₃H₆, etc., are polymerized (suitably at a temp. of about 100-250°) in the presence of a solid mixt. of H₂O₂ and ZnO which serves as a catalyst and with which ZnCl₂, fuller's earth, etc., also may be used.

Hydrating olefins. Henry Dreyfus. U. S. 2,020,672, Nov. 12. A molten salt (such as Ba pyrosulfate or ZnCl₂) which is a hydration catalyst is used in reactions, such as

the hydration of C_2H_4 at 300° under 20 atm. pressure to produce EtOH. Cf. C. A. 29, 7342.

Hydration products of olefins. Henry Dreyfus. U. S. 2,020,674, Nov. 12. An olefin such as C_2H_4 is treated with water vapor at an elevated temp. (suitably about 300°) in the presence of a metal metaphosphate such as that of Na which serves as a catalyst in the formation of products such as EtOH.

Alcohols. Imperial Chemical Industries Ltd and Stanley J Green. Brit 433,519, Aug. 16, 1935. Fatty oils or wax esters, including sperm and like oils, or the corresponding fatty acids or other esters thereof, are reduced to the corresponding alcs. by treatment with H and a hydrogenation catalyst, e. g., Ni, Co, Cu, Fe, Pt, Pd, or oxides thereof, or ZnO, with or without an acidic oxide, e. g., SiO_2 , Al_2O_3 or an oxide of W, Cr, Mo or V, the reaction mixt. being vigorously agitated and the H passed through rapidly to carry over the alcs. Pressure may be employed. App. is described.

Alcohols from olefins. Floyd J. Metzger (to Air Reduction Co.) U. S. 2,021,564, Nov. 19. In a continuous process of producing an alc. such as EtOH, water and an olefin such as C_2H_4 are supplied to a combined boiler and heat interchanger and heated in it to convert the water into steam, the resulting mixt. is brought into contact with an acid catalyst such as dil. H_2SO_4 (suitably at a temp. of about 220–300°) and resulting hot alc. contg. gases are passed through the heat interchanger to heat the incoming mixt. (various operative details being described).

Alcohols from olefins. N. V. de Bataafsche Petroleum Maatschappij. Ger. 618,515, July 30, 1935 (Cl. 12a, 5 04). Olefins, especially those obtained by "cracking" mineral oils are absorbed in H_2SO_4 . The H_2SO_4 is diluted with water to hydrolyze the alkyl sulfate. The hydrolyzed product is repeatedly extd. to remove polymers. The extn. residue is subjected to azeotropic distn. to obtain the olefin. The same low-boiling liquid is used for the extn. as for the distn. Examples are given.

Bubble still suitable for distillation of alcohol, etc. August A. Zentler. U. S. 2,020,009, Nov. 5. Various structural and operative details.

Drying alcohols or ketones. Standard Oil Co. of California. Fr. 785,214, Aug. 7, 1935. See U. S. 2,000,043 (C. A. 29, 4021).

Tertiary alcohols. Richard Z. Moravec and Wm. Eng (to Shell Development Co.). U. S. 2,019,762, Nov. 5. For the manuf. of tertiary alcs. such as *tert*-butyl alc. from acid liquor obtained by the absorption of tertiary olefins such as *tert*-butylene in an aq. soln. of a "polybasic" strong acid such as H_2SO_4 , sufficient basic material such as NH_3 is added to the acid liquor to form 2 phases, the alc. phase is sep'd. from the nonalc. phase, and the former is independently treated, as by distn., to recover tertiary alc. from it.

Hydroxyethyl alcohols. Clyde O. Henke and Milton A. Frahl (to E. I. du Pont de Nemours & Co.). U. S. 2,021,100, Nov. 12. See Brit. 430,578 (C. A. 29, 80004).

Esters of unsaturated acids such as those of methacrylic acid. Emmette F. Izard (to E. I. du Pont de Nemours & Co.). U. S. 2,020,685, Nov. 12. In forming an ester such as methyl methacrylate, the ester of a halogenated formic acid such as methyl chloroformate is caused to react with an olefin hydrocarbon such as C_2H_4 and the resulting ester of a halogenated satd. aliphatic monocarboxylic acid is dehydrohalogenated to form an unsatd. ester.

Esters of glycols. Gerald H. Coleman and Garnett V. Moore (to Dow Chemical Co.). U. S. 2,021,852, Nov. 19. A glycol diester such as the diacetate ester of ethylene glycol is made by the reaction of an alkylene dichloride such as ethylene dichloride with an alkali metal salt of a lower aliphatic acid such as NaOAc in the presence of a catalyst including an alkylamine, an alkanolamine, an alicyclic amine, a pyridine base such as pyridine itself or a salt of such an amine or base.

Isopropyl esters of aliphatic acids. Gerald H. Coleman (to Dow Chemical Co.). U. S. 2,021,851, Nov. 19. In forming an ester such as isopropyl acetate, propylene is

caused to react with a substantially anhyd. satd. aliphatic monocarboxylic acid such as glacial HOAc under superatm. pressure and in the presence of H_2SO_4 as a catalyst. A temp. of about 125° is suitable for the production of isopropyl acetate. Various examples are given.

Vinyl esters. Granville A. Perkins (to Carbide and Carbon Chemicals Corp.). U. S. 2,021,098, Nov. 19. See Brit. 418,943 (C. A. 29, 2176').

Vinyl esters. Otto Nicodemus and Walter Weisbehn (to I. G. Farbenind. A.-G.). U. S. 2,021,873, Nov. 19. See Ger. 604,640 (C. A. 29, 813').

Dicarboxylic acid esters. Charles W. Hawley (to E. I. du Pont de Nemours & Co.). U. S. 2,020,356, Nov. 12. In forming an ester, a polycarboxylic acid capable of forming an anhydride or an anhydride of a polycarboxylic acid such as phthalic anhydride is treated with an alc. in an amt. less than required for complete esterification of the acid or anhydride and the temp. of the reaction mixt. is maintained above the b. p. of the alc. while a stream of alc. or deriv. is passed through the reaction mixt.

Nitric esters. Frederick A. F. Crawford, Wm. A. P. Challener and Imperial Chemical Industries Ltd. Brit. 432,488, July 22, 1935. Nitroglycerin, nitroglycol and similar liquid nitric esters, or mixts thereof, are obtained by a continuous process in a series of reaction vessels, a proportion of the polyhydric alc. or mixt. of such, being added to each vessel and the whole of a suitable quantity of nitrating acid being added to the 1st vessel only. The reaction products are passed from each vessel to the next and the proportion of the alc. added to the 1st vessel is insufficient to produce an acid compn that has a deleterious effect on the nitric ester in contact therewith. Intensive cooling is used in the 2nd and succeeding vessels to minimize the effect of waste acid on the product.

Enolic sulfuric esters of reduced indantrones. David A. W. Fairweather and John Thomas (to Scottish Dyes Ltd.). U. S. 2,019,530, Nov. 5. In prep. sulfuric acid esters of the indantrone series by a process in which a tetrasulfuric acid ester of a reduced indantrone is hydrolyzed in an aq. medium, the tetrasulfuric acid ester is heated in an aq. medium contg. NaOH and Na hyposulfite to a temp. of about 60°, the heating being discontinued when one of the sulfuric acid groups has been removed and the resulting trisulfuric acid ester being subsequently heated in an aq. soln. contg. an alk. oxidizing agent and the reaction stopped when a substantial quantity of a disulfuric acid ester is formed. Various examples with details and modifications of procedure are given and various products are obtained which have good affinity for fibers and are converted into dyes of different shades by the action of very dil. acid. General claim is made to trisulfuric enolic esters of reduced indantrones as being new compds.

Methylene ethers. Tom Birchall and Samuel Coffey (to Imperial Chemical Industries Ltd.). U. S. 2,021,690, Nov. 19. A methylene ether such as methylene diethyl ether is prep'd. by interacting $(CH_3)_2N_2$ with an alc. such as EtOH in the presence of HCl or H_2SO_4 in the liquid phase (the acid being in quantity sufficient to decompose the $(CH_3)_2N_2$). Several examples are given.

Vinyl ethers. Walter Reppe and Werner Wolff (to I. G. Farbenind. A.-G.). U. S. 2,021,869, Nov. 19. See Brit. 430,764 (C. A. 29, 8001').

Amino alkyl amines. I. G. Farbenindustrie A.-G. Brit. 433,625, Aug. 19, 1935. See Ger. 602,049 (C. A. 29, 474').

Alkylene diamines. Werner M. Lauter (to Wingfoot Corp.). U. S. 2,020,690, Nov. 12. An alkylene diamine such as ethylenediamine is formed by the reaction of an alkylene dihalide such as ethylene dichloride under the influence of heat and pressure (suitably a pressure of about 150–300 lb. per sq. in. and a temp. of about 95°) in the presence of a metal compd. such as cuprous chloride which forms a complex salt with the resulting alkylene diamine.

Primary aromatic amines. Ford H. McBerty and Kenneth C. Simon (to E. I. du Pont de Nemours & Co.). U. S. 2,020,368, Nov. 12. An amine such as $PhNH_2$ is

produced from the corresponding aromatic nitro compd such as PhNO_2 by the use of comminuted sheet ferrous material the surface of which is partly covered by Sn, in the presence of water and an Fe reduction catalyst

Amines of high molecular weight. H. Th. Böhm A-G. Fr. 785,004, July 31, 1935. α -Amino fat acids derived from aliphatic, aromatic, cycloaliphatic, heterocyclic or mixed amines are heated in an inert solvent of sufficiently high b.p. until the sepn. of CO_2 ceases. Thus, heptadecylamine is prep'd by heating α -aminostearic acid in paraffin oil.

Alkylenes. H. Th. Böhm A-G. Fr. 785,005, July 31, 1935. Aliphatic alkylenes of high mol. wt. having more than 8 C atoms in the chain are prep'd by causing compds which give salts or complex compds, with bases to react with secondary amines having at least one aliphatic chain of more than 8 C atoms, and afterward heating to dissolve the amine. Thus heptadecylene is prep'd by heating heptadecylphenylamine in a current of HCl, and hendecylene from hendecylphenylamine and ZnCl_2 .

Acetals. I. G. Farbenind. A-G. Fr. 785,791, Aug. 19, 1935. Acetals are prep'd. from polyvinyl alc. or its esters under pressure in the presence of a substance which acts as a solvent and is liquid at the pressure of the reaction but gaseous at normal pressure, e.g., SO_2 , MeCl , EtCl , Me-O and ethylene oxide.

Diketene. George H. Law (to Carbide and Carbon Chemicals Corp.). U. S. 2,019,933, Nov. 5. See Can. 352,920 (C. A. 29, 80089).

Oxygen-containing addition products of ethylene. Henry Dreyfus U. S. 2,020,673, Nov. 12. Ethylene is treated with a lower aliphatic carboxylic acid such as HOAc and with water at a temp. of at least 350° and under a pressure of at least 5 atm. to form products such as EtOAc .

Aralkyl trithiocarbonates. Raymond W. Hess (to National Aniline & Chemical Co.) U. S. 2,021,726, Nov. 19. Compds. (suitable for use as rubber vulcanization accelerators, ore-floation agents or intermediates in *org. synthesis*) such as Na benzyltrithiocarbonate, etc., are produced by treating an alkali metal salt of an aralkyl mercaptan such as benzyl mercaptan with CS_2 (suitably with stirring and cooling) and the free aralkyl thiocarbonate acid may be obtained by treating the salts with dil. H_2SO_4 or HCl. Several examples with details of procedure are given.

Acenaphthene derivatives. Imperial Chemical Industries Ltd., Max Wyler and Arnold Kershaw. Brit. 432,885, Aug. 6, 1935. The derivs. are manuf'd by condensing acenaphthene (I) or 1-5-carboxylic alkylamide with an alkylphenylcarbamyl chloride (which may have a Me or chloro substituent in the Ph nucleus) in the presence of an Al halide condensing agent and, if desired, hydrolyzing the resulting 1-5-carboxylic or -5,6-dicarboxylic alkylamide to yield 1-5-carboxylic or -5,6-dicarboxylic acid, which are dye intermediates, or their anhydrides. Among examples, (1) I and phenylethylcarbamyl chloride are heated in light petroleum with AlCl_3 to produce 1-5-carboxylic ethylamide, and (2) the product of (1) is hydrolyzed by alc. KOH.

Benzimidazole derivatives. Soc. pour l'ind. chim. A. Bile. Fr. 784,869, July 27, 1935. See Swiss 175,020 (C. A. 30, 3041).

Imidazole derivatives. Adolf Sonn. Ger. 615,227, Oct. 17, 1935 (Cl. 12 p. 9). Imidazoles (4,5-dihydroimidazoles) substituted in the 2 position are prep'd by the action of aliphatic 1,2-diamines on imino ethers derived from aryl, arylkory or carboxyalkyl substitution products of HCOOH , AcOH , EtCOOH or PrCOOH . Thus, $\text{PhCH}_2\text{C}(\text{NH})\text{OMe-HCl}$, warmed with $(\text{CH}_3\text{NH}_2)_2$, yields $\text{Ph-CH}_2\text{C}_2\text{N-CH}_2\text{CH}_2\text{NH}$, b. 147° , HCl salt m. $168-70^\circ$.

Examples are given also of the prepn. of imidazoles from $(\text{CH}_3\text{NH}_2)_2$ and (1) an imino ether prep'd from $\text{CNCH}_2\text{COOEt}$ (imidazoline m. $110-12^\circ$), (2) salicylic acid imino ethyl ether (imidazoline m. 209°), (3) an imino ether prep'd from the condensation product of *o*-allylguaiacol and bromobutyronitrile (imidazoline b.,

$200-220^\circ$, picrate m. $189-90^\circ$) and (4) an imino ether prep'd. from the condensation product of 8-hydroxyquinoline and CICH_2CN . A product has also been prep'd. from propylenediamine and benzimidazole ethyl ether.

Amide derivatives. Henkel & Cie. G. m. b. H. Ger. 616,785, Aug. 5, 1935 (Cl. 12 p. 16). See Fr. 770,539 (C. A. 29, 4759).

Naphthalene derivatives. Imperial Chemical Industries Ltd. Fr. 785,586, Aug. 13, 1935. See Ger. 609,928 (C. A. 29, 51261).

Phthalic acid derivatives. Chemische Fabrik Grünau Landshoff & Meyer, A.-G. Fr. 785,423, Aug. 9, 1935. *N,N,N',N'*-Tetraalkylphthalimides are prep'd. by treating phthalyl halides, particularly phthalyl chloride, with dialkyl amines. An example is given of the prepn. of *N,N,N',N'*-tetraethylphthalimide, b. $175-80^\circ$, m. 39° .

Pyridine derivative. Chemische Fabrik von Heyden A.-G. (Ernst Haack, inventor). Ger. 613,402, May 18, 1935 (Cl. 12 p. 101). Addn. to 598,579 (C. A. 28, 7264). The deriv. 4-pyridylpyridinium dichloride is prep'd. by treating 2 mols. of pyridine with 1 mol. of Cl in the presence of an indifferent solvent or diluent, and heating the resulting pyridine-Cl comp'd. with excess of pyridine to $50-150^\circ$ till the above deriv. is formed. A small amt. of Br may be present in the Cl. Examples are given.

Derivatives of tetrahydro-3-hydroxyquinoline. I. G. Farbenind. A.-G. Fr. 785,541, Aug. 12, 1935. These derivs. are prep'd. by treating with epichlorohydrin at above 130° , with or without pressure and in the presence or absence of solvents, alkyl or aralkyl amines of the C_4H_9 series in which the position of a substituent in the ring does not prevent closing of the quinoline ring. Examples are given of the prepn. of 1-butyl-3-hydroxy-(b. $157-9^\circ$), 1-ethyl-3-hydroxy-7-methyl-(b. $171-2^\circ$), 1-butyl-3-hydroxy-7-chloro-(b. $202-5^\circ$), 1-benzyl-3-hydroxy-(b. 227°), 1-butyl-3-hydroxy-8-methyl-(b. $175-6^\circ$) and 1-methyl-3-hydroxy-tetrahydroquinoline, b. $165-6^\circ$.

Derivatives of 2-phenylquinoline-4-carboxylic acid. Hauns John. Brit. 433,045, Aug. 6, 1935. Esters of 2-phenylquinoline-4-carboxylic acid (I), its homologs and substitution products are prep'd. by esterifying the acids with glycerol (II) or halohydrins of II. When the products contain halogen, they may be caused to react with further quantities of the acids or their salts. The products may be used therapeutically. Among examples, (1) the α -monoglycerol ester of I is prep'd. by heating I with II in the presence of H_2SO_4 , or by treating the acid chloride with II or the K salt with α -monochlorohydrin, and (2) α,β,γ -tris (2-phenylquinoline-4-carboxylic acid) glycerol ester is formed when K 2-phenylquinoline-4-carboxylate is heated with β,β' -dichloroisopropyl ester of I.

Ester-like compounds. Henkel & Cie. G. m. b. H. (Alfred Kirstahler and Wilhelm J. Kaiser, inventors). Ger. 616,847, Aug. 13, 1935 (Cl. 12 p. 11). High mol. ester-like compds. are obtained by treating esters obtained from unsubstituted or substituted, sated or unsated, hydroxylated aliphatic, hydroaromatic or aliphatic-aromatic compds. congt. at least 6 C atoms, and aliphatic carboxylic acids (or substitution products) congt. reactive halogen atoms, with *org.* hydroxy compds. in an alk. medium. Thus, the dodecyl ester of chloroacetic acid is treated with PhONa and PhOH to obtain the dodecylester of phenoxyacetic acid, m. $33-34^\circ$. Other examples are given. The compds. are used as soaps and active O-yielding agents.

Condensation products. I. G. Farbenind. A.-G. Fr. 785,458, Aug. 10, 1935. Allophanyl chloride is condensed with aromatic hydrocarbons or their substitution products in the presence of acid-condensing agents. The products may be further treated with acid or alk. agents. Arylureas, arylburets, 2-aryl-4,6-diketo-1,3,5-triazines and arylcarboxylic acids are obtained in this way. Examples are given of the prepn. of 2-phenyl-4,6-diketo-, 2-phenyl-4,6-dihydroxy-, 2-tolyl-4,6-diketo- and 2-tolyl-4,6-dichloro-1,3,5-triazine, anisoylurea and 4-methoxybenzenecarboxylic acid.

Polymerization products. I. G. Farberind. A.-G. Fr. 785,910, Aug. 22, 1915. Org. compds. contg. a carbon double bond, such as vinyl ether, vinyl ester, acrylic ester, acrylic acid, acrylic nitrile, styrene and isopropenyl methyl ketone, are polymerized in the presence of a small amt. of a polymerizable 1,3-diene, e. g., 2-chloro- or 2-methyl-1,3-butadiene.

Carbohydrate polymers. Itzhak Itzhak A.-G. (Edward Jarber, inventor). Ger. 619,215, Sept. 20, 1913 (Cl. 120. 6). Addn. to 618,161 (C. A. 30, 1109). Alkoxes are heated to 160–170° with substantially less than 0.1% of mineral acid until decomposition begins. This may occur after about 15 mins. Water-sol. polymerization products less hygroscopic than those of Ger. 618,161, are obtained. The hygroscopicity of the products may be further reduced by heating them to 100–130° for one or a few hrs., with or without preliminary neutralization of the acid.

Phenols. I. G. Farberind. A.-G. Fr. 785,272, Aug. 6, 1915. Phenols are recovered from aq. soln. by a rectifying distn. of the soln., in the presence of CO_2 if NH_3 is also present. App. is described.

Cyclohexylphenols. I. G. Farberind. A.-G. (Karl Broderick, Hermann Helnicke and Ernst Korten, inventors). Ger. 616,515, July 31, 1913 (Cl. 120. 25). See 1r. 705,024 (C. A. 28, 67319).

Halogenated di- and tri phenylmethanes. The British Thomson-Houston Co. Ltd. Brit. 431,072, Aug. 8, 1935. These are obtained by the Friedel-Craft process by condensing a halogenated benzyl or benzil chloride with a halogenated or unsubstituted C_6H_5 in the presence of AlCl_3 . In examples, monochlorobenzyl chloride and $\text{C}_6\text{H}_5\text{Cl}$ (I) are condensed to give a dichlorodiphenylmethane; dichlorobenzyl chloride (II) and I, and trichlorobenzyl chloride (III) and $\text{C}_6\text{H}_5\text{Cl}$, are condensed to give trichlorodiphenylmethanes, III and I, and II and $\text{C}_6\text{H}_5\text{Cl}$ (IV), are condensed to give tetrachlorodiphenylmethanes; III and IV are condensed to give a pentachlorodiphenylmethane; and III and $\text{C}_6\text{H}_5\text{Cl}$ are condensed to give a hexachlorodiphenylmethane. The products are noncryst. and consist of mixts. of isomers. The main constituents being those mentioned in the examples, and they are used as dielec., insulating and cooling media in elec. app.

Alkylenguanidine salts. I. Rich Prochnow (to Anticomman G. m. b. H.). U. S. 2,019,872, Nov. 5. In the reaction of an alkylenediamine such as decamethylenediamine with guanidine sulfoxyanate, the materials are boiled together in an aq. soln. in the presence of NH_3 and the alkylenguanidine formed is taken up in solvents such as alc. and the resulting soln. is treated with a hot K_2CO_3 soln. or the like. Several examples are given. Cl. C. A. 29, 29933.

Catalysts for hydrogenation. Anthony M. Muckenfuss (to E. I. du Pont de Nemours & Co.). U. S. 2,021,607, Nov. 19. An aromatic hydrocarbon such as naphthalene, anthracene or acenaphthene, or a lubricating mineral oil fraction from mid-continent crude oil is heated with Na and H under a pressure of 250–500 lb. per sq. in. at 255–450° (for 8–10 hrs. in examples given) to produce catalysts suitable for use in hydrogenation of hydrocarbons such as those from which the catalysts are derived or in hydrogenating other org. compds.

Mercaptans and thio ethers. Wm. M. Lee. U. S. 2,020,421, Nov. 12. A secondary or tertiary alkyl ester (such as may be obtained by treating olefin material contg. over 2 C atoms with an O acid such as H_2SO_4) is treated with a mercaptan or with H_2S to produce an alkyl substituted deriv. of the sulphydryl radical contg. compd. corresponding in the C content of the added alkyl substituent to the original olefin. Various examples with details of procedure are given, including the production of *tert*-butyl mercaptan and *tert*-amyl ethyl sulfide.

Quaternary ammonium salts. Deutsche Hydrierwerke A.-G. Brit. 437,350, Aug. 13, 1915. Saturated heterocyclic bases are caused to react with alkyl chlorides contg. at least 8 C atoms and the *N*-alkyl derivs. obtained are converted into quaternary NH_4 salts by reaction with an alkylating agent that introduces an alkyl radical of not more than 6 C atoms. In an example, piperidine is heated with

1 ethyl chloride and the product is treated with Me_2SO ; the ethylmethylpiperidinium methylsulfate so obtained is useful in making aq. emulsions of paraffin, cetyl alc., olive oil, etc., and the emulsions may be used, as such or after addn. of Na_2CO_3 , for the treatment of fibrous materials.

Copper ammonium salt of diazoaminotetrazole. Willi Brün (to Remington Arms Co.). U. S. 2,021,178, Nov. 19. A soln. of the Na salt of diazoaminotetrazole is mixed with a cupric salt and NH_3 in the presence of HIOAc and in such sequence that no intermediate reaction forms a ppt. The product may form plate crystals or rhombic crystals. Cl. C. A. 29, 43791.

Selenium-containing anthraquinone compounds. Ivan Gulchmann and Wm. L. Rinselman (to E. I. du Pont de Nemours & Co.). U. S. 2,019,850, Nov. 5. In the prepn. of a C-dialkylanthraquinonedisulfoxide such as C-diphenyl-1,2,8,7-anthraquinonedisulfoxide, a compd. such as an α,α -dichloro- β,β -diminoanthraquinone, in which the amino groups are in opposite rings of the anthraquinone nucleus and the Cl atoms are in ortho position to them, is caused to react with an alkali metal selenide and the product is condensed with an aroyl chloride such as benzoyl chloride (various examples and modifications of procedure being described).

Addition products of sodium with naphthalene, etc. Norman D. Scott (to E. I. du Pont de Nemours & Co.). U. S. 2,019,812, Nov. 5. By the reaction of Na with naphthalene (or an alkyl naphthalene in the presence of a suitable reaction medium such as dimethyl ether, methyl isopropyl ether or a mixt. of xylene and dimethyl ether, derivs. are formed such as 1,2- or 1,1-disodium naphthalene, which can be hydrolyzed to dihydronaphthalene or treated with CO_2 and converted into Na salts of dihydronaphthalenedicarboxylic acids. Various examples with details of procedure are given.

Organic silver compounds. Karl Roth. Brit. 432,814, Aug. 2, 1935. A H_2O -sol. complex compd. of Ag acetyl-salicylate with $(\text{CH}_3)_3\text{N}$, is prepd. by causing acetyl-salicylic acid, or a salt thereof, to react with a Ag salt and treating the pptd. Ag salt with $(\text{CH}_3)_3\text{N}$. In an example, Na acetyl-salicylate is treated with AgNO_3 and $(\text{CH}_3)_3\text{N}$ in soln.

Basic lead trinitroresorcinol. Hans Tauson (to Winchester Repeating Arms Co.). U. S. 2,020,665, Nov. 12. NH_4OH is added to a soln. of trinitroresorcinol until the soln. is slightly alk. and a soln. of Pb nitrate is then added.

Organic acid chlorides. Wilhelm Stelmann. Fr. 785,075, Aug. 1, 1915. The corresponding anhydrides are treated with COCl_2 , if desired in the presence of metal chlorides or acetates as catalysts.

Distilling carbon tetrachloride. Joseph D. Kreis (to F. L. Irazz, trustee for "Dry Cleaning Syndicate"). U. S. 2,020,014, Nov. 12. Various details of app. and a method in which a mist is produced by substantially isothermal compression of vapors of a substance at a temp. below the normal b. p. of the substance are described, conference of the minute globules of the mist being produced by addn. of satd. vapors of the substance at substantially the normal b. p.

Aliphatic organic acids. Gilbert B. Carpenter (to E. I. du Pont de Nemours & Co.). U. S. 2,021,127, Nov. 19. An acid such as HIOAc is formed from CO and an aliphatic monohydroxy alc. such as MeOH or alkoxy compd. such as MeOAc (initially at a reaction temp. of about 300° and under 700 atm. pressure) in the presence of a catalyst contg. an acid of a metal of group 6-A of the periodic table such as chromic acid or tungstic acid. Cl. C. A. 29, 40277.

Apparatus for distilling fatty acids. Clemens Beggell. Ger. 601,800, July 4, 1935 (Cl. 234. 1).

Synthesis of acetic acid and other organic compounds. John C. Woodhouse (to E. I. du Pont de Nemours & Co.). U. S. 2,019,751, Nov. 5. HIOAc is produced by bringing MeOH and CO into contact with a metal oxide catalyst such as oxides of Si, Mg, Al, Ti, Zr and W or their mixts., which are adsorbents for gases, and at the same time some

other compds. such as Me formate and Me acetate are formed. A reaction pressure of 250-700 atm is preferred and the temp. may be 150-300°. Cf. C. A. 29, 179°.

Synthesis of aliphatic carboxylic acids such as propionic, butyric and valeric acids. Alfred T. Larson (to E. I. du Pont de Nemours & Co.). U. S. 2,020,589, Nov. 12. An acid is produced from steam, CO and an olefinic hydrocarbon such as C_3H_6 , C_4H_6 or C_5H_6 in the presence of CCl_4 and active carbon (suitably at a temp. of about 325° under 700 atm pressure).

Reduction of fat acids and their esters. Imperial Chemical Industries Ltd. Fr. 785,718, Aug. 17, 1935. Fat acids and their esters are reduced to the corresponding alcs. by passing a rapid current of H through a strongly agitated mixt. of catalyst and acid or ester, so that the alcs. are removed as they are formed. App. is described in which the H passes in a closed cycle.

1,4-Dihaloanthracene-2-carboxylic acids. Berthold Benert and Robert Held (to General Aniline Works). U. S. 2,019,840, Nov. 5. Ring-closing agents such as H_2SO_4 are caused to react upon a 2',5'-dihaloanthracene-2,4'-dicarboxylic acid which has the 6'-position unsubstituted, at an elevated temp. (suitably about 120-220°).

Adenosinephosphoric acids. Georg Henning, Chem. pharm. Werke G. m. b. H. Ger. 619,455, Oct. 1, 1935 (Cl. 12p. 7.01). In recovering adenosine-phosphoric and -polyphosphoric acids by grinding and extg. horse-flesh, muscle and other suitable animal materials, better yields are obtained by adding an alkali or alk. earth phosphate to the material during grinding. The added phosphate may afterward be converted into adenosine-phosphoric acid by adding acetylenic acid or a salt thereof to the ground material. Sp. processes are described.

Alkyl sulfonic acids. Imperial Chemical Industries Ltd. and Alfred Davidson. Brit. 433,312, Aug. 13, 1935. The conversion of alkyl inorg. esters having 10-18 C atoms into the corresponding sulfonates by means of an aq. soln. of sulfites is effected in a closed vessel at 120-150° in the presence of diarsinodiphosphoric acid (II) or a substituted I or a mixt. of a phosphate and an aromatic base. In examples, cetyl bromide, cetyl Na sulfate, dodecyl bromide and dodecyl Na sulfate are treated with Na_2SO_3 in the presence of a mixt. of $PhNH_2$ and Na phosphate or of I.

Colloidal dispersions of higher aliphatic anhydrides. Hans von Recklinghausen. Ger. 619,342, Sept. 28, 1935 (Cl. 23c. 2). A higher aliphatic anhydride is dissolved in a restricted amt. of a water-sol. org. solvent at a temp. above 40°, and the warm soln. is sprayed into water which contains a little NH_3 or other base, or to which NH_3 or other base is added after the anhydride soln. has been introduced. The dispersions are intended for the treatment of textiles.

Fat acid nitriles. I. G. Farbenind. A.-G. Fr. 785,622, Aug. 14, 1935. Nitriles are formed by passing vapors of higher fat acids free from OH groups and capable of forming soaps, e. g., oleic acid, coco- or palm-oil fat acid or functional derivs. of these fat acids, at the same time as NH_3 , over a catalyst capable of eliminating water and at a temp. of 320-420°.

Benzoates from phthalates. Alphons O. Jaeger (to American Cyanamid & Chemical Corp.). U. S. 2,020,595, Nov. 12. In transforming a salt of a polycarboxylic acid to that of the corresponding monocarboxylic acid as in the production of Ca benzoate from Ca phthalate, the initial material is heated with a strong inorg. base such as $Ca(OH)_2$ and $CaCO_3$ to a reaction temp. (which may be about 420-450°) in a rotary kiln at least partially filled with balls of relatively heavy, heat-conductive material such as steel balls. App. is described.

Benzoates from phthalates, etc. Joseph E. Jewett (to American Cyanamid & Chemical Corp.). U. S. 2,020,596, Nov. 12. A conversion such as the production of Ca benzoate from Ca phthalate is caused by heating the material (suitably to a temp. of about 400-450°)

in the presence of an alc. earth hydroxide such as $Ca(OH)_2$ and $CaCO_3$ and while passing through a mass of inert heavy, heat-conductive bodies such as chrome steel balls which are being tumbled without advancement as a mass in a direction transverse to a sinuous path of advance of the material under treatment. App. is described.

Methanol. Deutsche Hydrierwerke A.-G. (Walther Schraut, inventor). Ger. 619,438, Oct. 17, 1935 (Cl. 12o. 5.01). Crude wood spirit is treated in the liquid phase with H or a gas contg. H at a raised pressure, e. g., 60 atm, and at a temp. below 300°, e. g., 100-150°, in the presence of a hydrogenation catalyst. MeOH is then recovered by distn.

Apparatus for making ethylene glycol from ethylene, oxygen and water. Karl E. Skarblom. Ger. 619,195, Sept. 25, 1935 (Cl. 12o. 5.03). Addn. to 561,049 (C. A. 27, 1012).

Formaldehyde. Gutehoffnungshütte Oberhausen A.-G. Brit. 433,559, Aug. 16, 1935. This corresponds to Fr. 770,179 (C. A. 29, 480°).

Propylene oxide. Soc. française de catalyse généralisée. Fr. 785,149, Aug. 2, 1935. A mixt. of propylene, O and an inert gas such as N or CO_2 (propylene, air and CO_2) are heated to 300-375° in the presence of a catalyst such as Ag, Ag and Au, or Ag, Au and Cu.

Drivnyl ether. Randolph T. Major and Wm. L. Rough (to Merck & Co.). U. S. 2,021,872, Nov. 19. Substantially pure drivnyl ether is claimed as a new product, b_m about 28.3°. It is made by the reaction of fused KOH upon β,β' -dichlorodimethyl ether with const. stirring, refluxing in a continuous system, distg. through a condenser trap and maintaining a flow of NH_3 throughout the entire system. App. is described.

Diphenyl ether. I. G. Farbenind. A.-G. (Karl Marx and Hans Wesche, inventors). Ger. 616,825, Aug. 5, 1935 (Cl. 12g. 14.04). See U. S. 2,008,987 (C. A. 29, 585°).

Glycol monochlorohydrin. Compagnie de produits chimiques et électrometallurgiques Alais, Froges & Camargue. Fr. 785,170, Aug. 3, 1935. Cl is caused to react on CaH_2 in aq. medium, the formation of insol. Cl products being reduced by eliminating them from the reaction vessel as they are formed.

Biacetyl. Lonza-Werke elektrochem. Fab. G. m. b. H. (J. Pritzker, inventor). Ger. 619,348, Sept. 28, 1935 (Cl. 12o. 10). Biacetyl is recovered from mixts. contg. it, particularly from pyrolytic mixts., by treating the mixts. with a soln. of the Ni compd. of NH_4OH , whereby a ppt. of the known Ni compd. of biacetyl dioxime is obtained. The ppt. is thoroughly washed, dried at about 100°, and treated with dil. acid, and biacetyl is then extd., e. g., with ether. Preferably, the starting material is first neutralized and distd., and biacetyl then recovered from the distillate. The yield may be increased by treating the neutralized starting material or its distillate with a weak oxidizing agent, e. g., $FeCl_3$, whereby biacetyl is produced from acetyl methylcarbinol or other conversion product of biacetyl which may be present in the material. Sp. processes are described.

Bornyl oxalates. Lucienne Darrasse and Lucien Dupont (one-half to Leon Darrasse and Egon Elod). U. S. 2,020,769, Nov. 12. In the manuf. of bornyl oxalates by the action of anhyd. oxalic acid on essence of turpentine without the presence of a solvent or condensing agent, the reaction is conducted under continuous agitation at temps. of about 110-125° and the reaction water is eliminated from the liberated vapors by carrying out the operation in the absence of O in an atm. of inert gas such as CO_2 having no action on the pinene.

Isochroman and its derivatives. I. G. Farbenind. A.-G. (Hans Buschmann and Richard Michel, inventors). Ger. 617,549, Aug. 23, 1935 (Cl. 12g. 24). Addn. to 614,461 (C. A. 29, 596°). β -Phenylethyl alc. (II), treated with paraformaldehyde and gaseous HCl in the absence of water, yields I chloromethyl ether, which is converted into isochroman (III) by treating it with aq. acids, preferably at about 100°. Sp. processes are described. Sub-

stitution products of I having at least one free α -position react similarly. Thus, a methyl-II, m , 128-35°, and a nitro-II, m , 97-0°, have been prepared from a β -tolylethyl alc. and a nitro-I, resp.

Quinone. I. G. Farlenund, A.-G. (Curt Schuster and Franz H. Broch, inventors). *Ger.* 616,544, July 30, 1935 (Cl. 120 10). See *Int.* 779,214 (C. A. 29, 4774).

Urethans. I. G. Farlenund, A.-G. (Heinrich Ulrich and Paul Körding, inventors). *Ger.* 619,550, Oct. 11, 1935 (Cl. 120, 17 01). Carbonic or chlorocarbonic esters of higher aliphatic alcs. are treated with mono- or dialkyl, cycloalkylalkyl, or arylalkyl amines containing at least one OH group linked to an alkyl residue. Thus, the carbonic or chlorocarbonic ester of lauryl, cetyl, octadecyl or oleyl alc. may be treated with $\text{HOC}_2\text{H}_4\text{NH}_2$, $(\text{HOC}_2\text{H}_4)_2\text{NH}$, $\text{E}_2\text{NH}(\text{CH}_2)_2\text{OH}$, $\text{HOC}_2\text{H}_4\text{NHC}_2\text{H}_4\text{OH}$, or $\text{PhNHCO}_2\text{H}_2\text{OH}$. The reaction may be effected at 0-70° in aq. alk. soln. in the presence or absence of an org. solvent. The urethan derivs. so obtained are useful as dispersing agents for oils, fats and waxes and as softening or sizing agents for textiles. Products of similar properties, but more sol. in water, are obtainable by treating the urethan derivs. with an alkylene oxide.

1-Phenyl-2,3-dimethyl-5-pyrazolone Baptist Reuter. *Ger.* 534,908, Aug. 7, 1935 (Cl. 12p 8 01). See U. S. 2,005,605 (C. A. 29, 5130).

Benzoylaminochloroanthraquinones Alexander J.

Wuertz and Wm. Dettwyler (to E. I. du Pont de Nemours & Co.). U. S. 2,019,837, Nov. 5. 1-Benzoylamino-8-chloroanthraquinone and 1,8-dibenzoylaminoanthraquinone are chlorinated in PhNO_2 or other inert high-boiling solvent and HOAc and in the presence of an acid-binding agent such as NaOAc or KOAc and the chlorination may be controlled to give a 1,8-dibenzoylamino-4-chloro- or 4,5-dichloroanthraquinone in exceptionally pure form and also in the chlorination of 1-benzoylamino-8-chloroanthraquinone to produce either 1-benzoylamino-4,8-dichloro- or 1-benzoylamino-4,5,8-trichloroanthraquinones in substantially pure form and in good yields. By this procedure the introduction of 1 or 2 atoms of Cl into the starting material is readily controlled. The first atom introduced into the 1-benzoylamino-8-chloroanthraquinone enters the 4-position, giving substantially a pure 1-benzoylamino-4,8-dichloroanthraquinone, substantially free from the 4,5,8-trichloro body. Further chlorination gives the 4,5,8-trichloroanthraquinone. So also in the chlorination of 1,8-dibenzoylaminoanthraquinone, a substantially pure mono- α -chloro-1,8-dibenzoylaminoanthraquinone is obtained before any substantial amt. of dichlorination takes place. It is also possible to start with the diamino- or aminochloroanthraquinone which can be first benzoylated in the inert high-boiling org. solvent, and then chlorinated without isolation. Several examples are given.

ARTHUR W. DOX

Salt activation. II. Influence of salts on the stability of amylase. K. Venkata Giri. *J. Indian Chem. Soc.* 12, 567-74 (1935); cf. C. A. 29, 6611².—Purified sweet-potato amylase was kept 30 min. at 50° in 0.05 N acetate buffers from pH 4 to 6.5. It was found that solns. containing 0.05 N NaCl also had their activity protected in the lower pH range but not in the higher. At pH 4 fluoride, chloride, sulfate and nitrate were diminishingly effective in that order (all as Na salts). All but the first showed a max. protective action at about 0.05 N, but fluoride was most effective in the strongest soln. used, 0.2 N Li^+ , Na^+ and K^+ showed very little difference in their behavior, but Ca^{++} was much more efficient in dil. and less in concd. solns. Ca^{++} behaved similarly in its effect on the enzyme activity also. The stability of amylase was also reduced by high concns. of salt at higher pH . The effect of the salts studied on the stability of amylase is thus entirely paralleled by their effect on the activity. R. Baltzy.

Enzymic proteolysis. V. The structure of the prothromases. 2. Elucidation of the structure of clupein. Ernst Waldschmidt-Leitz and Ernst Kofranyi. *Z. physiol. Chem.* 236, 181-91 (1935); cf. C. A. 29, 3673².—The recent isolation of protaminase, the enzyme specific for the splitting off of terminal arginine from the carboxyl end of protamine chains furnishes a means of detg. the order of amino acid linkages in the mol. It liberates $\frac{1}{4}$ of the total arginine from clupein. Since 2 arginines are present for each monoamino acid, there must be at least 15 amino acids in the chain. After protaminase has split off the terminal arginine from clupein, the remaining clupein is further broken down by activated trypsin with rupture of 4 peptide linkages. The products may then be sepd. into 2 fractions: one representing 73% of the total and having a N:NH₂ ratio of 9, the other constituting 27% and having a ratio of 5. The larger fraction is a mixt. of tripeptides, each consisting of 2 arginine and 1 monoamino acid. The smaller fraction consists of 2 dipeptides, each contg. 1 arginine. One proline is present in the tripeptide mixt., none in the dipeptide mixt. The tripeptide fraction is not attacked by aminopolypeptidase, signifying that no monoamino acid with terminal NH₂ is present. One arginine is split off by carboxypolypeptidase; hence

the tripeptides consist of 1 monoamino acid between 2 arginines. From the resulting mixt. only $\frac{1}{4}$ of the peptide linkages are split by dipeptidase, hence 1 of the 3 must represent tertiary N as in arginylproline. The dipeptide fraction is not attacked by arginase and therefore contains no free arginine. Dipeptidase breaks all of the peptide linkages. Of the 4 possible combinations, arginylarginine and the dipeptide of monoamino acid are ruled out because carboxypolypeptidase splits half of the total peptide linkages. The dipeptides are therefore arginylmonoamino acid and aminoacylarginine and contain no proline. On the basis of these cleavage products the amino acid sequence in clupein is (MA) (AMA) (AMA) (APA) (AM), where A denotes arginine, M monoamino acid and P proline. Activated trypsin therefore splits the peptide linkage between each pair of contiguous arginines in the interior of the polypeptide chain. Linderström-Lang's theoretical deductions are thus corroborated. The specificity of a true protease, like that of peptidases, is detd. solely by the nature and arrangement of the amino acid units, and the assumption of a cyclic structure for proteins becomes superfluous. It is improbable that one and the same enzyme is active toward peptide linkages in both open peptides and diketopiperazines. Adding the 2 arginines split off by protaminase, the amino acid sequence in clupein becomes (MA) (AMA) (AMA) (APA) (AM) (A) (A), the only uncertainty being the exact location of the proline. Clupein, with mol. wt. 2021, cannot be a multiple of this formula. The double mol. wt. obtained by Van Slyke NH₂ titration may be due to salt formation between 2 clupein mols. A. W. Dox.

The constitution of nucleic acid. Katashi Makino. *Z. physiol. Chem.* 236, 201-7 (1935); cf. C. A. 29, 3695².—Titration of yeast nucleic acid with NaOH and phenolphthalein shows it to be a tetrabasic acid. This is taken as evidence of the cyclic structure of the mol., in which the ribose portion of each of the 4 nucleotides is esterified to 2 H₂PO₄ mols. and each H₂PO₄ to 2 ribose groupings, leaving an acidic OH on each of the 4 phosphoric acid groups. Depolymerization is due to the rupture of these ester linkages. The resulting increase in acidity is then in close agreement with that calcd. on the basis of the cyclic structure. A. W. Dox.

Lactic acid dehydrogenase. Th. Wagner-Jauregg and E. F. Möller. *Z. physiol. Chem.* 236, 216-21 (1935).—Al-

though the dehydrogenation of other hydroxy acids, malic and citric, requires in addition to the specific dehydrogenase and coenzyme the yellow flavin enzyme as H-carrier, this is not true of lactic acid. A lipothione-free dehydrogenase prep. obtained from *Es. coli* readily dehydrogenated lactic acid in the presence of methylene blue as O-donor and in the absence of coenzyme. The addition of yellow enzyme shortened the decolorization time only very slightly. This slight effect is attributed to coenzyme in the flavin enzyme soln. Neither crystal lactoflavin nor lactoflavophosphoric acid had any such effect. The coenzyme responsible could not have been coenzyme as the boiled soln. inhibited fermentation. Addition of flavin enzyme to dehydrogenase preps. from *Lactobacillus* likewise failed to accelerate the dehydrogenation of lactic acid. Evidently the flavin enzyme of yeast does not participate in the dehydrogenation of lactic to pyruvic acid.

A. W. Dox

Activation of the enzymic dehydrogenation of alcohol by glutathione. Th. Wagner-Jauregg and E. F. Möller. *Z. physiol. Chem.* 236, 222-7 (1935).—Dehydrogenation of EtOH by dehydrogenase preps. from frog muscle and from yeast is activated, as measured by methylene blue decolorization, by SH-glutathione or KCN. The effect is probably a suppression of heavy metal inhibitors. Other substances which bind heavy metals have a similar effect, viz., 0.01 M Na 1-amino-8-naphthol-4-sulfonate, HSC₂H₄ and Na₂S. Na₂P₂O₇ is without effect, and cysteine inhibits the SH-glutathione activation. The activation is less pronounced when contamination with heavy metals has been avoided in the prep. of enzyme. A function of glutathione, in addition to its activation of certain hydrolytic and dismutative enzymes (papain, cathepsin, arginase, methylglyoxalase) is, in conjunction with heavy metals, the regulation of dehydrogenation processes. A. W. D.

The behavior of urobilinogen in the liver. K. Felix and H. Moebus. *Z. physiol. Chem.* 235, 230-6 (1935).—When urobilinogen is mixed with a pulp of fresh hog liver and the mixt. aerated with air or O₂, an alteration occurs whereby the substance no longer gives the Ehrlich aldehyde reaction. The optimum pH for the reaction is at 7.1, and the presence of O₂ is essential, since no change occurs in an atm. of N₂. The diazo and Gmelin reactions are neg.; hence no bilirubin is formed in the oxidation. The process is enzymic and does not occur if the liver has been heated. Probably the point of attack is the CH₂ bridge between the pyrrole rings, since this has been shown by Fisher to be the essential grouping for the aldehyde reaction.

A. W. Dox

Pigments of human fat. L. Zechmeister and P. Tuzson. *Bull. soc. chim. biol.* 17, 1110-18 (1935); cf. C. A. 29, 6088¹.—Carotene, lycopene, capsanthin and xanthophylls of dietary origin, were isolated from human fat.

L. E. Gilson

Comparative rates of hydrolysis of α - and β -glycerophosphoric acids by various plant phosphatases II. Takadiastase. Jean Courtois. *Bull. soc. chim. biol.* 17, 1318-39 (1935).—See C. A. 28, 5836¹. L. E. Gilson

Fixative power of takadiastase toward glycerophosphates. Jean Courtois. *Bull. soc. chim. biol.* 17, 1340-5 (1935).—"Takadiastase, which has different affinities for α - and β -glycerophosphates, has the same fixative power for the 2 isomers; affinity is a qual. test of an enzyme; fixative power, on the other hand, is a quant. phenomenon."

L. E. Gilson

[Inhibiting] action of reduced glutathione and ascorbic acid on the destruction of adrenaline by the oxidizing enzymes of potato juice. J. Toscano Roco and A. Malafaya Baptista. *Compt. rend. soc. biol.* 120, 45-8 (1935).

L. E. Gilson

Action of glutathione on cytochrome C in vitro. E. J. Bigwood and J. Thomas. *Compt. rend. soc. biol.* 120, 69-72 (1935).—Oxidized glutathione is able to take up the H. mobilized by certain dehydrogenases. The reduced glutathione formed gives up H to oxytocytocrome C, thereby reducing the latter.

L. E. Gilson

Action of hydrogen cyanide on the oxidase of *Athaea* species. Vittorio Zanotti. *Boll. chim. farm.* 74, 669-70

(1935).—Leaves of *Athaea rosea* were subjected to HCN for 48 hrs., then dried, macerated and extd. with H₂O. The action of the oxidase in this ext. on 30% tincture of liguim vitae was compared with that of a similar ext. of noncyanated leaves. HCN inhibited the oxidase without destroying it.

Helen Lee Gruhl

Effect of Röntgen rays on the lipides of the epidermis. U. J. Wile, O. J. Cameron and H. C. Eckstein. *Arch. Dermatol. Syphilol.* 32, 69-72 (1935).—Samples of epidermis taken from 9 cadavers just after death were irradiated and analyzed for change in lipid content. Cholesterol was detd. by the Liebermann-Burchard method, and phospholipids were detd. by Whitehorn's method (C. A. 19, 663). Results showed a loss in cholesterol, in phospholipid and in total lipids.

O. Hartley

Insulin and glycolytic systems isolated from the myocardium of the rabbit and the cat. B. Tamm. *Biochim. therap. spec.* 22, 451-9 (1935).—A glycolytic enzyme was obtained from the myocardium of the rabbit and the cat. The former has an influence on glycogen and to a lesser degree on glucose, the latter acts on glycogen only. Insulin has no influence on the enzymic action.

A. E. Meyer

Chemical structure and biological action. E. C. Dadds. *Cambridge Univ. Med. Soc. Mag.* 12, No. 3, 112-14 (1935).—Thyroid, sex hormones and plant auxins are discussed in a lecture, developing the relationship between chem. constitution and biol. action. J. C. M.

Physiology of muscle protein. E. C. Smith. *Dept. Sci. Ind. Research, Rept. Food Investigation Board* 1934, 10-22 (1935); cf. C. A. 29, 5191¹.—From previously published data (C. A. 28, 5087¹) it would be expected that the protein of the living muscle plasma (intracellular protein) would be readily and completely extd. by salt solns within a wide range of concn. of salt; contrary to expectation, exhaustive extn. with any given salt soln yields only part of the total intracellular protein (C. A. 28, 1119¹). Dil. HCl exts. the whole of the intracellular protein, including any denatured protein that may be present, leaving behind only the connective tissue. Since the intracellular proteins are completely sol. in all the extractant solns. tested (NH₄Cl, LiCl, NH₄NO₃, NaClO₄, MgSO₄, KCl, NaCl), the fact that part is left undissolved

is best explained by assuming that fragments of muscle have escaped grinding, and solvents vary in their power of opening up the connective tissue which surrounds these fragments. The residual protein may be unaltered sol. protein identical with that already extd., or it may consist partly or entirely of protein which has been rendered insol. by denaturation during extn. When muscle is extd. with 0.01 N HCl a considerable proportion of the sol. protein is denatured; denatured myogen is co-pptd. with myosin between pH 4.8 and 8.0, but it remains undissolved when the joint ppt. is treated with buffered neutral salt and can therefore be detd. During the actual process of stiffening during rigor mortis, no change could be detected in the properties of myosin, nor was there any appreciable decrease in the salt-extractable fraction of the proteins. This contradicts the results of previous workers, and the difference is attributed to either the strict maintenance of a low temp. during storage or the absence of antiseptics in the present tests. Tests carried out with the sclerometer failed to reveal any measurable difference in the rate of onset of rigor mortis between 0° and 25°. The absence of a temp. coeff. seems to imply that the process of stiffening is due to a purely phys. change. It would appear that the colloidal system of the plasma is rendered unstable soon after death by the removal of one of the components of the system (possibly phosphagen), after which the system changes at a rate independent of temp. It remains an open question whether this change is of the nature of a sol-gel transformation.

A. Papineau-Couture

The action of x-rays upon the lactate, glucose, citrate and succinate dehydrogenases. R. E. Harward. *Brit. J. Radiol.* 8, 787-92 (1935).—Lactate, glucose, citrate and succinate dehydrogenases were prepd. from yeast, fresh minced liver, acetone-extd. liver and muscle, resp.

by standard methods. The preps. were irradiated with large doses of x-rays generated at 200 kv. and filtered by 0.5 mm. Al. Twenty thousand röntgens of such radiation had no effect on any of the first 3, but produced slight inactivation of the fourth. A similar dose of γ -rays produced the same effect on the succinate dehydrogenase.

Fifth H. Quimby
Present status of the question of the autolysis of living tissue. I. A. Smorodintzev. *Uspekhi Khim.* 4, 632-55 (1935).—A review on the concept of autolysis, the action of enzymes and their specificity, especially protease, and of phys. and chem. factors. The physiol. effects and the products formed by synthesis are discussed. One hundred and fifty-one references.

The annual organic production and nutrient phosphorus requirement in the tropical western North Atlantic
H. R. Seiwel. *J. conseil intern. exploration mer.* 10, 20-31 (1935).—Based on the annual dissolved O consumption of 62 cc. per sq. cm. of surface (H. R. Seiwel, *Papers in Phys. Oceanogr. and Meteor.* 3, 86 (1934)), the annual production of carbohydrate in the western N. Atlantic was calculated to be 0.0655 g. of glucose or 0.056 g. moisture and salt-free plankton per sq. cm. of surface. Analysis of 9 oceanic plankton samples gave an av. value of 49.43% C and 1.35% P with a ratio of 1 part C to 2.73×10^{-2} part P. Based on this ratio the annual dissolved P requirement for photosynthesis was estd. to be 75.6×10^{-2} g. per sq. cm. of surface. In the Barents Sea and English Channel only one tenth to one half as much phosphate is consumed annually. Eddy currents supply much of the consumed phosphate to the photosynthetic zone from the phosphate-rich mid-stratum ocean water.

The chemistry of chromosomes
H. H. Hellström, Knut Brandt and H. v. Euler. *Svensk Kem. Tids.* 47, 219-50 (1935) (in German).—Ultraviolet photomicrographs of *Drosophila* chromosomes are shown in different fluid reagents.

Researches on the blood serum proteins of some migratory fishes
O. Gomez Iñiguez and M. Fontaine. *Bull. inst. océanogr.* No. 679, 5 pp. (1935).—Osmotic changes in the blood concomitant with a transfer from sea water to fresh water perhaps does not alter the serum to globulin ratio of the blood.

The nature of snake poisons
F. Michael and K. Kraft. *Nachr. Ges. Wiss. Göttingen, Math.-physik. Klasse III*, [N. S.], 1, 85-93 (1935).—It is believed that snake poisons are not single entities, protein in nature, but consist of prosthetic groups requiring a colloidal carrier. When native snake poison is treated with adsorption agents the prosthetic group is removed. After elution the soln. again shows activity if a protein soln. is added. An ultrafilter through which only a small amt. of poison will pass will permit about 85% of it to pass through if the poison is first partially hydrolyzed with acid. If such hydrolysis is complete enough to destroy most of the toxicity the latter can be restored by adding protein soln. to the hydrolyzate.

The action of the two amylases of barley
Charles S. Haney. *Can. J. Research* 13B, 185-209 (1935).—Expts. confirmed the view that β -malt amylase selectively hydrolyzes one portion of the starch substance, this fraction (approx. 60% of the starch substance) is transformed into maltose and a residual nonreducing fraction remaining (erythrogranulose) which retains the property of chlorination by I. With regard to α -malt amylase, several lines of evidence indicate that this enzyme does not exert a selective action upon the erythrogranulose fraction, as is suggested in a current theory of starch constitution, but that it induces the breakdown of both fractions. In this case the reducing products do not consist exclusively of maltose.

Serum proteins in parathyroidectomized animals
Andor Illényi. *Magyar Orvost. Arch.* 36, 257-69 (1935).—The protein fractions of serum remain unchanged in animals in which the parathyroid has been extirpated.

The effect of ultraviolet radiation on lens protein in the presence of salts and the relation of radiation to industrial

and senile cataract
Janet H. Clark. *Am. J. Physiol.* 113, 638-47 (1935).—Fts. of lens protein (from ox lenses) were made in solns. of NaCl, KCl and CaCl₂. They were exposed to ultraviolet radiation at μ 1-7.8 and the development of opacity was followed by the intensity of the Tyndall beam from the opalescent soln. At μ 7.2 moderate heat alone produced no opacity and ultraviolet radiation at 4', although denaturing the protein, produced no opacity except to a slight degree in the presence of Ca. If the radiated exts. were heated to 40° for 2 hrs. the opacity was very marked in all the exts. contg. Ca. The effect was diminished by the presence of Na but not by the presence of K. It is probable that there is always some denatured protein present as a result of exposure to sunlight. This does not ppt. in the presence of K but a Ca concn. as low as 0.03% in the lens is sufficient to cause pptn. at body temp. An accumulation of denatured protein in the lens in old age combined with a higher blood Ca may therefore be responsible for senile cataract. The higher incidence of cataract in industrial workers is probably caused by exposure to large sources of radiant heat when low concns. of Ca or other substances producing a similar effect are present.

The effect of light and of darkness on the thyroid gland of the rat
H. S. Maycrson. *Am. J. Physiol.* 113, 659-62 (1935).—Rats kept in the dark, whether born and reared or placed there at weaning, when fed a well-balanced diet, show no differences in rate of growth, body wt. or in the microscopic structure of the thyroid gland in comparison with rats kept in diffuse roomlight or exposed to direct sunlight. C or quartz Hg vapor arc radiation. Darkness does not enhance, and radiation does not perceptibly modify the hyperplasia produced by feeding goitrogenic diets.

Physicochem. studies of the colloidal state of cholesterol, cholesterol esters and lecithin
(Remezov, Zepalova) 2

B—METHODS AND APPARATUS

STANLEY R. DUNFORD

Two types of modified Petri dishes
C. G. Dobbs. *Ann. Botany* 49, 852-4 (1935).—Edge infection can be prevented by a double wall so constructed as to form a "moat" around the dish. Type B is a rectangular dish suitable for use on the stage of a microscope.

Comparative investigations on colorimetric and iodometric determination of glutathione
Kurt Uhlenbrock. *Z. physiol. Chem.* 236, 192-6 (1935).—The colorimetric method is essentially the Na₂Fe(CN)₅NO reaction used by Blerich and Rosenbohm (*C. A.* 27, 2165) except that sulfosalicylic instead of tungstic acid is used for removal of potassium, the soln. is made alk. with Na₂CO₃ instead of KCN, and a photoelec. colorimeter is used because of its greater rapidity in measuring the fugitive color. Dets. of glutathione in numerous tissue exts. showed in most cases good agreement with the iodometric method.

Phosphatase determination in small quantities of serum
Ernst Müller. *Z. physiol. Chem.* 237, 35-9 (1935).—The superiority of serum phosphatase detn. over serum P and Ca dets. for the diagnosis of rickets has led to the development of this micromethod. One-half cc. of serum is mixed with 0.5 cc. of 0.015% Na β -glycerophosphate. For the blank detn. a 4-cc. aliquot is treated with 1 cc. of 20% CCl₃CO₂H and centrifuged, then 2 cc. of the supernatant liquid transferred to a 4-cc. volumetric flask and treated successively with 1 cc. standard KH₂PO₄ (1 mg. %), 0.5 cc. (NH₄)₂MoO₄ soln. (25 g. (NH₄)₂MoO₄ and 300 cc. N H₂SO₄ per l.), 0.4 cc. of 2,4-(H₂N)₂C₆H₃OH (0.5 g. concn. amolol in 100 cc. 5% Na₂SO₃) and dild. to the mark. After 10 min. the photometer reading is taken. For the phosphatase detn. 2 cc. of the glycerophosphate mixt. is treated with 1 cc. of barbitol buffer (μ 7.8), the flask is stoppered and placed in a thermostat 48 hrs. at 38°. The soln. is pptd. with 2 cc. of 20% CCl₃CO₂H and centrifuged or filtered. Two cc. of the clear filtrate (0.04 cc. serum) is treated with standard phosphate, (NH₄)₂MoO₄ and amolol, exactly as in the blank, and the photometer reading taken. The P liberated is calcd. from the equa-

1939. $C_2 = K_2 (A_1/100)$, where C_2 is mg. P in the unknown soln., A_1 the extinction coeff. of the unknown soln., and A_2 the A value of the standard phosphate soln.

A photometric method for the determination of Cr_2O_3 in digestibility experiments by the so-called quantitative indicator method. Lauri Paloheimo and Irja Paloheimo. *Biedermanns Zeits. B. Tierernähr.* 7, 317-24 (1935).—See C. 1 29, 645 P.

Ondase test in avian pathology. Charles S. Gibbs and L. W. Chapman. *Mass Agr. Expt. Sta. Bull.* 315 (Ann. Rept. 1934), 78 (1935).—The oxidase test is of value in differentiating leucemic from nonleucemic avian blood. The method of Sato and Sekiya (C. A. 20, 2515) was superior to other methods from the standpoint of keeping quality of the stain and the rapidity of staining.

Micromethod for the determination of urea in blood or urine. Levinson. *Bull. soc. chim. biol.* 17, 1157-62 (1935).—Blood is deproteinized with $ZnSO_4$ and $NaOH$. A known quantity of $NaOBr$ is added to the blood filtrate or urine and the excess remaining after reaction with the urea detd. iodometrically.

The determination of the carotenoid contents of blood, tissues and fluids in daily clinical practice. P. Ratchevsky. *Bull. soc. chim. biol.* 17, 1187-93 (1935).—For blood, absorb 0.1-0.4 cc. on cotton, weigh and treat with 2 cc. 95% $EtOH$ for each 100 mg. blood. Add 2 cc. petr. ether, shake well and add enough water to cause sharp sepn. of the petr. ether layer. Contg. the carotenoids. 1-2 successive drops of the petr. ether soln. on the same spot in a porcelain dish until a barely visible yellow ring appears and note the vol. required. This is equiv. to 0.03-0.05 γ carotene or about twice as much xanthophyll. Bile, urine and spinal fluid are concd. by evapn. and treated as blood. Tissues are ground with a little sand and KOH soln. and then extd. with $EtOH$ as above.

Physicochemical study of the dispersion of readings in colorimetry. R. Dolique. *Bull. soc. chim. biol.* 17, 1304-17 (1935).—Errors in colorimeter reading are discussed.

Colorimetric determination of polypeptides by the triketohydrindene hydrate reaction. Michel Polonovski. *Compt. rend. soc. biol.* 120, 28, 94 (1935); cf. C. A. 29, 6172. —The first step toward the formation of the blue color is the oxidation of $RCH(NH_2)CO_2H$ to $RCHO$, NH_2 , and CO_2 by the ninhydrin. The hydrated ketone group of the latter is reduced to a carbinol group. When the H in the α -position is replaced by an alkyl group as in synthetic α -aminoisobutyric and α -amino- α -ethylpropionic acids the reaction is impossible and these compounds do not give the blue color. In the method described by Cherbitzer and Herzenstein (C. A. 29, 1449, 7369) where the reaction is carried out in a soln. satd. with $(NH_4)_2SO_4$, glycylglycine and glycylleucine give the blue color while alanylalanine, leucylglycine and leucylglycylglycine do not. From this it is inferred that only peptides contg. a glycid radical with a free amino group will give the reaction under such conditions.

Colorimetric determination of urea. Juan A. Sánchez. *Rev. centro estd. farm. bioquím.* 25, 304-72 (1935).—See C. A. 29, 8037.

Determination of phosphorus in feces. Corazza Maria. *Arch. farmacol. sper.* 60, 386-8 (1935).—The org. matter is destroyed by the Fringsheim and Liebig methods and P detd. volumetrically by the Pincus method. Both methods give comparable results.

Determination of mercury in viscera. Clive Newcomb, S. Rajagopal Naidu and K. S. Varadachari. *Analyst* 60, 732-5 (1935).—The viscera are digested with portions of HNO_3 until finally a uniform yellow soln. is obtained. H_2SO_4 is then added and the soln. heated until white fumes are evolved. During this heating, air is passed through the soln. and the distillate is passed through water in receivers. In this way about $1/2$ of the Hg is distd. off. The heating is stopped and the contents of the receivers are treated with $KMnO_4$ to oxidize HNO_3 and

then decolorized with oxalic acid. The Hg is then pptd. as HgS . A fresh supply of water is placed in the 3 receivers and the heating repeated but this time the back end of the distg. flask is connected with a flask contg. concd. HCl so that when suction is applied at the front end, a stream of HCl gas is made to pass through the H_2SO_4 soln. contg. Hg , which is heated nearly to the b. p. of the acid. In this way the remaining Hg is distd. off as $HgCl_2$. The aq. soln. contg. $HgCl_2$ is treated with H_2S and the remainder of the Hg pptd. The entire HgS ppt. is dissolved in H_2O , water, to remove excess S , and the Hg is pptd. a second time as HgS which is filtered off, dried and weighed. In this way the recovery of the Hg in synthetic samples was nearly perfect. Arsenic does no harm because it is oxidized to the highest state and no $AsCl_3$ is formed.

Determination of the calcium and phosphate contents of bones. C. K. Deisher and W. M. McNabb. *Analyst* 60, 750-1 (1935).—In the study of bone obtained from excavations a check-up was made of the accuracy of the volumetric detn. of both Ca and phosphate. The basic acetate sepn. prior to the Ca detn. was compared with the direct detn. without removal of phosphate by means of an excess of oxalic acid and NH_4 oxalate. The former method gave low results when only one basic acetate sepn. was used but the direct oxalate pptn. gave good results, which were, however, high when 6.5% of Mg was present. The alkalimetric method for titrating the NH_4 molybdate ppt. gave high results if the titration was carried out in a hot soln. but was more satisfactory in the cold.

Clinical spectroscopy. Advantages and physical principles of the spectrograph and technique in taking specimens for biospectrometric analysis. L. Edward Gaul and A. H. Staud. *Arch. Dermatol. Syphilol.* 32, 385-93 (1935), cf. C. A. 29, 2238.

State and localization of inorganic salts in the skin as revealed by extraction and microincineration. D. J. Koovman. *Arch. Dermatol. Syphilol.* 32, 394-403 (1935).—Differences in microscopic appearance occur when ash is extd. with org. solvents or water before incineration, as compared with unextd. material. Their significance is discussed.

The determination of alanine in biological materials. E. W. McChesney. *J. Elisha Mitchell Sci. Soc.* 51, 147-50 (1935).—The method of Kendall and Friedemann, cf. C. A. 24, 5777, for the detn. of alanine is unsatisfactory. The conversion of alanine to AcH either by their procedure or any of a no. of modifications reaches an equl. at about 91% of completion. If no method can be found for the quant. conversion of alanine into lactic acid, a 9% correction must be added to the results obtained by the K and F method. The presence of certain other amino acids, such as valine and leucine, interfere with the detn.

A. L. Mehning. The determination of total carbon in urine. Modifications of Dumas's method. Norberto E. Insua. *Rev. sudamericana endocrinol. inmunol. quimioterap.* 18, 609-17 (1935).—Drying *in vacuo* over H_2SO_4 causes a loss of C of about 10%, at 37° of 16%. Drying at 57-60° causes evapn. of the total Me_2CO but because of the short time required (2-4 hrs.) no other loss occurs. Detn. of Me_2CO in the original sample and of the C in the dried residue gives accurate results.

A. E. Meyer. The reliability of clearance tests for renal efficiency. Cuthbert Leslie Cope. *Clin. Sci.* 2, No. 1, 35-42 (1935).—In tests on nephritics, samples of urine and blood were analyzed at hourly intervals after the oral administration of a soln. of either 15 g. of urea, 3 g. of creatinine or 30-50 g. of xylene. Good agreement was obtained by the 3 test methods.

James C. Munch. A proposed device which is capable of continuously indicating the approximate percentage of carbon dioxide in a stream of flowing gases. Wm. B. Draper and Bernard B. Longwell. *Colorado Med.* 32, No. 11, 879-80 (1935).—Anesthetic gases are bubbled through aq. soln. of bromocresol purple or methyl red. The CO_2 content is estd. from the color change. Concn. of 0.3% produces a

yellow color with bromocresol purple. With methyl red a 1% CO_2 concn is a pale pink color, 3% light red and 5% deep red, suggesting the need for replacement of soda lime. Soda lime dust is very irritant and should be removed from the anesthetic gas. J. C. M.

A portable thermoelectric couple for measuring skin temperature. R. T. Grant. *Gw's Hospital Rep.* 85, No. 2, 209-11 (1935).—A Cu-constantan thermocouple is described.

Yellow phosphorus from bones. G. H. Locket. *Schweizer. Z. 17*, 541-7 (1935).—Student lab. prepn.

A simple respiratory apparatus. Josef Gyurik. *Magyar Orvosi Arch.* 36, 240-2 (1935).—O. Keimnuth. Henri Tauber.

C—BACTERIOLOGY

LAWRENCE H. JAMES

Infection by, and resistance to, the Preiss-Nocard bacillus. IV. Notes on the toxin, the pyogenic action, and the lipid content of the bacillus. I. B. Bull and C. G. Dickinson. *Australian Vet. J.* 11, 129-38 (1935).—The most potent toxin was obtained when the organisms were grown as a pellicle in 250-ml. Erlenmeyer flasks containing 125 ml. fermented hormone broth plus 0.2% glucose, at pH 7.7, and in an atm. concn 18% of added CO_2 . Incubation was at 37° for 48 hrs. The addition of reducing substances, notably NaHSO_4 , to the toxin increased its stability. The addition of 0.4% of colloidal Fe to the toxic broth filtrate completely precipitated the toxin. Potash alum failed to do so. No evidence was found of the presence of chitin in the organism. Successive extractions with acetone, ether, alc., boiling alc. and petroleum ether removed lipid equal to 15.0% of the dry wt. When the residue was submitted to alk. hydrolysis, a further 15.51% of the extractable lipid was removed. K. C. Beeson.

The kinetics of the decomposition of glucose and lactic acid by small bacterial masses. The idea of minimum active mass. Paulette Chais. *Compt. rend.* 201, 626-8 (1935).—In experiments with 3 species of propionic bacteria there was a min. mass of the bacteria which could attack glucose and lactic acid, the speed of the reaction was proportional to the mass and lactic acid was attacked by smaller masses than glucose. Rachel Brown.

The influence of *Phytomonas tumefaciens* and *Phytomonas rhizogenes* on the actual activity of certain liquid and agar substrata. A. R. Wilson. *Phytopathology* 25, 634-63 (1935).—The changes in pH value induced by the hairy-root and by both pathogenic and nonpathogenic crown-gall bacteria on agar media were more rapid than those found in corresponding liquid media. E. C. B.

Artificial enhancing of the virulence of BCG vaccine. Franz Gerlach, Joseph Brisch and Mikhael Kaplan. *Z. Tuberk.* 72, 21-7 (1935).—All repetition of previous recorded expts. revealed the stability of the virulence of BCG vaccine. Cultivation on hematin-egg mediums of pH 7.1, 6.8 and 6.6, and a hematin content of 3-5% revealed no virulence change even after 7 successive passages on these mediums. The addition of alurate to the suspensions and intraperitoneal injection showed no change to increased pathogenicity. The infectious of organs suspended in salt soln. were without avail. The use of 5% H_2SO_4 for 3, 10 and 20 min. before inoculation did not alter virulence. The bacilli remained localized and benign. Deep cultures on Resredka bouillon treated with H_2SO_4 before and after 4 months' incubation and likewise after 16 months showed no increase in virulence. Even 10 and 25% beef and guinea-pig hematin added to Resredka bouillon caused no increased virulence in BCG cultures over 5 to 6 months' culturing. H. J. C.

The chemistry of the tubercle bacilli spores. XL. The occurrence of sterols in tubercle bacilli. R. J. Anderson, R. Schoenheimer, J. A. Crowder and F. H. Stodola. *Z. physiol. Chem.* 237, 40-5 (1935).—In a search for sterols in the lipid fractions of tubercle bacteria only minimal traces were found, and these occurred in the Me_2CO -sol. fat and in the crude wax fractions. The amounts were too small to warrant any assumption that

sterols are metabolic products of tubercle bacteria. The slight traces of sterol-like substances found might easily be impurities introduced in the process of handling. Long's synthetic medium, on which the bacteria were cultivated, contained asparagine and glycerol, and it is possible that one or both of these contained minimal traces of sterols. Contamination with sterols might also arise from the cork and rubber stoppers, cotton plugs, filter paper, and the hands during contact with glassware, filter paper, etc. In view of the many possibilities of contamination with natural sterols in working up large quantities of cultures, it is surprising that greater sterol contamination did not occur. Contrary to Hecht (*C. A.* 29, 2902), it is concluded that the tubercle bacillus contains no sterols. A. W. Day.

Serological differentiation of hemolytic streptococci of human and animal origin. P. R. Edwards. *Ky. Agr. Expt. Sta. Research Bull.* 356, 3-14 (1935).—These strains can be differentiated by precipitin tests in which acid extracts of the organisms are used as antigens. Buchheim tests check the precipitin results in differentiating human from animal streptococci. C. R. Teller.

Bacteriostatic action of dyes with Gram positive cocci. J. E. Fuller and Morrison Rugosa. *Mass. Agr. Expt. Sta. Bull.* 315 (two Repts. 1934), 22 (1935).—Basic fuchsin exerted the most pronounced bacteriostatic effect on staphylococci, and hemolysis and nonhemolytic streptococci, sarcinae and micrococci, followed by crystal violet and gentian violet in the order named. Acid fuchsin had little bacteriostatic activity. Of the organisms studied, streptococci were most resistant to dyes. High acid production by bacteria seems to be correlated with resistance to dyes. C. R. Teller.

Variation of *Salmonella pullorum*. Henry Van Roekel. *Mass. Agr. Expt. Sta. Bull.* 310, 40 pp. (1935).—The behavior of 163 strains was studied culturally, biochemically and morphologically. Freshly isolated variants in NaCl solns. of different concns. and in the presence of pos. and neg. sera differed greatly. Such properties as colony and cellular morphology, Gram-staining, and biochem. reactions revealed little or no variation in most cases. The power of the variants to attack fermentable substances was practically the same as that of the normal type. In general, the agglutinogenic power and the absorptive capacity of the variants tested were not equal to those of the normal type. C. R. Teller.

Sensitivity of *Hemophilus pertussis* to vitamin C and hydroquinol. O. Grooten and N. Bersonoff. *Compt. rend. soc. biol.* 120, 121-3 (1935).—*Hemophilus pertussis* is killed by 1000-5000 mc. ascorbic acid per l. and growth is inhibited by 10-100 mc. per l., depending on the age and other conditions of the culture. Reduction is almost without effect. Hydroquinolone is over 10 times as effective as ascorbic acid. Tyrocathecol and pyrogallol are somewhat less effective than hydroquinone. L. R. G.

Action of intestinal bacteria on esculin agar medium. A. Rochaix. *Compt. rend. soc. biol.* 120, 217-18 (1935).—R. confirms the work of Jame, Crosnier and Morel (*C. I.* 29, 7373) except that no blackening was obtained with Strong's bacillus. *Proteus X-19* caused blackening of the medium; *Proteus vulgaris* did not. L. R. G.

Investigation of the action of microorganisms on milk by the "milk-on-agar" culture. Constantino Gorini. *Milch. Forsch.* 17, 87-98 (1935).—Milk-on-agar plates were used to detect the production of chymase and protease by 115 cultures of pathogenic streptococci, 33 cultures of mastitis streptococci, 22 cultures of *Esch. coli*, 10 cultures of *Staph. aureus*, 22 cultures of *Staph. epidermidis* and 8 physiological variants of *E. coli*. The method was very satisfactory for detecting the coagulating and peptonizing abilities of these organisms and proved helpful in defining relationships or differences between species and strains. H. Maer.

Influence of salt on the growth and cell form in case of lactic acid bacteria. *Es. coli*, *A. aerogenes* and some other common milk bacteria. W. Henneberg and Hanna Kniefl. *Milch. Forsch.* 17, 146-57 (1935).—The effect of the concn. of NaCl on the growth and morphology of

68 cultures of common milk bacteria was reported. In most cases, milk, lactose agar or china blue lactose agar was used as the substrate. The individual species and strains were influenced in different ways by the salt concn.

Purification of suspensions of the virus of vaccinia by means of carbon dioxide. C. A. Behrens and F. A. Nielsen *Proc. Indiana Acad. Sci.* 44, 100-117 (1934), cf. C. A. 29, 1454.—A method of purifying vaccinia vaccine has been developed, which is based upon the isoelectric ptn of the suspended tissue by means of CO_2 . These purified preps are H_2O clear and contain a high percentage of virulent virus.

W. J. Peterson

D—BOTANY

THOMAS G. PHILLIPS

The effects of animal hormones on plants. László Havas and John Caldwell *Ann. Botany* 49, 729-47 (1935).—Various glandular exs. were administered to plants either by the roots or by the petiole stumps. A prep. of estrogenic hormone was found to be toxic to tomato plants. But even concd exs. of ovary, testis, pituitary, suprarenal, thyroid and of thymus appeared to have no marked effect and certainly no toxic action. In a few instances as with exs. of the suprarenal, there was slight evidence of increased flower development in hyacinths and tomato.

R. C. B.

The study of the effect of blue-violet rays on photosynthesis. R. H. Dastur and R. J. Mehta *Ann. Botany* 49, 809-21 (1935).—An increased production of carbohydrates was observed in leaves of plants exposed to a gas-filled elec. lamp of the "daylight" type as compared with leaves exposed to an ordinary gas filled elec. lamp. The former is richer in the blue-violet rays than the latter. With sunlight and with red and blue-violet rays all of equal intensity, the formation of carbohydrates was found to be greatest in the sunlight. Both the red and the blue-violet region seem to be necessary for normal photosynthetic activity.

R. C. Burrell

Effect of certain chemicals on the "combination streak" virus of tomatoes. Michael Shapovalov *Phytopathology* 25, 864-74 (1935).—A great variety of org. and inorg. compds. were tested for lytic effect on the streak virus of tomatoes. Some affected one component of the streak but not the other, others, both components, and still others were without effect on either component. H_2SO_4 of about 1.5% concn. was highly toxic to both components of the virus.

R. C. Burrell

Chemical studies on the virus of tobacco mosaic. IV. Some effects of different chemical agents on infectivity. W. M. Stanley *Phytopathology* 25, 899-921 (1935); cf. C. A. 28, 2837.—The effects of 110 chemicals on the infectivity of purified preps of tobacco mosaic were detd. Most of the agents effective in controlling the virus are oxidizing substances, protein precipitants or agents known to cause pH changes. V. Determination of the optimum hydrogen ion concentration for purification by precipitation with lead acetate. *Ibid.* 922-30.—The optimum pH for the Pb subacetate ptn. was about 9, for the neutral Pb acetate ptn., 5.5, and for the elution of the virus from the neutral Pb acetate ppt., about 7.

R. C. B.

Effect of tannic acid on the infectivity of tobacco mosaic virus. H. H. Thornberry *Phytopathology* 25, 931-7 (1935); cf. C. A. 29, 5878.—Inhibition of tobacco mosaic infection on plants treated with tannic acid before inoculation was proportional to the concn. of the acid. Tannic acid at concns. of 0.01 to 10% had but slight effect upon infection when applied to plants after inoculation. In virus suspensions the inhibiting effect of tannic acid depended upon the concn. of the acid and the time of action.

R. C. B.

Particle diameter of certain plant viruses and *Phytomonas pruni* bacteriophage. H. H. Thornberry *Phytopathology* 25, 938-46 (1935).—Thirteen plant viruses and virus strains in nonpurified samples were estd. by ultrafiltration analysis to have diams. of about 15 m μ . Purified tobacco virus and particles of *Phytomonas pruni* bacteriophage were estd. to be about 11 m μ in diam.

R. C. Burrell

Toxicity of low concentrations of ammonia to mycelium and sclerotia of *Sclerotium rolfsii*. L. D. Leach and A. E. Davey. *Phytopathology* 25, 957-9 (1935).—Aq. solns. of NH_3 in concns. as low as 50 p. p. m. of NH_3 for exposures of 24 hrs. have been found lethal to the mycelium of *S. rolfsii* in lab. tests. Increasing the concn. of NH_3 to 150 p. p. m. reduced the necessary exposure to 2 hrs.

R. C. Burrell

Diffusible nature of the inhibitory agent produced by fungi. J. Cedric Carter. *Phytopathology* 25, 1031-4 (1935).—Certain combinations of microorganisms exhibit a sp. antagonistic action toward one another. Stale agar produced by the growth assoc. of *Helminthosporium salinum* and bacterium 9a2 will inhibit the further growth of *H. salinum*. The inhibitory agent is thermostable and diffusible.

R. C. B.

The dependency of the result of a graft on the relationship of stock and scion. Karl Süberschmidt. *Z. Botan.* 29, 65-137 (1935).—The physiol. marks of the growing together of the parts of a graft were the accumulation of nitrogenous compds. in the scion and an increase of proteolytic activity in the press juice from the stock. The proteolytic enzyme of the stock, however, in grafts involving unrelated plants may not act on the protein elaborated by the scion.

R. C. Burrell

Chemical investigations of the tobacco plant. V. Chemical changes that occur during growth. Hubert B. Vickery, Geo. W. Fucher, Charles S. Leavenworth, Alfred J. Waleman and Laurence S. Nolan. *Conn. Agr. Expt. Sta. Bull.* 374, 557-619 (1935), cf. C. A. 28, 571.—A rapid accumulation of a high relative proportion of oxalic acid in the very young tobacco plant was found. This is suggestive of an extremely rapid rate of metabolism in these plants. The 3 chief acids present, malic, citric and oxalic, maintained a nearly const. ratio to one another in the leaves from the 40th to the 110th day, although the total quantity of org. acids present increased about 400% in the interval between 40 and 75 days, and then sharply decreased. The metabolism of these 3 acids is closely related, and oxalic acid shares with the other 2 acids proportionately in the chem. changes. No definite evidence connecting org. acid metabolism with either carbohydrate or protein metabolism was obtained. The predominant malic acid was followed by oxalic and then by citric in order of quantity present. The amt. of unknown acids was intermediate between the oxalic and citric acids. In the stems, the unknown acids predominated, malic and oxalic being present in considerably smaller amts.; citric acid was invariably present but in very small amts. In the pods also, the unknown acids predominated, malic second in quantity, and followed by traces only of citric and oxalic acids. The amide N results suggest that in the leaf of the tobacco plant asparagine and glutamine are the only amides present. On the other hand, the stem tissue contains a considerable proportion of an unstable amide-like substance in addition to asparagine and glutamine. The growth of the plant is divided into 3 stages, e. g., to 3-4 weeks, when the seedling is establishing itself, from the 5th to 10th weeks, a period of rapid growth, and the 3rd or reproductive period which begins after 9-10 weeks and which is characterized by a decrease in wt. of the leaves and an increase in both org. acids and ash in the leaves and stems. In the 1st stage the nitrate N dropped markedly, the NH_4 , amide and amino N diminished, and the nicotine N increased. The dry matter, org. acids, ash, carbohydrates and N in all forms increased in abs. quantity per plant, but the relative distributions of the org. acids, and of the forms of carbohydrate and of N underwent considerable changes. Malic acid diminished, and oxalic and citric acids increased. The proportion of the total sol. carbohydrate as fermentable carbohydrate diminished. In the second period of rapid growth, the individual org. acids remained remarkably const. in both leaf and stem. In general, the nitrate content of the leaf decreased while that of the stem increased. The

nicotine in the leaves increased but that in the stem remained const. Both amides and NH_3 in stem and leaf increased. Apparently the total N of the plant decreased in the 3rd stage or mature period. Similarly, nitrate, amide and ammonia N decreased, while nicotine N increased in the leaves but remained const. in the stems. In this final stage of growth there was a striking translocation of org. and inorg. substances from other parts of the plant, particularly the leaves into the developing seed pods. Approx. $\frac{1}{2}$ of the org. solids of the plant was ultimately located in the fruit, and nearly $\frac{1}{4}$ of this was Et_2O -sol. material, mostly true fat. There was a marked storage of N in the seed pods amounting to approx. $\frac{1}{4}$ of the entire N of the plant. Much of it is probably in the form of seed protein. The picture is one of transformation of the plastic materials of the leaves and to a lesser extent of the stems into stable reserves of nutriment for the succeeding generation. The recently reported results of Vladescu are discussed (C. A. 29, 2999). C. R. F.

Isolation of stachyose from peas (*Pisum sativum*). G. Tanret. *Bull. soc. chim. biol.* 17, 1235-6 (1935).—Five kg. of ground dry peas was extd. with boiling alk. and the sugars in the ext. were sepd. by treatment with CaO , BaO , SrO , CO_2 , etc. About 2 g. of pure cryst. stachyose, $[\alpha]_D^{20} = +131.5^\circ$, $n_D^{20} = 1.72-3$, and an addnl. quantity of crude sirupy product was obtained. The peas contained about 3.5% sucrose, 1.7% stachyose and a very small quantity of reducing sugar. L. E. G.

Changes in the chemical composition of developing apples. H. O. Askew. *J. Pomology Hort. Sci.* 13, 232-46 (1935).—Jonathan and Dunn's Favorite varieties were examd. weekly. By the use of I to stain the starch granules in the flesh of the fruit it was shown that, in the 1st sample, traces only of starch were present. Starch formation begins in the layers of tissue near the periphery and progresses toward the core area. With maturing fruit the core areas were the first to be cleared of starch and the last starch to be hydrolyzed was that contained in the cells near the periphery. N and ash (%) decreased steadily throughout the exptl. period according to the equation $\log C = a + bI$, where C was the concn. of the constituent concerned, a and b were consts. and I was the time in days from the taking of the first sample. The initial concns. and the rates of fall of these constituents varied with the variety and with the growth conditions of the orchard. The rate of accretion of dry matter, and of intake of N and ash decreased after about 95 days from the date of max. blossom, slightly in the case of dry matter and greatly in the cases of N and ash. The uptake of N and ash ceased after about 120 days. J. O. H.

The physiological action of ammonia gas on plants. Kurt Garber. *Landw. Vers.-Sta.* 123, 277-344 (1935).—The microchem. method for the detection of NH_3 in leaf tissue (cf. Bredemann and Radeloff, C. A. 27, 3972) does not disturb the natural NH_3 content of the plant. Expts. were carried out on red clover, tomatoes, cucumbers, beans, lupines and several kinds of young nursery trees. The concn. of NH_3 gas which the plant can tolerate without injury depends on the pH value of the cell sap as well as the state of nutrition of the plant. Well-nourished plants with a high carbohydrate content will tolerate the NH_3 gas better than those which are poorly nourished. Various degrees of sensitiveness to NH_3 are possible, for the same reasons. As long as the concn. of NH_3 is not fatal to the plant, that which is taken up by the leaves is deprived of its harmful effects as though it had been absorbed by the roots or formed by chem. changes within the plant. In plants with a cell sap of pH below 5 the NH_3 will form NH_4 salts, while in those with a cell sap of pH above 5 the NH_3 is utilized in amide synthesis. In plants with slightly acidic cell sap, the assimilation will be stopped by a comparatively weak concn. of gas (1:7500). If the cell sap is strongly acidic, the assimilation will be increased by this concn. of gas. Respiration is scarcely influenced by the action of NH_3 . Transpiration is generally decreased by a concn. as low as 1:4000. The harmful action of NH_3 is first noticeable in the reaction of the cell sap which occurs simultaneously with the pptn. of cell pro-

tein, swelling of the chloroplasts, disturbance of assimilation and decompos. of protein. John O. Hardesty.

[Report on] research botany. H. Evans. Mauritius Dept. Agr., 5th Ann. Rept. *Sugarcane Research Sta.* 1934, 40-8; cf. C. A. 29, 2573.—Control of arrowing in sugar cane. Arrowing did not occur with the DK.74 variety of cane when the plants were heavily fertilized with either nitrate or phosphate; heavy applications of lime reduced arrowing. Arrows in the no-nitrate plots appeared about 3 weeks earlier than those in the heavy lime plots. Soaking of setts before planting. Setts were soaked for 8-16 hrs. in a satd. soln. of lime (I), a satd. soln. of lime contg. 1 lb MgSO_4 per 50 gal. (II), a complete nutrient soln. (III), and water alone (IV). All treatments improved the rate of germination of the setts. Soaking in either I or II gave decidedly better results than soaking in either III or IV. All treatments caused a significant increase in the cane yields. I gave the best results and there was not much difference in the effect of the other treatments. No marked hydrolysis of sucrose occurred as a result of soaking, at least up to a period of 3 days after the cutting had been removed from the soln. More water was absorbed by cuttings from I than from IV. Cuttings did not absorb a significant amt. of Ca from I in 12 hrs. Only minute traces of minerals entered the cutting when it was soaked in a soln. contg. abundant minerals. The superiority of I seems to be due solely to its effect in increasing the amt. of water absorbed by the cutting. Borer larvae present in the cuttings were completely eradicated by soaking in I. Under field conditions, the rapidity of germination increased with the initial reducing sugar content of the cuttings. For quick and uniform germination it is necessary to obtain cuttings with a high and approx. equal reducing sugar content. K. D. Jacob.

The biochemical bases in plant breeding. N. N. Ivanov. *Theoretical Bases of Plant Breeding, Leningrad Acad. Agr. Sci.* 1, 991-1016 (1935).—I. discusses the subject and presents original data under the following headings: the chem. variability of plants; biochemistry and breeding for quantity and quality of chem. substances; biochemistry and synthetic selection and breeding; biochem. methods for the plant breeder and new problems of biochemistry in its application to plant breeding. J. S. Joffe.

Breeding for chemical composition. N. A. Bazilevskaya. *Theoretical Bases of Plant Breeding, Leningrad Acad. Agr. Sci.* 1, 1017-1043 (1935).—B. presents the subject under the following headings: fundamental trends in chem. variability; chem. variability and the environment; the influence of acclimatization on the chem. compn., genetic data from chem. variability; obtaining new products of biosynthesis in crosses; the role of mutations in obtaining new products of biosynthesis; jarovization; the fundamental paths of plant breeding for chem. compn., the problems and methods of chem. selection; chemistry and morphological attributes; correlation between chem. attributes and microchem. analyses. J. S. Joffe.

Alkaline extract of the anterior hypophysis and germination. E. Pascual. *Soc. biol. Rosario (Argentina) Nov.* 24 (1934); *Rev. sudamericana endocrinol. inmunol. ginecoterap.* 18, 713.—The germination of some seeds is accelerated. A. E. Meyer.

Alkaline extract of the anterior hypophysis and plant growth. E. Pascual. *Soc. biol. Rosario (Argentina) Nov.* 24 (1934); *Rev. sudamericana endocrinol. inmunol. ginecoterap.* 18, 713.—Hypophyseal ext. prep'd. by the method of Evans and Simpson (C. A. 26, 3020) accelerated the growth to *Phaseolus vulgaris*, *Zea mays*, *Vicia faba*, *Lupinus albus* and *Hyacinthus* but was ineffective on *Pisum sativum*, *Lens culiculata*, *Salvinia rotaris* and *Lemna gibba*. The action was marked during the first days of growth. Large doses of the ext. have a toxic action. A. E. Meyer.

Polarity and growth substance. A. Th. Czaja. *Ber. deut. botan. Ges.* 53, 197-220 (1935).—When growth substance is applied to a stem parallel to the main axis, bending takes place and when applied transverse to this

axis a retardation of growth in length and an increase in thickness results. With the *Avena* coleoptile there is no increase in thickness but pos bending takes place on transverse application. These results are explained on the basis of pre-existing streams of growth substance in plant organs in parallel and transverse directions which det. the form of the cells, when added growth substance is applied this balance is altered and various changes in cell shape and therefore the plant organ occur. Lawrence P. Miller

Root growth, growth substance and the theory of growth substance action. A. Th. Czaja. *Ber. deut. botan. Ges.* 53, 221-45 (1935). cf. preceding abstr.—On the basis of the geotropic behavior of roots under the exptl. conditions described C. concludes that there are 2 opposing streams of growth substance in roots in the longitudinal direction, one emanating from the root tip and the other from the growing point of the top. C. discusses the work of Ramshorn (*Planta* 22, 737) on the p. d. between growing points and the rest of the plant and the effect of growth substance on this potential difference, and the action of growth substances in inducing neg. osmosis as a possible explanation of the mode of action of these substances on the cell. Lawrence P. Miller

Investigations on the uptake of fluorescent substances by living plant cells. Helmut Döring. *Ber. deut. botan. Ges.* 53, 415-37 (1935).—With the aid of the luminescence microscope the uptake of eosin, erythrosin, fluorescein, trypanflavine, quinone, hydrastine, acridine, esculin and esculetin by living cells (usually from the outer scale of *Allium cepa*) was studied. The fluorescence of tissues stained by eosin differs in living cells from that of dead cells indicating a difference in the physicochem. union. Fluorescein is taken up from acid soln. by the nucleus, plasma and plastid starch and from alk. soln. by the vacuoles. Lawrence P. Miller

Effect of ethylene on apples at low temperatures: evidence for the production of ethylene by unripe, immature fruit. F. Kidd and C. West. *Dept. Sci. Ind. Research, Rept. Food Investigation Board* 1934, 119-22 (1935). cf. C. A. 24, 2491.—From the expts. described it is tentatively concluded that C_2H_4 is produced by quite unripe and immature fruit and not only, as has been previously thought, by ripe fruit, and that there must be a threshold value for the stimulating dose, below which no effect is produced. A. Papineau-Couture

Combustible gaseous products of fruits. R. Gane. *Dept. Sci. Ind. Research, Rept. Food Investigation Board* 1934, 124-8 (1935).—Total combustible gaseous substance produced by a known wt. of oranges at 15° was measured. When ventilation was maintained at a steady rate, the quantity of combustible matter in the airstream remained const. so long as the fruit was sound, but with the onset of fungal attack the rate of output, both of CO_2 and of combustible substance, greatly increased. If the combustible matter is an essential oil with a framework of, say, C_{10} , the concn. of the substance would be of the order of 1 p. m. (by vol.) in the air stream. On removing the outer layers of the peel contg. the oil glands, the amt. of combustible matter in the air stream and the rate of production of CO_2 were both approx. doubled. In similar expts. with bananas, the ratio of CO_2 derived from the combustible gaseous products to that produced directly in respiration was about 1:250 in the unripe green stages and decreased as the peak of respiratory activity was reached. The level of respiratory activity was raised by ventilating the fruit with O_2 , but the amt. of combustible gaseous substances produced was unchanged. A large and rapid increase in combustible gases occurred in the later stages of ripening, at the time when the rate of respiration started to increase once more. Tests so far conducted indicated that injury to green fruit is without effect on the time of ripening. Both the O_2 and the IO_2 methods were found unsuitable for estg. the volatile substances produced by apples, probably because substances with a carboxyl group can react with O_2 or IO_2 to give unstable peroxides which, in presence of H_2O , yield H_2O_2 , which liberates I from KI. A. Papineau-Couture

Effect of ammonia and of hydrochloric acid on the

respiratory activity and the climacteric in apples. F. Kidd and C. West. *Dept. Sci. Ind. Research, Rept. Food Investigation Board* 1934, 130-2 (1935).—In contrast with the action of CO_2 , HCl (at a concn. of 50 p. m.) exercises no appreciable influence on the pitch of respiratory activity of apples and does not stimulate the onset of the climacteric. NH_3 (1000 and 400 p. m.), on the other hand, had an immediate effect; respiration was stimulated, and a day or 2 later the climacteric occurred. These results support the suggestion that the onset of the climacteric is connected with changes in acidity in the cell, and that it occurs when, in the presence of O_2 , the acidity has fallen to a crit. value (cf. C. A. 29, 2998). They are, however, opposed to those of Thornton (C. A. 27, 5780-1, 29, 4404) and of Gane (following abstr.). A. P.-C.

The effects of ozone on bananas. R. Gane. *Dept. Sci. Ind. Research, Rept. Food Investigation Board* 1934, 128-30 (1935).—The rate of production of CO_2 by green bananas at 15° was measured in atm. contg. different concns. of O_3 . If the fruit is within a few days of its period of rapid ripening, ventilation with air contg. 40 p. p. m. O_3 is not effective in retarding the process, but if exposed at an earlier stage the retardation may be very evident. The rate of production of CO_2 in air contg. 25-30 p. p. m. O_3 is only slightly higher than in ordinary air; ripening in the ozonized air was considerably retarded. With 5-7 p. p. m. O_3 there was no significant change in the rate of respiration or in the rate of ripening. A concn. of 15 p. p. m. O_3 did not appreciably affect the output of CO_2 or delay ripening. A. P.-C.

Acidity and sugar content of bananas during ripening. R. Gane. *Dept. Sci. Ind. Research, Rept. Food Investigation Board* 1934, 132-3 (1935).—The acidity of the pulp of bananas, as measured by the glass electrode, changes very rapidly during ripening at 15°. The pH of various samples of green unripe fruit showed little variation, ranging from 5.20 to 5.50. As soon as ripening commenced and respiration started to increase there was an increase in the acidity of the pulp; the fall in pH continued until well after the peak of respiratory activity, and reached a max. at pH 4.34. Further changes in pH were small, and the rise which followed occurred at the time when the characteristic aromatic odor was produced. At 0° there was a slight rise in pH in 16 days, during which time the rate of production of CO_2 was unchanged. A table is given showing the increase in respiration (mg. CO_2 per kg. per hr.), percentage of reducing sugar, sucrose and total sugar over a period of 13 days. A. Papineau-Couture

Effect of temperature on the sucrose/hexose relation in potatoes. J. Barker. *Dept. Sci. Ind. Research, Rept. Food Investigation Board* 1934, 133-5 (1935).—Curves are given showing the changes in total sugar, sucrose, hexoses and the sucrose/hexose ratio when potatoes were changed from 10° to 1° and vice versa. The results suggest that sucrose and the hexose sugars are readily interconvertible in the potato and that their relative proportions are detd. by a balancing mechanism which is strongly influenced by change in temp. The balance is disturbed in favor of the formation of sucrose by a fall of temp. from 10° to 1°, and vice versa. A. Papineau-Couture

Metabolism of nitrogen by apple fruits during development on the tree and in storage. A. C. Hulme. *Dept. Sci. Ind. Research, Rept. Food Investigation Board* 1934, 135-43 (1935).—The study was carried out with the previously described method (C. A. 29, 4290). The fresh wt. of pulp per apple continues to increase up to maturity, but the fresh wt. of peel reaches an asymptotic value early in the fruit's development. Presumably when this value is reached the cells of the peel merely stretch longitudinally to allow for the continued swelling of the pulp tissue; this is supported by the cytological observations of Tetley (*Rept. Food Investigation Board* 1932, 75). The change in total N confirms the results of Archbold (C. A. 27, 3234-5) and earlier workers. The rapid decrease in total sol. N (as percentage of total N) which occurs during the early development of the fruit in the case of both peel and pulp is striking. The final decrease in total N, protein and sol. N in the case of the pulp may possibly be

connected with the ripening of the seeds. During the climacteric rise in respiration there do not appear to be any violent changes in the total protein and total sol. N fractions. The increase in protein during storage at the expense of sol. N already reported is also apparent in the present expts. Results for the acid content of the fruit over the period of growth, taken in conjunction with the data for N, show that the acid cannot arise directly from products of the breakdown of protein as has been suggested by Ruhland and Wetzel (C. A. 22, 3182) for members of the Crassulaceae and for *Rheum hybridum*.

A. Papineau-Couture
Respiration of pea seeds. A. J. M. Smith and R. Gane Dept. Sci. Ind. Research, Rept. Food Investigation Board 1934, 147-52 (1935).—A study of the respiration of green peas under various humidity conditions and in atmos. of various compns. apparently established the existence of 2 stages in the respiratory phenomena of germination, which it seems reasonable to relate to the stages that have been shown by Kipp (J. Wiss. Bot. 71, 533 (1929)) to occur in the germination of the light-sensitive seeds of *Nicotiana tabacum*, where light is the necessary stimulus to the second phase.

The occurrence of adenosinetriphosphoric acid in living yeast. H. v. Euler, E. Adler and M. Petrusson *Stenskt Kem. Tids.* 47, 249-51 (1935) (in German).—Adenosinetriphosphoric acid is definitely identified in yeast and functions in the same manner as is muscle.

A. R. Rose
The action of certain metals at a distance, in contact, and in solution on the development of *Thielavia basicola* Zopf. and on that of other fungi. C. Sempio. *Riv. pat. reg.* 24, 413-91 (1934); *Rev. Applied Mycol.* 14, 646-7.—At a distance of 1-2 mm. from the conidia of *Thielavia (Thielaviopsis) basicola* in hanging-drop broth cultures Pb prevented germination altogether or retarded growth considerably; the mycelium developed characteristic swellings and rosette formations, and conidia were scarcely ever produced. If the Pb was removed before or at the commencement of germination the fungus at once began to grow rapidly. Cu and Al very slightly retarded the early stages of development while Pt, Ag and Au had practically no effect on germination and only a slightly depressive effect on growth of the germ tube. When Cu, Al or Ag fungi were placed in contact with the conidia of *T. basicola* in hanging-drop broth cultures, growth was completely inhibited as a result of passage of large amts. of the metals into colloidal soln.; Au and Pt fungi had practically no effect and Pb was only slightly depressive. $\text{Cu}(\text{NO}_3)_2$ (0.001 M), $\text{Al}(\text{NO}_3)_3$ or $\text{Pb}(\text{NO}_3)_2$ (both at 0.0001 M) contg. 2% sucrose and glycerol had practically no effect on the conidia of *T. basicola*; AuCl_3 had a slight effect, and PtCl_4 still more; AgNO_3 (all at 0.0001 M) completely inhibited growth. While there was a certain parallel between the effects produced by the metals in contact with the fungus and those produced by the same metals in soln., no parallel existed between these effects and those produced by the same metals at a distance. When the metals were placed at a distance of 1-2 mm. from the spores of *Erysiphe graminis* and *Puccinia graminis* in water or broth hanging-drop cultures practically no effect was produced. Oden E. Sheppard

Anthocyanins from the flowers of *Pharbitis nil* (Kataoka) 10. Anthocyanin pigment of the flowers of deep-blue hyacinth (Hayashi) 10.

Ascorbic acid in internal glands. Isolation from hypophysis. Jorge R. Mendive and Venancio Deuloufo. *Z. physiol. Chem.* 236, 208-11 (1935).—Colorimetric detns. on various glands of Argentine steers showed that

hypophysis, corpus luteum and the suprarenal contain considerably more ascorbic acid than the other glands. Thymus and spleen take an intermediate place in the table, then follow testis, pancreas and thyroid with only a small ascorbic acid content. Ascorbic acid was isolated as such from hypophysis, and as vitamase from corpus luteum.

A. W. Dor
Comparative investigations on the vitamin C (ascorbic acid) content in blood and in cerebrospinal fluid. F. Plaut and M. Bülow *Z. physiol. Chem.* 236, 241-56 (1935), cf. C. A. 29, 5162.—Ascorbic acid occurs in the cerebrospinal fluid of man and rabbit only in its reduced form. In the blood it occurs predominantly in its reversibly oxidized form. Its reduced form is demonstrable after copious feeding of vitamin C. Variations in the ascorbic acid picture of the blood involve only the reduced portion. Blood cannot oxidize ascorbic acid either *in vitro* or *in vivo*. When introduced into the circulation ascorbic acid passes out without being oxidized. Administered orally it reaches the blood in its reduced form and is carried away as such. Spinal fluid cannot reduce reversibly oxidized ascorbic acid *in vitro*. When injected into the spinal canal the oxidized acid does not undergo reduction and is absorbed more rapidly than the reduced acid. Ascorbic acid is able to pass from the blood into the spinal fluid, and when injected into the spinal canal it can pass into the blood; but there appears to be a mechanism which under physiol. conditions controls its release from the spinal fluid. Reduced ascorbic acid entering the blood is very rapidly removed. This explains why with moderate vitamin C intake reduced ascorbic acid is not as a rule demonstrable in the blood, and with copious intake it is found only in small quantities. The oxidized ascorbic acid of the blood is not appreciably affected by the vitamin C metabolism. Ascorbic acid remains a longer time in the spinal fluid, regardless of its mode of access, than in the blood stream. These observations explain why excess and deficiency of vitamin C are more easily recognized by spinal fluid examn. than by blood examn. There is no evidence that the nervous system can reduce ascorbic acid.

A. W. Dor
Changes in the sensitivity of rachitic rats for vitamin D. J. van Niekerk. *Arch. nêrland. physiol.* 20, 477-80 (1935).—In order to reconcile values obtained in the biol. assay of the substance "D" with the activity in International Units, it is assumed that the sensitivity of the exptl. animals has fallen to about 1/4 of the original value over the period 1920/1932.

F. L. D.
The physiological action of vitamin B₁. H. G. K. Westenbrink. *Arch. nêrland. physiol.* 20, 481-4 (1935); cf. C. A. 28, 2448.—It is quite probable that polyneuritis resulting from the lack of B₁ is the result of chronic poisoning produced by the degradation products of carbohydrates.

F. L. Dunlap
Feeding experiments with marrow stem cabbage. H. Binger, A. Werner, J. Schultz, H. Augustin and H. Finzenhagen. *Biedermanns Zentr. B. Tierernähr.* 7, 325-43 (1935); cf. *Ibid.* 5, 450-68 (1933).—In 3 years of feeding tests, 40 kg. of beet roots was compared with 40 kg. of marrow stem cabbage, with dairy cows. In 2 trials, 1-2 kg. of protein-rich concentrates was withdrawn from the ration during the marrow stem cabbage period, while at the same time starch values were added in the form of dried cuttings or of potato flakes. Marrow stem cabbage affected the milk yields favorably, but the percentage of milk fat did not increase. Marrow stem cabbage affected the live wt. of cows less favorably than beets. F. L. D.

Experiments on feeding skim milk powder to laying hens. G. Wiegner and A. Tscherniak. *Biedermanns Zentr. B. Tierernähr.* 7, 344-60 (1935).—Dried skim milk produced a somewhat smaller egg yield than cod meal.

F. L. Dunlap
The acid-base equilibrium of cattle as influenced by hay and grass silage without mineral acid addition. E. Brouwer and N. D. Dijkstra. *Biedermanns Zentr. B. Tierernähr.* 7, 361-71 (1935).—The pH and total CO₂ content of the urine were somewhat lower in the silage groups than in the hay groups. Nevertheless the urine

in all the silage groups remained strongly or rather strongly alk. From this it may be concluded that the org. acids were for the most part oxidized and that mainly alk. metabolic products were produced from the silage rations. There was no shift in the acid-base equil. as might be caused by an accumulation of the org. acids in the blood before their oxidation, for the pH and the total CO_2 of the blood plasma were practically the same in both the silage and the hay groups. F. L. Dunlap

Total metabolism experiments on rats with special reference to the influence of vitamin D. W. Schoch. *Biedermanns Zentr. B. Tierernähr.* 7, 382-443 (1935).—A study of energy metabolism under the influence of vitamin D. The expts. were conducted on white rats in a new exptl. cage and in a respiratory app. The results show that vitamin D has no effect on energy metabolism or on the digestibility of protein. The differences between results obtained with rachitic and nonrachitic rats in fasting as well as in feeding expts. were within the exptl. error. In detg. the net energy, measured as protein and fat increase, the thermal energy was calcd. F. L. Dunlap

Treatment of human beriberi with crystalline antineuritic vitamin A. J. Hermano and Froilan Eubanas. *Philippine J. Sci.* 57, 277-87 (1935).—The material employed in this preliminary report was cryst. vitamin B₁ hydrochloride prep'd from rice polishings. One-cc. injections were given by intramuscular injection at each treatment, each cc. contg. 1 mg. of the salt. Twelve cases were treated, 10 adults and 2 infants. The results were such as to give promising indications of curing human beriberi. Nineteen references. F. L. Dunlap

Effect of vitamin B (B₁) insufficiency upon the nervous tissues of young dogs. C. O. Prickett. *Ala. Agr. Expt. Sta., 45th Ann. Rept.* 19-20 (1934).—The macroscopic and histol. changes due to vitamin B deficiency are outlined. The brain lesions and spasticity were marked. The deficient diet contained 28% fat and 8% autoclaved yeast. C. R. Fellers

Utilization of nitrogen, calcium and phosphorus by the growing chick. C. W. Ackerson, M. J. Blish and F. E. Muschel. *Neb. Agr. Expt. Sta., Research Bull.* 80, 3-16 (1935).—The N, Ca and P contents of 125 newly hatched chicks were det'd. Thirty chicks were fed accurately for 60 days at the end of which time the retention of N was 37.8%, Ca 43.4% and P 27.3% of the resp. elements fed. The av. gain in live wt. per g. of N fed was 12 g.; the rate of gain was 41.5% of the dry matter fed. The coeff. of variability was approx. 5% except for the Ca figures, which had a variability of 8%. Forced feeding of a pelleted ration permits of accurate control of the food intake of baby chicks. No significant sex differences in the utilization of the nutrients were observed. C. R. F.

Vitamin A requirements for growing chicks. A. E. Tepper and F. D. Reed. *N. H. Agr. Expt. Sta., Bull.* 284, 24 (1935).—In a ration deficient in vitamin A little difference in wt. was found in chicks fed 1, 2 or 3% of cod liver oil. One group of chicks fed 0.5% sardine oil plus irradiation showed less wt. gain than the cod liver oil groups. No macroscopic vitamin A injury resulted from any treatment. C. R. Fellers

Sardine oil versus cod liver oil (for chicks). A. E. Tepper. *N. H. Agr. Expt. Sta., Bull.* 284, 24 (1935).—The New England College Conference poultry ration plus 0.5% sardine oil proved equally as efficacious as 1% cod liver oil. There was a slight growth retardation when only 0.25% of the sardine oil was used in the chick ration. C. R. Fellers

Vitamin B in cottonseed meal. F. W. Sherwood and J. O. Halverson. *N. Car. Agr. Expt. Sta., 46th Ann. Rept.* 44-5 (1933).—Five samples of cottonseed meal averaged 3-4 International Units of vitamin B per g. Fleischmann's yeast contained 6 units and Northwestern yeast 12.5 units per g. Peanut meal contained 2-2.5 units per g. Both yeast samples were of equal vitamin G potency. Cottonseed and peanut meals were 12.5% as rich as the yeast in vitamin G. C. R. Fellers

Menhaden fish oil as a source of vitamin D for growing chicks. J. O. Halverson and R. S. Dearystine. *N.*

Car. Agr. Expt. Sta., 46th Ann. Rept. 62 (1933).—By supplementing the basal ration of Hart (cf. C. A. 27, 527) by that of Lachat, Halverson and Palmer (C. A. 27, 527) with 1/2 and 1% menhaden fish oil, lots of 20 standardized young chicks showed degrees of bone ash and growth comparable to similar amts. of cod-liver oil.

C. R. Fellers
Study of the food habits and physical development of preschool children over a two-year period, with special reference to seasonal variations in growth. Hughina McKay and Mary Brown Patton. *Ohio Agr. Expt. Sta., Bull.* 549, 72 pp (1935); cf. C. A. 29, 5487.—Children from 19 to 40 months of age were used as the subjects of careful dietary and phys. studies at 4 seasons during a 2-year period of study. Total protein in relation to height was more significant than in relation to wt. While age had no significant relationship to protein intake, total Ca showed a significant relationship to height but practically none to age and wt. Total P was related to both height and wt. Age, wt. and height were all significant in regard to Fe intake, wt. having a higher value than the other 2. In 9 out of 15 instances, high intakes in regard to cal. per kg., protein per kg., total Ca, total P, P per kg., total Fe and Fe per kg. were found during the periods of greatest gain in wt. C. R. Fellers

Vitamin D requirements of chickens. R. R. Murphy, J. E. Hunter and H. C. Knandel. *Pa. Agr. Expt. Sta., Bull.* 320, 27 (1935).—When denied access to sunlight growing chicks required 34 U. S. P. units of vitamin D per 100 g. of feed; laying hens required double this amt.

C. R. Fellers
Action of vitamin D on the circulation and blood vessels. H. Handovsky and N. Goormaghtigh. *Compt. rend. soc. biol.* 120, 74-9 (1935).—In dogs large repeated doses of vitamin D first stimulate the cellular activity of the smooth muscles of the blood vessels, then bring about atrophy and necrosis. In the first stage the reaction to small doses of adrenaline is inverted; in the second stage there is sensitization to the hypertensive action of adrenaline and signs of hyperthyroidism. L. E. Gilson

Histological study of the effects produced (in rats) by large doses of carotene, carrot lipides and vitamin A. Tomás Ocaña. *Rev. soc. argentina biol.* 11, 147-54 (1935); *Compt. rend. soc. biol.* 120, 267-9 (1935).

L. E. Gilson
Biochemistry of vitamin A. I. State of combination of vitamin A in liver oils. Ladislav Reti. *Rev. soc. argentina biol.* 11, 283-90 (1935); *Compt. rend. soc. biol.* 120, 577-80 (1935).—Livers of fish, chickens and various mammals were exam'd. In every case the vitamin A (polyene alc.) was all combined with fatty acids. Methods are described. L. E. Gilson

The anemias of nutritional deficiency. Geo. R. Minot. *J. Am. Med. Assoc.* 105, 1176-9 (1935).—Address

F. P. Griffiths
Low-calorie, low-fat, ketogenic diet for treatment of infections of the urinary tract. Reed M. Nesbit and C. H. McDonnell. *J. Am. Med. Assoc.* 105, 1183-4 (1935).—A low-fat, low-calorie diet supplying 0.66 g. protein and 0.33 g. carbohydrate (no sugar) per kg. body wt. produced ketosis without gastric disturbances. Ketosis is dependent on the inadequacy of available glucose and not on amt. of fat ingested. F. P. Griffiths

Variations in phosphatase content of bone, kidney and blood in experimental rickets. G. Scow. *Bull. soc. ital. biol. sper.* 10, 823-6 (1935).—During exptl. rickets in rats the phosphatase of the blood increased normally while that of the kidney and bone was below normal. During recovery there was a marked increase in phosphatase in bones and kidney with a diminution from the blood. H. L. G.

Control and reparation of the international standard of vitamin B. Antonio Allegri. *Boll. soc. ital. biol. sper.* 10, 836-9 (1935).—A daily dose of 80 mg. of the international standard was an adequate vitamin B ration for pigeons. In some cases this dose caused severe and even lethal enterorrhagia. A new method of prep'g. the standard is given. Rice husks are ext'd. for 2 days in H_2O acidified to pH 4.5 with H_2SO_4 . After filtration fuller's

earth is added to the liquid, shaken for 24 hrs., filtered, dried and washed with H_2O and alc. Three kg. of the adsorbate represents the vitamin B_1 content of 100 kg. rice husks and 11.25 mg. of the final product corresponds to 10 mg. of the international standard. H. L. Gruehl

Sunflower-seed diet in experimental polyneuritis. Antonio Allegri. *Boll. soc. ital. biol. sper.* 10, 339-43 (1935).—The oil extd. from the seeds had no preventive or curative action on avitaminosis B in pigeons. The vitamin B seemed to be contained entirely in the residue from the extn. After a year of sunflower-seed diet the vitamin B reserve was lower than normal. H. L. G.

Nutritional treatment of acne vulgaris. Charles Lerner. *Arch. Dermatol. Syphilol.* 31, 520-31 (1935).—Twenty acne patients were put on a diet in which the table salt was equilibrated with Ca, K and Mg, for 13 weeks. Good results were obtained with the pustular and indurated types of acne. O. Hartley

Supplementing casein with cystine 12 and 24 hours before and after the casein meal. Lauri Paloheimo. *Suomen Kemistilehti* 8B, 31 (1935) (in German).—A preliminary report. The addn of 3% cystine N to the casein N gave a noticeable displacement in the N balance in the pos. direction in exptl. rats. F. I. Jukkola

Protein supplements in poultry rations. V. Copra meal as a supplement in rations for growing chicks. F. M. Fronda and Manuel P. Mallonga. *Philippine Agr.* 24, 350-56 (1935), cf. C. A. 28, 3436.—Copra meal is not a good source of protein for growing chicks. A. L. Mehning

Chemical constitution and biological properties of the complex lipids of the carrot. D. Romoli-Venturi and A. Pugliese. *Biochim. terap. sper.* 22, 421-57 (1935).—The following substances were obtained: (1) A phospholipid of vitamin reactions corresponding to A and D and contg. Ca, P and N in org. linkage. R. V. discusses the possible structure of this substance. (2) Pure carotene. (3) A compd. showing the phys.-chem. characteristics of A, free from carotene. (4) A carotene-free compd. with the characteristics of E. Vitamin D was present in all fractions. The biol. properties were substantiated by extensive biol. expts. A. E. Meyer

The maximal concentration of urine, its investigation and diagnostic value in renal insufficiency. Manuel E. Varela. *Serapa. id.* (Buenos Aires) 1935, II, 130-5.—Normal persons on a diet rich in protein and low in liquids eliminate a urine of 1 030-40 sp. gr. A decrease of the sp. gr. occurs in beginning renal insufficiency when the nonprotein N in the plasma is not yet increased. There is a parallelism between deficit in concn. and elimination of phenolsulfonphthalein. A. E. Meyer

The dietetic factor determining the glucose tolerance and sensitivity to insulin of healthy men. H. P. Himsworth. *Clin. Sci.* 2, No. 1, 67-94 (1935), cf. C. A. 29, 2582.—The area falling above the resting blood-sugar level or below the insulin depression curve is constant for normal human beings so long as the diet remains unchanged. Improvement in glucose tolerance with the change from a diet low in carbohydrate and high in fat to a diet high in carbohydrate and low in fat is due solely to carbohydrate, and not to caloric intake, fat, protein or the ketogenic ratio. The development of insulin sensitivity is independent of the dose of insulin administered. Changes in glucose tolerance may be accounted for by changes in the pancreatic insulin secretion. The greater the carbohydrate intake in the diet, the greater is the sensitivity to insulin. James C. Munch

The diet of diabetics prior to the onset of the disease. H. P. Himsworth. *Clin. Sci.* 2, No. 1, 95-116 (1935).—The diet of 143 diabetics was compared with that of 258 normal persons. The majority of the diabetics had preferred a diet contg. excess fat, whereas a smaller no. than the normal preferred excess carbohydrate diet. Diabetics had chosen diets with greater caloric value. The habitual ingestion of a low carbohydrate diet may cause progressive impairment of sugar tolerance and insulin sensitivity, resulting in diabetes. James C. Munch

Diet and the incidence of diabetes mellitus. H. P.

Himsworth. *Clin. Sci.* 2, No. 1, 117-48 (1935).—In world-wide studies of distribution of diabetes and its increase during the last 30 years, high incidence was found in countries with a diet low in carbohydrate and high in fat. This explains the higher incidence in the city than in the country. There was no relation to consumption of excess sugar or alc. Caloric value of the diet did not appear to be a factor. Increase in diabetes during the last 30 yrs. was assocd. with increase of fat in the diet. James C. Munch

Preliminary observations on vitamin A deficiency as shown by studies with the visual photometer. Ira O. Park. *J. Oklahoma State Med. Assoc.* 28, No. 10, 357-64 (1935).—The effect of oral administration of carotene in oil to 275 patients was followed by the Jeans and Zentmire technique (*J. Am. Med. Assoc.* 102, 812-5 (1933)). Low A intake was assocd. with the production of rhodopsin.

There is a possibility that vitamin A is destroyed by the toxin of measles. Clinical improvement was observed after the administration of carotene in gastrointestinal, sinus, kidney, nervous, mental and circulatory disturbances, diabetes, leucemia, pernicious anemia and night blindness. The addn of vitamin B as brewers' yeast was beneficial in certain cases. James C. Munch

Dilatometric method for studying the digestibility of meals "in vitro". Kamala Bhagvat and Motnahalli Sreenivasaya. *Proc. Indian Acad. Sci.* 2B, 316-21 (1935).—The dilatometer previously described, C. A. 26, 4610, is shown to be suitable for the study of the tryptic digestion of skimmed cow milk and of a casein soln. in phosphate buffer. The 2 solns. are digested at the same rate, if the protein N of cow milk is considered to be 87% of the total N in milk. W. Gordon Rose

Some aspects of dietetics. Anon. *Pharm. J.* 134, 250-60 (1935).—A review of modern principles in dietetics is given, e. g., balanced food, dietary means of preventing constipation, the use of soybean milk in infant feeding (cf. C. A. 27, 2716), ketogenic diet treatment (cf. C. A. 28, 3474, 4456, 6458) etc. S. Waldbott

The effect of diet on the hemoglobin concentration of the blood. L. N. Ellis and O. A. Hessey. *Am. J. Physiol.* 113, 582-5 (1935).—Hemoglobin detrs. on rats were made at 1 month and 1 year of age to study the influence of 5 diets. At 1 month of age the hemoglobin concn. increased along with the Fe content of the ration. A max. of 12.6 g. per 100 cc. was obtained. At 1 year of age the hemoglobin concns. were independent of the Fe content of the diet. E. D. Walter

A comparison of the anemia produced by feeding young rats upon human, cow and goat milk. Howard H. Beard and Thomas S. Bogess. *Am. J. Physiol.* 113, 642-6 (1935), cf. C. A. 27, 5382.—The feeding of human milk did not produce anemia. The drop in erythrocytes and hemoglobin in cow-milk anemia was slower than in goat-milk anemia. Hypertrophy of the heart muscle, atrophy of the spleen and fatty degeneration of the liver were the most consistent gross pathol. findings in the anemic rats. The importance of Fe in preventing these changes was discussed. The pathol. findings in goat-milk anemia are not similar to those in pernicious anemia of man, and any close relationship between both types of anemia must be denied. Fe, with and without Cu, prevented the onset of goat-milk anemia. E. D. Walter

Further observations upon the origin of creatine from proteins and amino acids. Howard H. Beard and Thomas S. Bogess. *Am. J. Physiol.* 113, 647-53 (1935); cf. C. A. 26, 4085.—Rats were fed complete synthetic diets contg. either 4% casein or egg albumin as the sole protein for a period of 5 weeks. Rerfeeding these rats on 25% of casein, or egg albumin, or 21% of glycine or glutamic acid, for a period of 4 more weeks, caused av. increases in the total creatine of the muscles from 20 to 50% above the control animals on the 4% protein diets. Total N, fat and total solid content of the muscles of all rats showed very little change. Creatine is shown to be a product of the exogenous catabolism of proteins and amino acids. E. D. Walter

Synthesis of lactoflavin (Kuhn, *et al*) 10 Titration curves and dissoc const of L-ascorbic acid (Kumler, Daniels) 2

HOMER W SMITH

The male sex hormone and its artificial preparation in the laboratory. L. Ruzicka *Bull. soc. chim.* [5], 2, 1497-1512 (1935); cf. *C. A.* 29, 3710¹—Lecture with bibliography of 34 references. C. R. Addinall

Diffusion of lactic acid into and out of the voluntary muscles of the frog. Abdul Ghaffar. *Quart. J. Exptl. Physiol.* 25, 229-39 (1935)—Observations on the diffusion of d-lactate in and out of resting frog muscle during immersion in a Ringer sola. contg. Na d lactate show that only about 1/4 of the muscle H₂O appears to be involved in the diffusion process, the rest appearing to be shut off by membranes impermeable to lactate. These 2 portions of muscle have been termed "interspaces" and "cells," resp. In the fatigued muscle the interspaces tend to disappear presumably because of swelling of the cells. In heat rigor almost all of the muscle H₂O becomes available for the diffusion of lactate. An excited state of the isolated muscle does not appear to render the membranes bounding the cells permeable to lactate. The normal lactic acid concn in the cells of isolated frog muscle is found to be lower than that in the interspaces whether the frog is fresh or has been previously cooled or fatigued. The 2 values rise and fall together. This parallelism suggests that the intact animal possesses some mechanism by which a relationship is maintained between the concn. of cells and interspaces. Rachel Brown

Diffusion of iodide into and out of the voluntary muscles of the frog. Abdul Ghaffar. *Quart. J. Exptl. Physiol.* 25, 241-5 (1935), cf. *C. A.* 29, 6944¹—Observations on the diffusion of iodide into frog muscle when immersed in Ringer sola. contg. NaI show that with fresh muscle only about 1/4 of the muscle H₂O appears to be involved in the diffusion process. In muscle in heat rigor, iodide diffuses through almost all of the muscle H₂O. The diffusion const. of iodide through fresh muscle is 1.2×10^{-4} and that through muscle in heat rigor is 8.5×10^{-4} . The diffusion constant of iodide through 2% agar gel is 9×10^{-4} . Rachel Brown

The antagonodotropic effect of epiphysan. Paul Engel *Wien klin. Wochschr.* 48, 1160-1 (1935)—The active agents of the pineal gland are contained in epiphysan (Richter). Biol. tests gave a content of 80 rat units of the antitumorizing substance per ampoule. D. B. Dill

Urne melanogen. Otto Furth and Alfred Friedrich *Wien klin. Wochschr.* 48, 1175-7 (1935); cf. *C. A.* 29, 7447¹—The mol. relation, with S as unity, is $C_{16}H_{11}N_4SO_5$. D. B. Dill

Experiments on the electrical excitability of the eye. H. D. Bouman. *Arch. neerland physiol.* 20, 430-45 (1935)—Twenty-six references. F. L. Dunlap

Effects of thyroidectomy on the lipide, fat acid, cholesterol and protein contents of the blood serum and the protein-lipide ratio. C. I. Parhon and I. Ornstein *Bull. soc. chim. biol.* 17, 1119-23 (1935)—Male and female rabbits 3-4 months old were thyroidectomized. After 2-3 weeks the total lipide, fat acid and cholesterol contents of the serum had almost doubled while, the protein content was practically unchanged. The protein-lipide ratio had decreased to 19.9 from an original av. value of 31.4. Fifteen references. L. E. Gilson

Fixation of potassium in birds and fish. A. Leulier and F. Paulant *Bull. soc. chim. biol.* 17, 1124-36 (1935), cf. *C. A.* 28, 2762¹—K detns were made on hen, duck, turkey and pigeon eggs, chick embryos (cf. *C. A.* 29, 3012¹) and young rainbow trout of various ages. L. E. Gilson

Albumose and peptone contents of muscles of horned cattle. I. A. Smorodintzev and N. N. Krulova *Bull. soc. chim. biol.* 17, 1149-50 (1935)—No albumoses or peptones could be detected in fresh beef muscle or beef stored 1-15 days at 1°. The method used consisted in

detg. the increase, if any, in free amino N after treating the sample with an erepsin prepn capable of digesting albumoses and peptones but not natural muscle proteins. Fifteen references. L. E. Gilson

The ammonia of human and cow milks. Michel Polonovski and Paul Boulanger *Bull. soc. chim. biol.* 17, 1178-83 (1935)—Very fresh cow milk contains 1 mg., or slightly less, per l and fresh human milk slightly over 1 mg. Cow colostrum contains 17-21 mg./l and human colostrum about 5. If the milk is made alk. by adding satd borax soln (pH 9.3) the NH₃ increases slightly in cow milk but not in human milk. Increase in NH₃ on standing is due to bacterial action. L. E. Gilson

Inactivation of adrenaline by extracts of various organs. J. Toscano Rico and A. Malafaya Baptista *Compt. rend. soc. biol.* 120, 42-5 (1935)—At pH 7.4 and 38°, synthetic L-suprarenine was rapidly destroyed by exts of dog spleen, guinea pig liver and guinea-pig and cat kidneys, much less rapidly by exts of dog kidney, rabbit spleen and dog, calf, hog and rabbit livers; and not at all by exts of cat spleen liver and intestine, hog spleen and various kinds of skeletal muscle. L. E. Gilson

Protein metabolism of *Chaetophractus villosus* B. Brauer. *Compt. rend. soc. biol.* 120, 361-2 (1935)—See *C. A.* 29, 7427¹. L. E. Gilson

Humoral distribution of sodium chloride in blood and effusions. G. Dell'Acqua *Boll. soc. ital. biol. sper.* 10, 765-8 (1935)—The av. values for NaCl (Rusznayk method (*C. A.* 27, 43, 4533)), from 104 cases, were 613.93 mg./100 cc for effusions (transudates and exudates) and 509.98 mg./100 cc for blood (serum and whole blood). Helen Lee Gruehl

Physicochemical investigations of human sweat. Gustav Illopi *Arch. Dermatol. Syphilis* 171, 301-12 (1935)—The pH of perspiration induced in 20 persons by heat varied with the diet and the alkali reserve of the individual, but followed these less closely than did urine pH. Na and Cl contents of the perspiration increased as the treatment progressed, but K, Ca and Mg concns fell. Twenty-five references. O. Hartley

Chemical study of chicken blood. Arcadio C. Gonzaga *Rept. New York State Vet. Coll.* 1933-34, 53-7.—The concns of sugar and nonprotein N in the blood are high during the early life of chickens, then gradually decrease with age. The increase in age is associated, with a slight increase in the level of the urea N and of Fe with a corresponding increase in hemoglobin and O vol. The uric acid content is higher in 1-day-old chicks and in those 2-4 months of age than in any other age groups. The venous blood has on the av. but slightly more sugar than the arterial blood; it has greater concn of total nonprotein N, urea N and uric acid, but less amts. of Fe, hemoglobin and O. K. D. Jacob

Chemical analysis of blood of five male and five female carabao. Lhas G. Posa. *Philippine Agr.* 24, 388-92 (1935)—The av. blood of the 10 carabao contained N 30.04, nonprotein N 28.53, urea 13.51, uric acid 1.67, creatinine 1.68, creatine 4.43, Cl as NaCl 477.29, Ca 28.19 and sugar 73.65 mg./100 ml. The serum Ca is more than double that usually given for other farm animals. A. L. Mehring

The mechanism of spontaneous hydrolysis of the organic phosphorus of the blood in vitro. G. De Toni and G. Graf. *Biochim. therap. sper.* 22, 395-410 (1935), cf. *C. A.* 29, 2215¹—While the inorg. P continuously increases in blood laked with H₂O, this is not the case when the phosphatase is destroyed with CCl₃CO₂H. Spontaneous chem. hydrolysis does not occur. A. E. Meyer

The ratio between dehydroascorbic and ascorbic acids in the liver, the heart and the adrenals in relationship to the administration of sympathetotropic substances. I. ernando Copello. *Biochim. therap. sper.* 22, 490-506 (1935); cf. *C. A.* 29, 8141¹—Excitation of the parasympathetic system with eserine or acetylcholine causes a decrease of the ratio dehydroascorbic acid (D): ascorbic acid in liver and heart, because of a diminution of the former. Paralysis of the parasympathetic with atropine causes an increase

of (I) in the liver and heart. The adrenals do not show an appreciable variation.

A. E. Meyer
Indicanemia during gestation, parturition and puerperium. Roberto A. Ferrari. *Rev. sudamericana endocrinol. inmunol. quimioterap.* 18, 690-701(1935)—The indican content in the blood of normal women varies between 0.03 and 0.12%. An increase during gestation, etc., as asserted by some authors was not observed.

A. E. Meyer
The metabolism of bone Donald Hunter. *Cambridge Univ. Med. Soc. Mag.* 12, No. 3, 115-32(1935)—11 effects of variation in Ca, P and calciferol intake, thyroxine, parathyroid exts and scurvy upon bone growth were followed by the madder method.

James C. Munch
The isoelectric point of animal tissues V The isoelectric point of certain cells G Yagurum. *Folia Anatomica Japonica* 8, No. 4, 465-72(1935). cf. *C. A.* 29, 7354¹—The isoelectric point for old and young rabbit epithelial cells from the esophagus was 4.2 and 3.2, duodenum 4.1 and 3.6, intestine 4.0 and 3.4, kidney glomerulus 7.0 and 4.6. Similar figures were obtained on epithelial cells of mice of various ages. For human erythrocytes of adults the isoelectric point was 0.70, for the fetus, 0.65.

James C. Munch
The role of heavy metals in animal metabolism J R E. Richardson. *Guy's Hospital Gazette* 49, 239-41(1935)—The spectroscopic identification of Na, K, Ca, Mg, I, e, Zn, Cu, Mn, Al, Rb and Sn is considered.

J. C. M.
A new study of heat production in man H T W Adams and E. P. Poulton. *Guy's Hospital Reports* 85, No. 1, 50-75(1935)—Carbohydrates and fats are burned in the fixed ratio of 1:1.33. On a fat and protein diet under basal conditions, a rise in R Q is associated with fall in O and const. CO₂. A carbohydrate diet, under the same condition, produces a rise in R Q with a fall in O, but an increase in CO₂. CO₂ results only from combustion, whereas O is involved also in the interconversion of fats and carbohydrates. When the R Q falls between 0.775 and 0.875, the correlation coeff., r , between CO₂ and heat production was 0.9503 \pm 0.00598. If heat is calcd. from CO₂, the output is too large with a high R. Q value, and too small with a low R. Q. J. C. Munch.

Does normal mental function depend on normal blood-sugar concentrations? Ellis Powell. *Tri-State Med. J.* 7, No. 5, 1421-2, 1431(1935)—Pancreatic involvement leading to hyperinsulinism with a fasting blood sugar of 48 to 60 mg. per 100 cc. produced marked depression of the mental functions.

James C. Munch
Changes in the muscle pigments. J. Brooks. *Dept. Sci. Ind. Research, Rept. Food Investigation Board* 1934, 30-4(1935)—In order to det. the influence of pressure of O on the rate of formation of methemoglobin, the rate of oxidation was measured at 30° at const. partial pressure of O ranging from 4.5 to 723 mm., the residue of the gas mixt. being N. The rate of oxidation (given by k) increased with decreasing pressure of O, and reached a max. at a pressure of 20-25 mm. The results are decisively in favor of the reaction consisting of reaction of O with reduced hemoglobin. The rate is not a simple function of the partial pressure of O, which may be due to the fact that the reaction between O and reduced hemoglobin is a surface reaction of the Langmuir type. It has been stated that the addn. of 10% CO₂ to air does not increase the rate of formation of methemoglobin in beef muscle and beef fat at 0°, and the above results agree with this conclusion. In the storage of chilled beef in 10% CO₂, no significant increase in the storage life (from the standpoint of bloom) can be expected by enriching the mixt. with O unless considerable amts. are added, e. g., to give roughly a total concn. of 60% O. For periods up to 60 days the addn. of O to the atm. should be unnecessary if the correct conditions of storage and air circulation and humidity could be defined. That the rate of discoloration of chilled beef stored in high concns. of CO₂ should be markedly greater than the rate in air alone was confirmed by the storage at -0.7° of 2 hind quarters from the same animal, one in 10% CO₂ and the other in 35% CO₂. A. P.-C.

Bile secretion. Hiroshi Toabe. *Nagoya J. Med. Sci.* 9,

31-56(1935).—A description of the effect of intramuscular, subcutaneous or intravenous injections of several substances on the bile secretion of dogs. Flow of bile to the duodenum was prevented by a ligature of the common bile duct. Secreted bile was collected from a fistula. Secretion of bile is influenced by a neural, humoral or humoral-neural mechanism. The first mechanism is characteristic of substances that are poisons of the autonomic nervous system; these poisons have but slight effect on the secretion of bile. Substances characteristic of the second mechanism are responsible for a large increase in the aq. constituent of bile. Substances responsible for the third mechanism are truly chologogue, since the increased bile secretion includes an increased amt. of bile solids.

W. Gordon Rose
Lymph sugar J W Heim, R S. Thomson and F. C. Bartter. *Am. J. Physiol.* 113, 549-51(1935). cf. *C. A.* 27, 2491, 28, 5111¹—A set of conditions which must be observed to establish a true basis for a comparison of the blood- and lymph-sugar levels has been formulated. When these conditions are satisfied, the sugar contents of lymph and plasma were nearly the same. The glucose-tolerance curves for simultaneously collected lymph and plasma of anesthetized and unanesthetized dogs were detd. The curves for lymph very closely resemble those of plasma. When sugar is given either by intravenous injection or by stomach tube, it enters the lymphatic system readily and is removed from the lymph at approx. the same rate as from blood.

E. D. Walter
Reflex liberation of circulating sympathin. A C Liu and A. Rosenbluth. *Am. J. Physiol.* 113, 555-6(1935). cf. *C. A.* 29, 8118¹—Stimulation of an afferent nerve in adrenalectomized rats under urethan anesthesia may lead to a delayed contraction of the denervated mitrating membrane. The response depends upon how many sympathetic nerves are intact in the animal and available for reflex activation. The agent responsible for the contractions is sympathin liberated reflexly into the blood. Sympathin may play a role as a hormone in certain physiol. conditions.

E. D. Walter
Effect of physical training on blood volume, hemoglobin, alkali reserve and osmotic resistance of erythrocytes. John E. Davis and Nathan Brewer. *Am. J. Physiol.* 113, 686-91(1935).

F. D. Walter
Acidosis as a factor of fatigue in dogs F. W. Schlutz, Minerva Morse and A. B. Hastings. *Am. J. Physiol.* 113, 595-601(1935); cf. *C. A.* 29, 6949¹—The effect of exptl. alkalosis and acidosis on the capacity of dogs for work was studied. Alkalosis induced by the administration of NaHCO₃ often reduced the capacity of dogs for muscular exercise although the acid-base balance of the blood was normal at exhaustion. Conversely, acidosis following ingestion of NH₄Cl often exerted a favorable effect and in no case appreciably reduced the capacity of the dogs for exercise. Ingestion of NaHCO₃ promoted the formation of lactic acid in the exercising dog while that of NH₄Cl depressed its formation. Acidosis accompanying phys. exercise is not to be regarded as a causal factor of fatigue in dogs.

E. D. Walter
The excretion of phenol red by the dog. James A. Shannon. *Am. J. Physiol.* 113, 602-10(1935); cf. *C. A.* 29, 7441¹—The excretion of phenol red in the dog was studied with special reference to the effect of plasma level. As the plasma level is raised the phenol red clearance falls, both absolutely and relative to the inulin clearance, until at plasma levels of above 25 mg. % the phenol red/inulin clearance ratio is less than 0.7. The depression of the phenol red clearance effected by raising the plasma level of the dye is reversible. The excretion of phenol red is not specifically influenced by phlorizin. Wide variations in urine flow appear to have no effect upon the clearance of this dye.

E. D. Walter
The influence of frequency of contraction of the isolated mammalian heart upon the consumption of oxygen. A. E. Cohn and J. M. Steele. *Am. J. Physiol.* 113, 654-8(1935); cf. *C. A.* 21, 1020—Expts. are described which confirm the observation that the rate at which dog hearts beat in heart lung preps. influences the consumption of O₂.

directly. Both in expts in which the hearts were driven by induction shocks and in those in which they were influenced only by the nature of the prepn. itself, the rate of O_2 consumption progressed about $1/4$ as fast as change in the rate of contraction. Elec stimulation itself had no effect on the rate of metabolism. E D Walter

Factors concerned in the arrest of contraction in an ischemic myocardial area. Robert Tennant. *Am J Physiol* 113, 677-82(1935).—Simultaneous registration of optical myograms and aortic pressure pulses indicate that abolition of myocardial contraction similar to that following coronary occlusion is produced in the presence of O_2 by KCl and NaCN, but not by CH_3CO_2Na . Perfusion of a ventricular zone in the normally beating heart with Na lactate in buffered blood-Locke's soln. similarly arrests contraction. This suggests that excess lactate is a factor in preventing contraction under anoxic conditions. This does not exclude change in pH as another possible mechanism. E D Walter

Sex hormones (Ruzicka, Wettstein) 10 Allo-1-pregnene-3,20-dione—specificity of corpus luteum activity (Butenandt, Mamoh) 10 Sex hormones and related substances (Dirschel) 10

H GIDEON WELLS

Carcinogenic hydrocarbons and their relationship to the sterols. J W Cook. *Chem Weekblad* 32, 563-6 (1935).—Review of historical development of recognition of the cancer-producing constituents of coal tar and earlier investigations, the development of fluorescence spectroscopy and the systematic study of synthetic carcinogenic hydrocarbons including a summary of the results obtained from the examn. of a complete series of tetra- and penta-cyclic hydrocarbons and a moderately wide range of benzanthracene derivs. The speculation is advanced that a meso H atom in a completely aromatic structure plays some role in the carcinogenic process. The isolation of 1,2 benzopyrene from coal tar and its synthesis are re-counted and an account is given of the cyclization of bile acid derivs., and the eventual synthesis of methylcholanthrene, a carcinogenic hydrocarbon related to the sterols. It is inferred that there is some enzymic factor present in the animal body which is capable of effecting dehydrogenation of the sterol ring system and that excessive activity of this factor may conceivably contribute to the production in vivo of carcinogenic compds. C R Addinall

The chemical variability of (tuberculous) primary infection and reinfection and the changes occasioned by carbonic and lactic acids. M. S. Gostev and R. A. Radkevich. *Z. Tuberk.* 72, 97-101(1935).—The chem. compn. of 3 primary infections and 3 reinfection foci are recorded. Qualitatively the foci resembled each other but quantitatively the primary infections showed a greater mineral content. As CaO and P_2O_5 , the percentages differed in the well known compn. of calcification. As a cause of exacerbation in tuberculosis the accumulation of lactic and carbonic acids in the tissues plays a part. The solvent action of acids on Ca depositions is significant. H J. Corper

Chloride in blood and urine in rheumatic infection. M I Krynski and I B Schulzko. *Wien klin. Wochschr.* 48, 1065-7(1935).—Cl concn in urine is low in acute rheumatic infections and returns to normal in convalescence. Blood Cl shows variations but these are not closely related to the progress of the disease. D B D

The pathological physiology of the infarct. III. Ammonia and lactic acid in necrosis and autolysis. G. Borger, H. Bayerle, T. Mayr and C. Peters. *Z. physiol. Chem.* 237, 113-20(1935), cf. C. A. 29, 6644'.—Infarcted tissue, resulting from ligation of the blood vessels, undergoes a coagulation necrosis wholly different from the autolysis of excised tissue. The 2 are readily distinguished by the difference in NH_3 content. During the 1st 20 hrs. the infarcted tissue shows a somewhat higher NH_3 content than normal tissue, then the NH_3 returns to the normal value. Probably an incipient autolysis occurs which is

soon checked by the onset of necrosis under control of vital processes. The excised tissue, on the other hand, rapidly undergoes autolysis, so that in a few days its NH_3 content is many times that of infarcted tissue. In infarcted tissue the pH increases and the lactic acid content decreases, while the reverse is true of autolyzing tissue. A W. D.

The nature of experimental catalepsy. A. van Harreveld and D. J. Kok. *Arch. nederl. physiol.* 20, 411-29 (1935).—Nineteen references. F. L. Dunlap

Fixation antigens of the tubercle bacillus. I. Fixation antigens contained in the lipid substances extracted from heat killed bacilli. Michel A. Macheboeuf, Georgette Lévy and M. Chambaz. *Bull. soc. chim. biol.* 17, 1194-1200(1935).—See C. A. 29, 5473'. II. Fractionation and purification of the active lipide fraction. Michel A. Macheboeuf and Antoine Bonnesol. *Ibid.* 1201-9. The active material obtained as above was further purified by repeated pptn. from $CHCl_3$ soln. by Me_2CO and by cold $MeOH$. III. Purification of the alexin fixing hap-

tene. Separation from phosphatides and removal of nitrogen-containing impurities. Some physicochemical properties of the active fraction. Michel A. Macheboeuf, Georgette Lévy and Marguerite Faure. *Ibid.* 1210-34. Other methods of isolating the active substance were tried. The purest product obtained contained 3.4% P and no N, carbohydrate, sterol or unsaponifiable material. It rapidly swelled and dispersed in water and was extd. by water from its Et_2O soln. L. E. Gilson

Polypeptide contents of blood and spinal fluid in general paralysis. Cyto-polypeptide dissociation. A. Prunelli. *Bull. soc. chim. biol.* 17, 1378-84(1935).—See C. A. 29, 4820'. L. E. Gilson

Relation of cell lysis (hemolysis and leucolysis) to the cholesterol content of pleural fluids. V. de Lavergne and P. Kissel. *Compt. rend. soc. biol.* 120, 151-2(1935).—In pathol. conditions the cholesterol content of the fluids is high, 10-240 mg. %. The cholesterol is liberated by lysis of white and red corpuscles. L. E. Gilson

Production of hyperpolydipidemia in rabbits by intra-peritoneal injections of peptone. O. Lambret and J. Driessens. *Compt. rend. soc. biol.* 120, 184-6(1935). L. E. Gilson

Histological changes in the spleen and in Jensen sarcoma grafts during regression of the latter due to the action of insulin. O. Lambret and J. Driessens. *Compt. rend. soc. biol.* 120, 188-90(1935); cf. C. A. 29, 6644'. L. E. Gilson

Experimental azotemia by injection of diphtheria toxin in the guinea pig. J. Chaher, M. Jeune and R. Fornier. *Compt. rend. soc. biol.* 120, 206-7(1935).—Many times the lethal dose was injected. The blood urea began to increase about 6 hrs. later and continued to increase as long as the animals lived. It averaged 0.16% at the end of the 15th hr. and in one which lived 3 days it reached 0.4% (normal is 0.03-0.04%). The adrenaline content of the adrenals decreased rapidly after the 6th hr. L. E. Gilson

"Index of polydipidemia" in experimental cancer in guinea pigs and in human cancer. René Loucq. *Compt. rend. soc. biol.* 120, 250-2(1935).—In absence of cachexia or infections there was no significant change in blood polydipptides. L. E. Gilson

Changes in the fibrinogen content of the blood in cancer. René Loucq. *Compt. rend. soc. biol.* 120, 253-5(1935).—In human cases and in exptl. cancer in guinea pigs the fibrinogen content was about doubled. L. E. Gilson

Effects of tumor extracts on virus and staphylococcus infections. G. Van Der Schueren. *Compt. rend. soc. biol.* 120, 261-3(1935).—In rabbits, exts. of various animal tumor tissues inhibited vaccine and herpes virus, had no effect on Shope's virus, and stimulated staphylococcus development. L. E. Gilson

The Donagógico reaction in diabetics. Paolo Brocca. *Boll. soc. ital. biol. sper.* 10, 737-8(1935).—Diabetes does not affect the Donagógico reaction which is pos. only when albuminuria accompanies the glucosuria. H. L. G.

Chemical constitution of the lipoma. Emanuele and Guido Stolfi. *Boll. soc. ital. biol. sper.* 10, 742-4(1935).—In a study of 6 cases there were no appreciable differences

in the constitution of the fats of the lipoma and the subcutaneous connective tissue.

Helen Lee Gruelch
Antigenic power of glycogen and amides. A. Giovannardi. *Boll. soc. ital. biol. sper.* 10, 771-80(1935).—Merkel glycogen and sol. amide produced some precipitins and complement-fixing bodies after repeated injection into rabbits.

Helen Lee Gruelch
Proteinemia in thyroid dysfunction. R. Olivetti and A. Bobbio. *Minerva med.* 1935, II, 430-46.—Serum proteins (Howe-Cionini method) were detd. on 52 persons. There was a hypoproteinemia with lowering of the albumin globulin ratio accompanying the syndrome of lowered basal metabolism while hyperproteinemia with hyperalbuminemia occurred in myxedema.

Helen Lee Gruelch
Porphyrin formation by pathogenic fungi of the skin C. Carré and A. St. v. Mallinckrodt-Haupt. *Arch. Dermatol. Syphilis* 170, 521-9(1931).—Forty-two species of skin fungi were investigated for porphyrin formation, as shown by fluorescence and spectroscopy. Species which are elaborated in the deeper skin layers or inside the body, such as sporotrichum and yeasts, produced much more porphyrin than strains which usually remain in surface layers of the skin.

O. Hartley
The influence of pathological skin conditions on experimental hyperketonemia. Alberto Midana and Luigi Del Grande. *Arch. Dermatol. Syphilis* 171, 203-22(1935).—Twenty-three patients with extensive dermatoses, chiefly psoriasis and eczema, and 10 controls, were given a carbohydrate free diet and tested for induced hyperketonemia. Increase in ketone bodies in normal individuals averaged 8.7% and did not exceed 39%, in skin patients, it averaged 84% and reached 181% in one case. There was high correlation between area of skin involved in the dermatosis and percentage of increase in ketone bodies, irrespective of the nature of the skin disease. β -Hydroxybutyric acid showed the greatest increase. The test was repeated on several patients after recovery and nearly normal values were obtained. Normal liver function was proven in all the patients, so that the increase in ketone bodies is attributed to disturbances in skin metabolism caused by the dermatoses. The ketonemia is much greater than that found in severe liver damage, perhaps because the wt. of the skin is 3 times that of the liver.

O. Hartley
Investigations of turpentine hypersensitivity with the patch test. Niels Danbolt and W. Burckhardt. *Arch. Dermatol. Syphilis* 171, 252-9(1935).—Fifty-nine persons with a pos. skin test to turpentine were tested with α -pinene; all reacted. The response produced by α -pinene was of the eczematous type; that due to d - α -pinene, the toxic type. When fractionally distd., the turpentine fractions boiling above pinene gave only weak skin reactions. The toxic response is produced chiefly by undiluted turpentine or pinene and never observed with a 10% soln. In 166 persons tested, undiluted turpentine produced a toxic reaction in 58%; with 30% strength, only 15% reacted.

O. Hartley
The reaction capacity of the skin to chemical eczemas on the basis of investigations on eczematous and healthy individuals with chemical irritants. N. S. Vedrov and A. P. Dolgov. *Arch. Dermatol. Syphilis* 171, 641-6(1935).—Of 324 eczematous patients tested, 28% reacted to white Russian turpentine, 33% to refined petroleum, 11% to 5% formalin and 7% to tincture of arnica. In 100 healthy persons, the percentages were 6, 11, 3 and none, resp. A new test was developed for measuring general skin sensitivity; it made use of (1) phenol in benzene in 3, 5, 10, 15, 20 and 25% strengths, and (2) $HgCl_2$ in acetone in a duplicate series of concns. Eighty % of the eczema patients reacted to both chemicals in 5-10% solns.; 80% of the healthy persons required 15-20% solns. The greater sensitiveness of allergies is considered due to a lower irritability-threshold, possibly because of increased skin permeability.

O. Hartley
Specific sensitization of the skin to simple chemicals. N. S. Vedrov and A. P. Dolgov. *Arch. Dermatol. Syphilis* 171, 647-64(1935).—Allergic individuals are much more easily sensitized to specific chemicals than nonallergic, but in some industries a large proportion of

the latter may become allergic. Out of 81 men handling turpentine in their work, 45% tested pos. to it, as compared with 6% of 160 persons not so employed, and 17% of persons with idiopathic eczemas. Of 72 eczema patients tested, 70% were sensitized to dinitrochlorobenzene by a single drop of 10% soln. in acetone. Sixteen references.

O. Hartley
Sulfur content of hair and of nails in abnormal states. II. Nails. Joseph V. Klauder and Herman Brown. *Arch. Dermatol. Syphilis* 31, 26-34(1935); cf. C. A. 28, 4954.—Of 44 cases of abnormal nails examd., only 10 contained a normal amt of S; the lowest value was 1.1%. Hydrolyzed wool was administered orally for 3 months, with improvement in only 5 cases, although the S content increased in the nails of some of the others. Subnormal values for S were found in 90% of normal nails of patients (33) with various systemic infections. The subnormality was greater in nails than in hair in these cases. Four patients sensitized to sunlight had normal S in their nails.

O. Hartley
Gastric acidity in acne vulgaris with a consideration of normal gastric acidity. Samuel L. Immerman. *Arch. Dermatol. Syphilis* 31, 343-7(1935).—Fractional gastric analyses of 93 cases of acne vulgaris after bread and water meals failed to show hyp acidity or any correlation between gastric acidity, hemoglobin content and red blood cell count.

O. Hartley
Minerals in relation to disease of the larger domesticated animals. H. H. Green. *Empire J. Exptl. Agr.* 3, 363-78(1935).—A review is given of the dietary significance of P, Ca, Mg, Fe, Cu, I, F, Cl, Na and K with reference to the occurrence of osteoporosis, osteomalacia, rickets, osteofibrosis, nutritional anemias and hypomineralemias. Forty-three references. K. D. Jacob

Experimental study on the formation of gallstone. I. Influences of fat-soluble vitamins, especially vitamin A (cod-liver-oil and "biostern"), upon the amounts of potassium, sodium, calcium and magnesium in the blood. Tamotsu Maruno. *Japan J. Gastroenterol.* 7, 120-4(1935).—During a period of 2 months different rabbits were fed cod-liver oil (10 cc per diem), olive oil and injected with biosterol. The serum constituents with cod-liver oil changed as follows in the eight-week period: Ca (10.9 to 11.2), Mg (2.6 to 3.6), K (7.3 to 10.5) and Na (455 to 293). All values are in mg. % M. considers these values typical and the changes due to excess of vitamin A since olive oil alone caused no changes.

C. M. McCay
The function of parathyroid hormone in heat stroke. Variations of calcium and potassium in the serum. E. Sanfilippo and S. Ricca. *Biochim. therap. sper.* 22, 411-20(1935).—The hyperglucemia produced in heat stroke is considerably increased by previous treatment with parathyroid hormone. The hypocalcemia is more accentuated in the initial stage in the treated animals and the high K content of the blood is conspicuous in the terminal stage of hyperthermia.

A. E. Meyer
The blood sulfur in Addison's disease. Paolo Larizza. *Biochim. therap. sper.* 22, 458-64(1935).—A considerable increase is due primarily to an augmentation of the org. nonprotein S, to a lesser degree to increase of the inorg. S. The protein S is slightly decreased in the serum, but increased in the whole blood and in the corpuscles. The findings were not changed by cortical hormone therapy and intravenous NaCl treatment.

A. E. Meyer
Blood cholesterol in the preagonic period of tuberculosis. Isidoro R. Stemberg. *Semana med.* (Buenos Aires) 1935, II, 1223-8.—The increase of blood cholesterol in the terminal stage of tuberculosis is an exception.

A. E. M.
The xanthoproteic reaction in blood as a test of renal function. Håkon Rasmussen. *Acta Med. Scand.* 86, 302-14(1935).—"The xanthoproteic test is of clinical value as a prognostic sign in chronic renal disease since it indicates the onset of true chronic uremia."

S. M.
Coronary disease and coronary thrombosis in youth. Paul D. White. *J. Med. Soc. New Jersey* 32, No. 10, 690-695(1935).—Specific studies were made on 4 cases of coronary disease under the age of 30, 21 under the age of

40 and 138 under the age of 50 years. Metabolic disturbances caused deposition of fat in the intima of arteries; the presence of these deposits excites fibrosis, calcifications and atheromatous abscesses. Infections did not seem to play a definite part in the production of coronary involvements.

James C. Munch
Contact dermatitis. Robert L. Howard. *J. Oklahoma State Med. Assoc.* 28, No. 7, 259-61 (1935).—H. presents a detailed list of household remedies, animal hairs or emanations, fabrics, cosmetics, dusts, metals, lacquers, varnishes, plants, foods, dyes, chemicals and drugs found to produce contact dermatitis, together with case reports for certain cosmetics, silk and Ni. Among the chemicals reported are $\text{NiH}_2\text{persulfate}$, HgS_2 , Metol, pyrogallol acid, naphthalene, oil of mirbane, *p*-dichlorobenzene, *p*-toluidine, pyrethrum, pyroxylol and cellulose acetate resin. Among the drugs were benzocaine, butesin, butyn, chloral, cocaine, ephedrine, nupercaine, orthoform and procaine.

James C. Munch
Adsorption of diphtheria toxin and toxoid on colloidal gels. F. A. Miller, Thos DeVries, and Mary Ann Miller. *Proc. Indiana Acad. Sci.* 44, 88-92 (1934).— Al(OH)_3 , $\text{Ca}_3(\text{PO}_4)_2$ and silica gels have been studied to det. their adsorptive powers for diphtheria toxin. The gels tested seem to possess properties of adsorbing the toxin in considerable amts and the rate of release when injected into animals was relatively slow, seeming to offer advantages over the unmodified antigen in the production of antitoxin. The method of detg. the degree of immunity developed by toxoid has been modified. Instead of injecting increasing doses of toxin to find the degree of immunity developed in the animals, the guinea pigs are bled 3 and 4 weeks after giving the toxoid and pooled samples of the blood serum are then tested for the actual no. of antitoxic units produced.

W. J. Peterson
Gastric ulcer formation by bile acid salt. Munehide Yoshitomi. *Fukuoka-Ikudai-gaku-Zasshi* 28, 406-14 (1935).—An attempt was made to produce gastric ulcer by bile acid in rabbits. Some ulcers were formed by transfusion with Tyrode soln. or with dil. rabbit blood, both contg. $1/1000$ mole of Na taurocholate. The ulcer-forming action of the bile acid is closely related with the acidity of the gastric juice. Lecithin inhibits the ulcer-forming action of the bile acid. The acidity of the gastric juice in the rabbit is slightly decreased by Na taurocholate.

The present state of our knowledge of the therapeutic action of organic arsenic compounds. H. Schlossberger. *Ber.* 68A, 149-63 (1935).—An address. G. G.

Fungistatic and fungicidal effects of two wood preserving chemicals on human dermatophytes. Sodium *o*-2-chlorophenylphenolate and sodium tetrachlorophenolate. Lester M. Wieder. *Arch. Dermatol. Syphilis* 31, 644-55 (1935). O. Hartley

Treatment of burns with A and D vitamins and camphor oil. Carlos O. Franzetti. *Semana med.* (Buenos Aires) 1935, II, 998.—Combination of local application of 7% camphor oil with medication of A and D vitamins causes disappearance of the general intoxication caused by burns and of edema. A. E. Meyer

I-ZOOLOGY

R. A. GORTNER

Reducing substances and chlorides of the blood of Orthoptera. Raoul M. May. *Bull. soc. chim. biol.* 17, 1045-53 (1935).—Data are given for *Locusta viridissima*, *Diurippus* (*Caraculus*) *marousi* and *Orphonia denticauda*. Blood Cl ranged from 0.310 to 0.352% and the glucose equiv. of the reducing substance (Baudouin-Lewis method) ranged from 0.04 to 0.27%, with no great differences between the 3 species. L. E. Gilson

Biochemistry of the aphids (*Pemphigus utricularis*, *P. corniculatus*) infesting *Pastacia terebinthus*. J. Timon.

David and B. Gouzon. *Compt. rend. soc. biol.* 120, 164-6 (1935). L. E. Gilson

Microinjection study of the red corpuscles of the teleost, *Cichlasoma fasciatum* Jen. A. Polcard and P. Rojas. *Rev. soc. argentina biol.* 11, 164-5 (1935); cf. C. A. 29, 4059*.—Each cell leaves a ring of brown ash contg. Fe_2O_3 enclosing a white dot of Fe-free ash left by the nucleus. L. R. Gilson

A study of the moisture requirements of the eggs of the chicken ascariid *Ascaridia galli*. Anne McKee. *J. Parasitology* 21, 220 (1935).—The chicken ascariid eggs required a relative humidity above 81% at 22° to survive. At 100% humidity and 30° the eggs develop the same as controls in H_2O . F. P. Griffiths

Some marine biotic communities of the Pacific Coast of North America. Early stages of succession from marine conditions to land. Archie MacLean. *Ecological Monographs* 5, 319-24 (1935).—In a lagoon which was undergoing transformation from sea to land, bivalves were favored by or tolerated a certain amt. of org. matter and S compds, but H_2O which contained 2038 cc. $\text{H}_2\text{S/L}$ was unfavorable to their growth. E. D. Jacob

The physiology of the silk-producing gland in the silkworm (*Bombyx mori* L.). I. Rivka Ashbel. *Arch. sci. biol.* (Italy) 21, 192-6 (1935).—The excretory tubes are the most active part from the point of view of respiration and from this it is concluded that it is the predominating part in the function of the gland. The intensity of respiration is a function of the temp. P. F. Metteli

The carbohydrates of the albumin glands of *Rana esculenta*. Fr. N. Schütz and Max Becker. *Biochem. Z.* 280, 217-26 (1935).—Hydrolysis with dil. acids of the dry substance from the albumin glands of *Rana esculenta* sets free 30-35% reducing substance. Of this about 1-1.5% is polysaccharide (glycogen). Galactogen could be detected only in traces. The glycoprotein yielded on hydrolysis 1 mol. galactose and 1 mol. glucosamine. S. Morgulis

Studies on the chemical embryology of amphibia. VIII. Oxidation processes in the giant salamander egg. Fujito Yamasaki. *J. Biochem. (Japan)* 22, 181-4 (1935). Cf. C. A. 27, 4851.—An increase in glutathione content during the development of the salamander egg is said to occur. (This statement can only be accepted, if the glutathione content recorded for the early stage is a typographical error.) The indophenoloxidase reaction appears very early not only in the embryo but also in the perivitelline fluid. No glutathione was found either in the perivitelline fluid or in the jelly. IX. Presence of urea and uric acid in the fertilized giant salamander egg. Makoto Takamatsu and Tatsumi Kamachi. *Ibid.* 185-7.—The fertilized salamander egg contains relatively little urea and only traces of uric acid. S. Morgulis

The muscle extractives in hibernating giant salamanders (*Megalobatrachus japonicus*). Takeshi Iwasaki. *J. Biochem. (Japan)* 22, 233-42 (1935).—In muscle ext. from the hibernating giant salamander there was much creatine and an appreciable amt of methylguanidine but no arginine or carnosine. S. Morgulis

The permeability of the skin of frogs to water as determined by D_2O and H_2O . G. v. Hevesy, E. Hofer and A. Krogh. *Skand. Arch. Physiol.* 72, 199-214 (1935).—The permeability is measured by the no. of days which 1 mole requires to pass through 1 sq. cm. at a const. difference of 1 mole concn. In expts with D_2O on isolated skin and frog legs the permeability was found to be the same in both directions and no effect of ions was observed on the permeability. The permeability of the web is about 0.1 as great as that of the skin from the abdomen or thighs. In short expts. the permeability varied inversely with the viscosity of the water. After a longer time (10 hrs.) the permeability at low temp. decreases further. Sectioning of the nerve causes an increase of about 30% in the permeability of the operated leg, which lasts several days. The permeability with D_2O at 21° was 100-170 and with ordinary H_2O 22-37. S. Morgulis

The action of thyroxine and similar chemical substances

on the development of sea-urchin larva. Marie-Rose Zellins. *Bull. inst. oceanograph.* No 678, 10 pp. (1935).—Thyroxine causes characteristic retardations in the growth and differentiation of sea-urchin larva in dilns. of 1/50,000 to 1/600,000 parts. It is without effect before the first mitotic division, but in later stages it modifies general cellular metabolism. Chemically related substances do not have such an effect. Walter H. Seegers

Larval and imaginal tracheal systems of the odonata and their metamorphosis. Heinrich Wolf. *Z. wiss. Zool.* 146, 591-620 (1935).—Largely morphol. The epidermis of the tracheae, unlike that of the body skin, is strongly pigmented, apparently with hemoglobin, the indications are that this exerts an oxygen-carrying function. Immediately after metamorphosis the imago of eschmids secretes a soln. of uric acid. K. V. Thumann

Physiology of the movement of Malacodella. Friedrich Eggers. *Z. wiss. Zool.* 147, 101-31 (1935).—Unlike

other Nemertinea, the organism is not free-living, but commensal in *Cyprina islandica*. Probably on this account, it is completely devoid of chemotaxis either to the host or to the other sex. It is also geo- and photo-tactically neg. K. V. Thumann

Osmoregulation in native crustaceans of water and moist air. Erna Widmann. *Z. wiss. Zool.* 147, 132-69 (1935).—By f.-p. detns the blood of a no. of crustaceans was found to undergo an annual cycle, the salt content reaching a max. from November to March and a min. from May to September for all animals. The effect is due to temp. The decrease in concn. of blood salts for 10° rise in temp. varies for different animals and sometimes for different sexes of the same animal, it causes an increase in f.-p. depression of 0.1-0.3° on the total Δ of 0.6-2.2°. In hunger the salt concn. of the blood is lowered by a Δ of 0.2°, thus opposing the winter effect of low temp. Salt feeding raises the blood salt concn. K. V. Thumann

12—FOODS

F. C. BLANCE AND H. A. LITPER

Analyses of common foods. E. M. Bailey. Conn. Agr. Expt. Sta., *Bull.* 373 (39th Rept. on Food Products) 529-51 (1935).—These collected proximate analyses of the several classes of foods are brought up to date in convenient form for use. C. R. Fellers

Metallic contaminations of foods. II. Effect of cooking and storage on foodstuffs in aluminum vessels. N. C. Datta. *Proc. Indian Acad. Sci.* 2B, 322-32 (1935). cf. C. A. 29, 1889°.—The Al in foods cooked and stored in Al vessels was detd. gravimetrically as the phosphate. Milk and milk products dissolve only traces of Al from vessels. The small amt. of Al dissolved by fruit and vegetable juices during storage in Al vessels depends on the nature of the org. acid present and on the buffering capacity of the food. The presence of NaCl increases the corrosive action of acid foods on Al. The amt. of Al dissolved by tamarind soln. contg. NaCl almost equals the sum of the amt. dissolved by each separately. A max. of 50 mg. of Al can be added daily to the diet by the inclusion of acidic foods contg. NaCl and cooked and stored in Al vessels. Feeding expts. with rats show that foods prepd. in Al vessels have no harmful effect on the growth, reproduction and general well-being of the animals. Rachel Brown

Aluminum possesses wide adaptability to many conditions and requirements of the food industries. J. R. Akers. *Food Ind.* 7, 587-8 (1935).—General. C. R. Fellers

Glass-lined equipment. P. S. Barnes. *Food Ind.* 7, 590-2 (1935).—The value of vitreous and glass equipment in the food industries is pointed out. C. R. Fellers

Rubber products find increasing use in food manufacture. A. E. Juve. *Food Ind.* 7, 594 (1935). C. R. Fellers

Plastics find increasing utility in food equipment and food plant accessories construction. James A. Lee. *Food Ind.* 7, 587-6 (1935).—General. C. R. Fellers

Paints and painting to protect the equipment and plant interior from corrosion; paints must be chosen and applied with care. Victor Buhr. *Food Ind.* 7, 597 (1935). C. R. Fellers

Paints for plant and equipment. R. C. Sheeler. *Food Ind.* 7, 598 (1935). C. R. Fellers

Steel alloys (in food manufacturing). Walter M. Mitchell. *Food Ind.* 7, 577-9 (1935).—Stainless steels of the 18-8 type give satisfactory results in food processing where the metal comes in contact with foods. C. R. Fellers

Nickel and its alloys. F. L. LaQue. *Food Ind.* 7, 550-2 (1935).—Ni and its alloys satisfy the exacting requirements of food-processing equipment. Their non-corrosiveness is especially stressed. C. R. Fellers

Copper, brass and bronze in the food industries. Carter S. Cole. *Food Ind.* 7, 583-4 (1935).—The uses are outlined. C. R. Fellers

Copper alloys in food manufacture. James T. Kemp. *Food Ind.* 7, 584 (1935).—Greater strength is imparted by alloying Cu, and with some alloys, greater resistance to corrosion. C. R. Fellers

Tin as an anticorrosion coating. Bruce W. Gosner. *Food Ind.* 7, 585 (1935).—General. C. R. Fellers

Lead (in the food industries). F. E. Wormser. *Food Ind.* 7, 586 (1935).—Pb is never used in contact with foods because of its toxic properties. The use of Pb and Pb compds. in building construction and maintenance is outlined. C. R. Fellers

The fermentable glucides of flour and dough. R. Guillemet. *Compt. rend. acad. agr. France* 21, 899-92 (1935); cf. C. A. 29, 6654°.—These glucides, more or less hydrolyzable, with high enzymolytic index, slightly sol in alc., and in part clarified by Pb, are fructohololoses. It is not a question of Tanret levosins, stachyose, raffinose nor gentianose. In dough in fermentation, the sucrose from the living yeast with fructose forms 1/3 of the fermentable stock of white flours and regulates in a large measure the course of the bread making fermentation. The previously formed hexoses and the sucrose and fructose detached from the fructohololoses ferment first; the maltose is attacked more and more rapidly.

The application of fats and oils to the baking industry. Geo. F. Garnatz. *Oil and Soap* 12, 290-3 (1935).—The application of fats and oils in the production of bread, cakes, biscuits and crackers is discussed. E. S.

What is a quality dairy product? M. E. Parker. *Natl. Butter and Cheese J.* 26, No. 20, 26-7 (1935). A. H. Johnson

Further investigations on the determination of the hydrogen-ion concentration of milk by the colorimetric method. G. Schwarz and Ottmar Fischer. *Milchsch. Forsch.* 17, 158-69 (1935). cf. C. A. 23, 3991°.—As standards for comparison, instead of inorg. buffer solns., milk serums were prepd. by using normal sweet milk, adding to portions increasing amts. of sour milk, treating with methanol (20 ml. milk, 30 ml. methanol), placing the mixt. in a refrigerator for 30 days and then filtering. The pH of serums was detd. electrometrically, indicator added and the serum placed in sealed glass tubes to fit in a comparator device. These standards were good for 6 months. The indicator soln. consisted of 20 mg. bromocresol blue, 50 mg. methyl red and 100 mg. bromocresol purple dissolved in 1000 ml. neutral methanol. One ml. indicator was added to 10 ml. serum. Samples of serums to be tested were prepd. by addn. of methanol in the ratio given above. Measurements were made with an accuracy of about 0.1 pH within limits of pH 5.6-6.7. H. Macy

A gravimetric micromethod for determination of milk fat and dry matter. G. Gorbach and R. Kadner. *Milchsch. Forsch.* 17, 100-2 (1935).—A new app. is described for the

microdetn of milk fat and dry matter by ether ext. The method is much faster than macromethods with a Soxhlet extractor. The max. error was 0.07% for fat content, but somewhat greater for dry matter. H. Macy

Composition of media for the bacteriological analysis of milk. C. S. Bowers and G. J. Hucker. N. Y. Agr. Expt. Sta., *Tech. Bull.* 228, 3-42 (1935).—A total of 1142 samples of milk of types normally encountered in control work was studied, with agar of varied compns. Comparative bacterial counts were made to det. their relative efficiencies. The addn of yeast ext. to standard agar or its substitution for beef ext. did not increase the efficiency of the medium. However, yeast ext. is desirable in media for the cultivation of *Leuconostoc* and *Lactobacillus*. The addn of a fermentable carbohydrate and 0.5% skim milk to standard agar increased its efficiency. The colonies were more numerous, larger, and more readily counted. The best all round medium for milk control consisted of 0.5% tryptone (Digestive Ferments Co.), 0.1% glucose, 0.5% fresh skim milk and 1.5% agar. C. R. P.

"Milking through" cows, the qualities and composition of their milk and the suitability of an Austrian Alpine breed for the "finish milking" industry. Wolfgang Schempfing. *Milchforsch* 17, 118-45 (1935).—Expts are reported concerning companions in compn and properties of the milk from cows beyond their normal lactation period and those under normal conditions of lactation. Percentage of fat, size of fat globules, creaming ability, sp. gr., total dry matter, fat-free dry matter, viscosity, lactose, protein, cond., Ca, Cl, K, Na, H₂PO₄, acidity, 1-p depression, rennet coagulability, bacterial flora, reductase, Schardinger enzyme and diastase were all studied and data reported for each group of cows.

H. Macy
The relation of mastitis to rennet coagulability and curd strength of milk. H. H. Sommer and Helene Matsen. *J. Dairy Sci.* 18, 741-9 (1935).—Subclinical mastitis causes milk to have a lower curd strength and to coagulate more slowly with rennet. Philip D. Adams

What causes most common off-flavors of market milk? Wm. H. Chilson. *Milk Plant Monthly* 24, No. 11, 24-8 (1935).—About 25 to 30% of the cows in the herd studied gave milk which developed off-flavor during the months from February to June. When milk was pasteurized by heating at 143°F. for 30 minutes, the off-flavor developed to a more pronounced degree than in raw milk. If the milk which usually gave the off-flavor is heated at 170°F. for 10 min., the off-flavor does not develop. This was taken to indicate that there is an oxidizing enzyme in the milk which catalyzes oxidation and this enzyme is destroyed by heating for 10 min. at 170°F. When skim milk which had been held at 170°F. for 10 min. was mixed with raw cream to form a milk contg. 4% of fat, this milk did not develop the oxidized flavor. When raw cream was added to the heated skim milk to form 15 or 20% cream, the oxidized flavor sometimes developed. The development of the occasional oxidized flavor in the latter case and none in the former was due to the greater amt. of raw skim milk (contg. the active oxidizing enzyme) contained in the cream. Oxidized flavor was never found in skim milk unless the fat content was too high. Oxidized flavor was more likely to develop in cream of low fat content than in cream of high fat content because of the higher proportion of oxidase-contg. skim milk in the former. There was also a difference in susceptibility of fat to oxidation by the enzyme. The addn of CuSO₄ to cream which did not develop the oxidized flavor caused the off-flavor to develop. A. H. Johnson

Tallowy flavor in milk. C. D. Dabie. Pa. Agr. Expt. Sta., *Bull.* 320, 22 (1935).—An oxidized or tallowy flavor which developed in 48-60 hrs. at 4.5° was intensified by pasteurization, but heating to 80° eliminated it. The active principle, probably an oxidizing enzyme, was present in the milk plasma. The L no. of the fat was decreased in proportion to the degree of flavor present. The flavor is absent in summer when cows are on pasture.

C. R. Fellers

Investigation of resazurin as an indicator of the sanitary

condition of milk. Guy A. Ramsdell, Wm. T. Johnson and F. R. Evans. *J. Dairy Sci.* 18, 705-17 (1935).—Only 1 hr. is required to complete the resazurin test. By means of it milk can be classified into 4 groups as regards sanitary condition. Milk from diseased udders and from physiologically abnormal cows has significant effects on the reduction of resazurin. The rate of color change of resazurin-milk mixts. on incubation yields considerable information concerning the bacterial flora. Philip D. Adams

Standardization of the Borden Body Flow Meter for determining the apparent viscosity of cream. J. C. Henning. *J. Dairy Sci.* 18, 751-6 (1935).—Standardization was accomplished with sugar solns. and the seconds of flow showed a straight-line relationship to viscosity in centipoises. Philip D. Adams

Experimental cream canning. Alfred H. Loveless. *Food Sci.* 52-8, 87 (1935).—The rate of heating and the viscosity of cream were studied. The viscosity changes considerably during the 1st day after sterilizing, and continues to change at a decreasing rate over a period of many days. Variations in agitation seem to be the cause of variation in viscosity. The use of a preheating temp. of 140°F. (instead of 110°F. as generally used in com. practice) produces an increase of about 50% in viscosity after sterilization and reduces the tendency of the cream to form grains by coagulation of the protein, this gives a smoother cream. A. Papineau-Couture

What happens to cream in paper milk-containers? Thomas Duffee, W. S. Arnott and P. R. Nelson. *Milk Dealer* 25, No. 2, 40-2 (1935).—A cream layer forms less readily on milk in paper containers than on milk in glass bottles. The difference in cream-rising phenomena in the 2 types of containers was more pronounced for pasteurized milk than for raw milk. Thus the fat content of the top 50 cc. of cream from a glass bottle was 22% while the fat content of a similar sample from a paper container was 6.75%. The use of various types of paper containers, coating glass bottles with paraffin, vaseline, halowax, etc., impressing pos. or neg. charges on the milk affected the fat content of the top 50 cc. of cream. Attempts were made to explain the exptl. findings on the basis of electrostatic phenomena. Any static charge of electricity induced in the milk to create a potential sets up an electrostatic force in the fat globules. Pasteurization changes the structure of these globules sufficiently to permit the induction of a higher potential than is developed with raw milk. When milk is bottled, the container acting as a Leyden jar prevents the discharge of this potential. The container, whether glass, paraffined glass or paper, has an opposite charge to that on the fat globules in the milk. Therefore, a certain elec. attraction is created depending on the capacity of the particular container material. Since the electrostatic capacity of glass is greater than that of paraffin which in turn is greater than that of paraffined paper, the ability of glass to counteract the residual potential in the fat globules is greatest, that of paraffin being less and paraffined paper least. The above ideas were used to explain the observed data. A. H. Johnson

The keeping quality of butter depending on different packing materials. Autodetactive spoilage of butter. F. Kieferle and A. Seusz. *Milchforsch* 17, 181-9 (1935).—See C. A. 29, 6659. H. Macy

Butter cultures. W. Ritter and M. Christen. *Landw. Jahrb. Schweiz* 49, 749-60 (1935).—Volatile acids, biacetyl and acetylmethylcarbinol, formed as by-products of lactic fermentation, vary in quantity with the length of time of incubation of the milk culture. These substances are formed in much greater quantities if citric acid or citrates are added to the milk. After successive transfers, the aroma-producing streptococci may disappear from the culture and a harsh acid flavor or a malt flavor may appear. Sometimes the proportion of volatile acids will increase and that of acetylmethylcarbinol decrease without apparent effect on the flavor of the culture. F. O. W.

The diketone produced when butter cultures are steam distilled with ferric chloride added. B. W. Hammer. *J. Dairy Sci.* 18, 769-71 (1935).—It appears that the

diketone is biacetyl rather than one of the homologs. If homologs are present they are in relatively insignificant amounts.

Philip D. Adams
International agreement for the unification of methods for the sampling and analysis of cheese in International trade. *Anon. Ann. fals.* 28, 450-6 (1935).—Text of the agreement with appendices describing the procedure to be used for sampling and the methods to be used for the determination of H_2O and fat.

A. Papineau-Couture
The detection of preservatives in process cheese. I. G. Schwarz, Ottmar Fischer and O. Kahler. *Milchforsch.* 17, 170-80 (1935).—Three distinct and independent processes are described for the detection of benzoic acid in process cheese (1) microscopic observations of crystal building, (2) microdeton of m. p. and (3) color reaction. Benzoic acid was found in 23 of the 135 samples.

H. Macy
Use of hydrogen-ion determinations on young cheese in predicting acid development in Cheddar cheese during storage. Delmar W. Spicer and L. H. Burgwald. *Natl. Butter & Cheese J.* 26, No. 21, 14-15, 33-4 (1935).—The determination of the H -ion concentration during the cheese-making process did not indicate significant changes in acidity any more accurately than did the usual titration method. The amount of acid that developed in cheese while in storage was closely related to the titratable acidity at the time of milking. The amount of acid that American cheese will develop within 6 weeks time could be predicted quite accurately by determining the H -ion concentration of the cheese when from 3 to 10 days old. In a majority of cases cheese having a pH value of 5.07 or above did not develop acid in storage, while those having a pH of less than 5.07 did develop acid in storage.

A. H. Johnson
The bacteriology of Swiss cheese. IV. Effect of temperature upon bacterial activity and drainage in the press. L. A. Burke, G. P. Sanders and K. J. Matheson. *J. Dairy Sci.* 18, 719-31 (1935). *cf. C. A.* 29, 7514.—The area just beneath the rind cools more rapidly than the interior. Bacterial growth and acid production correspond in general with the decrease in temperature of each part of the cheese.

Philip D. Adams
Vitamin A in eggs and food. Walter C. Russell and Milton W. Taylor. *New Jersey Agr.* 17, No. 4, 3 (1935). *cf. C. A.* 29, 1465.—Eggs from hens that received no pigmented foods in the diet contained 300 units of vitamin A per yolk, as compared with 425 units in those from hens receiving a ration containing 35% of yellow corn and 3% of dried alfalfa. Both groups received cod liver oil as 1% of the total ration. Egg yolk color was not a reliable indicator of vitamin A content. The vitamin A content of the eggs amounted to 18% of the vitamin A intake in the 1st group and to 31% in the 2nd group. The livers of birds affected with leucemia, bronchitis or cholera were definitely low in vitamin A. The eggs contained 2-10 Steenbock units of vitamin D per yolk. In 1 experiment the vitamin D content of the eggs amounted to 10% of the intake in the feed.

K. D. Jacob
The sardine canneries of California. The fish and its by-products. V. Cahalan. *Food* 5, 59-63 (1935).—A brief description of present-day sardine-canning practice in California.

A. Papineau-Couture
The vitamin A and D contents of canned salmon. Grace M. Devaney and Lydia K. Putney. *J. Home Econ.* 27, 658-62 (1935).—The vitamin A content of salmon varies between 0.3 and 0.25 international units per g. for chum to 8 units per g. for Chinook. The vitamin D content varies from 1.9 and 2.6 units for chum and Chinook to 8 units for a red salmon.

A. L. V.
Composition of miscellaneous tropical and subtropical Florida fruits. A. L. Stahl. *Fla. Agr. Expt. Sta.* Bull. 283, 20 pp. (1935).—The chemical composition of 5 varieties of Florida mangoes, *Mangifera indica* 7 times, *Citrus aurantiifolia* 6 lemons, *Citrus limonia* 2 limequats, 1 calamondin, *Citrus reticulata* 1 Japanese persimmon, *Diospyros kaki*, sourpaw, *Annona muricata* papaya, *Carica papaya* white sapote, *Cassipouva edulis*, fig, *Ficus carica*, Surinam cherry, *Eugenia uniflora*; guava, *Psidium cattleianum*, pomegranate, *Punica granatum*, tamarind, *Tamarindus*

indica; and jujube, *Ziziphus jujuba*. The moisture, oil, acid, protein, ash, reducing sugars, hydrolyzable sugars and total sugars are given. Twenty-one references.

C. R. Fellers
Changes in apples during storage. E. J. Rasmussen. *N. H. Agr. Expt. Sta.* Bull. 284, 18-20 (1935).—The effect of fertilization, especially $NaNO_3$, on storage life was uncertain. The fruit grown on nitrate-fertilized trees was a little softer than that from unfertilized trees and had the greenest ground color and highest acidity.

C. R. Fellers
The vitamin B and G contents of Arizona-grown grapefruit and broccoli. Gladys Hartley Roehm. *J. Home Econ.* 27, 663-4 (1935).—Grapefruit pulp is rich in vitamin G (0.4 unit per g.) and poor in vitamin B (0.16 unit per g.). The peel is rich in vitamin G. Broccoli has 3-4 vitamin G units per g. or 8 times more than milk. Its vitamin B content is the same as that of other leafy plants.

Amy Le Vesconte
Presence of yeasts in fruit juices that are sold for beverages. J. M. Brannon and R. J. Pollitt. *Milk Dealer* 25, No. 2, 35 (1935).—Yeasts were found in samples of orange and grapefruit juice. If the juices were kept cold, they remained in good condition for several weeks which is much longer than juices are held before being consumed. The presence of yeasts in fruit juices should cause no particular concern as yeasts are consumed with several fresh fruits.

A. H. Johnson
Vitamin B content of raw Pinto beans. Mary L. Greenwood. *N. Mex. Agr. Expt. Sta.* Bull. 232, 3-10 (1935).—The vitamin B (B₁) value as determined by the Chase technique was 208 Sherman units per oz. The relation of vitamin B to health is discussed.

C. R. Fellers
Examination of sweet pickles. E. M. Bailey. *Conn. Agr. Expt. Sta.* Bull. 373 (34th Rept. on Food Products) 509-13 (1935).—Of the 114 samples examined, 3 contained saccharin, 19 contained benzoates and 7 contained both saccharin and benzoates.

C. R. Fellers
Stability of provitamin A in alfalfa and silage. M. W. Taylor. *New Jersey Agr.* 16, No. 6, 3 (1934); *cf. C. A.* 28, 6788.—Machine-dried alfalfa lost 50-67% of its carotene content during storage in the barn for 3-7 months, the greatest losses occurring during the 1st 3 months. Immediately after the hay was cut and dried it contained 70,000-90,000 international units of carotene per lb. Samples of silage contained 7000 units of carotene per lb. of wet material. There were indications that the carotene in silage is quite stable under silo conditions over long periods of time.

K. D. Jacob
Molasses hay silage. C. B. Bender. *New Jersey Agr.* 17, No. 5, 3-4 (1935).—Green alfalfa and mixed grasses, averaging 68% H_2O , were chopped and packed into silos within 1-6 hrs. after cutting in the field. The green material was mixed with a 40% solution of molasses in water at the rate of 100 lb./ton. The temperature in the silos seldom exceeded 100°F. When the silos were opened in the following spring the material was in excellent condition, of good odor, quite green and succulent, and the average chemical analysis compared favorably with that of the fresh green material. When the green material was allowed to lie in the field for 12-24 hrs. before ensiling the H_2O content averaged 44%, the temperature in the silos reached a maximum of 160°F and the material was quite decomposed and moldy when the silos were opened.

K. D. Jacob
The comparative digestibilities of artificially dried pasture herbage by sheep and rabbits. C. J. Watson. *Empire J. Exptl. Agr.* 3, 346-50 (1935).—Mixed pasture grasses, cut in August when 5 weeks old and artificially dried, contained H_2O 9.07-10.0%, ash 9.27-9.37, protein 20.76-20.93, Et-O. ext. 5.11-5.15, crude fiber 21.33-21.56 and N-free ext. 43.16-43.36%. The material was a highly digestible feeding stuff for sheep but was not so satisfactory for rabbits because of the inability of the latter to make efficient use of the crude-fiber fraction.

K. D. Jacob
Utilization of some by-products of Puerto Rican industries as feeds for livestock. F. Pico and J. H. Ramirez. *Puerto Rico Agr. Expt. Sta.* Ann. Rept. Director 1933-4, 163-4 (1935).—Grapefruit bran made from the dried

ground skin of the grapefruit has the following percentage compn.: moisture 7.53, carbohydrates 78.65, fat 1.09, protein 4.94, fiber 4.82 and ash 4.97. The product was very palatable to dairy cows. C. R. Fellers

Acidification experiments with the addition of ammonia and ammonium salts C. Windheuser, O. Hoffmann and E. Ohlmer. *Biedermanns Zentr. B. Tierernähr.* 7, 372-81 (1935).—This paper deals with the influence of admixtures of aq. NH_3 , $(\text{NH}_4)_2\text{CO}_3$ and NH_4HCO_3 on the fermentation of feed plants. Meadow grass, red clover, soybeans, beet roots, marrow stem cabbage and maize were tested with aq. NH_3 . Maize was tested in a silo; the others were tested in glass vessels. The aq. NH_3 contained 2.5-7% NH_3 and the added amts of NH_3 were 0.12 to 0.3%. The silages from the marrow stem cabbage and maize were of unobjectionable quality, while the others—though free from butyric acid—were less satisfactory foods because of their high content of AcOH and their low content in free lactic acid. The expts with $(\text{NH}_4)_2\text{CO}_3$ and NH_4HCO_3 were carried out in glass vessels. Grass silage with 1% of $(\text{NH}_4)_2\text{CO}_3$ was less good as a food—though free from butyric acid—because of its low lactic acid content and its high content in AcOH. The maize silage with 0.4% $(\text{NH}_4)_2\text{CO}_3$ and that with 0.65-2% NH_4HCO_3 were of unobjectionable quality. The digestion coeffs. of pure protein were higher and the losses of pure protein and of digestible protein were lower, but that of dry matter was somewhat higher than in the corresponding silage without admixts. F. L. Dunlap

Cosmetic colors [foodstuff colors] (Redgrove) 17 Supplying pure water for beverage manuf. (Stähler) 14 Iodine in Westphalia [detn. in spinach and milk] (Balks) 7. Some African oil seeds (Aron) 27. Influence of the reaction and fertilizing on the compn. and digestibility of meadow grass (Nehring) 15. Combination of catalysts to reduce digestion time in the detn. of N II Dairy products (Poe, Schafer) 7. Corrosion of Al [by fruit expts] (Bryan) 9. Chocolate and cacao products—their relation to pharmacy (Churchman) 17. The action of microorganisms on milk (Gorini) 11C Sterilizing liquids [milk] (Fr pat 781,959) 13 Phosphatide compds [products used in the foodstuff industry] (Ger pat 619,235) 25

Food flavoring materials containing lecithin Stroud Jordan (to American Lecithin Co.). U. S. 2,019,494, Nov. 5. Lecithin is added to a normally volatile essential oil such as lemon oil or to an oil-sol. raspberry flavoring or the like, for flavoring candy, cakes, etc.

Composition for coloring foods Hugh E. Allen and Albert G. McCaleb U. S. 2,021,621, Nov. 19. A product suitable for coloring meat juices, meats, etc., is prep'd by reaction of animal blood hemoglobin with mono Na glutamate (suitably by heating together at about 70-75°) and may be associated with curing salts such as NaNO_2 , NaNO_3 or KNO_2 .

Apparatus for deaerating liquid foods (suitably as a step preparatory to irradiation with ultraviolet rays). Henry C. Stephens and Stedman B. Hoar (to Natural Food Products Co.) U. S. 2,020,250, Nov. 5. Various structural and operative details of a cascade deaerator. Amino acid salt sirup (concentrated food product) Chyosaku Wada Brit. 432,895, Aug. 6, 1935. See Fr 771,095 (C. A. 29, 890°).

Treating rice, rice offals or paddy, etc. Sam H. Gibbon (one-half to Steel Bros. & Co. Ltd.) U. S. 2,021,721, Nov. 19. For improving the food value of the material its water content is brought up to about 15-30% (as by soaking in warm water) and it is then maintained for a short time (suitably 5 to 10 min.) at a temp. below the freezing point of water (suitably about -40°), and is then heated in water and may be dried. App. is described.

Improving grain meal Rudolf Rüter. Ger. 608,947, Aug. 10, 1935 (Cl. 53c 602). The baking qualities of flours are improved by treating the flour with org. amines or amides, halogenated at the N atom, e. g., toluenesulfochloroamide, amyldibromoamine

Determining rope infection in bread. Herbert H. Bunnell. U. S. 2,019,950, Nov. 5. Freshly baked bread is incubated and its catalase activity is then measured. App. is described.

Testing milk Max Gebetsrother. Austrian 142,913, Oct. 10, 1935 (Cl. 53a). In detg. milk fat by the Gerber method with the aid of H_2SO_4 and amyl alc., use is made of red-colored amyl alc. of sp. gr. 0.815-0.816 to which CH_2O has been added, suitably in a proportion of 5 cc. of 30-50% ClH_2O soln to 1 l. of alc. A clear dividing line between acid and fat in the butyrometer is thus obtained.

Preserving milk, cream, cheese, etc. Ralph L. Eagles Brit. 432,894, Aug. 6, 1935. Dairy products are preserved by enclosure in air-tight substantially full receptacles, each provided with a vent designed to vent at about 4 lb. per sq. in. above atm. pressure; the product is kept therein out of contact with air and in contact with the gas, principally CO_2 , generated therefrom.

Electrolytic treatment of milk, etc. "Elaet" Gesellschaft für elektrische Apparate G. m. b. H. Brit. 433,570, Aug. 18, 1935. Acid is eliminated from milk, cream, butter, whey, etc., by upward passage through the compartments formed by the end electrodes of a cell and a series of vertical plates that serve as intermediate bi-polar electrodes.

Precipitating proteinaceous matter from whey, etc., by use of chlorine. Stefan Ansbacher, Geo. E. Flanagan and Geo. C. Supplee (to Borden Co.). U. S. 2,021,712, Nov. 19. For pptn. of nitrogenous matter (as from whey in the manuf. of milk sugar), Cl_2 gas is added (suitably to the point of satn. and while the material has a pH below 7.0).

Cleansing milk containers such as those lined with glass. Geo. B. Ashton (to Victor Chemical Works). U. S. 2,020,228, Nov. 5. Various details are described of a process involving rinsing the containers with water, treating them with a detergent such as one contg. Na_2PO_4 and NaOCl which is allowed to remain in contact with the container for at least an hr., and then removing the detergent with water.

Preserving meat, fish, etc. Karl A. Johansson and Johan A. Wallström. Brit. 431,994, July 18, 1935. In treating meat and like food materials prior to storage with vacuum for extg. blood and other liquids and with NaCl which is forced into the materials by pressure, the materials are first placed in cases, etc., e. g., of tar-free wood or rustproof sheet metal, with salt and then subjected to the vacuum and pressure treatment. App. is described.

Preserving fish by cold storage Hugues M. J. de Mené de Bellefont and Joseph E. A. Folliot (to Société René Mauballarg & Cie.). U. S. 2,020,109, Nov. 5. Fish are placed in containers which are hermetically sealed and subjected to a refrigerating treatment which brings the contents to a temp. below 0° but does not freeze them. App. is described.

Salting fish Institut für Seefischerei, Otto Bähr and Otto Wille. Ger. 608,938, Sept. 30, 1935 (Cl. 53c 603). Fish-salting processes are improved by addn. of a phenol. Thus, 0.1-0.2% of hydroquinone may be added to the salt used.

Extracting fatty oils, deodorizing liquids Wilhelm Kelle and Franz Carlsson. Brit. 432,771, Aug. 1, 1935. Oil or fat is extd. from meat, fish, fruits, etc., and waste waters or other liquids contaminated by fish, meat, etc., are deodorized by exposing at water-bath temp., e. g., 77-85°F., to the action of cryptococcus fungi or other saccharomyces types and of such bacteria as are contained in wheat and rye flours and then centrifuging or otherwise sepg.

Pectin from plant and fruit materials Wm. C. Platt (to Calif. Fruit Growers Exchange). U. S. 2,020,872, Nov. 12. The pH of a pectin ext. contg. solid substances is adjusted (suitably to about 1.2-1.6 for filtering under pressure with use of a freely flowing siliceous filter-aid) to a pH at which clear filtrates may be obtained with a filter-aid capable of high rate of flow but normally incapable of producing clear filtrates from the exts. without such adjustment of the pH .

Pectin preparations. Hans Schauweker. Fr. 785,151, Aug. 3, 1935. Dry pectin is made readily sol. in water by mixing finely powd. sugars, e. g., dextroses, with the finely powd. pectin. One or more acids such as citric or tartaric may be added according to the use to which the pectin is to be put.

Pectous material. Mutual Citrus Products Co., Inc. Brit. 432,244, July 23, 1935. Material contg. pectose, e. g., fruit pulp, is washed to remove H_2O -sol. ingredients and the pulp is then mixed with a filter-aid, e. g., Lueselguhr, pressed and dried. The washed material may be finely ground before addn. of the filter-aid and H_2SO_4 may be added at this stage. Jellies may be obtained by hydrolyzing the pectose to pectin.

Wax emulsions suitable for coating citrus fruits. John R. MacRill (to Calif. Fruit Growers Exchange). U. S. 2,019,758, Nov. 5. A compn which forms an emulsion when mixed with a solvent such as Na_2CO_3 soln. and with water is formed of ingredients such as paraffin 553, carnauba wax 68, a vegetable oil such as cottonseed oil 98, oleic acid 183 and triethanolamine 98 parts.

Solidified honey. Victor J. Hampton. U. S. 2,021,450, Nov. 19. Natural honey is transformed into a hard, glassy solid product, by subjecting it to a partial vacuum, simultaneously heating it to about 70° and allowing the resultant viscous mass to solidify in an atm. the relative humidity of which is 45% or less.

Increasing the viscosity of gelatin. Jay Bowman and Vernon L. Harnack (to United Chemical & Organic Products Co.). U. S. 2,020,234, Nov. 5. Gelatin for

use as a food or for other purposes is treated to increase the ratio of its viscosity to its jelly strength by heating to about $95-125^\circ$ for several hrs.

Condiments for seasoning foods. Erich Brust. U. S. 2,021,403, Nov. 10. A mixt. of citric acid with a larger proportion of salt is slowly heated, with const. stirring, to the m. p. of the citric acid and the stirring is continued to coat the particles of salt with a film of citric acid, followed by cooling, with continued stirring, and addn. of substances such as paprika, pepper and sugar.

Treating nuts such as pistachio nuts in the shell. Joseph A. Zaloom. U. S. 2,020,533, Nov. 12. Salted nuts in the shell are provided with an outer coating such as edible shellac to seal the shell and assist in preserving the kernel in good condition.

Coffee. Ricolfin (S. A. r. l.). Fr. 785,418, Aug. 9, 1935. A better extn. of the alkaloids and aromatic substances is made by adding to the boiling water used or to the roasted ground coffee NaH_2PO_4 in the presence of compds of NH_4 , alkali carbonates or bicarbonates and compds of Fe or Al.

Preserving green fodder. Friedrich A. Henglein (to I. G. Farbenind. A.-G.). U. S. 2,021,996, Nov. 26. Green fodder, e. g., crimson clover, is treated with a soln. of "wood-sugar" which serves as a preservative, while the material is kept in a silo.

Preserving green fodder in silos, etc. Georg Meder and Erich Leger (to I. G. Farbenind. A.-G.). U. S. 2,022,139, Nov. 26. Formic acid and a formate such as that of Na, K or NH_4 are used together as preservatives.

13—CHEMICAL INDUSTRY AND MISCELLANEOUS INDUSTRIAL PRODUCTS

(PLASTICS, RESINOIDS, INSULATORS, ADHESIVES, ETC.)

HARLAN S. MINER

Present-day material problems in the chemical industry. E. Rabald. Chem. Fabrik 1935, 441-6.—A review of imports and exports of Cu, Pb, Zn, Sn and Al; of German production from domestic and imported ores; of methods of economizing in construction and of combating corrosion by coating and alloying; of the recovery of scrap metal, and the substitution of other materials for metals. Thirty-five references. J. H. Moore

Progress in engineering knowledge during 1935. P. L. Alger. Gen. Elec. Rev. 38, 546-57 (1935).—A review of the contributions by General Electric Co.'s engineers. C. G. F.

Size distribution of industrial dusts. J. J. Bloomfield. U. S. Pub. Health Repts., Suppl. No. 115, 9 pp (1935).—17 references. J. A. Kennedy

Increasing the production of plastic materials. M. K. Shcherbakov. Uspekhi Khim. 4, 773-99 (1935).—A review of various production processes, sources of raw materials and the chem., phys. and elec. properties of the products obtained. F. H. Rathmann

Progress in the chemistry of synthetic resins. B. V. Maksorov. Uspekhi Khim. 4, 539-72 (1935).—A review of the manuf. and properties of the various types of synthetic resins. F. H. Rathmann

Preparation of artificial resins by benzoylation of aluminoids. B. V. Maksorov and K. A. Andrianov. Rev. gen. mat. plastiques 11, 82-3, 115, 211-13 (1935).—Casein, CH_3O -treated galalith, horn, yeast, fish scales, castor-seed cake, gelatin and glue can be benzoylated by treating with NaOH and refluxing with $BzCl$ at $80-110^\circ$; the paste reaction product can be steam distd. to remove volatile products, washed with warm dil. AcOH and then with H_2O till free from Cl, and finally dried in vacuum at $80-90^\circ$ yielding a product that is sol. in mixts. of alc. with Me_2CO or aromatic hydrocarbons, and in chlorinated hydrocarbons, less sol. in EtOH and BuOH, very difficultly sol. in Et_2O , spirit of turpentine and oils, and completely insol. in benzene and water; in dil. solns. of bases the product swells and finally dissolves. Fractional pptn. of C_4H_9 -alc. soln. by means of xylene showed that products

of considerably higher m. p. and viscosity can be sepd. from the total reaction products. Lacquers produced by prep. 4 15-25% soln. of the resin in alc.- C_4H_9 mixt., with or without addn. of a plastifier (6% tritoly phosphate on the wt. of resin), were applied to thin paper and to glass, dried at atm. temp. for 50-60 min. and then 30 min. at 100° . The resulting films were not scratched by a sharp point under a load of 300 g., and could be wound around a rod 5 mm. in diam without showing any signs of cracking. The dielec. properties of freshly prep. films were comparable to those obtained under the same conditions by the usual insulating lacquers (phenol-formaldehyde resins, copals, glyptals, etc.); but the resistivity falls off rapidly when treated with H_2O or acid or alk. solns., especially HCl. A. Papineau-Couture

Thermal insulators and their application. A. Clauset. Verre silicates ind. 6, 425-7 (1935).—An elementary theory of thermal insulation. Herbert S. Willson

Asbestos in electrical insulation. H. Warren. India Rubber J. 90, No. 17a (Intern. No.), 19-22 (Oct. 31, 1935).—A review and discussion. C. C. Davis

Recent progress in dielectric strength. John B. Whitehead. Elec. Eng. 54, 1288-9 (1935).—A summary of some 1934-1935 results indicating the scope and significance of research involved in the formulation and application of elec. insulating materials. Fifty-five references.

W. H. Boynton
The adhesive power of adhesives. Max Delpy. Kunststoffe 25, 165-8 (1935).—The use of various adhesives for sticking paper to paper, patching tire inner tubes, making safety glass and soldering metals is discussed. To obtain good adhesion, the adhesive must penetrate and fill surface pores. J. W. Perry

The distribution of the plasticizer in the artificial leather film. Walter M. Münzinger. Kunststoffe 25, 249-51 (1935).—Artificial leather is apt to become sticky, when solvent residues or relatively nonvolatile solvent impurities or excessive amts. of plasticizers diffuse to the surface. J. W. Perry

Coated fabrics in construction industry. Dorman McBurney *Ind. Eng. Chem.* 27, 1400-3 (1935). G. G. Turkey-red oil from grapeseed oil. Welwart. *Seifen- und Ztg.* 62, 933 (1935) — Practical experience has convinced W. that sulfonated grapeseed oil is a poor substitute for sulfonated castor oil. J. W. Perry. Sulfonated oils. A. E. Sunderland. *Soap* 11, No. 10, 61-4, 71, No. 11, 61-4, No. 12, 67-9 (1935) — Manuf. properties and applications of sulfonated oils are discussed. E. Scherubel.

Dressings, polishes and abrasive preparations for automobile finishes. Carl Becker. *Jr. Seifen- und Ztg.* 62, 709-11, 732-3, 752-3, 772-4 (1935) — Raw materials, recipes, production methods and the proper use of various preps are discussed. J. W. Perry.

Shoe dressings—yesterday and today. Karl Dopf. *Kunststoffe* 25, 168-9 (1935).

Five recipes. Floor wax, rust removing paste, liquid metal cleaner, liquid furniture polish and liquid black stone polish. Leo Ivanovsky. *Seifen- und Ztg.* 62, 708-9, 732 (1935). J. W. Perry.

Iron in common sponges. P. Robin. *J. pharm. chim.* 21, 600-4 (1935) — The quantities of Fe occurring in sponges of different origin are recorded. They vary with the geographical source, being larger in Mediterranean, smaller in West Indian sponges. S. Waldbott.

Paint removers. R. Forster. *Paint Manuf.* 5, 314-16 (1935) — There are 4 types of removers for paint films. (1) mech., (2) caustic alkali, (3) elec. method and (4) org. solvent. The 4th type is subdivided into 3 groups: (1) $(CH_3)_2CO$, (2) high flash or nonflammable and (3) Me-Cl base. Waxes and solvents are discussed. A paint remover may contain wax, a protective colloid, a wax precipitant and a wax solvent. Special measures are necessary for removal of coatings other than oil paint. A formula is given for each of the 3 types of org. solvent paint removers and several patent nos. are appended. W. H. Boynton.

Synthetic detergents and their practical application. Oskar Uhl. *Seifen- und Ztg.* 62, 687-8, 719-20 (1935). — A review emphasizing practical problems. J. W. P.

Plastics used in food equipment (Lee) 12. Fire risks and their prevention (Wood) 30. Gas filters (Fr. pat. 751,773) 1. Lacquers and plastic masses (Brit. pat. 432,762) 26. Urethans [derivs as dispersing, softening or sizing agents] (Ger. pat. 619,500) 10. Alkali metal tetraphosphates [products used as detergents] (U. S. pat. 2,019,665) 18. Quaternary ammonium salts [emulsions for treatment of fibrous materials] (Brit. pat. 433,356) 10. Cellulose foils [gas mask windows] (Brit. pat. 432,772) 23. Ester-like compds. [as soaps and active O-yielding agents] (Ger. pat. 616,847) 10.

Effecting reactions with circulating gases. Kenneth Gordon and Imperial Chemical Industries Ltd. Brit. 432,574, July 30, 1935. In carrying out reactions with circulating gases, the gases are purified by being passed in rapid co-current flow with a liquid absorbent, which removes in each operation only a small proportion of the undesired constituents. Specific applications are dehydrogenation, NH_3 synthesis and $MeOH$ synthesis.

Filters for gas masks and like protective apparatus. Degea A.-G. (Auerger). Ger. 619,278, Sept. 26, 1935 (Cl. 61a, 29.30). A paste contg. gas-absorbing reagents is kneaded into a porous support, e. g., rubber sponge. The paste may contain also a binding or stiffening agent, e. g., waterglass, cement or gelatin, and (or) a powder adsorbent, e. g., active C.

Plastic materials. Deutsche Hydrierwerke A.-G. Fr. 755,009, July 31, 1935. Artificial albuminoid materials in gelatin, strong glue, casein, albumin, etc., are softened and made elastic by adding aliphatic, aromatic or cycloaliphatic alcs. contg. 6 or more C atoms or ethers or esters of these compds., or cyclic ethers contg. an OH group or an ether or ester thereof. Thus, a soln. of oleic alc. in

1 MeOH is incorporated in fused gelatin, and acetone-glycerol benzoate in BuOH is added to an artificial casein material.

Plastic materials. I. G. Farbenind. A.-G. Fr. 755,522, Aug. 12, 1935. In making films, threads and molded articles from plastic materials sol. in org. solvents, particularly cellulose derivs., haloalcohol esters of polyhydric alcs. in which all the free OH groups are esterified with aliphatic carboxylic acids of straight chain contg. at least 8 C atoms, are used as emollients. Examples are ethylenechlorohydrin naphthenate and -phenylsearate, monochlorohydrin-ditrate and -erythritedipalmitate, and dibromohydrin ester cocinic acid ($CH_2Br-CHBr-CH_2-O-COR$, R is cocinic acid).

Plastic substances. I. G. Farbenind. A.-G. Fr. 755,705, Aug. 17, 1935. Plastic substances of high mol. wt. are made by causing alkali, alk. earth or NH_4 sulfides, particularly polysulfides, to act on polyhalo compds. having the halogen atoms attached to C atoms of lower aliphatic chains and contg. the group CO , e. g., glycerol-trismonochloroacetate, the di-ester of glycol and $CHCl_2COOH$, sorbitol tetrakismonochloroacetate, dichloroacetone, β -chloroethyl ester and β -chloroethylamide of $CH_2ClCOOH$ and dichloroacetyl ethylenediamine.

Plastic substances. I. G. Farbenind. A.-G. Fr. 755,861, Aug. 21, 1935. Rubberless products resembling rubber are made by causing alkali, alk. earth or NH_4 sulfides, particularly polysulfides, to act on aromatic compds. contg. at least 2 halogen atoms in aliphatic side chains, e. g., benzylidene chloride, benzotrichloride or *p*-xylene dichloride. A diluent such as EtOH or water is used, and if water is used dispersing or emulsifying agents are added.

Testing thermosetting plastic materials. Balclutha Corp. Brit. 432,646, July 31, 1935. The materials are tested by subjecting a predet. quantity thereof to heat and pressure in a mold provided with a channel along which the material may flow, maintaining the heat and pressure until the material sets and measuring the extent and (or) rate of flow along the channel. App. is described.

Apparatus for extruding plastic material under pressure. Imperial Chemical Industries Ltd. Fr. 755,788, Aug. 19, 1935. Means for removing gas by reduction of pressure before extruding.

Plastic compositions containing resins and cellulose derivatives. Harry B. Dykstra and Walter E. Lawson (to E. I. du Pont de Nemours & Co.). U. S. 2,021,121, Nov. 12, 1935. Compds. such as those contg. cellulose esters and ethers, etc., are plasticized with esters of the general formula $R'OOCOR''COOR''COOR''$ in which R' and R'' are univalent radicals derived from monohydric alcs., R' is a bivalent hydrocarbon radical and R'' is a bivalent aliphatic hydrocarbon radical, such as butyl phthalyl vinyl glycolate or the like.

Artificial resins. Wilhelm Kraus. Brit. 432,637, July 25, 1935. Condensation products are prep. by condensing a phenol, e. g., PhOH or cresol, 1, urea 1-2 and an aq. acid CH_2O soln. of fu below 3, 2-4 mol. proportions in the presence of such quantity of $(CH_3)_3N$, that the reaction mixt. is acid. The $(CH_3)_3N$ may be added as a whole or in parts or it may be prep. from NH_3 and CH_2O added separately. The urea may be replaced by mints thereof with other compds. that react with CH_2O , e. g., thiourea, urethan, formamide, acetamide and oxamide. The products may be worked up with fibrous or filling materials, e. g., cellulose.

Synthetic resins. Walter Wollaston (to Brunswick-Balke-Collender Co.). U. S. 2,019,591, Nov. 5. A compn. of stiff consistency is formed contg. a urea formaldehyde resin mixed with a phthalic anhydride glycerol resin, a phenol-formaldehyde resin and a filler such as lithopone, ZnO or barytes and articles such as billiard balls, toys, etc., are molded from the compn. under heat and pressure, and are then finally shaped and finished.

Synthetic resins. I. du Pont de Nemours & Co. Brit. 433,432, Aug. 12, 1935. Resinous substances are prep. by causing to react at elevated temp. and in the presence of alkali 1 or more dihalo derivs. of formula halo-

X-halo, wherein X is CH_3 or an aliphatic hydrocarbon chain, which is preferably broken by an ether linkage, with 1 or more dinuclear phenols of formula $\text{R}(\text{HOAr})\text{C}(\text{ArOH})\text{R}'$, where Ar and Ar' are phenylenes, which may carry alkyl, alkoxy or halo substituents or, preferably, a secondary or tertiary alkyl group in β -position to the phenolic OH, and R and R' are H, alkyl or aryl groups. A portion of the phenol may be replaced by an equiv. amt. of a dihydroxydithiosulfone or by 1 or more monohydric phenols and a proportion of the dihalo compd. may be replaced by a monohalo compd. Among examples, resins are prepd. by condensing, in presence of H_2O and NaOH , dichlorodimethyl ether and (1) di-(4-hydroxyphenyl)-dimethylmethane (I), with or without the addn of di-(4-hydroxyphenyl)-sulfone, (2) di-(4-hydroxy-3-methylphenyl)-dimethylmethane, (3) di-(4-hydroxy-3,5-dichlorophenyl)-dimethylmethane, and (4) *o*-cresol and I, or by condensing I, in presence of H_2O and NaOH , with ethylene or amylene dichloride. The resins may be used in various compns in conjunction with solvents, pigments, fillers, plasticizers, etc., as adhesives, impregnating, coating, sizing, glazing or water-proofing agents, binders for lunoleum plastics, glass substitutes, cements and sealing waxes, varnishes, etc.

Synthetic resins. Wilhelm Kraus. Austrian 142,893, Sept. 25, 1935 (Cl. 39a). Urea and N_2H_4 are condensed with CH_3O in the presence of an acid condensing agent. The preferred proportions are 1 mol. of CH_3O or slightly more for each mol. of urea, 2 mols. of CH_3O for each mol. of N_2H_4 , and less than 0.05 mol. of N_2H_4 for each mol. of urea. N_2H_4 may be taken as its hydrate or as a salt. Other reagents which condense with CH_3O , e. g., thiourea or phenol, may be added to the mixt. The reaction is effected at a raised temp. in the presence or absence of water or other solvent. Sp. processes are described. The products are more easily molded than the known resins of the urea- CH_3O type.

Synthetic resins. Soc. pour l'ind. chim. à Bâle. Ger. 612,626, Sept. 16, 1935 (Cl. 12a 17 05). Resins insol in water are prepd. by heating 1 mol. of urea with 2 mols. of CH_3O . The aq. soln. of the condensation product is further heated in the presence of free OH ions with substances (except dicyanodiamine) which, with CH_3O or its condensation products and free OH ions, form insol. resins, till the insol. resins sep. Examples of the substances used in the second stage are phenylurea, thiourea, PhNH_2 , urea, biuret, and β -naphthylamine, all with NaOH .

Synthetic resins. Allgemeine Elektrizitäts-Ges. Ger. 619,439, Oct. 1, 1935 (Cl. 12a 26 02). See Brit. 393,034 (C. A. 28, 3529).

Synthetic resins. Elly Pollak (nee Hissberger). Fr. 785,763, Aug. 19, 1935. A soft resin is prepd. by heating together urea and $(\text{CH}_3)_2\text{N}$ in the presence or not of a solvent and, after removal of the liquid, is transformed into a hard sol. resin by sepn. of water.

Synthetic resins from urea (or thiourea) and formaldehyde. I. G. Farbenind. A.-G. (Karl Eisenmann and Hans Scheuermann, inventors). Ger. 618,743, Sept. 10, 1935 (Cl. 12a 17 05). Addn. to 588,426 (C. A. 28, 1560). The ester added to the reaction mixt. in the process of Ger. 588,426 is replaced by a higher alc. contg. more than 8 C atoms in the mol., e. g., cetyl alc. or mixts. of alcs. obtained by reducing animal or vegetable oils, fats or waxes or by oxidizing paraffin wax. The proportion of higher alc. must be at least 20%, calcd. on the urea- CH_3O product. The soly. properties of the products vary with the proportion of higher alc. The products are useful as components of lacquers or, after addn. of an acid hardening agent, for making molded articles. Examples and numerous details are given.

Resin compositions. Carbide Chemicals & Carbon Corp. Fr. 784,681, July 22, 1935. Vinyl resins resulting from the joint polymerization of a vinyl halide with a vinyl ester of an aliphatic acid have added thereto heat stabilizers composed of metals or metal compds. which form insol. Cl. derivs. and (or) substances having a moderate reducing action. Examples are oxides of Sb, Bi, Cu and Hg, sulfite

of Ag, Cd, Ca, Ce, Na and Sr, silicates of Cu and Mg, metallic Cu, Cd, Al and Mg, mixts. of basic Pb sulfate and Pb sulfite, and "sublimed blue lead." The compns. may be heated to a much higher temp. than the resin alone without decompos.

Vinyl resins. Soc. Nobel française. Fr. 785,569, Aug. 13, 1935. Condensation products of polyvinyl alcs. and aldehydes having a chem. structure of acetals are stabilized by antioxidants such as hydroquinone, pyrogallol and "antioxygen RR5."

Resinous composition suitable for coatings, etc. Caryl Sly (to I. I. du Pont de Nemours & Co.). U. S. 2,022,011, Nov. 26. A resinous reaction product is formed from a noncellulosic polyhydric alc. such as glycerol and the product obtained by heating together an org. polybasic acid such as phthalic anhydride and a cellulose deriv. such as cellulose acetate or ethyl or benzyl cellulose.

Cyanamide resin. Palmer W. Griffith (to American Cyanamid Co.). U. S. 2,019,490, Nov. 5. CH_3O is added to an unaltered soln. of cyanamide of a pH between 4 and 8 and the ppt. formed is sepd. and chemically combined with water to form a product which is suitable for molding.

Polyhydric alcohol-polybasic acid resins. Ben E. Sorenson (to E. I. du Pont de Nemours & Co.). U. S. 2,019,510, Nov. 5. See Can. 351,817 (C. A. 29, 6975).

Electric insulating compositions. Siemens & Halske A.-G. Ger. 619,253, Sept. 30, 1935 (Cl. 21c 2 11). Rubber is mixed with a water-insol. cellulose deriv. e. g., cellulose laurate, without the aid of a solvent or dispersing agent. A softening agent, e. g., a mineral wax, is included in the compn., and is preferably mixed separately with the rubber or the cellulose deriv. The proportion of cellulose deriv. may be about 40%. The compns. are particularly useful for insulating submarine cables.

Heat-insulating material. Insulations (London) Ltd. Fr. 784,802, July 25, 1935. Diatomaceous earth is ground, mixed with ground furnace slag and a binder, such as CaCO_3 and a small amt. of NaCl . The mass is moistened, compressed to the desired shape and heated under steam pressure until a chem. reaction takes place between the CaCO_3 , NaCl and slag. Glucose may be used as a temporary binder.

Cables, insulation. Allgemeine Elektrizitäts-Gesellschaft (to The British Thomson-Houston Co. Ltd.). Brit. 432,284, July 24, 1935. Cables, condensers and other elec. app. are impregnated with a compd. contg. a considerable amt. of CO_2 that has been dissolved therein under pressure and which escapes to fill any voids formed in the impregnated dielec. during operation of the app.

Nonconducting coverings for heat. Franz Wm. Seiving, Abel Bergqvist and Karl E. Olsson. Brit. 432,019, July 15, 1935. In heat insulation comprising spaced sheets of a transparent material having the mech. properties of paper, e. g., cellulose acetate, the sheets are impregnated with particles of material having a metallic luster, e. g., metals, alloys, metallic compds. Air bubbles may be blown in the mass during the prepn. of the sheets.

Dielectric materials. The British Thomson-Houston Co. Ltd. Brit. 433,070, Aug. 8, 1935. Elec. app. is provided with a dielec., insulating and (or) cooling medium comprising a non-cryst. halogenated diphenyl ketone in which the mol. proportion of the halogen is at least equal to that of the H. Diphenyl ketone, prepd. by causing C_6H_5 to react with CCl_4 in presence of AlCl_3 , hydrolyzing the product and fractionating, is halogenated in presence of Fe or Fe chloride as catalyst to give mixts. of isomeric halogenated diphenyl ketones. In Brit. 433,071, Aug. 8, 1935, the medium comprises a non-cryst. solid or liquid halogenated dibenzyl. Such products may be prepd. by treating chlorobenzenes with ethylene dichloride in presence of AlCl_3 .

Dielectric material suitable for condensers. Raymond H. Hobrock (to Western Elec. Co.). U. S. 2,020,468, Nov. 12. Material such as paper is impregnated with an insulation compn. comprising a halogenated naphthalene or halogenated stearic acid and a substantially amorphous paraffin hydrocarbon material in minor proportion (the

components of the mixt. being sol in the liquid phase but insol in the solid phase).

Adhesives I G Farbenindustrie A-G Brit 432,977, Aug 7, 1935. Addn to 401,200 (C A 28, 24811). Low polymerized halogenated polyvinyl chlorides that are obtained according to 401,200 by further chlorination of polyvinyl chlorides in the presence of solvents or agents promoting the formations of suspensions are used as a basis for adhesives, particularly for leather cements. In an example, a leather cement is obtained by dissolving low polymerized polyvinyl chloride 20 in methylene chloride 80 parts Cf C A 29, 22629.

Dry powdered adhesives Henkel & Cie G m b H Brit 432,480, July 15, 1935. This corresponds to Fr. 766,504 (C A 28, 74457).

Testing the adhesive properties of coatings such as asphalt, paint or lacquer Geo R Hoover and George E. Shafer (to American Rolling Mill Co.) U. S. 2,020,891, Nov. 12. A jet of fluid such as water or other inert liquid is projected from a nozzle so as to impinge at the edge of an isolated area of the coating material (the coating support and nozzle being at an angle of about 45°). App is described.

Cements Alfred S. Colling Brit 432,493, July 25, 1935. A cement that will stick rubber or fabric to metal consists of Paris white 40, rosun 3, dammar or copal gum 15, CH₂ 15, naphtha 23 and rubber 15 parts. Whiting may be added to make the cement suitable for sticking vitreous tiles to plaster cement surfaces.

Wetting and other agents Soc. pour l'ind. chim. à Bâle Fr 785,475, Aug. 10, 1935. Products having excellent capillary properties are made by acylating the NH₂ group or groups of aromatic amines which contain at least one hydroxyalkyl or hydroxyalkylaryl sulfonamide group, esterified if desired with H₂SO₄, with aliphatic carboxylic acids contg more than 3 C atoms. The OH group is then esterified with H₂SO₄ if not previously esterified. Thus, the hydroxymethylamide of 1-nitro-3-benzenesulfonic acid is esterified with H₂SO₄, reduced to the 1-amino compd., and acylated with oleic acid chloride or lauric acid chloride. Other examples are given.

Wetting and other agents Compagnie nationale de matières colorantes & manufactures de produits chimiques du nord réunies établissements Kuhlmann Fr 785,561, Aug. 13, 1935. These are prep from ketones of the formula RCOR and RCOR' (R being an aliphatic chain of more than 8, preferably 12-18, C atoms, R' being a chain of less than 5 C atoms), by halogenation. One or more of the halogens may be replaced by a solubilizing group or a short chain contg such a group. Thus, a ketone derived from stearic acid is dissolved in CCl₄ and Cl is passed through the soln. Other examples are given.

Wetting and washing agents Herbert Fleisch, Carl Fleisch and Leonore F. Abelmann (trading as Farb- und Gerbstoffwerke Carl Fleisch, Jr.) Brit 433,206, Aug 7, 1935. See Fr 767,788 (C A 29, 5329).

Wetting, washing and dispersing agents, soaps I G Farbenindustrie A-G Brit 433,305, Aug 8, 1935. Oxidation products of nonaromatic hydrocarbons of high mol wt are dissolved in a H₂O-insol solvent or mixt. of solvents, the soln is treated with an alk. substance dissolved in H₂O in such amt that the acid portions of the oxidation products are neutralized, the aq soap soln is sep'd and the unaponifiable constituents may then be ext'd from it by means of the same or another H₂O-insol solvent. The soap soln may be evap'd to dryness and formed into shaped soaps, soap powder, etc. Among examples, hard paraffin is oxidized with air by heating in the presence of Na and Mn palmitates, the product is dissolved in a mixt of benzene and alc and stirred with warm Na₂CO₃ soln, the soap soln is removed after settling, ext'd with benzene and evap'd in a roll drier to form a soap powder.

Compositions for use as wetting agents Wm Todd (to Imperial Chemical Industries Ltd.) U. S. 2,020,385, Nov. 12. A dry mixt readily sol in water is formed of a wetting agent such as one of the sulfonated alkylated naphthalene series and an alkali metal sulfonate of ben-

zene, aniline or an N-substituted aniline such as Na benzyl-aniline sulfonate or the like.

"Assistants" suitable for use as wetting agents in the textile and related industries Hans Deller and Hermann Schuette (to I G. Farbenind. A-G.) U. S. 2,020,453, Nov. 12. A product from the incomplete liquid phase oxidation of nonaromatic hydrocarbons of high-mol wt. such as paraffin or gas oil from which non-oxidized hydrocarbon material has been sep'd and which contains at least 15% of alcs and olefins is caused to react with a sulfonating agent. Various examples are given.

Phosphoric esters Bohme Fettechemie-Ges m. b. H. Ger. 619,019, Sept. 20, 1935 (Cl. 12a 5 04). Aliphatic alcs. contg more than 8 C atoms are treated at atm or raised temp. with acetylphosphoric acid or a reagent which yields it, e. g., a mixt of AcCl and H₃PO₄. Phosphoric esters of the alcs., useful as wetting, emulsifying and cleansing agents, are obtained. Examples are given of the manuf. of esters from stearyl, lauryl and oleyl alcs.

Moldable composition Harold S. Holt (to E. I. du Pont de Nemours & Co.) U. S. 2,022,001, Nov. 26. A thermoplastic, substantially water insensitive CH₂O-treated casein compn is used together with a polycarboxylic acid-polyhydric alc. condensation product.

Molding powder suitable for making brushes of electric machines Carleton N. Smith and Newcomb C. Chaney (to National Carbon Co.) U. S. 2,020,053, Nov. 5. A finely divided conductive material, principally C, is used with a minor proportion of a vinyl resin such as that formed by the conjoint polymerization of vinyl chloride and vinyl acetate, the vinyl resin being distributed on the surface of the conductive material in extremely fine subdivision.

Urea-formaldehyde molding composition Kenneth N. Francisco (to American Cyanamid Co.) U. S. 2,020,024, Nov. 5. A cellulose filler such as paper pulp is impregnated with a urea-CH₂O condensation product and the material is then dried and ground to a powder. Agglomerated into lumps with an aq. soln of a urea-CH₂O condensation product, the lumps are disintegrated into relatively dense granules, and the granules are preformed under pressure to give a product which can be molded under heat and pressure to form strong and uniform products.

Molded book covers of rubber and other materials Arthur G. Rendall (to Morland & Impey Ltd.) U. S. 2,020,214, Nov. 5. A layer of rubber is used adjacent at least one layer of another thermoplastic material such as a synthetic resin compn, which is united with and harder than the rubber. Various mfg details are described.

Artificial leather Horace Johnson Martin Fr. 785,102, Aug. 2, 1935. Waste and crude leather are reduced to a uniformly colloidal state by mech. disintegration in the presence of water, e. g., in a colloid mill, and the resulting product is tanned giving a leather having the properties of the natural product but which can be made in any desired shape or length.

Fabric-coating apparatus for making artificial leather Atlas Agrochem Fab A-G (Otto Spreckelsen, inventor) Ger. 619,124, Sept. 23, 1935 (Cl. 84 7).

Condensation products Henkel & Cie G m b H Fr 785,490, Aug. 10, 1935. Products which are emollients, artificial resins, etc., and may be used in lacquers, varnishes, etc., are made by causing oxidation products of natural resins or resinic acids contg at least 1 COOH group to react with org. compds contg at least 1 OH group, or their functional derivs capable of reacting, e. g., glycerol, glycol, BuOH, hexanol, benzyl alc., PhOH, creosol, epichlorohydrin, aminopropandiol, triethanolamine and their halides and alkylene oxides.

Phenol-amine-aldehyde condensation products Aug Nowack A-G, Richard Hessen and Karl A. Schuch Brit. 433,766, Aug. 19, 1935. Condensation products are prep from CH₂O, a phenol or homolog thereof and an aromatic amine by condensing the CH₂O with 1 of the aromatic components to yield a sol. resinous product and further condensing this with the other aromatic compd and CH₂O or with a preformed sol. resinous condensation

product derived from the other aromatic compd. and CH_2O , the reaction taking place in a liquid or viscous medium and the condensation being continued until formation of layers takes place. Among examples, (1) a viscous $\text{PhOH}\cdot\text{CH}_2\text{O}$ resol is dissolved in PhNH_2 and the product condensed with CH_2O in the presence of Na_2CO_3 , and (2) an acid-condensed $\text{PhNH}_2\cdot\text{CH}_2\text{O}$ resin is dissolved in PhOH or cresol and the product condensed with CH_2O in presence of Na_2CO_3 or NH_3 .

Phenol-formaldehyde condensation products Alan A. Drummond, Howard H. Morgan and Imperial Chemical Industries Ltd. Brit. 433,539, Aug. 12, 1935. Resins are made by causing CH_2O to react with a cresol or a xyleneol, or a mixt. thereof, in the presence of more than 0.5% of NH_3 (calcd. on the amt. of phenol), the reaction being continued sufficiently long and the proportion of phenol to CH_2O being sufficient for the reaction product to be permanently fusible and sol. in drying oils.

Urea-formaldehyde condensation products I. G. Farbenindustrie A.-G. Brit. 433,536, Aug. 12, 1935. These are made by subjecting the products obtainable by condensation, preferably in the presence of acid condensing agents, of urea and (or) thiourea and CH_2O or its polymers, or of methylol derivs. of urea and (or) thiourea or alkyl ethers thereof, or of amorphous products of high mol. wt. obtainable from the said methylol compds. by splitting off H_2O , or of mixts. of said substances, in a monohydric alc. solvent, to condensation in the presence of an aliphatic alc. contg. more than 8 C atoms, neutralizing the reaction mixt., expelling the excess of alc. solvent and heating the remaining resinous product until it has become sol. in aromatic hydrocarbons. The products may be worked up alone or together with cellulose esters or ethers and the usual softening agents or with drying oils to form lacquers and adhesives. The resins, after adding a suitable acid or acid-forming hardening agent, and, if desired, with the addn. of softening agents, may be used for precast articles that harden on heating and are suitable as substitutes for glass. Among 8 examples, (1) dimethylol-urea is heated with BuOH , TiOH , urea nitrate and the mixt. of alcs. obtained from the acids of palm kernel oil, the reaction mixt. is neutralized with Na_2PO_4 , the excess BuOH is removed in a vacuum kneading-machine and the resin is further kneaded at 85–95°, and (2) a mixt. of dimethylolurea and dimethylolthiourea is heated with BuOH , TiOH and octadecyl alc., as in (1) and the product is kneaded with phthalic anhydride and hardened in molds.

Resinous polymerization products Harold J. Tattersall and Imperial Chemical Industries Ltd. Brit. 433,540, Aug. 12, 1935. Polymerized acrylic esters or their homologs are made in sheet form by polymerizing the ester or esters or mixts. thereof by heat, light or other known means, preferably in the presence of an O-catalyst, if desired with the addn. of plasticizers, dyes or other effect materials, interrupting the polymerization when the mixt. has the consistency of a thick sirup just capable of pouring, placing the sirup between 2 horizontal sheets of glass or other material, preferably polished, of which the upper 1 is counterpoised, allowing polymerization to proceed slowly at not above 50° or, if necessary, with cooling down to about 5° until solidification is complete, and removing the sheet of polymerized material, advantageously after 1st heating the plates with the solid polymer between them. In examples, (1) *Me methacrylate* is heated to not above 80° in the presence of Bz peroxide until the mol. wt. is 3000 by Staudinger's method, cooled to 30°, polymerization completed at 20–25° between glass plates, the sandwich heated to 80–90° and the sheet of polymer detached, and (2) the materials and app. of (1) being used, a 1st layer is polymerized without the top sheet of glass, which is applied only after a 2nd layer of partly polymerized material has been poured on top of the 1st.

Sheets made from polymerized substances Imperial Chemical Industries Ltd. Fr. 785,506, Aug. 12, 1935. Polymerized acrylic esters or their homologs are obtained in the form of sheets by polymerizing the ester or esters by heat, light or other means, preferably in the presence

of an O-catalyst such as benzoyl peroxide, with the addn., if desired, of dyes, plasticizers, etc., interrupting the polymerization when the mixt. has reached sirupy consistency, just capable of flowing, placing the sirup between 2 sheets of glass or other polished material, and allowing the polymerization to proceed slowly at not above 50° until solidification is complete.

Chlorinated polymers of acrylic acid and derivatives for making molded articles, etc. Walter Bauer (to Rohm & Haas Co.) U. S. 2,021,763, Nov. 19. Various examples are given of the production of chlorinated derivs. from compds. such as polymerized acrylic acid methyl ester, polyacrylic acid, polymerized methacrylic acid ethyl ester, etc., which may be used for the production of artificial materials such as lacquers, films, intermediate layers for safety glass, articles to be used in electro-technology, threads, artificial leathers, oil-cloth, rayon, fabrics of various kinds.

Compositions containing collagen products Wilfred Graham Dewsbury and Arnold Davies Fr. 785,114, Aug. 2, 1935. See Brit. 431,360 (C. A. 30, 1934).

Sheets and threads from polyvinyl chloride Max Hagedorn (to Agfa-Ansco Corp.) U. S. 2,020,642, Nov. 12. A soln. of an after-chlorinated polymerized vinyl chloride contg. a firmly bound quantity of Cl above that corresponding to the formula $\text{CH}_2\text{Cl}\cdot\text{CHCl}$ and needing for solution of 1 gm. less than 15 cc. of a mixt. of PhCl and epichlorohydrin mixed in the ratio of 3:1 at 100°, said mixt. keeping the polyvinylchloride in soln. for at least 5 min. when cooled to 20°, is used for casting to form films or sheets or for forming threads.

Emulsions. H. Th. Böhm A.-G. Fr. 785,006, July 31, 1935. Stable emulsions of fatty materials are made without the addn. of special protective colloids by mixing electroequiv. amts. of 2 different colloidal electrolytes, one having a colloidal cation and the other a colloidal anion giving rise to an electrostatically neutral compd. insol. in water and adding to this compd. an excess of one of the constitutive elements or any other colloidal electrolyte until the material gives a stable emulsion with water. The fatty material is preferably added to one of the constituents before mixing with the other constituent. As electrolytes with colloidal cation may be used quaternary NH_4 compds. of the aliphatic, aromatic, aliphatic aromatic, hydroaromatic and heterocyclic series, or salts of alkyliso- and alkylisothio-urea. As electrolytes with colloidal anion may be used alkyl esters of strong mineral polybasic acids, e. g., dodecyl-, hexadecyl-, octadecenyl- and octadecyl-sulfates or their alkali salts, alkali salts of fat acids, free fat acids and products having a basis of Turkey-red oil. Thus, paraffin oil or soft paraffin is emulsified with an alkali salt of dodecyl sulfate, lauryl-pyridinium bisulfate is added in amt. such that the paste obtained has max. viscosity. The salted water is sepd. by heating, and a high percentage emulsion of pos. charge is obtained by a fresh addn. of lauryl-pyridinium bisulfate. By adding dodecyl sulfate an emulsion of neg. charge is obtained. Other examples are given.

Emulsifying agents, etc. Henryk Cohn and Conrad Siebert. Fr. 785,078, Aug. 16, 1935. Waxes, such as wool fat, are saponated at ordinary temp. by means of an alc. soln. of KOH contg. petroleum ether. The product insol. in alc. is sepd. and from the dissolved product is sepd. by means of water an insol. substance, which, on swelling, absorbs a large amt. of water which may be removed again by heating. The product has various technical uses but is particularly suitable for the prepn. of emulsions, and for cosmetics and pharmaceutical products.

Dispersing agents, etc. Imperial Chemical Industries Ltd. Fr. 785,500, Aug. 19, 1935. Products which are used for emulsifying and dispersing or as auxiliary agents in the textile industry are obtained by causing degreas to react with ethylene oxide. The reaction is carried out in the presence of a substance having surface activity or a caustic alkali.

Cleansing compositions. Johann Bertram and Erich

Schieweck. Fr. 785,941, Aug. 22, 1935 See Ger. 616,443 (C. A. 29, 7531¹).

Cleaner Rudolf Wille Ger. 616,885, Aug. 5, 1935 (Cl. 30k 13) A compn for removing black grease or oil, etc., from the hands, etc., consists of leather felt pads soaked in a mixt. of soap soln and acetone or other solvent miscible with water.

Bleaching agents Henkel & Cie G. m. b. H. Fr. 785,329, Aug. 7, 1935 Bleaching agents contg percompds and salts of pyro- and meta phosphates are stabilized in alk medium by adding Al hydroxide, or salts of Al by which the hydroxide is formed. One example contains soap 57, neutral Na pyrophosphate 12, Na perborate 12, Na₂CO₃ 14 and Al hydroxide 5 parts.

Penetrating liquid suitable for removing dirt, grease and rust from metal and lacquered surfaces, etc. Dudley K. French U. S. 2,021,448, Nov. 19 A mixt. of kerosene 60, sulfonated castor oil 20 and sulfonated coconut oil neutralized by rosin soap 20% is stabilized by less than 1% of alc. and forms an emulsion when mixed with water.

Polish Henri J. S. Cuvilliez Fr. 785,300, Aug. 6, 1935 The polish contains mineral oil 2.5, turpentine oil 2.5, alc 1, glycerol 0.11, CaCO₃ 0.6, shellac 0.3 and animal wax 1 kg.

Polishing composition for use on furniture or automobiles John Rong U. S. 2,020,125, Nov. 5. A polishing compn is formed of motor lubricating oil 1 oz, kerosene 0.5 oz, gasoline 0.5 oz, "ammonia oil" 1 oz, japan varnish dryer 1 oz, furniture glue 0.5 oz, "liquid bronze" 1.5 oz, Javel water 1.5 oz, "turpentine 0.25 oz, "plain white ammonia" 0.25 oz, a "commercial disinfectant" 4 drops and camphor oil 7 drops.

Polishing devices such as wheels or belts comprising resilient rubber Frank H. Manchester (to Wingfoot Corp.) U. S. 2,021,371, Nov. 19. A body of resilient rubber carries a thin outer layer of treated rubber, difficultly separable and substantially inelastic, having very small fissures and carrying an outer coating of adhesive and abrasive material.

Aqueous oil emulsions such as automobile polishes. Foster D. Snell and Cyril S. Kimball U. S. 2,021,027, Nov. 12 An emulsifier compn suitable for making aqueous emulsions of oils with 1 part of emulsifier to 50 parts of oil such as a lubricating oil to 200 parts of the emulsion as a whole comprises at least 3 colloidal substances including (a) starch, dextrin, glycogen or flour, (b) gum arabic or gum senegal, gum tragacanth or gum karaya and (c) algin or pectin (the carbohydrate material predominating). A metal soap such as Ca or Al oleate or stearate and an unorg abrasive material such as diatomaceous earth may be added to form a polishing compn.

Cores for electric apparatus Haristoff-Metall-A.-G. (Hametar). Ger. 619,064, Sept. 23, 1935 (Cl. 21g 31.03) Powd. ferromagnetic material of a granule diam below 0.2 mm. is mixed with a binder, e. g., a soln of borax or resin, and with finely ground asbestos of a filament thickness below 0.001 mm. The mixt. is then compressed in the usual way.

Cores for electric apparatus Siemens & Halske A.-G. Ger. 619,095, Sept. 23, 1935 (Cl. 21g 31.03) Powd. ferromagnetic material is compressed into a rigid form with the aid of an insulating binder in a proportion below that necessary for the required degree of insulation. The compressed material is then further insulated by impregnation with an oil or fat in a nonviscous liquid form.

Magnets Mitsubishi Denki K. K. Yogo Kato and Takehiko Takei Brit. 432,152, July 22, 1935 In a magnet consisting of a magnetized mass of particles of oxides of Fe and other metals, disintegration is prevented by an exterior protective covering or by a reinforcement embedded in the material or by both these means. The material may be oxides of Fe and Ni or Co and has an external cover of gauze, sheet metal, enamel or lacquer or, alternatively or in addn., reinforcing bars of Ni, porcelain or earthenware, embedded therein.

Spark plug with an ionizing catalytic element Charles Michel U. S. 2,022,140, Nov. 25 The bottom end of a central electrode is surrounded by a grounded body and

1 is covered with a layer of radioactive substance of ionizing catalytic character incorporated in a porous enamel of high m. p.

Envelopes or containers for chemical heating compositions Karel Gutwirth. Brit. 431,255, July 3, 1935

Optical polarizers Edwin H. Land. Brit. 433,455, Aug. 15, 1935 A polarizing body comprises a set suspending medium having a multiplicity of dispersed particles of an inorg. polarizing periodide embedded therein with their polarizing axes oriented into substantial parallelism. The prepn. of the suspending medium, which is preferably a cellulose compd., the incorporation of the polarizing particles therein, and the orientation of the particles are effected as described in Brit. 412,179 (C. A. 29, 1907¹). Purpureocobalt chloride sulfate periodide is preferably used.

Laminated material suitable for container cap facings George Goebel (to Crown Cork & Seal Co.). U. S. 2,020,776, Nov. 12 A cap shell contains a cushion liner such as cork and a facing comprising a backing such as adhesive united to the liner and carrying a coating of sprayed metal such as Al, Zn, Ni or Cu.

Laminated composition gaskets suitable for engine manifolds, etc. John H. Victor, Wm. A. Heunze and Joseph B. Victor (to Victor Mfg. & Gasket Co.). U. S. 2,021,571, Nov. 19. Layers of preliminary oil-treated and baked packing material and other layers of untreated material, of various thicknesses, are built up, with an adhesive such as a phenol resin, to a desired thickness, with use of heat and pressure, the exterior surfaces of the material having indentations in which a graphite compn is placed.

Composite gasket sheets Claude B. Bailey (to McCord Radiator & Mfg. Co.). U. S. 2,019,474, Nov. 5 Various details of app. and operation are described for the manu. of sheets with outer layers of discrete particles such as those of asbestos and an insert layer of sheet metal such as sheet steel.

Laminated sheet material suitable for decorative purposes Benjamin Ames (to Dennison Mfg. Co.). U. S. 2,020,928, Nov. 12 Sheets of material such as paper, cloth or regenerated cellulose are adhesively united, one sheet being more wavy than the other so that when the material is stretched crosswise of the waves the other sheet will tear along lines extending transversely to the direction of stretching.

Decorative material suitable for use on table tops, etc. Amerigo F. Caprio (to Celluloid Corp.). U. S. 2,019,951, Nov. 5. A relatively thin metal foil such as Al foil has a design embossed on it and is united, by an adhesive, to a transparent facing sheet of a thermoplastic material contg. a cellulose deriv. such as cellulose acetate or nitrate and to a backing sheet of a thermoplastic deriv. of cellulose such as celluloid.

Plywood, etc. Karl Vierling, Matthias Schmiling and Hugo Klingenberg (to I. G. Farbenind. A.-G.). U. S. 2,019,834, Nov. 5. There is applied to the surfaces to be joined a soln. of a water-sol. condensation product of a urea and CH₂O to which an acid-reacting agent or acid-forming agent inert to CH₂O has been added shortly before use of the soln., and the surfaces are united by heat and pressure.

Moistureproofing thin, flexible transparent cellulose acetate sheeting adapted for wrapping purposes Norman F. Beach and James G. McNally (to Eastman Kodak Co.). U. S. 2,019,645, Nov. 5. The material is first treated with an adhesive layer comprising a gum such as ester gum and on the gum layer there is superimposed a layer mainly formed of wax such as paraffin or candelilla wax. An arrangement of app. is described.

Mineral fiber from clay and limestone. Isaiah B. Eagle. U. S. 2,020,403, Nov. 12 A mixt. of clay and waste limestone is formed into briquets or the like which are subsequently fused to produce a molten stream of material, and a stream such as one of steam is directed against this molten stream to produce a fibrous product. App. is described.

Apparatus for making artificial pumice from slag. Wilhelm Benzinger. Fr. 757,782, Aug. 19, 1915.

Decolorizing mineral substances such as fine sand, clay or kaolite. Frederick W. Birn (to Virginia Smelting Co.) U. S. 2,020,192, Nov. 5. The mineral matter is treated in water containing an acid to reduce the pH of the resulting mix. to 2.5 or less and this mix. is then mixed with a coarse mix. of Zn hypochlorite or the like such as one which has been prepared by treating Zn dust with SO_2 in the presence of water.

Disintegrating diatomaceous earth. Guy C. Pierce (to Fila L. Pierce) U. S. 2,021,576, Nov. 19. A mass of particles of the material of given size is compressed by a pressure less than required for disintegration of the particles, and a shearing force is then applied to the compressed mass to shear the particles into particles of smaller size. App. is described.

Dental impression material. Laurence F. Harrison (to Ormwood Products Corp.) U. S. 2,021,036, Nov. 12. An embossed impression material is formed from ingredients such as resins, oil, Portland cement, triethanolamine, agar-agar, coral gum, water and wax or the like. U. S. 2,021,036 relates to an impression material containing dusted cement vulcanized rubber filaments together with other ingredients such as water, agar-agar, glycerol, a rubber lower mix, K_2SO_4 , menthol and oil of wintergreen.

Thermoplastic compositions. Wingfoot Corp. Fr. 745,541, Aug. 14, 1915. A boiling mix. of rubber in an organic solvent is treated with an amphoteric metal halide, e. g., $SnCl_4$, $FeCl_3$, $CrCl_3$ or $AlCl_3$, and the product is poured into a large amt. of water containing a reducing agent, e. g., hydroquinone, Na^+ or Na_2SO_3 . The solvent is removed by steam distn. and a thermoplastic condensation product of rubber is obtained.

Thermoplastic compositions suitable for making dental impressions, etc. Laurence F. Harrison (to Ormwood Products Corp.) U. S. 2,020,211, Nov. 12. A resin is fused with glycerol at a temp. of 200-220°, the temp. of the mix. is lowered to about 170° and there is then incorporated with it a substantially water-insol. soap such as Al or Zn stearate and a triethanolamine soap. Various modifications are described.

Coating-compositions. Oskar Schnor (to Metallgesellschaft A.-G.) Brit. 423,101, Aug. 8, 1915. Adds to 400,224 (C. 28, 63289). A form of the liquid coating-compn. claimed in 409,234 contains 25-60% of an Al-Si pigment contg. 7-95% Si, in such fine state of division that it passes through a sieve of 10,000 meshes per sq. cm., together with 25-70% of 1 or more binding media or vehicles. Up to 10% of diluents and up to 35% of inert mineral fillers may be added. Driers may be added. The addition of alk., $BuOH$, hexamine or $PhNH_2$ prevents thickening.

Coating-compositions. Hubert-Lambert and Edmond Hubert. Fr. 764,732, July 23, 1915. Coating- and binding-compos. are made by mixing a natural or artificial emulsion of rubber or like vegetable milks with powder material to vary the viscosity of the mix., dyes, an emulsifying agent and a vulcanizer. The start of the vulcanization may be obtained by the addition of a certain amt. of SiO_2 , e. g., in the form of fine sand.

Coated fabrics. Wm. H. Hale. Brit. 423,205, Aug. 8, 1915. Fabric is reinforced by coating with a plastic compound composed of silicates of Na, Fe_2O_3 , soap, soda, carnauba wax and gum arabic. The coated fabric may be used as a lining between the inside and outside of boots and shoes, etc.

Coated projection screen. David E. Knapp. U. S. 2,020,787, Nov. 12. To produce an uneven light-reflecting and distributing surface, a light-colored priming coating is applied to a sheet of fabric, the sheet is embossed, the entire surface is coated with a lustrous coating comprising powder, metal such as Al and flaky light-reflecting particles such as those of mica and the raised portions of the embossed sheet are wiped off while still wet so as to leave the depressed portions coated with the lustrous coating

and the raised portions of contrasting appearance beneath a transparent glass or the wiped surface.

Nonflammable coatings for sliding-clasp fastener parts. Gen. H. C. Corner and Lightning Fasteners Ltd. Brit. 422,847, July 31, 1915. The parts, made of non-metallic material, e. g., celluloid, are rendered nonflammable by applying a thin film of a nonflammable material that evolves carbonation-suppressing gases when heated, e. g., a chlorinated rubber compn. is sprayed thereon, the stinger tapes being protected by masks. If necessary, a bonding coating, e. g., a gelatin or synthetic resin soln., is applied previously.

Protecting coatings such as automobile finishes during shipping, handling or storage. Lloyd G. Copeman (to Copeman Laboratories Co.) U. S. 2,020,220, Nov. 5. Various details are described relating to the use of a protective coating formed of paper and rubber deposited from an aq. dispersion, which serves to protect the permanent coating and is readily removable when desired. U. S. 2,020,227. See Brit. 420,250 (C. 29, 34289).

Metal-coated articles. R. I. du Pont de Nemours & Co. Brit. 422,218, Aug. 12, 1915. Base materials of a cellulosic nature are treated with a permanently-setting adhesive compn. to which, when partially dried but still in a tacky state, a metal powder, the individual particles of which have light-reflecting faces, is applied, said faces being then oriented by burning with brush rolls while the adhesive is still incompletely dried. The adhesive is finally hardened by taking.

Ornamentation comprising pyroxylin and metal ornaments. Morris H. Wagman. U. S. 2,020,607, Nov. 5. An article such as a lady's hand bag is provided with a pyroxylin coating on which metal initials or ornaments are secured by a cellulose backing and use of a solvent such as $BuOAc$ and $BuOH$.

Ornamenting plastered or whitewashed surfaces. Xavier Meier. Ger. 619,578, Sept. 28, 1935 (Cl. 756 6). Use is made of a paint prepd. in a medium comprising a decoction of Iceland moss, animal glue and a small proportion of glycerol. A design is painted on paper with this paint, and the moist paper is then applied to the surface with the aid of a rubber roll.

Protective foil. Wolf & Co. Kommandit-Gesellschaft auf Aktien, Hans I. Schulz and Julius Appel (to Transparent Paper Ltd.). Brit. 423,011, Aug. 7, 1915. A protective foil for application to cards, pictures, maps, etc., comprises a foil of cellulose hydrate having a coating that becomes plastic and adhesive when warm and which is composed of a cellulose deriv. of low viscosity and a resin that retains the same in soln. in the warm, with or without plasticizers. The coating layer should contain cellulose deriv. 30-60, natural or synthetic resin 10-60% and 15-60% of plasticizer referred to the dry products. If the resin is a solvent for the cellulose deriv. in the liquid condition, the plasticizer may be omitted. The foil may be waterproofed with a lacquer coating prior to the application of the adhesive layer.

Paper impervious to moisture and grease. Edmond H. Bucy (to Atlas Powder Co.). U. S. 2,021,172, Nov. 19. Flexible paper sheets are treated with an oil-sol. condensation product of the $PhOH-CH_3O$ type in soln. in a drying oil such as linseed oil and castor.

Ultramarine blue. Henry Dourif (to Standard Ultramarine Co.). U. S. 2,020,539, Nov. 12. An ultramarine gel for laundry purposes capable of reverting to liquid form upon agitation comprises a mix. of finely divided ultramarine blue particles with monoethanolamine, diethanolamine or triethanolamine and water, forming a nonsetting compn. readily dispersed in water. App. is described.

Gramophone records. Abraham van Paap, Henrij van Paap, Rozalie van Paap-Maykels (representatives of Salomon van Paap, deceased). Brit. 423,763, Aug. 1, 1915. Defective or obsolete sound-record disks are reconditioned by coating them with a thermoplastic sound-record compn. having a basis of a polyvinyl compd., e. g., a polyvinyl ester such as polyvinyl acetate, and simultaneously or subsequently subjecting them to pressure between matrices. Intermediate heat-insulating layers of

paper, fabric, wood, etc., may be interposed between the disk and the coating

Sealing compositions for containers Crosse & Blackwell Ltd., Wm Clayton and Robert I. Johnson. Brit. 432,571, July 30, 1935 The compns comprise an alkali silicate, alk earth silicate or org silicate in soln or dispersion in an aq system, 1 or more turgescant materials of colloidal character, e.g., starches, bours, proteins, hydrophilic colloids, H_2O -sol cellulose derivs, or aq suspensions of H_2O -insol cellulose derivs, and an org hygroscopic substance, e.g., glycol, glycerol or diethylene-glycol Natural or synthetic resins and fillers, e.g., kaolin or diatomaceous earth, may be added

Stencils Sydney G Pipe Brit. 432,358, July 25, 1935 A sheet for use in the manuf of stencils for screen stencil printing comprises a sheet of transparent paper coated with cellulose acetate (I). A sheet of oiled or waxed paper is coated with I and, optionally, with an outer coating of adhesive, e.g., shellac, the stencil is cut in the coating and the necessary parts are removed, the sheet is applied to a silk screen with the aid of heat or a solvent and the paper backing is removed to leave parts of the screen blocked out by I.

Isinglass Charles F. Carpenter and Morrison, Carpenter & Co Ltd Brit 432,159, July 22, 1935. In the production of isinglass finings by dissolving isinglass in H_2O , the material is subjected to a steady agitation as the soln proceeds The isinglass may be so treated for about 12 hrs after standing in acidulated H_2O about 3 hrs The soln is then filtered App is described

Photomechanical printing processes Bekk & Kaulen chem Fab G m b H. Ger. 617,749, Aug 24, 1935 (Cl 57d 2 03). Addn to 605,296 (C. A. 29, 1183). The alk. shellac soln. used in the process of Ger. 605,296 is prep'd. with the aid of an aq soln of an alk comp'd. of Li, e.g., $LiOH$ or Li_2CO_3 . Cf. C. A. 30, 198.

Flexible planographic printing element ("offset blankets or plates") Benjamin L Sites (to the Miehle Printing Press and Mfg Co.). U. S. 2,020,479, Nov. 12 A backing of paper is united with a sheet of fabric on which is cemented a top sheet of rubber

Etching solid areas on intaglio printing cylinders. Irving Gurwack (to Shellmar Products Co.). U. S. 2,021,687, Nov. 19 An etching fluid is applied through a preliminarily screened carbon tissue or resist, and a desired deep etch is obtained without breaking down or undercutting the screen by placing solid CO_2 in an etching bath to reduce its temp. to below 5° , first applying to the resist an etching fluid of normal temp adapted to penetrate the thin areas of the resist and then continuing the etching with the chilled etching fluid

Transferring designs, etc Bakelite Corp Brit. 432,508, July 29, 1935 Compd paper sheet material, etc., for use in the manuf of panels, table tops, etc., is coated with a compn requiring baking by applying the compn in liquid form to a metallic surface, baking, transferring the baked film to the material and fixing it thereto by an interposed bonding-sheet impregnated with adhesive. In an example, a synthetic resin lacquer (prep'd by causing glycerol to react with 2 parts of phthalic anhydride with the application of heat till $200-10^\circ$ is reached, when the reaction is arrested by adding a solvent, e.g., diethyl oxalate, and dilg with Me_2CO) is applied to a Cr-plated metal sheet or to Al foil, dried and baked Designs may be printed on the film before baking and may be covered by an enamel coating, or the metal sheet may be etched so that a relief or intaglio design is formed on the film; an ornamental film may be formed also by applying differently-colored compns, superposed or side-by-side. The coated metal sheet is placed on top of material consisting of a no. of paper sheets impregnated with synthetic resin, a paper sheet impregnated with rubber or an alkyl resin being interposed, and heat and pressure are applied, the metal sheet being finally removed. Dyes and pigments may be added to the lacquer.

Composition for blocks or surfaces of brakes James N. Longley (to Ferodo Ltd.). U. S. 2,020,701, Nov. 12 A synthetic resin binder in finely divided form is mixed with 5-7 times its volume of a nonmetallic inert and inert finely divided water-insol filler such as "rottenstone" having an av. particle size not less than that of diatomaceous earth, and the mixt. is consolidated by heating to above 132° and subjecting to a pressure of 4 to 5 tons per sq in. Asbestos fiber, etc., also may be used

Apparatus for testing the hardness, etc., of brake lining Wm. S. James (to Bendix Aviation Corp.). U. S. 2,022,040, Nov. 26 Various structural, mech and operative details

Brake operating liquid. Franklin P. Frey (to Johnson Oil Refining Co.). U. S. 2,020,543, Nov. 12. Castor oil 40 and EtOAc 60% are used together.

Uniting pieces of leather stock as in shoe manufacture Max W. Tetlow (to United Shoe Machinery Corp.). U. S. 2,019,585, Nov. 5 Pieces of stock are stitched together with thread composed at least in part of sol fibers (such as those of cellulose acetate) the material of which when dissolved is adhesive in character, and the thread is treated with a solvent which cements the stitches in place.

Stiffened shoe upper material Charles E. Reynolds (to Cambridge Rubber Co.). U. S. 2,021,870, Nov. 19. Material such as canvas, twill or duck is impregnated with a starchy sizing agent which adheres firmly to the fibers of the material and is rendered stiff and stable but somewhat flexible, and, after squeezing out the surplus, the material is further treated with an aq dispersion of a waterproofing agent such as "Vulter" and is dried, using sufficient waterproofing constituents to protect both the fiber of the goods and the stiffening agent.

Preserving animal and vegetable substances. John Bleck Fr. 785,524, Aug. 12, 1935. An aq soln. of Na_2SO_4 and NaF (neutral or acid) contg. a suspension of kaolin is used. Na_2SiF_6 may also be present. An example contains in water Na_2SO_4 , 80-85, NaF 2-6, Na_2SiF_6 0.25-2 and kaolin 12-17%.

Dispersions such as those of insecticides or pigments Wm. S. Calcott and Ira Williams (to E. I. du Pont de Nemours & Co.). U. S. 2,021,143, Nov. 19. Material to be dispersed, such as S (or various other named materials) and a dispersing medium, in liquid condition, such as water and glycerol or NH_4 caseinate, are passed through a tube at a velocity greater than the crit velocity and in unobstructed flow Various operative details are given.

Fly killer I. G. Farbenund A.-G. (Kaspar Pfaff and Michael Erleben, inventors) Ger. 616,770, Aug. 5, 1935 (Cl. 45, 3 01). Flies are destroyed by spraying closed rooms with a soln. or emulsion of aromatic hydroxy-carboxylic acids esterified or etherified in both the $COOH$ and OH groups Other insecticides may be present. In an example, a spray of the methyl ester of 1-phenoxy-benzene-carboxylic acid, soft soap and the oleic acid ester of Na hydroxyethanesulfonic acid emulsified in water is used. Other examples are given

Sterilizing liquids Jesús Cambón Fr. 784,959, July 30, 1935. Metals such as Ag or Au are deposited in colloidal form on pulverulent inert material such as clay, infusorial earth, Al_2O_3 or MgO and this is used for sterilizing wines, beer, milk, etc

Fireproofing agents Günther Schwedler and Hans Schwinzer. Brit. 432,819, Aug. 2, 1935 See Fr. 774,664 (C. A. 29, 2268).

Fire extinguishers Établissements Bouillon Frères Fr. 785,180, Aug. 3, 1935 Powders which are bad conductors of electricity, such as $NaHCO_3$, talc, $CaCO_3$, $MgCO_3$, etc., are mixed with substances which under the action of heat form a resistant insulating layer on the article on which the powders are sprinkled, e.g., $Al_2(SO_4)_3$, Na_2SO_4 , $NaHSO_4$ and Na tetraborate

14—WATER, SEWAGE AND SANITATION

EDWARD BARTOW

Water investigations. Uniform methods and standardization Haase. *Chem. Fabrik* 1935, 421. J. H. M. The Stuttgart water supply. E. Link. *Deut. Wasserv.* No. 7, 141-2(1935); *Wasser u. Abwasser* 33, 229-30.—Details F. P. Griffiths

Russian water-supply systems. V. E. Kojnov. *Water Works Eng.* 88, 1234-7(1935). W. A. Moore

Mineral water of the springs in Bad Deutsch-Altenburg J. Gangl and R. Posega. *Wien. klin. Wochschr.* 48, 1157-60(1935) —The content of electrolytes and gases is given D. B. Dill

Thermal springs at Aix-les-Bains Georges Schneider *Ann. mines* 8, 5-64(1935) —The sulfur spring, in 1927, flowed about 12 l. H_2O per sec. at 40° of the following compn., Ca 111, Mg 22, K 2, Na 28, SO_4 167, 7 and Cl_{25} 8mg per l. The alum spring flowed about 29 l. per sec. at 43°. The solids contained Ca 07, Mg 14, K 0, Na 28, SO_4 131, 9 and Cl 16, 6 mg. per l. H. E. M.

Supplying pure water for beverage manufacture. E. S. Stetler. *Food Ind.* 7, 635-6(1935). —The ground water is softened by zeolite treatment, mineralized, adjusted for pH value, filtered, treated with O_3 to destroy bacteria, refrigerated to 33°F. and treated with ultraviolet irradiation for a final sterilization C. R. Fellers

The occurrence of iron in the water of the northeast Pacific Ocean Thomas G. Thompson and Raymond W. Bremner. *J. conseil intern. exploration mer.* 10, 39-47(1935); cf. *C. A.* 30, 4074. —The inland waters of the San Juan Archipelago averaged 0.0053 mg. atoms total iron per kg. of unfiltered sea water during the spring and summer and 0.00147 mg. atoms per kg. during the fall and winter Sol iron (filtered water) averaged 0.00026 mg. atoms per kg. for the spring and summer and 0.00075 mg. atoms for the fall and winter. Most of the iron contributed by the rivers to the sea is in the suspended form. The sol and total iron content of the water over the continental shelf in the Gulf of Alaska is similar to that of the previous water. The sol iron content of the ocean varied but little vertically and was about half that in the coastal waters during the spring and summer. The total iron content of the open ocean was about 0.00035 mg. atoms per kg. in the water layer near the surface. Max. values of about 0.0007 mg. atoms iron were found at 800 to 1000 m. which is the zone of very low O values. Below 1000 m. the total iron content decreased but slightly. Rex J. Robinson

Step-photometric determination of silicic acid and the application of the method to the examination of water and mineral water. R. Strohecker, R. Vaubel and K. Breitwieser. *Z. anal. Chem.* 103, 1-12(1935). —Most natural waters contain 5-50 mg. of dissolved SiO_2 per l. probably present in a state of mol. dispersion and, according to Fresenius (*C. A.* 26, 541; 28, 5557) the dissolved SiO_2 has a therapeutic action. A silicomolybdic acid suitable for analysis can be obtained by adding 0.2 cc. of 50% H_2SO_4 by vol and 2 cc. of 10% NH_4 molybdate soln. to 50 cc. of the water. The most suitable filter for the step-photometric measurement is the violet filter S 43. The Lambert-Beer law holds rigidly for the yellow color measurement only up to about 10 mg. SiO_2 per l. From then on there is a slow but perceptible decrease in the extinction power. The K_2CrO_4 and picric acids soln. used for measuring the color of silicomolybdic acid show the same phenomena at almost the same color value and consequently their suitability for colorimetric comparisons can be based upon the step photometer. With respect to the blue reduction product of the silicomolybdic acid complex, the color is more intense than should be the case for dil. solns. Data are given to show the accuracy of the measurements as compared with the much more tedious gravimetric detn. of SiO_2 W. T. H.

The determination of the CO_2 pressure of natural water. Aino Pekkarinen *Suomen Kemistilehti* 8B, 34(1935)(in German) —A preliminary report. The method of Kauko

(*C. A.* 28, 3337) can be used to det. the pH after passing CO_2 -satd. air through the water. E. E. Jukkola

The corrosive effect of ground water on concrete. Toivo Karttunen. *Teknillinen Aikakauslehti* 25, 301-2(1935). —Analysis of the water from a concrete-lined well showed decided changes in compn. depending on the length of time the water stood in the well. E. E. Jukkola

Ozone solves color, odor and taste problem in Hobart (Ind.) plant. Theodore O. Ferkinnhoff. *Am. City* 50, No. 11, 47-8(1935) —Ozonization of H_2O after filtration removes vegetable taste and odor and reduces color index from 25 to approx. 2. Germicidal action is appreciable, a reduction in *Es. coli* per ml. on 37° agar from 1000 on 3 raw H_2O (8 after filtration) to zero after ozonization being obtained. Ozone is prep'd by applying a potential of 18,720-20,800 v. to a stream of dry air, approx. 1000 gals. H_2O is ozonized per kw-hr. Expts with other methods for taste, odor and color removal showed ozonization to be the most effective G. H. Young

Permanent chlorine standards Francis E. Daniels. *Public Works* 66, No. 11, 26(1935), cf. *C. A.* 29, 1546. —Directions are given for prep. $K_2Cr_2O_7$ - $CuSO_4$ standards for use in field testing sets (1/2-2-in. depths in comparator tubes). In checking the standards the o-tolidine was added to the diln. H_2O before adding the measured amts. of carefully titrated Cl_2 soln., only in this way could consistently accurate checks be obtained. Necessary tables for diln. are included G. H. Young

Improved standards for the residual chlorine tests. R. D. Scott. *Water Works and Sewerage* 82, 399-400(1935); cf. *C. A.* 29, 2634. —Use of buffered chromate-dichromate standards rather than the conventional dichromate- $CuSO_4$ mixts. is recommended on the basis of greater flexibility; color matching is exact regardless of whether viewed through the length or breadth of tubes over the broad range of 0.01-3.0 p. p. m. Cl_2 Buffering is necessary to prevent changes in color of standard solns., a pH of 5.2-5.7 being required for max. stability. Directions for prep. of the chromate-dichromate soln., and the KH_2PO_4 -NaOH buffer (pH 6.5) are detailed together with the necessary table of dilns. for a Cl_2 range from 0.01 to 3.0 p. p. m. Standards thus prep'd will stand as much as 6 weeks' direct exposure to sunlight without fading. G. H. Young

The development of the ammonia chlorine treatment for water disinfection. Paul D. Haney. *Kansas Water Sewage Works Assoc.* 4, 76-82(1934-5). —A review, with 9 references. M. G. Moore

Plant tests for residual chemicals resulting from water treatment. Selma Gottlieb Kallis. *Kansas Water Sewage Works Assoc.* 4, 80-2(1934-5). —The various methods for the detn. of residual Cl , pH hardness, Cu, Fe, alkyl, and Al are discussed. W. A. Moore

Standardization work in the field of water softening Splittergerber. *Chem. Fabrik* 1935, 421-7. —Proposed analytical methods and reagents. J. H. Moore

\$1,000,000 water-softening plant. Robert W. Wolfenden. *Water Works Eng.* 88, 1238-9(1935) —The raw water at the Hamilton, Ohio plant is first aerated, then softened by the lime, alum, and soda ash treatment. Provision is also made for the use of chloramine or Cl_2 if necessary. W. A. Moore

Madisonville (Ky.) new filter plant. Hall Arnold. *Public Works* 66, No. 11, 11-12(1935). G. H. Y.

A well filter of ball-shaped stoneware. F. Hosemann. *Deut. Wasserv.* No. 3, 58-9(1935), *Wasser u. Abwasser* 33, 240-1. —The wall of the well is built of a double layer of balls of masonry cemented at points of contact. The advantage of greater porosity is claimed. F. P. G.

The use of activated carbon at Garden City. A. H. Rogers. *Sewage Works J.* 7, 601-5(1935). E. H.

Pure water and sewage. Experiences with sprinkling systems. Gusovius. *Berliner Börsen Ztg.* No. 317, 15(1935); *Wasser u. Abwasser* 33, 270-1. —Results of the

use of purified effluent for crop fertilization are discussed. Care in application is essential and moderate increases in crop yields result. F. P. Griffiths

Primary elements for sewage and water-works meters L. D. Carlyon *Water Works and Sewerage* 82, 375-8 (1935).—Discussion of the fundamental principles, applications and relative merits of the (1) Venturi tube, (2) flow nozzle and (3) orifice, as applied to the measurement of sewage, sludge, water and air. G. H. Young

Water supply and sewage disposal at Singapore, Straits Settlements Isadore W. Mendelsohn *Water Works and Sewerage* 82, 371-4 (1935). G. H. Young

A day at a sewage treatment plant Frank W. McCann *Sewage Works J.* 7, 694-5 (1935). E. H.

Experiences at Newark sewage-treatment plant Thomas J. Smith *Sewage Works J.* 7, 684-91 (1935), cf. C. A. 29, 7539¹. E. Hurwitz

Economic operation and power development at the Springfield, Ill. sewage-treatment plant W. B. Walraven *Kansas Water Sewage Works Assoc.* 4, 134-41 (1934-5). W. A. Moore

Disposal of sewage from the South Essex Sewerage District, Salem, Massachusetts. Edward Wright *Sewage Works J.* 7, 663-72 (1935). E. Hurwitz

Construction of a sewage treatment plant under relief program Robert C. Wheeler. *Sewage Works J.* 7, 706-12 (1935). E. Hurwitz

Sewage and waste water disposal in the Niers (Germany) area Schmitz-Lenders *Zentr. W. Bauverw.* No. 22, 422-31 (1935). *Wasser u. Abwasser* 33, 264-5. F. P. Griffiths

The Stuttgart sewage-disposal system Maier and Sohler *Deut. Wasserw.* No. 7, 143-7 (1935). *Wasser u. Abwasser* 33, 275-6.—Details are given. F. P. G.

The present knowledge of sewage disposal P. Langbein *Der Bauingenieur* No. 13-14, 147-53 (1935). *Wasser u. Abwasser* 33, 260-2, cf. C. A. 29, 5209¹—A review. F. P. Griffiths

Successful sewage-plant operation. Ralph E. Fuhrman *Kansas Water Sewage Works Assoc.* 4, 119-21 (1934-5), cf. C. A. 28, 6903¹.—The value of the lab in the operation of a sewage plant is stressed. W. A. M.

The patent situation in sewage treatment Paul Hansen *Public Works* 66, No. 11, 13-14, No. 12, 49-50. *Water Works and Sewerage* 82, 425-6 (1935). G. H. Y.

The use of chemicals in the treatment of sewage F. M. Veatch *Kansas Water Sewage Works Assoc.* 4, 122-7 (1934-5).—Twelve recently advanced methods for the chem. coagulation of sewage are discussed. The Scott-Darcy process for the prepn. of FeCl_3 is also described. V. states that this process is the most economical source of FeCl_3 for use in medium and large size treatment plants. W. A. Moore

Chemical mechanical treatment of sewage Louis P. Booz *Am. City* 50, No. 11, 65, 67 (1935).—The new Perth Amboy (N. J.) sewage plant is described. G. H. Young

Chemical mechanical treatment of sewage V. Sludge treatment Factors governing choice of method—results obtainable Philip B. Streadwell and Michael J. Blew *Public Works* 66, No. 11, 22-4 (1935), cf. C. A. 30, 199¹.—Under sludge treatment are discussed (1) dewatering on drying beds, (2) vacuum-filter dewatering, (3) centrifuge dewatering, (4) chem. sludge digestion, (5) ultimate disposal (1) Choice of methods, (2) patent situation, (3) design procedure and (4) degree of treatment possible and results are discussed. G. H. Y.

Chemical treatment of sewage evaluated in A. P. H. A. committee report Langdon Pearse *Water Works and Sewerage* 82, 392-3 (1935).—(1) Chem. treatment usually accomplishes a degree of treatment intermediate between plain sedimentation and biol. processes (2) By addn. of a zeolite filter, following chem. pptn., the Guggenheim process substantially equals an activated-sludge process. (3) Seasonal or occasional use of chemicals attracts favorable notice where sedimentation alone may suffice for the greater part of the year or for many years out of a cycle

(4) Otherwise overloaded plants find the use of chemicals in addn. to sedimentation, ahead of biol. filters, worth while. (5) Fe salts, particularly FeCl_3 and $\text{Fe}_2(\text{SO}_4)_3$, seem most satisfactory for chem. treatment; such salts may be economically manifold at the treatment plant from Fe scrap and Cl_2 . (6) Use of FeCl_3 for sludge conditioning prior to vacuum filtration has been generally adopted where practicable (7) Chem. treatment in handling industrial wastes is practicable where cost and performance justify the procedure as compared with other methods. G. H. Young

Plant experiments on the filtration of settled sewage W. Rudolfs, J. H. Brendlen and Wm. T. Carpenter. *Sewage Works J.* 7, 628-39 (1935).—Filtration through a mechanically cleaned rapid sand filter was effective in reducing the required settling time. The filter rates were varied from 0.58 to 3.33 gal. per min. without effecting materially the biochem. O. demand, suspended solids or turbidity of the effluent. Companson is made with results obtained in a plain settling tank not equipped with filter. E. H.

The possibilities of the digestion of garbage in a sewage-treatment plant Harold E. Babbitt. *Sewage Works J.* 7, 658-62 (1935); cf. C. A. 29, 3757¹. E. Hurwitz

Effects of sewage gases on concrete A. F. Pistor *Sewage Works J.* 7, 697-705 (1935).— H_2S and CO_2 react with concrete to cause its deterioration. E. Hurwitz

Putting sewage effluent to work Charles C. Agar. *Water Works and Sewerage* 82, 398 (1935).—Portable pump installations enable plant effluents to be used for (1) flushing tank walls, (2) breaking up solids in gas vents and (3) washing screen chambers, etc. G. H. Young

Determination of suspended solids in sewage by light absorption Glenn W. Holmes *Sewage Works J.* 7, 642-57 (1935).—The electronic cell was used with excellent results in the detn. of suspended solids. Communion of the larger suspended particles greatly improves the relationship between the suspended solids and light absorption. E. Hurwitz

Activated-sludge plant in Helsingfors R. Graugvist. *Tek. Foren. Finland Forh.* 55, 179-87, 215-17 (1935).—The plant consists of 4 units. Unit I is built according to Activated Sludge Ltd. specifications, which have been modified in Units II and III. Unit IV is an Imhoff system.

Operating data on the Units I, II, III and IV are, resp.: aeration time, 12.8, 9.2, 6.7, 10.8 hrs.; air consumption, 18.2, 15.8, 13.8, 9.1 cu. m./cu. m. water, biochem. Oxygen consumption in 5 days, 405 on all units, purification effect 94, 94.5, 94.4, 92.8%; capacity 3.55, 5.25, 6.15, 3.84 cu. m. water/sq. m. area/24 hrs.; sludge concn. 51.2, 54.0, 76.9, 71.2%; power consumption 306, 276, 234, 294 kw. hr./1000 cu. m. water. The gases with a heat effect of 6900 kg. cal. per cu. m. are collected and used for fuel on gas engines used for power. H. C. Duus

Sewage and sludge pumping Henry Ryon *Sewage Works J.* 7, 673-83 (1935); cf. C. A. 29, 8191¹. E. H.

Thermal considerations in the design of heated sludge-digestion tanks Edward W. Moore. *Sewage Works J.* 7, 618-27 (1935).—M. has collected and summarized the data available on heated digestion tanks in light of the fundamental laws governing heat of flow and has developed a method of calcg. the approx. thermal balances in digestion tanks. E. Hurwitz

Adaptability of sewage sludge as a fertilizer E. E. DeTurk. *Sewage Works J.* 7, 597-609 (1935).—Activated sludge cannot be considered more than a low-grade fertilizer. Digested sludge has very little fertilizer value. Both types of sludge would be most valuable as fillers for synthetic fertilizers. Activated sludge contains 2 to 3% available N, 2 to 2.5% available phosphoric acid and approx. 0.2% potash. Digested sludge contains approx. 2% N of very low availability, 1.5% P_2O_5 and 0.17% K_2O . E. Hurwitz

Public-health significance of sewage sludge when used as a fertilizer. Fred W. Tanner *Sewage Works J.* 7, 611-17 (1935).—Longevity studies indicate the presence of viable *Eberthella typhosa* in sludge sufficient to require a caution as to its use on truck-garden crops. The danger

appears to be minimized in well-digested sludge.

Pollution of the Volga River by the Pravidnitskii paper combine. R. M. Pavilnova. *Bumazhnyia Prom.* 14, No. 8, 48-59 (1935).—The pollution of the Volga River by the waste waters of the paper mill and ways of economical elimination of the nuisance are discussed. C. Blanc

Recent trade waste-treatment methods. Willem Rindolls. *Sewage Works J.* 7, 713-26 (1935).—The literature published during the years 1932-34 on treatment of trade wastes.

The disposal of industrial waste water in the central (city) sewer system. G. Jordan. *Z. Gesundheitswesen u. Gesundheitsfürsorge* 5, 553-60 (1935). *Wasser u. Abwasser* 33, 256-7.—A discussion. F. P. Griffiths

Grease removal at Hamilton, New York. Leon Waldron. *Sewage Works J.* 7, 606 (1935). E. Hurwitz

The disinfection of swimming pools with chlorine. P. Alborno. *Rev. méd. del Rosario* 24, 1174-80 (1931). *Wasser u. Abwasser* 33, 241-5.—The use of a Cl-contg prepn (Chlorox) in the disinfection of pools. F. P. Griffiths

Use of hypochlorous acid in the Stadion swimming pools, Breslau. P. Wolf. *Das Bad* 30, 13-4 (1935). *Wasser u. Abwasser* 33, 247-8.—Application of NaOCl soln. twice daily to the sides and inlets of these open-air pools prevented growth of algae. F. P. Griffiths

Rept. on cane [wo] constituents of water (Hance) 15. Iodine in Westphalia [detn in water] (Balks) 7. Se in the Colorado River (Williams, Byers) 8. Alkal metal tetraphosphates [products used for softening water] (U. S. pat. 2,019,667) 18

Purifying water. Albert Schneider and Friedrich Gaisner. *Brit.* 432,123, July 22, 1935. In purifying H_2O , e. g., boiler feed water, by freeing it from hardness formers, the raw water is heated to about 100° and caused to trickle down in fine distribution in a cylindrical vessel into which a gas consisting chiefly of carburetted H and (or) N is introduced in counter current from below, NH_3 being previously added to the H_2O or the gas. App. is described.

Purifying water. Rudolf Adler. *Ger.* 610,180, Sept. 25, 1935 (Cl. 85b, 1.01). A water-clarifying reagent is prep'd. by digesting a soln. of $Al_2(SO_4)_3$ with more than an equimol. amt. of freshly ppt'd. $Al(OH)_3$ or $Fe(OH)_3$, and evap. the product, preferably *in vacuo*. Examples are given.

Purifying water. Léon Drin. *Fr.* 784,780, July 21, 1935. Water is purified for drinking by an excess of hypochlorites and the excess is removed by a filter of active charcoal which also has a clarifying effect.

Purifying water. Robert Cambier and Marcel Cambier. *Fr.* 785,131, Aug. 2, 1935. Water contg. fermentable org. material is purified by suspending active charcoal therein and beating energetically with a current of air. App. is described.

Apparatus for biological purification of waters. Soc. d'entreprises et d'applications sanitaires. *Fr.* 781,705-6, July 23, 1935.

Apparatus for proportional mixing of treating agents such as water-purifying reagents with water or other materials. Harvey C. Waugh (to American Water Softener

Co.). U. S. 2,021,247-8, Nov. 19. Various structural, elec. and operative details.

Water-softening apparatus. Gustav F. Gerdt. *Brit.* 432,047, Aug. 6, 1935. App. comprising a vessel through which feedwater flows to the boiler and to which H_2O from the bottom of the boiler is returned for renewed chem. action has the return pipe provided with 2 throttles and with means between the throttles to indicate the flow of the return H_2O .

Apparatus for softening water as by treatment with lime or soda and for separating resultant sludge. Charles H. Spaulding. U. S. 2,021,072, Nov. 10. The raw water is mixed with a pptg. agent such as lime or Na_2CO_3 in an agitating zone and the resulting mixt. is flowed upwardly through a quiescent pptg. zone open at the bottom and free from undissolved pptg. agent and through which the water rises at a constantly decreasing velocity, the velocity at the bottom being sufficient to support all but large sludge particles and that at the top being insufficient to support any substantial sludge particles, so that a considerable volume of sludge remains suspended in the lower part of the pptg. zone and acts as seed and the larger particles as formed descend out of the pptg. zone.

Apparatus for making a continuous record of the oxygen content of flowing water such as that fed to boilers. Clark Pettinill and Elmer J. Harlow. U. S. 2,019,871, Nov. 5. The water is passed through a transparent vessel and suitable reagents such as pyrogallol acid and Na_2CO_3 are introduced into the water whereby the light-absorptive quality of the water is changed by reaction between the O and the reagents, the water is passed through a second transparent vessel, and light from a common source is passed through the vessels and onto light-sensitive electric generative cells, currents from which are used for making the desired continuous record.

Chlorinating apparatus formed of transparent material such as glass and suitable for chlorinating water, etc. Dudley J. Lambert (one-half to Guy Ilearn). U. S. 2,021,116, Nov. 12. Various structural and operative details.

Apparatus for treating waste waters for clarifying. Lucien Linden. *Fr.* 785,936, Aug. 22, 1935.

Removing salt from sea water. Mutosel. *Fr.* 784,767, July 21, 1935. The halides are transformed by base-exchange agents into halides of heavy metals, e. g., of Cu, which are afterward transformed to insol. compds. and sep'd. from the water. The salts of Cu obtained are re-transformed to neutral Cu salts capable of being used to regenerate the base-exchange agents.

Sewage treatment. John G. Reyan (to Guggenheim Bros.). U. S. 2,021,679, Nov. 19. Sewage is aerated in the presence of added sewage sludge produced in the process and a water-sol. comp'd. of a trivalent metal such as Fe and Al sulfates to coagulate putrescible matter in the sewage in the form of a settleable sludge, the sludge is sep'd. from associated liquor, and is used as an addn. to sewage to be subjected to the aeration. App. is described.

Filtering sewage or other materials applied to vertical fibers of a brush mat filter. Gilbert J. Fowler. U. S. 2,021,122, Nov. 12. Various details of app. and operation are described.

Apparatus (with rotary drums) for incinerating sewage, etc. Roger Granger. U. S. 2,020,652, Nov. 12. Structural, mech. and operative details.

15—SOILS, FERTILIZERS AND AGRICULTURAL POISONS

M. S. ANDERSON AND K. D. JACOB

Ontario soils and farm chemical problems. G. N. Ruhnke. *Can. Chem. Met.* 19, 287-90, 292 (1935).—A study of the different kinds of soils, the detn. of their dominant morphological and chem. characteristics, also their classification into soil types. Pasture problems, tobacco fertilization and animal diet are other problems for the agricultural chemist.

Variations in soil reaction. K. Nehring. *Z. Pflanzen-*

ernähr. *Düngung Boden* 40, 137-41 (1935); cf. C. A. 29, 1558^h.—Polemical against Fehr (C. A. 29, 6319^h). Some of the seasonal changes in *pu* reported by F. are improbably large, e. g., *pu* 7.6 in summer and 4.6 in winter, in the case of a cultivated soil with 1.7% $CaCO_3$. Compared with this, the changes observed by N. were slight; records over a period of 3 years indicate that forest soils tend to become more acid in summer. C. J. S.

Plant associations as indicators of the value of sandy soils. D. Fehér. *Z. Pflanzenernähr., Düngung Bodenkd.* 40, 129-37 (1935).—Plant assocns on 28 sandy soils of the Hungarian plain and contents of citric acid sol. P_2O_5 and K_2O , nitrate N and humus were not in general very closely correlated. The lab. examn of soil samples is still an indispensable supplement to ecological indications of a soil's adaptability to forestry. C. J. Schollenberger

The acidity index G. Deines and P. Kürbis. *Z. Pflanzenernähr., Düngung Bodenkd.* 40, 141-8 (1935).—Fehér's claim (C. A. 28, 5570f) that the pH at any soil- H_2O ratio can be calc'd from a single detn. at any other ratio is not justified, since it requires the assumption that soil acids dissociate in a simple manner, like common soil acids. It is possible to calc. the change in pH with variation in soil H_2O ratio (C. A. 27, 4332), best by a graphic method but approx. by formula, but the general course of the curve for the soil under investigation must first be ascertained. C. J. Schollenberger

Study of base-exchange power and base content of typical Connecticut Valley soils as influenced by heavy liming and fertilization. J. L. Haddock and H. H. Coyle, Jr. *Mass Agr. Expt. Sta., Bull.* 315, (*Ann. Rept.*, 1934) 14 (1935).—In spite of heavy fertilizer and lime treatments the exchange bases in soils remain remarkably const., even on light, sandy types. The greatest influence on the availability of these bases seems to be the total exchange power of the soil, which is influenced by texture and soil humus. C. R. Fellers

Analysis of soils for copper. T. F. Manns and Raymond Russell. *Del. Agr. Expt. Sta., Bull.* 192 (*Ann. Rept.* 1934) 50-1 (1935).—Analysis of 25 soils for Cu by the Biazotti method (C. A. 29, 4092f) showed only 4 exceeded 20 p.p.m. An application of $CuSO_4$ of 50 lb. per acre on Del. soils increased the yields of corn and potatoes. C. R. Fellers

The manganese content of soils and its influence on the determination of pH by the quinhydrone electrode. L. Günter. *Landw. Jahrb. Schweiz* 49, 735-48 (1935).—The oxidizing action of Mn compds. is the cause of drift of potential in pH detns. on soil suspensions. Some of the hydroquinone of the quinhydrone is oxidized to quinone, and the 1 to 1 ratio thereby altered. Consequently, potential readings should be made within a minute after the addn. of the quinhydrone, on soils strongly alk. and those low in humus, within a half minute. The addn. of $Ca(OH)_2$ in quantity almost equiv. to the exchangeable Mn in a soil suspension causes changes in apparent pH analogous to those caused by the addn. of quinhydrone. E. O. W.

Nitrification studies with soil types of Northern Puerto Rico. Juan A. Bonnet. *J. Agr. Univ. Puerto Rico* 19, 73-103 (1935).— $(NH_4)_2SO_4$ should not be used as a source of N for plants in Lares clay loam, Sabana Seca clay, and Catalina clay, and in some cases Múrcia clay loam, unless special attention is given to lime broadcasting. For the most part, some nitrate is beneficial in these soils as well as in other types. $Ca(NO_3)_2$ is the preferred form of nitrate. $(NH_4)_2SO_4$ is well nitrified in Toa silt loam, Coto clay light texture phase, and in Espinosa clay, even in the absence of lime. Nitrification tests were conducted on 21 different soil samples representing 9 soil types. Partial chem. analyses of the soils are given. C. R. Fellers

Nitrogen fixation in soils. N. R. Dhar and S. K. Mukherji. *Proc. Acad. Sci. United Provinces Agra Oudh, India* 4, 330-41 (1935).—When cane sugar was added to an unsterilized soil and exposed to light and air, the ammonia N increased from 0.00192 to 0.00437% in 13 days. Appreciable increases were also obtained on sterilized samples. The max. increase, 0.01444%, was reached in 28 days followed by a decrease to 0.00642% in 63 days at which time the trax amt. of nitrate N was found. The amt. of ammonia N found in samples exposed to light was always greater than in those kept in the dark. Proper aeration of soils increased the ammonia N content. Insufficiently aerated soils treated with molasses showed increases in acidity. In completely sterilized soils, the increase of ammonia N is due to photooxidation of the energy-rich compds. K. C. Beeson

Nitrogen fixation in soils on the application of molasses. N. R. Dhar, S. K. Mukherji and P. K. Kar. *Proc. Acad. Sci. United Provinces Agra Oudh, India* 4, 175-8 (1934).—A quantity of sieved soil was sterilized at 150° for 3 hrs. Two hundred and fifty-g. portions each of sterilized and unsterilized soil were mixed with pure cane sugar and 50 ml. H_2O and placed in shallow enameled dishes 10 in. in diam. Exposure to sunlight for 6 to 7 hrs. daily was allowed, and the ammonia N and nitrate N were detd. periodically. In the unsterilized soil an increase of ammonia N from 0.00092 g. to 0.0091 g. was found in 10 days when 20 g. of sugar was added. Ten g. of Na_2HPO_4 in addn. to the sugar increased the ammonia N to 0.0140. No increase in nitrate N was found. At the end of 55 days only 0.00151 g. of ammonia N was found, and when Na_2HPO_4 was added only 0.001008 g. of ammonia N was present. At this point the nitrate N had increased from 0.000728 to 0.00242 and 0.00176 g., resp. Much smaller increases in both forms of N were found in the sterilized soils. The ammonia N increases up to a limiting value until the nitrate N begins to increase, then the ammonia N as well as the sum of the 2 tends to decrease. The addn. of 35 kg. of molasses to 500 sq. ft. of soil caused a ten-fold increase in the ammonia N when the soil was properly aerated. K. C. Beeson

The effects of soil liming on the composition of sugar cane. G. Rodriguez. *Proc. Sugar cane Investigation Comm. (Trinidad)* 4, 389-94 (1934).—A study was made of the effects of lime (10 tons per acre) on the compn. of sugar cane grown on a heavy acidic clay. Liming caused a marked increase in mineral uptake, especially of phosphates, by the cane plant and significantly increased the total ash and P contents of the juice. Liming tended to decrease the sucrose and increase the glucose content of the juice. The relative amts. of phosphate fixed on the cellulose framework were significantly higher in the unlimed cane; Ca and Mg contents, considered together, showed pos. correlation with phosphate content. K was higher, but not significantly so, in limed cane. K. D. Jacob

Evaluation of limestone used as a [soil] supplement. L. Tschumi and J. Stalé. *Landw. Jahrb. Schweiz* 49, 726-34 (1935).—A method of evaluation of agricultural limestone consists of stirring mechanically for a half hour in 500 cc. 0.1 N disodium citrate soln. a quantity of the substance equiv. to 1.59 g. $CaCO_3$, and detg. the quantity of Ca dissolved. The soly. increases in inverse proportion to the diam. of the grains, showing a sharp increase for particles of a diam. less than 0.15 mm. It is therefore advantageous in practice to apply finely ground limestone. The soly. depends also on the geologic origin of the sample. Results obtained on dolomitic limestone must be corrected by multiplying by a factor, percentage of $CaCO_3$ plus percentage of $MgCO_3$ /percentage of $CaCO_3$. E. O. W.

Soil conditions determining response [of sugar cane] to fertilization with potash. P. E. Turner. *Proc. Sugar cane Investigation Comm. (Trinidad)* 4, 394-6 (1934); cf. C. A. 29, 1923f.—Soils contg. less than 0.005-0.008% exchangeable K_2O gave significant responses to K fertilizers in the presence of 2-3 cwt./acre of $(NH_4)_2SO_4$. In lab. expts. with K-deficient soils which did not respond to K fertilizers, it was found that over 50% of the K applied as K_2SO_4 was fixed in a comparatively unavailable form when the soil temp. was allowed to rise to 40° but practically no fixation occurred at 30° . It is not unusual in Trinidad for the temp. of the top in. of an exposed soil to rise to 40° . It therefore appears advisable to work K fertilizers below the surface of the soil. K. D. Jacob

Further research on permanent pastures as influenced by flood water containing potash waste liquor. Stahlin, Zapfe and E. Klapp. *Landw. Vers.-Sta.* 123, 237-75 (1935); cf. C. A. 24, 1456.—Analyses of flood waters, soils and crops gave results which agreed with previous evidence that soils and plants were not damaged by the constituents of flood waters of streams richest in waste liquor from the potash industry. John O. Hardesty

A growth and respiration factor for certain Rhizobia. Sam R. Hoover and Franklin E. Allison. *Trans. 3rd*

Intern. Congr. Soil Sci., Oxford, 1935 1, 158-60(1935).—The results of further studies on the "coenzyme R" (C. A. 27, 5345) found essential to the growth of *Rhizobia* of various strains are reported. It occurs not only in legumes, but in practically all vital materials examd.; yeast and liver are good sources. Addns. of adequate amts. to synthetic media increase the growth rate of *Rhizobia* 20-30 times; a great excess is not toxic. These effects are evident upon other soil bacteria also. Expts have not indicated that this growth factor has any function in N fixation. The effects upon bacterial respiration are remarkably rapid, a 2-5-fold increase in rate within an hr. The substance is produced in quantity by *Asiobacteria*, and can be extd. from the culture with acetone and recovered in aq. soln. Attempts at crystn. were unsuccessful. The impure prepn. at 0.4 p. m. produced half max. growth increase. The substance is dialyzable and resistant to hydrolysis in 25% H_2SO_4 for 24 hrs. and in 0.1 N NaOH to 15 mins. autoclaving at 15 lb. It is insol. in ether, $CHCl_3$, and CaH_2 . The isoelec. point is near pH_4 , but the substance is not identical with the pantothenic acid of Williams and Saunders (C. A. 29, 2199) nor is the relationship to other growth factors settled. C. J. S.

The microbiology of Australian soils. III. The Ross-Cholodny method as a quantitative index of the growth of fungi in the soil, with some preliminary observations on the influence of organic matter on the soil microflora. H. L. Jensen. *Proc. Linnean Soc. N. S. Wales* 60, 145-54 (1935).—The influence of different kinds of org. material, mostly hay meal, on the microorganisms of various soils was studied at temps. from about 10° to 40° and at varying degrees of moisture. Plate counts showed that the multiplication of bacteria was generally greatest at the lower temps., but the reverse was true of actinomycetes. The ratio of actinomycetes was narrowest at high temp. and low moisture. Fungi generally attained their most abundant vegetative development at $16-21^\circ$. Plate-counting, as applied to fungi, seems satisfactory only for the detn. of the no. of fungal spores in the soil. The figures for the density of mycelium, obtained by the microscopic method, as well as the plate-counted nos. of bacteria and actinomycetes, showed a correlation with the rate of CO_2 production. J. R. Adams.

Microbiological study of podzol soil profiles II. Laurentian soils. P. H. H. Gray and C. B. Taylor. *Can. J. Research* 13C, 251-5(1935). cf. C. A. 30, 2085.—Microbiol. studies of samples from the sep. horizons of 2 soils from the Laurentian uplands showed that, as with soils previously studied from the Appalachian uplands, biol. activity was dependent upon the org.-matter relations of the horizons. A_1 (org.-matter) horizons were the most active, as shown by the evolution of CO_2 , nitrification of the soil's own N, by nos. of microorganisms (bacteria, actinomycetes and fungi) and by the production of NH_4 from urea. Bacterial nos. in the illuvial horizons were, however, higher than those in the eluvial (leached) horizons above, a condition that did not obtain with the Appalachian soils. The org. matter of a soil bearing a coniferous (spruce) flora was deficient in nitrifying power. The biol. activity at different levels of a virgin clay soil was found to be in sharp contrast with that of the podzol soils. III. Bacteria found in separate horizons. P. H. H. Gray. *Ibid.* 250-62.—An investigation has been made to det. the presence of bacteria concerned in certain important biochem. reactions in the sep. horizons of 5 heavily leached (podzol) soils of Quebec. Cellulose-decomp. bacteria were represented by a species of *Micrococcus*, and by *Cytophaga hutchinsoni*. Organisms of the group *Mycobacteriaceae* were found in media devised to isolate bacteria able to decompose phenol and naphthalene. Of the N-fixing bacteria the aerobic organism *Asiobacteria* was absent, but the anaerobic organism, *Clostridium butyricum*, was present in all of the horizons. The decompn. of urea was due to Gram-negative spore forming rods whose systematic position has not been detd. J. W. Shipley.

[Report on] botany, forestry and pathology. [Determination of available potash in soils by the Aspergillus niger method]. H. L. Lyon. *Hawaiian Sugar Planters'*

Assoc., Proc. 54th Ann. Meeting (Rept. Committee in Charge Expt. Sta.) 1934, 27-37.—In samples of 14 soils the amts. of available K_2O as detd. by the 1% citric acid method and by the *Aspergillus niger* method were 0.019-0.047 and 0.020-0.044%, resp. The methods gave closely agreeing results on all samples. K. D. Jacob.

The relation between plant growth, soil and nutrient ratio in fertilization. I. K. Rackmann. *Z. Pflanzen-ernähr., Düngung Bodenkd.* 40, 148-78(1935).—Detailed data on yields and assimilation of nutrients by oats grown in pots of sand with systematic variations in fertilization with NH_4NO_3 , $CaH_2(PO_4)_2$, KCl + K_2SO_4 and a uniform addn. of salts with a soil suspension are reported. The effect of variation in $CaCO_3$ supplied was also investigated. Conclusions: Uptake and action of one nutrient are largely dependent upon the abs. and relative amts. of others available. The nutrient requirements of plants change with growth. At first, N is in greatest demand, then K_2O and P_2O_5 at ripening, but all nutrients accelerate the rate of formation of org. matter. CaO is in greatest demand at a late stage, although its rate of uptake parallels the formation of org. matter. With a const. ratio, the proportional amts. of nutrients assimilated vary with the level of supply. At high level, relatively more of the limiting nutrient is absorbed. In the field, this is usually N. Lack of a single element diminishes uptake of others, so that demand for all is greater at a late stage of growth. At maturity, oats have the highest requirement for P_2O_5 with 1.5-2 parts K_2O to 1 part N, and the highest requirement for K_2O when 0.75-1 part P_2O_5 to 1 part N is supplied. At a normal level of fertilization, young plants produced most dry matter when $N:P_2O_5:K_2O = 1:0.25:1$; at maturity, the highest yields of grain and of straw were produced when the ratios were 1:1:1.5 and 1:0.5:2, resp. The effects of lack of N and K_2O are evident in the first weeks of growth, lack of P_2O_5 may be evident only from decreased yield of grain. Delay in supplying nutrients until the approach of maturity does not prevent their utilization, but the effect is to decrease the yield, especially of straw. Under these circumstances, N accumulates in the grain and K_2O in the straw. The rate and total uptake of nutrients is greater from an acid than from a neutral or alk. soil, with young plants, this is true even of CaO . The nutrient content of plants is not an indication of the supply in the soil. Soil pH increases with growth of the crop, but falls again as the crop matures, because of greater uptake of N at earlier stages and of CaO later. With a high level of $CaCO_3$ supply, this effect may be obscured. In these pots of sand, the effects of fertilizer chemicals upon pH were marked. C. J. Schollenberger.

Origin of combined nitrogen in the atmosphere. The analysis of tropical rain and its importance in agriculture. A. Ram. *Proc. Acad. Sci. United Provinces Agra Oudh, India* 4, 147-58(1934).—Rain water falling at Allahabad contains 0.10-1.450 p. p. m. ammonia N and 0.28-2.56 p. p. m. of nitrate N with an av. content of 0.469 and 0.881 p. p. m., resp. The ratio of nitrate N to ammonia N is 1.9. The chief source of ammonia N present in rain water seems to be the soil and the decompn. of org. matter on the surface of the soil, and very little of it seems to come from the sea. The high ratio of nitrate N to ammonia N appears to be due to the increased photo-oxidation of the NH_3 present in the atm. and the action of ultraviolet rays coming from the sun. The max. amt. of nitrate N present in the atm. is found in the summer. The amt. of nitrate N has no connection with the incidence of thunderstorms. K. C. Beeson.

The effect of temperature on the bacterial ammonification of urea. S. P. Tandon. *Proc. Acad. Sci. United Provinces Agra Oudh, India* 4, 169-72(1934).—Estimation of urea.—Urea was detd. in the presence of NH_3 as follows: To a 5-ml. aliquot add a known vol. (excess) of a standard soln. of $NaOBr$ (standardized against standard H_2AsO_4 and I soln.). When the reaction has ceased add an excess of the standard H_2AsO_4 soln. to neutralize the unused hypobromite. The excess of H_2AsO_4 is titrated with the I soln. The $NaOBr$ is a measure of the total urea and NH_3 . Det. the NH_3 present colorimetrically with

Nessler's soln. Twenty g. of air-dried fresh soil was sieved and put into a 200-ml. Erlenmeyer flask with 80 ml. of a 2% urea soln. The flasks were plugged with cotton wool and maintained at a const. temp. Samples were withdrawn at intervals for the urea detn. The results indicate that the optimum temp. for bacterial ammonification of urea is about 40°. K. C. Beeson

Influence of lime on the availability of potash. H. C. Harris. Del. Agr. Expt. Sta., *Bull.* 192 (*Ann. Rept.* 1934) 18-21 (1935).—The Na cobaltumtrite method (C. A. 27, 2904) for the detn. of K was thoroughly satisfactory for soil K analysis. The Neubauer and PtCl₄ methods were also used as controls. Conclusion: If the Neubauer method and a detn. of the exchangeable K give an indication as to the availability of K in the soil, liming has had little influence in that respect. The continued use of K fertilizers and farm manure has not materially increased the replaceable K of this soil. C. R. Fellers

Effect of fertilizers and cropping upon the nature and amount of electrolysable bases in the soil with particular reference to potash. G. M. Gilligan. Del. Agr. Expt. Sta., *Bull.* 192 (*Ann. Rept.* 1934) 25 (1935); cf. C. A. 28, 6225³.—Preliminary findings show that liming increases the availability of K and P when electroanalysis is used as an index to availability. When base-exchange (leaching with neutral NH₄OAc) is employed as an index to availability of K, the results are similar but of a lower order. This variation may be due to equal changes since the reaction with NH₄OAc takes place at approx. *pH* 7.0 whereas the *pH* decreases as electroanalysis progresses. It is questionable whether or not electroanalysis is capable of giving a true index to the availability of K since it is well known that liming decreases the amt. of K in the soil soln. When subjected to electroanalysis the soils from the limed portions of the plots yield more K than the soil from unlimed portions. Without exception the soils from the limed plots yield the higher content of K. Limed soils yield a greater amt. of Mg, Mn and P than the unlimed soils of the same plots when subjected to electroanalysis. Of the elements added, P is the most readily reflected in the dialyzates. C. R. Fellers

Effect of fertilizer treatment on germination of sugar cane under field conditions. P. E. Turner. *Proc. Sugarcane Investigation Comm. (Trinidad)* 4, 404-16 (1934).—A dressing of (NH₄)₂SO₄ applied at planting time had an adverse effect on the germination of sugar cane in certain expts. but not in others. The adverse effect tended to become more serious as the size of the dressing was increased. The magnitude of the effect was reduced by previous treatment of the soil with ground limestone. The beneficial effect of ground limestone on germination was independent of the size of the initial dressing of (NH₄)₂SO₄. (NH₄)₂SO₄ had no deleterious effect when it was applied 3 weeks after the cane was planted. (NH₄)₂SO₄ nitrifies very rapidly in Trinidad soils and its deleterious effect on germination of cane setts may be due to the formation of a high concn. of H ions in the surrounding soil soln. Germination was also adversely affected by the application of either superphosphate or K₂SO₄ at the time of planting. Previous treatment of the soil with ground limestone had a favorable effect on germination in most of the presence and absence of superphosphate and K₂SO₄. K. D. Jacob

Small scale fertilizing experiments by the Azotobacter method. A. Stockl. *Landw. Jahrb. Schweiz* 49, 697-725 (1935).—The Azotobacter method (C. A. 26, 6048), as a rapid method for detg. fertilizer requirements of soils, shows the greatest possible agreement of its results with those of field expts., is usable for most types of soils, and is easily carried out in a short time and at slight expense. While the Durks and Sheffer method (C. A. 28, 3164⁴) depends on the assumption that, with increasing percentages of available P₂O₅ in the soil, the fertilizer requirement decreases, the Azotobacter method takes into account the soil reaction and the quantity of CaCO₃ present. The chief disadvantage of the Azotobacter method is that it indicates as slightly deficient some soils adequately supplied with P₂O₅. To carry it out carefully requires double

the time that the D and S. method requires, but much less time and expense than the Neubauer method requires. The Azotobacter method is not recommended for peat soils, nor for soils fertilized for many years with liquid manure. It does not indicate K₂O requirements. E. O. W.

Studies on humus production from stall manure. Kurt Simon. *Z. Pflanzenernähr., Düngung Bodenk.* 40, 178-89 (1935); cf. C. A. 29, 888⁴.—A review and general discussion of the nature and production of humus and its functions in the soil, with a brief account of expts. with manure proving the formation of H₂O-sol. humus substances by fermentation. Twenty-two references. C. J. S.

The influence of some potash fertilizers and associated salts upon the lime status of the soil. O. Lemmermann and L. Fresenius. *Z. Pflanzenernähr., Düngung Bodenk.* 40, 189-99 (1935).—Porcelain percolators were filled with 2.3 kg. sandy loam treated with various salts at the rate of 350 lb. per acre and leached with 100 ml. H₂O daily until 12 l. had been collected. Ca was detd. in the percolate. The data indicated that Mg salts cause the greatest loss of Ca; K salts came next and Na salts caused the least loss. The sulfates are slightly more active than chlorides. Kamite, 40% K₂O salt and sulfate of potash-magnesia to furnish equiv. K₂O caused losses of Ca in proportion to Mg supplied; Na assoc. with Mg in these salts had little protective effect. C. J. Schollenberger

The influence of the [soil] reaction and fertilizing on the composition and digestibility of meadow grass. I. The influence of the reaction. K. Nehring. *Biedermanns Zentr. B. Tierernähr.* 7, 444-62 (1935).—In pot tests with timothy and red clover, besides an influence of the reaction on the yields, there was a change in compn., especially in relation to the content of crude protein and of the different mineral constituents (CaO and P₂O₅) which increased distinctly under the influence of increased lime adds. Corresponding field tests with timothy and red clover showed similar results. In 2 test series, lasting several years, the influence of the reaction on compn. and digestibility of natural meadow crops was studied. Addn. of lime effected a considerable yield increase and a distinct change in compn. As to crude nutrients, the addn. of lime increased the ash, crude fat and crude fiber, while there was a corresponding decrease in the amt. of N-free ext. The effect on the protein was not const.; in one series it was not essentially affected, while in the other it was favorably influenced. The content of CaO increased considerably; an increase in P₂O₅ was not noticed in all cases. In the first series (on an acid soil of an elevated fen) digestibility was only slightly influenced. In the other series (on an exchange acid sand soil) digestibility was considerably increased by the addn. of lime, especially with physiologically acid fertilizing. Physiologically alk. fertilizing was able to reduce partly the unfavorable effect of the acid reaction, but not as to the yields. The addn. of lime effected the following av. increases in the yields per year per hectare: first expt., starch values 700, digestible crude protein 120 kg.; second expt., starch values 500, digestible crude protein 130 kg. F. L. Dunlap

[Report on] chemistry. P. E. Hance. Hawaiian Sugar Planters' Assoc., *Proc. 54th Ann. Meeting (Rept. Comm. in Charge Expt. Sta.)* 1934, 69-90; cf. C. A. 28, 6503⁴.—Growth-failure of cane.—A spectrographic study of a soil sample from a virgin portion of a growth failure area showed the absence of B and P. Cu was present in fair concn., together with Fe, Al, Ti, Ca, Na, Mg, Mn, Si and K. The soly. of native Fe and Mn in an alk. growth-failure soil was markedly increased by the application of a mixt. of equal parts of S and filter press cake at the rate of 2 tons/acre. The increases amounted to as much as 500 lb./acre-ft. of Fe as Fe₂O₃ and 250 lb. Mn as MnO₂. Inorg. constituents of water.—Distd. water from different stills varied widely in Cu content. Sea water was shown spectrographically to be less concd. than well water in Ti, Mn, Cu, Al and P. *Dein. of available Fe and Mn in Hawaiian soils*.—Procedures involving the use of NH₄OAc and NH₄Cl solns. were unsatisfactory. A procedure was developed involving the use of neutral N NH₄ citrate (prepd. by mixing equal vols. of 2

NH₄OH and citric acid solns. and adjusting to neutrality with bromothymol blue) as an extg. medium. It possesses the advantage that the amts. of Fe and Mn extd. by neutral NH₄ citrate are of such magnitude as to make possible the detection of small fluctuations resulting from responses to soil treatments. *Arsenic in refined sugar*—Refined Hawaiian sugars did not contain As in amts. detectable by either the spectrographic or Gutzeit methods. The small quantity of As (2 p. p. m.) absorbed by the cane plant remained in the mill by-products as a result of refining operations. K. D. Jacob.

Asparagus investigations Robert E. Young. *Mays Agr. Expt. Sta., Bull. 315 (Ann. Rept. 1934) 62-4 (1935)*.—On *Merrimac* coarse sandy loam at N. Estham a 3-year field expt. showed that fertilizer contg. 8% N applied at the rate of 1 ton per acre gave max. results in the N series. NaNO₃ gave the best results of any N source. A fertilizer mat contg. 12% P₂O₅, where the P was derived from superphosphate, gave best results in the P series. Fertilizers contg. 6% K₂O produced crop increases of 32% over the no-potash control plots. KCl was preferable to other K salts. The substitution of NaCl for KCl reduced yields. Even when NaCl was added to complete fertilizers, no yield increases were noted. N fertilizers should not be added all at once, but 1/2 should be applied at the end of the cutting season and 1/2 about a month later. Asparagus was greatly benefited by the addn. of lime to an acid soil. The resulting yield increase was 22%. Cyanamide, in both powd. and granular forms, was an excellent weed killer in asparagus fields. C. R. Fellers.

Cane ecology F. Hardy. *Proc. Sugarcane Investigation Comm. (Trinidad) 4, 352-3 (1934)*.—Cane plants were grown in quartz sand and watered with pure nutrient solns. Cultures lacking in either N or P produced crops weighing only about 5% of those receiving a complete nutrient soln. In the absence of K the crop was reduced approx. 50%. Growth was not affected by the absence of either Ca or Mg. The highest sugar content (percentage wt. of cane material) occurred in the culture lacking N, closely followed by that lacking P. The glucose ratio (glucose accompanying 100 parts of sucrose) was very much lower in the cultures lacking either N or P than in any of the others, but was relatively high in the culture lacking K. K. D. Jacob.

The mineral nutrition of grape vines E. Vinet. *Compt. rend. acad. agr. France 21, 911-10 (1935)*, cf. C. A. 29, 873¹.—Fertilizers have a marked effect on the development of the wood, its mineral compn. and its productivity. Fertilizers increase the density of the wood and the best developed and densest woods are obtained in plots which receive the greatest amt. of K₂O. In this regard K₂SO₄ is not superior to KCl but it is superior in enriching the wood in K₂O and increasing the sugar production. K₂O fertilizers also improve the fruit-bearing aptitude of the vines. The absence of K₂O in the fertilizers causes a physiol. unbalance which leads to poor development of the wood and smaller production. J. R. Adams.

Responses of the tomato in solution cultures with deficiencies and excesses of certain essential elements. Paul L. Fisher. *Md. Agr. Expt. Sta., Bull. 375, 283-98 (1935)*.—Tomato plants of the Marglobe variety were grown in solns. deficient in, and in solns. with excesses of, the following essential elements. B, Ca, Mg, K, N, P and S. Generally there was decreased growth of plants grown in solns. deficient in each of the elements. This same decrease was not produced in every case by an excess of these elements in solns. Plants can make relatively good growth in concns. double that of control cultures, with the exception of Ca, N and S. The distinctive symptoms of tomato plants grown in solns. deficient in each of the essential elements studied are very similar to those reported by McMurtrey (C. A. 27, 2712) for tobacco. In general, the effects were observed much earlier in tomatoes. Because of the ability of the tomato to stand high salt concns., no distinctive differences or responses were obtained as a result of growing tomato plants in excessive salt concns. of the elements studied. C. R. Fellers.

Rate of fertilizing cotton with and without poisoning

(from arsenic). R. Y. Bailey and J. M. Robuson. *Ala. Agr. Expt. Sta., 45th Ann. Rept. 13-14 (1934)*.—Four different rates of a 4.8:0.6:4.8 fertilizer made from NaNO₃, superphosphate, and KCl were compared for cotton on Norfolk sandy loam over a 10-yr. period. The rates of application of the fertilizer varied from 500 to 2000 lb. per acre per year. Some of the plots were dusted annually with Ca arsenate to control boll weevil while other plots were left as controls. The As dust gave an av. increase in cotton yield per acre of 40 lb. per year on the unfertilized plots and of 203 lb. on the fertilized plots. There was no evidence of poisoning or incompatibility by the fertilizer ingredients or Ca arsenate. C. R. Fellers.

Fertilizer requirements for Irish potatoes, wheat and soybeans when grown in rotation C. B. Williams, W. H. Rankin and S. C. Clapp. *N. C. Agr. Expt. Sta., 46th Ann. Rept. 18-19 (1933)*.—Larger yields of soybean hay were produced from 400 lb. of 12-24 fertilizer contg. K from low-grade potash salts like kainite than from a complete fertilizer of the same analysis contg. equiv. amts. of K from either KCl or K₂SO₄. P influenced the crop most, and N least. For potatoes, K₂SO₄ proved a better source of K than kainite or KCl. Scabby tubers resulted from potatoes fertilized with kainite. C. R. Fellers.

Fertilizer and lime requirements for tobacco grown in rotation with oats, soybeans and rye E. G. Moses. *N. Car. Agr. Expt. Sta., 46th Ann. Rept. 21 (1933)*.—Long-time expts. on plots showed that cottonseed meal and NaNO₃ ranked 1st and 2nd as sources of N for tobacco. KCl was preferred to K₂SO₄. Bone meal and basic slag as sources of P injured the quality of the tobacco and delayed maturity. C. R. Fellers.

The question of the fertilizing action of brown coal H. Kappen, R. W. Beling and G. v. Strinck. *Z. Pflanzen-ernähr., Düngung Bodenkd. 40, 215-28 (1935)*.—Pot expts. with mustard on sandy loam, comparing urea, Leunassal-peter (NH₄ sulfate-nitrate) and 3 ammoniated brown coal preps. contg. 1.0, 4.7 and 3.5% N from NH₄ as sources of N in a complete fertilizer, are described. The results indicated that the value of these preps. was solely in the NH₄ salt content; neither the N nor the org. matter of the coal had any effect. Treatment of coal with gaseous or liquid NH₃ causes some combination of N in unavailable forms, hence it is not economical. The products made from coal and dil. NH₄OH or NH₄ salt solns. contain the added N in available form, but carry so little that they are at a disadvantage in comparison with other N fertilizers. C. J. Schollenberger.

Nonacid-forming mixed fertilizers II. The value of dolomitic limestone supplements of different degrees of fineness as measured by the increase in water-soluble magnesium in the soil. J. R. Taylor, Jr., and W. H. Pierre. *J. Am. Soc. Agron. 27, 764-73 (1935)*; cf. C. A. 29, 6904¹.—After a period of 24 days, tests on a DeKalb silt loam soil of pH 5.4 showed that the finer than 100-mesh dolomitic limestone in a mixed fertilizer liberated in the soil-fertilizer zone practically as much Mg as did pure MgSO₄ contg. an equiv. amt. of Mg. As measured by the concn. of sol. Mg, the finer the division of dolomitic limestone used in the production of nonacid-forming fertilizers, the greater the rate of decompn. in the soil-fertilizer zone. To obtain any benefit during the year in which it is applied, the dolomitic limestone should all pass the 20-mesh sieve and a large part should pass the 60-mesh sieve. The rate of decompn. of W. Va., Ohio, Tenn., and Ala. dolomitic limestones as indicated by the concn. of Mg, nitrate N and H ions in the soil-fertilizer zone was practically the same. It appears that in many cases dolomitic limestone used in this manner should supply a large part, if not all, of the Mg needs of plants, even when grown on Mg-deficient soils. J. R. Adams.

The determination of phosphoric acid in Nitrophoska containing lime W. Lepper. *Landw. Vers.-Sta. 123, 345-8 (1935)*.—The shortened method of Petermann, as described previously (C. A. 29, 2111¹), compares favorably with other methods for the detn. of citrate-sol. P₂O₅ in Nitrophoska. John O. Hardesty.

Rock phosphate, superphosphate, soft phosphate and

basic slag compared as sources of phosphoric acid for corn, wheat and soybeans grown in rotation. C. B. Williams, W. H. Rankin and S. C. Clapp. *N. Car. Agr. Expt. Sta., 46th Ann. Rept.* 19-20(1933).—Superphosphate produced larger yields than other forms of P in a 5-yr. expt.

Improving superphosphate. P. A. Baranov. *J. Chem. Ind. (Moscow)* 12, 832-5(1933).—The addition of 5-10% of bone meal to superphosphate greatly improves the physical properties and fertilizing power of the product. Addition of phosphorite meal is also helpful, but less so than the addition of bone meal.

Absorption by food plants of chemical elements of importance in human nutrition. A. B. Beaumont and E. B. Holland. *Mass Agr. Expt. Sta., Bull.* 315, (Ann. Rept. 1934), 14-15(1935).—By use of a fine sandy loam at pH 4.4, toxicity symptoms appeared when FeSO_4 was added at the rate of 1280 lb per acre for spinach, and at 640 lb per acre for turnips. For $\text{Fe}_2(\text{SO}_4)_3$, the toxic contents were, resp., 640 and 320 lb., and for CuSO_4 , 320 and 160 lb. At a soil pH of 5.4, FeSO_4 became toxic for spinach at contents of 5120 lb per acre, and for turnips at no content. Using $\text{Fe}_2(\text{SO}_4)_3$ became toxic for spinach at 2560 lb.; CuSO_4 was toxic for spinach and turnips at a content of 1280 lb. In soil-tank expts., the use of 16-24 kg per hectare of KI increased the yield of turnips but not of spinach.

Control of the bacterial wilt disease of tobacco, pepper and Irish potato. R. F. Poole. *N. Car. Agr. Expt. Sta., 46th Ann. Rept.* 24-5(1933); cf. C. A. 28, 6918¹⁸.—The addition of 200-600 lb. of S per acre for the control of bacteria wilt reduced the soil pH from 5.6 to 3.2-4.5 and greatly injured the plants. Even after $\text{Ca}(\text{OH})_2$ or dolomitic lime was added to the soils before replanting, the injury still persisted. Conclusion: The use of S as a control has little practical value.

[Report on] entomology. C. E. Pemberton. Hawaiian Sugar Planters' Assoc., *Proc. 54th Ann. Meeting (Rept. Committee in Charge Expt. Sta.)* 1934, 19-26, cf. C. A. 28, 6514¹⁸.—Good control of the cane root grub (*Anomala orientalis*) was obtained by applying to the soil a mixt. of mud press cake and As_2O_3 . Neg. results were obtained with As_2O_3 incorporated in Oliver filter mud and spread over the fields in irrigation water; the As was fixed at the surface of the soil and was almost completely retained there for at least 1.5 yrs. Cane plants did not absorb As from the soil except in exceedingly minute amounts, which were taken up even where no As was applied. Canes from untreated fields, as well as those from fields treated with As_2O_3 at the rate of 1890 lb/acre (worked into the soil), contained 2 p.p.m. of As on the dry basis. K. D. J.

The coding moth problem. S. L. Allman. *Agr. Gas. N. S. Wales* 46, 459-63(1935).—Addn. of white oil (1 gal/80 gal of spray) to the last 3 cover sprays of Pb arsenate gave effective control of the insect. Decidedly poorer results were obtained when either kerosene, casein or fish oil was substituted for white oil. Of the nonarsenicals tested, nicotine sulfate plus white oil was the most effective but was decidedly inferior to Pb arsenate. Poorer results were obtained with erythrite sprays. The highest spray residue (0.0114 grain As_2O_3 per lb of fruit) was obtained with white oil in the last 3 cover sprays. The lowest residue (0.0076 grain/lb) occurred when nicotine sulfate was substituted for white oil. The Pb arsenate-fish oil spray caused a very heavy fruit drop. K. D. Jacob.

Studies on brown root rot of cereals. III. Phosphorus nitrogen relations of infested fields. IV. Effects of fertilizer amendments. V. Preliminary plant analyses. T. C. Vanterpool. *Can. J. Research* 13C, 220-60(1935).—These papers deal with the elucidation of the factors which predispose wheat seedlings following summer fallow to *Pythium* root rot in certain parts of Sask. The chem. soil analyses on 63 sample pairs reveal that available P in the soil is lower and nitrate N higher in brownish patches than in normal patches. Greenhouse expts. and field observations show that phosphate amendments at the time of seeding, and farmyard manuring, permit the development of normal plants in brownish soil; cereal

straw applications inhibit the disease to some extent, while inorg. nitrogenous fertilizers usually have no effect or occasionally may prove detrimental. Preliminary plant analyses indicate that the total P in diseased plants is lower than in healthy ones, and that there is relatively more water-sol. N and relatively less protein N in diseased than in healthy plants. The soil and crop-culture factors, especially the practice of bare summer fallowing, which may influence the available P-nitrate N ratio in the soil, are discussed in relation to disease incidence. It appears that any crop practice which tends to increase the available P-nitrate ratio in the soil inhibits the disease, and conversely. This is used as a basis for control recommendations. It is considered that an improper balance of available P and nitrate N in the soil leads to an unbalanced metabolism of the wheat seedlings at a crit. stage in their development, thereby predisposing them to fungal attack. The effect of the unbalanced nutrients on the parasitic vigor of the pathogen still requires elucidation.

J. W. Shipley. Influence of certain dusts and sprays upon the growth, yield, quality and general characteristics of peanuts. H. B. Mann. *N. Car. Agr. Expt. Sta., 46th Ann. Rept.* 41-3(1933).—Pot expts. showed that the addition of S to the soil at the rate of 94 lb per acre made the foliage a bright green color and hastened maturity in peanuts. The S increased the soil acidity an av. of 1.4 pH. CaSO_4 increased the soil acidity only 0.5 pH. CaCO_3 decreased it by 1.1 pH. The rate of application of the CaSO_4 and CaCO_3 was 400 lb. per acre. S was decidedly injurious to the foliage and to yield. CaSO_4 and Bordeaux mixt. were ineffective. CaCO_3 gave greatly increased nodulation. CaSO_4 decreased nodulation.

C. R. Fellers. Investigations on derris preparations. II. Evaluation of derris root and stability of rotenone in commercial preparations. 1. Evaluation. P. W. Danckwort and G. Baumgarten. *Arch. Pharm.* 273, 385-9(1935), cf. C. A. 28, 4836¹⁸.—This is a criticism of methods at present in vogue, notably those based on EtO extn. 2. Stability of rotenone preparations. P. W. Danckwort and H. Patzsch. *Ibid.* 387-8. Results obtained in a series of stability tests indicate that the rotenone content over a period of 4 months is slightly lowered. With old preps even in nonalk. solns some loss of rotenone may be expected.

W. O. E. Changes in apples during storage (Rasmussen) 12. Sewage sludge as a fertilizer (De Turk) 14. Public health significance of sewage sludge when used as a fertilizer (Tanner) 14. Iodine in Westphalia (detn. in soils) (Balks) 7. Some African oil seeds [used as fertilizer] (Anon.) 27. Pure water and sewage [fertilization] (Gusovius) 14. Testing rind hardness in sugar cane [and cohesion and penetrability of soils] 28. Dispersions such as those of insecticides (U. S. pat. 2,021,143) 13.

Fertilizer. Charles K. Lawrence (to Atmospheric Nitrogen Corp.) U. S. 2,010,713, Nov. 5, NH_4NO_3 45-60 is used with ammoniated triple superphosphate 55-40 parts. Cf. C. A. 29, 4125¹⁸.

Phosphate fertilizers. Hoersch-Köln-Neussens A.-G. für Bergbau und Hüttenbetrieb (Friedrich Heinrich, inventor). Ger. 616,940, Aug. 15, 1935 (Cl. 16 2). A continuous wet process for producing $\text{CaH}_2(\text{PO}_4)_2$ consists in: (a) treating crude natural or synthetic phosphate with HCl to obtain $\text{CaH}_2(\text{PO}_4)_2$ or free H_3PO_4 , and passing in NH_3 to ppt. $\text{CaH}_2(\text{PO}_4)_2$; (b) heating the $\text{CaH}_2\text{-NH}_4\text{Cl}$ soln. of (a) with CaO to liberate NH_3 , which is dried ready for re-use in stage (a); the CaH_2 lye of (b) is freed from excess of $\text{Ca}(\text{OH})_2$, evapd. and heated to 750° with steam to generate HCl lye, used in stage (a) and the residual CaO is re used in stage (b). Examples are given.

Fertilizers. Lonza Elektrizitätswerke und chem. Fab. A.-G. (Fmil. Lüscher and Ernst Sturmann, inventors). Ger. 618,791, Sept. 16, 1935 (Cl. 16 5). Addn. to 598,446 (C. A. 28, 5590¹⁸). Known fertilizers comprising $\text{Ca}(\text{NO}_3)_2$ and soil phosphates are warned and mixed with a basic substance which has been produced in a finely sub-

divided state by chem. reaction, e. g., pptd. CaCO_3 or slaked lime. Strewable compns. stable to storage are obtained.

Fertilizers. Gewerkschaft Victor and Wintershall A.-G. (H. Schmalfeldt, inventor). Ger. 619,397, Oct. 2, 1935 (Cl. 16.4). Products contg. KH_2PO_4 and $\text{MgH}_2(\text{PO}_4)_2$ are prep'd. by heating mixts. of KCl and MgCl_2 , e. g., natural or synthetic carnallite, to about 180° with the appropriate amt. of H_3PO_4 soln. of 30–40% concn. Traces of HCl in the products may be neutralized by treatment with NH_3 or addn. of a solid alkali.

Mixed fertilizer. Hubert Kappen. Ger. 616,947, Aug. 8, 1935 (Cl. 16.6). Solid Mg salts contg. K salts are dampened and treated with excess of NH_3 and CO_2 or gas mixts. contg. these. The product is powd., exposed to air, warmed and retreated with NH_3 and CO_2 to give a product rich in ammonia N . Cf. C. A. 29, 3102¹.

Peat-containing fertilizer. Werner Liehr and Eduard Dyckerhoff (to Eduard Dyckerhoff). U. S. 2,019,824, Nov. 5. A mixt. including dry peat and plant fertilizing material such as an aq. fertilizer soln. is subjected to a pressure of not less than 130 kg. per sq. cm. and sufficiently high to cause a colloidal change in the peat without the application of external heat. The product may be formed into pellets.

Nitrogen fertilization of soil. Cornelis B. de Bruyn (to Shell Development Co.). U. S. 2,020,824, Nov. 12. NH_3 gas is passed into irrigation water to produce a concn. of NH_3 in the water which will avoid burning of vegetation, and the treated water is supplied to the soil.

Ammonium sulfate. Andreas v. Kreisler. U. S. 2,021,093, Nov. 12. For the production of coarse cryst. $(\text{NH}_4)_2\text{SO}_4$ from synthetic NH_3 , the sulfate is crystd. from its aq. soln. with addn. of 2–6 parts carbamide per 100 parts of NH_4 sulfate. The cryst. product may contain about 0.1–0.5% of carbamide and is suitable for use as a fertilizer.

Superphosphates. Lewis B. Skinner. U. S. 2,021,–

671, Nov. 19. Coarsely comminuted calcareous material such as crushed limestone is subjected to attrition (suitably in a rotary pebble mill or the like, of a described app.) in the presence of H_3PO_4 employed in an amt. required to convert the Ca content of the material substantially all into mono- Ca phosphate as a substantially dry product at the end of the reaction.

Insecticides. I. G. Farbenindustrie A.-G. Brit. 432,–188, July 23, 1935. See Fr. 754,735 (C. A. 28, 1459⁴).

Insecticides. Chemische Fabrik Marienfelde G. m.-b. H. Brit. 432,626, July 30, 1935. Concd. derris root and other exts. emulsifiable with H_2O are obtained by adding weakly acid alkali-resin soaps to derris root and other exts. obtained by means of and contg. di- or tri-chloro-ethylene.

Insecticides, etc. Soc. anon. des établissements Nifo. Fr. 785,049, July 31, 1935. AcH in various forms is used as insecticide, bactericide, fungicide, etc.

Germicide, insecticide and fungicide. Julius Hyman (to Velocor Corp.). U. S. 2,020,648, Nov. 12. A fraction of a polymer derived from vapor-phase cracked gasoline and boiling in the kerosene to gas-oil range is subjected to mol. O oxidation in the presence of a seccative metallic soap such as Mn linoleate or soap-forming compd. of a seccative metal such as Co , Pb or Mn until pptn. substantially ceases, the ppt is sep'd and the filtrate is recovered.

Destroying parasites. Gesellschaft für Neuzeitliche Bodenbehandlung m. b. H. Fr. 785,481, Aug. 10, 1935. Vegetables, leaves, etc., are sprinkled with finely powd. siliceous mineral substances having absorbent properties, e. g., concreted quartz, flint, quartz sand or firestone having a high content of amorphous silicic acid.

Weed killers. Fahlberg-List A.-G. chem. Fab. Ger. 619,237, Sept. 25, 1935 (Cl. 45.5). Partly dehydrated CuSO_4 is mixed with the double salt $\text{ZnCl}_2 \cdot 2\text{NH}_4\text{Cl}$ or with a mixt. of the double salt and free ZnCl_2 . An acid salt, e. g., NaHSO_4 , may also be added. The products are stable to storage.

16—THE FERMENTATION INDUSTRIES

C. N. FREY

Double-effect distillation of alcohol under vacuum. E. Barbet. Intern. Sugar J. 37, 434–5 (1935).—The merits of the vacuum system of distn. are discussed. It not only economizes in steam but gives a definitely purer product contg. much smaller quantities of volatile acids, aldehydes, ethers and higher alcs.

Alcoholic fermentation of saccharine materials. D. Sidersky. Bull. assoc. chim. 52, 753–9 (1935).—The max. theoretical yield of alc., 64.3% from 1 kg. of sucrose, is never reached in practice, but 60.1% has been obtained by S. in the fermentation of beet diffusion juice. The alc. usually lost by entrainment in the CO_2 gas may be recovered by passing the gas through activated C and releasing the absorbed alc. by steaming the C . The yield of alc. has been increased 0.7% by this measure.

Scientific aspects of cacao fermentation. A. W. Knapp. Bull. Imp. Inst. 33, 31–49, 147–61, 306–19 (1935).—A review with 49 references. A. P.-C.

The rum industry of Martinique. J. Guillaume. Ann. zymologie [2], 2, 125–32 (1935). A. P.-C.

Barleys of 1935. J. Raux. Brasserie & malterie 25, 257–66 (1935); cf. C. A. 29, 8224¹.—Av. compns. of barleys from different regions of France are tabulated and discussed.

Spirituous liquors from grains: gin. E. Dorchie. Ann. fals. 28, 452–6 (1935).—A description of the manuf. and compn. of gin, with analyses of a no. of com. samples of known genuineness. Considerable variations occur in the products of different distilleries, but the variations are much narrower with different samples from the same distillery. Constituents other than EtOH never fall below 322 mg. per 100 cc. of abs. alc.; higher alcs., the most important of these constituents, do not fall below 270

mg. per 100 cc. of abs. alc. furfural was present in undeterminable traces in all samples except those from one distillery which yielded a product contg. 1.0–9.6 mg. per 100 cc. abs. alc. Artificial Gins are low in non- EtOH constituents and contain not more than traces of higher alcs.

Wines of the 1934 vintage in the Champagne area. Lebrun and Radet. Ann. fals. 28, 465–77 (1935).—Analyses of 65 wines are tabulated and discussed.

The preparation and the determination of trehalose in yeast. A. Steiner and C. F. Cori. Science 82, 422–3 (1935).—Treatment of starch-free bakers' yeast with $(\text{NH}_4)_2\text{SO}_4$, followed by pptn. with H_2SO_4 + $\text{Fe}_2(\text{SO}_4)_3$, in 7.5% H_2SO_4 , exts. the trehalose (I) completely. Neutralization with BaCO_3 ppt's the small amt. of polysaccharide present while I remains in soln. The filtrate is freed of Ba and heavy metals and conc'd. *in vacuo*. Addn. of 20 vols. of alc. ppt's some salts, which are filtered off. The soln. is placed in the refrigerator. After standing overnight, or in a few days, the typical rhombic crystals of I are formed, which grow considerably in size in the next 10 days. During glucose fermentation the I content of yeast increases markedly. In one prep'n. in which 300 g. of yeast was allowed to ferment 150 g. of glucose, 1.5 g. of I was obtained in the 1st crystn. and 0.6 g. by working up the mother liquors. Directions are given for the detn. of I. Fresh bakers' yeast contains 0.1–1.5 g. I per 100 g. moist wt., the amt. depending upon the medium upon which the yeast was grown.

Felix Saunders

Amber sorghum from Minnesota as a source of alc. (Grossi) 28. Sterilizing liquids [wines and beer] (Fr. pat. 784,959) 13.

Alcohol. *Aktiebolalet Separator* and Nils E. Svensson. Brit. 432,387, July 23, 1935. In processes for producing alc. from sugar-contg liquids produced by extrn. from sugar beets, etc., the yeast, after fermentation in vats, is extrd. by means of centrifuges having a conveying device or pile of disks arranged within the bowl and a sludge space outside the conveying device or pile of disks, the septed yeast being discharged to a point immediately outside said device, etc., or, when the outer periphery of said device, etc., is at a smaller distance from the center than 7/10ths of the inner radius of the bowl, to a point at least 7/10ths of this radius from the center. The yeast is then subjected to a further fermentation in a vat contg nonfermented sugar-contg liquid. App is described.

Alcohols from sugars. I. G. Farbermand A-G (Johannes Muller and Ulrich Hoffmann, inventors). Ger. 534,074, May 18, 1935 (Cl. 12a 5 03). Addn to 544,606 (C. A. 26, 3514). The method of 544,606 for obtaining alcs by reducing sugars with H in the presence of an activated Ni or Cu catalyst is extended to include the use of nonactivated catalysts, OH ions being present in the latter case. In example, unactivated Ni is used with $\text{Ca}(\text{OH})_2$, $\text{Ba}(\text{OH})_2$, and MgSiO_3 .

Propionic acid production by fermentation. Hugh R. Stiles (to Commercial Solvents Corp.). U. S. 2,020,251,

Nov. 5. Fermentation, such as that of molasses or corn mash, is conducted in the presence of a bentonite clay or hydrous Al oxide or activated alumina which serve as catalysts.

Use of sucrose octa-acetate as a denaturant for alcohols. Herbert G. Stone (to Eastman Kodak Co.). U. S. 2,019,744, Nov. 5.

Fermentation of sugar-cane juice. Albert Lepelletier-Baufond. Fr. 745,223, Aug. 5, 1935. The juice is purified by bringing its pH value successively to the isoelec. points of the org. and mineral impurities and is then seeded with a suitable yeast, with the addn. of yeast nutrients if necessary. A wine like product is obtained.

Treatment of wine, must, etc. Edouard Muller. Ger. 619,191, Sept. 23, 1935 (Cl. 6c. 1). The acidity of wine, must and other fruit juice preps. is reduced by electrolyzing the materials in a partitioned cell. Material of reduced acidity is withdrawn from the cathode compartment. Exptl. results are given.

Temperature-controlling means for malt kilns and like drying apparatus. Heinrich Muger. Ger. 619,384, Oct. 2, 1935 (Cl. 82a 26).

Apparatus for hopping beer wort. Weigelwerk A-G. Ger. 617,842, Aug. 23, 1935 (Cl. 6b. 14). Addn. to 602,371 (C. A. 29, 544).

17—PHARMACEUTICALS, COSMETICS AND PERFUMES

W O EMERY

Determination in the presence of tertiary alcohols of the free primary and secondary alcohol contents of essential oils by acetylation in pyridine. Raymond Delaby and Sebastien Sabets. *Bull. soc. chim.* [5], 2, 1710-24 (1935).—Acetylation of primary and secondary alcs, present in essential oils contg. tertiary alcs by means of Ac_2O and pyridine gives results comparable to those furnished by phthalization. The procedure is rapid and economical. Results, satisfactory from a practical standpoint, are obtained in 1-2 hrs. Phenols and primary alcs, and amines are quantitatively acetylated in 0.5-1 hr.; secondary alcs are almost totally acetylated in 1 hr. while tertiary alcs and aldehydes are scarcely affected. Pyridine acts as a neg. catalyst which paralyzes the acetylation of tertiary alcs, by Ac_2O whereas P_2O_5 acts as a pos. catalytic agent. Tech. details as to app., materials, technique and calcn. are given. The acetylating mixt. consists of 1 part of Ac_2O with 2 parts of anhyd. pyridine dried over and distd. from $\text{Ba}(\text{OH})_2$. It is found essential to use an excess, 2-3 times the theoretical amt. of the acetylating mixt. This method gives 99, 98.7 and 99.3% results with PhCH_2OH , geraniol and l-citronellol. The accuracy of this method shown for acyclic terpenes has also been demonstrated for santalols (C. A. 26, 4727). The method gives 97, 96 and 93% results with the secondary alcs menthol, borneol and cyclohexanol but only 0, 1, 2.3 and 2.2% with the tertiary alcs MePr(PhCH₂)COH, linalol, terpineol and MeEt(PhCH₂)COH and 4.7, 5.7, 7.5 and 0% with the aldehydes citronellal, citral, hydroxycitronellal and Balil. The primary amine Me anthranilate was acetylated 99.6%. Tests made on various essential oils were sensibly in agreement with results found by the Radcliffe-Chadderton phthalization technique. The method outlined is more selective than the pyridine- AcCl method published by Smith and Bryant (C. A. 29, 1749).

Azochloramide. Anon. *J. Am. Med. Assoc.* 105, 1191(1935).—The following dosage form has been accepted for admission to New and Non-Official Remedies by the Council on Pharmacy and Chemistry of the Am. Med. Assoc. *Azochloramide in Triacetin* 1.500—A soln. contg. 1 g. of azochloramide in triacetin, a bitter colorless oily liquid, b. 238-9°, has d_4^{20} 1.154-1.158, n_D^{20} 1.4205-1.4310, sapon value 762-72 and contains approx. 95% $(\text{ClH}_2\text{OAc})_2\text{CH}_2\text{OAc}$. Tests for pH and H_2O content are also given. C. R. Addinall.

Cetyl alcohol—the universal cream base. Joseph

Kahsh. *Drug Cosmetic Ind.* 37, 595-6, 598(1935).—The properties and uses with formulas are given. H. M. B.

Use of the methyloones in perfumery. Paul Jellinek. *Riechstoff Ind. u. Kosmetik* 10, 177(1935).—A discussion with a table showing the amts. of the 4 methyloones necessary to produce the various odor types. H. M. B.

New procedures in the chemistry of aromatics. A. Lewinson. *Riechstoff Ind. u. Kosmetik* 10, 187-9(1935); cf. C. A. 30, 2357.—A review dealing with the ketones of value in perfumery. H. M. Burlage.

Alkaloids of *Cytisus caucasicus*. A. P. Orshov, S. S. Norkina and T. Makomova. *Arch. Pharm.* 273, 319-72 (1935).—Leaves collected in the summer of 1934 yielded from Et₂O extrn. an alkaloidal mixt. (0.4%), from which a liquid base was isolated as the perchlorate m. 210-11° and having $[\alpha]_D^{20}$ 50°, probably identical with lupanine whose perchlorate m. 210° and has $[\alpha]_D^{20}$ 61°. Comparison of other salts as the hydriodide, methiodide and chloroplatinate gave addnl. confirmation. From the mother liquors of the lupanine perchlorate a beautifully crystalline salt was isolated having the formula $\text{C}_{24}\text{H}_{39}\text{N}_2 \cdot \text{C}_2\text{H}_5\text{H}_2\text{O}_7$ (OH)(NO₃)₂ and m. 204-5°, which identifies the salt with pachycarpine picrate. From the CHCl_3 extrn. a min. amt. of long cryst. needles, m. 120-2°, was obtained, too small, however, for further investigation. W. O. E.

Estimation of essential oils in drugs, and the oil content of peppermint, sage, fennel and caraway. L. Koffer and G. v. Herrenschwand. *Arch. Pharm.* 273, 348-402 (1935).—A simple procedure is described, according to which the essential oil is driven over and detd. volumetrically. For reception of the distillate a 60-cc. flat-bottom flask contg. 20 g. NaCl is employed, on the neck of which a hood-like attachment is placed at the end of distn., this attachment develops into a narrow tube graduated into 0.01 cc. The lower side of the flask carries a wide tube closed by a rubber stopper, which on pushing in drives the NaCl soln into the graduated column for subsequent reading. The entire operation requires only 1 hr. This receiving and measuring app. presupposes a distn. app. of the type suggested by previous investigators. It requires not more than 60 cc. distillate for exhaustion of the drug. With certain drugs like peppermint and sage the yield of oil is less from the powder than the whole drug. Most of the com. samples of the 4 previously noted drugs in powder form proved on examn. to be inferior or worthless. W. O. E.

Behavior of drugs of high oxidation potential. P. W.

Danckwort, W. Dietrich and G. Wilkens. *Arch. Pharm.* 273, 403-8(1935).—Some 49 drugs have been examined, the results obtained are comparatively reported. W. O. E.

Adsorption of nicotine from tobacco smoke by different adsorbents. J. Bodnár, Vitéz Ladi-laus Nagy and Tibor Vecsey. *Pharm. Zentralhalle* 76, 657-61(1935).—The elimination of nicotine from cigarette smoke by tips containing silica gel; by various chemicals as tartaric, tannic and phosphotungstic acids, iron alum and FeCl_3 contained in pledgets of cotton in the cigarette mouth piece has been studied. It is shown that such pledgets impregnated with tartaric acid, in an amt. of about 25 mg., do not influence the smell and taste of cigarette smoke as much as other materials, but a 45% adsorption of the nicotine resulted. It is further shown that the cotton pledgets of certain com. cigarette tips are practically worthless as nicotine adsorbents, the paper insets of certain cigarette tips adsorb more nicotine (45% at the most), but much less than that guaranteed. W. O. E.

Incompatible drug mixtures K. Brunner. *Pharm. Zentralhalle* 76, 885-92(1935).—Numerous examples are cited of incompatible mixtures by double decomposition through acid or basic components, of acid and basic material, formation of difficultly sol. salts, oxidation and reduction phenomena, incompatible powder mixts. W. O. E.

Discoloration and filtration under pressure C. Rohmann and J. H. Ehlers. *Pharm. Zig* 80, 1190-7(1935).—An illustration and description are given of a specially constructed app. designed to impart pressure to a discolored extract of the Bredin type. Precise directions for its manipulation are given. W. O. E.

Certain simple drug tests L. Rosenthaler. *Scientia Pharm.* 6, 109-10(1935).—Swiss pharmacopeial and more simple tests are comparatively recorded, for citric and salicylic acids, acetanilide, antipyrine, salicylate, pptd. CaCO_3 , eufine and theophylline, glucose, Hg salicylate, tamarind pulp, tartar emetic, theobromine and theophylline. W. O. E.

Homeopathic preparations VIII. Occurrence of enzymes (desmolases). A. Kuhn and G. Schifer. *Pharm. Zig* 80, 1029-31(1935), cf. C. A. 29, 237.—The results obtained in the examn. of some 50 odd plant preps. with respect to their content of oxidases, peroxidases and catalases are reported. W. O. E.

Emulsions, emulsifiers and new saline bases. G. Wallrabe. *Pharm. Zig* 80, 1147-9(1935).—An address. W. O. E.

Morphine. R. Fischer. *Pharm. Zig* 80, 1055-7(1935).—In sterilization as commonly effected, a possible decompn. of the alkaloid is not to be ignored, since long storage in unsuitable glass containers may represent an undesirable factor on account of alkali from the glasses. This problem may best be solved through recourse to suggestions made by Th. Paul. Thirty-six references. W. O. E.

Fluidextracts, now and in the past. E. Kessler. *Pharm. Zig* 80, 1080-2(1935); cf. C. A. 29, 6222¹. W. O. E.

Chemical and biological experiments and reflections on homeopathy. Th. Sabatichka. *Pharm. Zig* 80, 1002-5, 1108-11(1935).—An address. Thirty references. W. O. E.

Diagnosis and prognosis during the period of urostropic medicine. M. Weiss. *Sädelst. Apoth.-Zig* 75, 870-9(1935). W. O. E.

Estimation of ipecacuanha alkaloids. Lajos David. *Pharm. Zig* 80, 1121-5(1935).—The various procedures official in pharmacopeias and certain text books on alkaloids are reviewed in connection with a suggested method involving extrn. of the alkaloids with CHCl_3 and their titration with standardized HCl. W. O. E.

Percolation and percolators C. Koch. *Pharm. Zig* 80, 1170-2(1935); cf. C. A. 29, 5221¹. W. O. E.

Certain chapters of the homeopathic pharmacopeia. Wolfgang Brandrup. *Pharm. Zig* 80, 1160-1(1935).—Data are presented on the primary tincture of *Drosera*. W. O. E.

Estimation of soap in pharmaceutical preparations.

W. Stüwe. *Apoth. Zig* 50, 1545-8(1933).—Certain procedures are outlined and discussed for the examn. of various soaps as potash, glycerinated liquid, potash spirit, liq. cresoli sapon., spirit sapon., camphorated spirit, medicated, jalap, camphorated liniment, ammon. liniment, liq. formaldehyde and H_2O in medicinal. W. O. E.

Operations with a discolator. Karl Höll. *Pharm. Zig* 80, 1155-7(1935).—The operations involve the prepn. and evaluation of cinchona, ipecacuanha, strophanthus and strychnos tinctures, as also the application of the discolator in forensic analysis, as the detection of strychnine in various org. tissues. W. O. E.

New drugs and pharmaceutical specialties during the 3rd quarter of 1935. F. Zernik. *Sädelst. Apoth.-Zig* 75, 957-9(1935), cf. C. A. 29, 7017¹. W. O. E.

The estimation of essential oils in drugs and plant material R. Wasieky, Irida Graf and Stella Bayer. *Scientia Pharm.* 6, 101-6(1935).—For the estn. of oils in drugs and plant material a simple and rapid method is described. It utilizes the principle recommended by A. Kuhn (C. A. 28, 2125¹) involving the estn. of moisture with xylene. The defects inherent in app. heretofore employed are discussed and the elimination of such defects through appropriate changes is indicated. The type of app. suggested consists of a l. flask and rung tube in which a reflux condenser empties and which possesses a U-shaped branch; the one shank is quite narrow and carries a scale divided into 0.01 cc., the U-tube carries in the convex bend a short tube with glass cock. In carrying out the operation 2-20 g. of the sample (corresponding to the oil content) and 150-500 cc. satd. NaCl soln. are introduced into the flask, then allowed to boil vigorously for 1 hr. Toward the end of the distn. the boiling is interrupted a few min., the flask rotated and the distn. continued 10 min. After appropriate cooling, the vol. of the distd. oil is noted, the result indicating the cc. of oil per g. of drug. In the case of drugs with oil of a d. greater than or about 1, also with certain other drugs as *Flos Chamomillae vulgaris*, a small quantity of pinene is pipetted into the distn. flask; allowance for such addn. is made when the vol. of oil is noted. The influence of the fineness of the sample, as also its compn. on the analytical result is discussed. The results obtained in the examn. of certain drugs are reported. The app. is suited to the prepn. of aqueous aromatics. W. O. E.

Albumin tannate. F. Reimers. *Scientia Pharm.* 6, 100-9(1935); cf. C. A. 29, 6362¹.—The results obtained in the examn. of a series of com. samples obtained in Denmark indicate unsatisfactory qualities in this commodity. W. O. E.

Absorption of the most important cinchona alkaloids in the ultraviolet. Leopold Fuchs and Anni Kampitsch. *Scientia Pharm.* 6, 113-22(1935).—The ultraviolet absorption spectra of pure quinine and cinchonine, and their stereoisomers quinidine and cinchonidine have been detd. under different conditions and thereby 2 absorption types noted. The aq. and alc. solns. of the neutral salts correspond likewise to the type of the absorption spectra of their bases. The not very far reaching changes in the spectra observable within this type of absorption, for example through addn. of H_2O to the alc. soln., are traceable to the influence of the solvent or to the formation of heterogeneous assocn. combinations (solvat formations via Hantsch), resp., while the influence of the pH only appears in the solns. of acid salts or in excess acid. The latter form the 2nd type of absorption spectra; in between are found the aq. solns. of acid salts, which in alc. soln., corresponding to the lower pH concn., show a very similar spectrum to the base. Acid concns. stronger than 0.1 N only change the spectra of both alkaloids very slightly. In all the solvents examd. a distinct difference between the quinine and cinchonine spectra was noted, conditioned on the chromophore MeO group of quinine as opposed to the cinchonine. Solns. of the chlorides and sulfates, the latter calcd. to half the mol. wt., yield the same spectrum, also solns. in 0.1 N H_2SO_4 and HCl. Kundt's rule—red shifting of the spectra with increasing n of the solvent—could only be partially

corroborated, and indeed with solns. in 0.1 N HCl acid alc. as compared with the soln. in aq. 0.1 N acid. Of the absorption curves of alkaloidal solns. in 90% and in dil. (15 to 20%, resp.) alc. the latter in contradiction to Kundt's rule are moved toward the long wave length. Under like conditions quinidine and cinchonidine possess almost the same absorption spectra as quinine and cinchonine, higher quant. divergencies in the magnitude of extinction coeffs., as deduced from the curves of J. Manta, were not observed. In connection with the authors' expts. the findings of H. Fischer are discussed. W. O. E.

Precipitation of alkaloids with sodium glycerophosphate. L. Rosenthaler (Bern) *Scientia Pharm.* 6, 122-3 (1935).—Reference is made to a micromethod by D. v. Klobuzitsky (*C. A.* 28, 48377), in connection with the pptn. of 14 different alkaloids, a description of which is given. W. O. E.

Oleates. Luis de Prado *Rev. centro estud. farm. boguam* 25, 403-18, 453-72 (1935).—The chemistry of oleates, fixed oils and oil solns. used in pharmacy is discussed. L. E. Gilson.

Alkaloidal content of infusions and decoctions of the seeds of *Lupinus albus*. D. Torrisi *Boll. soc. ital. biol. sper.* 10, 807-9 (1935).—The amt. of alkaloid extractable by simple infusion or decoction of the seeds of *Lupinus albus* is greater from the roasted seeds than from the raw because of the greater absorptive power of the latter. The alkaloidal content of 100 g. raw or slightly roasted seeds is about 1 g. while after intense roasting it is only about 0.90 g. The prolonged intense heat destroys a small portion of the alkaloid. Helen Lee Gruhl.

Importance of applying a correction in the determination of morphine in opium in the method of analysis prescribed by the British Pharmacopoeia of 1932. Jitendra Nath Rakshit *Ann. chim. anal. chim. appl.* 17, 315-16 (1935).—The pptn. of morphine by NH_4Cl in the presence of alc. and ether in solns. contg. morphine that has been treated with milk of lime is incomplete. From results obtained in the recovery of morphine from the mother liquor after the above pptn., the conclusion is drawn that, for every 100 g. of opium taken, 0.66 g. should be added to the wt. of morphine obtained in the analysis by the British method. W. T. H.

Combating epidermophytes of feet and hands. H. O. Loos *Arch. Dermatol. Syphilis* 170, 602-14 (1934).—Eleven dyes and 26 other chemicals were tested for fungistatic and fungicidal value against *Epidermophyton interdigitalis*. Brilliant green was by far the most effective. O. Hartley.

The "membrane method" for determining the fungicidal action of chemicals. Its clinical implications. Herman Sharlit *Arch. Dermatol. Syphilis* 31, 217-23 (1935).—Samples of collodion were impregnated with each of the following tetraiodohexamethylenetetramine (I), thymol (II), I plus II, iodine (III), salicylic acid (IV), benzoic acid (V), boric acid (VI) and Arning's tincture (VII). When the tubes were completely lined with the medicated collodion, I through V were fungistatic against all fungicides tested except *Aspergillus niger*, on which II only was effective. When only the upper half of the tube was covered with collodion, with no contact between medium and membrane, II alone was fungistatic. Tests showed that II volatilized from the membrane and was taken up by the medium, and that the chemicals in the contact expts. diffused into the medium appreciably. Analogies are drawn to diffusion through human skin membranes. Salicylic acid is considered the ideal fungicide and boric acid the ideal fungistat because they diffuse rapidly through the skin and appear unchanged in the urine. O. Hartley.

Further studies in fungicides. Comparative evaluation of phenol derivatives by modified laboratory procedure. Lyle B. Kingery, Roger Williams and Glen Woodward *Arch. Dermatol. Syphilis* 31, 452-9 (1935).—The fungicidal powers of 38 phenol and thymol derivs. were detd. on *Monilia tropicalis*. None was as effective as I in vitro, but hexylresorcinol ranked highest, with 3,5-dibutylphenol second. In the presence of hide dust, 3 times as much I

and hexylresorcinol were required to kill the fungi as before and with blood serum, 10 fold concns. were needed. NaOCl and I were the only popular ringworm remedies which retained fungicidal power in the presence of these proteins. O. Hartley.

Mycostatic studies on certain monilias and related fungi. Paulina Gomez-Vega *Arch. Dermatol. Syphilis* 32, 49-58 (1935).—Ten dyes and 8 disinfectants were tested in vitro for fungistatic properties. Crystal, gentian, methyl violet and cresol were most effective. Clinically, crystal violet proved therapeutic in several dermatomycoses, and mercurochrome cured a case of tinea and one of onychia when the treated part was exposed to sunlight. Mercurochrome was fungistatic in 1:10,000 diln. when accompanied by sunlight, but ineffective in 1:500 strength without it. O. Hartley.

Preliminary observations on the chemistry and pharmacology of the alkaloids of *Duboisia hopwoodii*. C. S. Hicks and H. Le Messurier *Australian J. Exptl. Biol. Med. Sci.* 13, 175-88 (1935).—The chief alkaloid was isolated and fairly well identified as *d-nornicotine*. C. G. King.

Yield and characteristics of digitoxin obtained from *Digitalis purpurea*. Nahuel-Huapi. G. Spagnol and N. Manzano *Rev. sud americana endocrinol. inmunol. quimioterap.* 18, 683-9 (1935).—The dried leaves from the drug cultivated in Argentine yielded 0.317% digitoxin. The physiol. activity was one cat unit to 0.96 mg. A. E. Meyer.

Ethereal oil of *Torilis anthriscus*. Gmel. Tatsuo Kariyone and Atsuko Majima *J. Pharm. Soc. Japan* 55, 887-93 (1935).—(In German 168-70).—K and M. obtained from the fruits of *Torilis anthriscus*, Gmel. an ethereal oil which had the following phys. properties: d_4^{20} 0.8774, n_D^{20} 1.4504, n_D^{25} 1.4343, acid no. 0, ester no. 8.23, I no. 70.7 and methoxy no. 0. The fractional distn. of oil (100 g.) gave the following constituents: cadinene dihydrochloride, $\text{C}_{15}\text{H}_{24}\text{Cl}_2$, m. 116°, $[\alpha]_D^{25}$ -37.67° (in CHCl_3), hydrobromide, $\text{C}_{15}\text{H}_{24}\text{Br}_2$, m. 122-3°. *Torilene*, as sulfate, $\text{C}_{15}\text{H}_{24}\text{SO}_4$, m. 145°. *Torilene* sulfate on boiling with 10% alc. KOH for 20 min. gave *torilene* hydrate, $\text{C}_{15}\text{H}_{24}\text{O}$, m. 51-5°. The fruit of *Torilis anthriscus* contains about 10% oil. The oil was hydrolyzed with 10% alc. KOH and treated with MeOH. The Me ester was then fractionated and each fraction was hydrolyzed and sepd. according to the method of Twitchell. The fatty acid thus obtained was petroselinic acid, $\text{C}_{15}\text{H}_{30}\text{O}_2$, m. 33°; amide, $\text{C}_{15}\text{H}_{29}\text{NO}$, m. 70.5°. Oxidation with KMnO_4 of the crude acid obtained from the alc.-sol. lead salt gave dihydroxy-stearic and sativinic acid through which the presence of oleic and linoleic acid was proved. F. I. Nakamura.

Antiseptic action of physical and physicochemical factors. Sterckx *Ann. hygienique* [2], 2, 132-40 (1935).—A brief review of work published in 1934 and 1935. A. Papineau-Couture.

The accurate determination of the rotatory power of essential oils. Y. R. Naves and M. G. I. *Parfums de France* 13, 253-8 (1935). (In French and English).—A discussion of the chief sources of error in the accurate detn. of the α of essential oils, and the precautions required to eliminate or minimize them. A. Papineau-Couture.

Natural and artificial musks. Ignaz Herold *Seifen-Industrie-Zig* 62, 695-7, 767-9, 849-51 (1935).—A historical review. J. W. Perry.

Modern perfume compositions. Fritz Schulz. *Seifen-Industrie-Zig* 62, 693-9 (1935).—Recipes for 5 joqual compns. are given. J. W. Perry.

Almecerin as the basis of skin creams or as an agent for improving them. Josef Augustin. *Seifen-Industrie-Zig* 62, 702, 726 (1935). J. W. Perry.

Modern fat free skin creams made with triethanolamine. I. Bell and Julius Hubbscher. *Seifen-Industrie-Zig* 62, 702-4, 728-9 (1935).—The use of triethanolamine in skin creams is discussed and 7 recipes are given. J. W. Perry.

Hair oils. Hans Schwarz *Seifen-Industrie-Zig* 62, 610-12 (1935).—The selection of ingredients and their proper proportioning are discussed. J. W. Perry.

Cosmetic colors. I. H. Stanley Redgrove. *Pharm. J.* 134, 288-9(1935).—Pigments used in cosmetics are discussed under the heads of natural earths, synthetic inorg. white, yellow, blue, green and black pigments, and carmine, the Al lake of the cochineal color. Emphasis is laid on the question of toxicity in contact with the skin. II. *Ibid.* 606-8.—Colors of natural org. origin (chlorophyll, cochineal, alkanin) are considered, then synthetic dyestuffs, with Fuchner's table of classification into harmful and harmless dyes (F in Handbuch der experimentellen Pharmakologie, Vol. I, cf. *C. A.* 14, 2031), foodstuff colors, with table of 61 dyes permitted in different countries are also discussed (cf. Hesse, *C. A.* 6, 3293). III. *Ibid.* 135, 533.—The toxicities of certain lake colors, especially those contg Ba even if "insol.," are discussed (cf. E. Klarmann, *Aromatics*, April, 1931). Suitable dyes or pigments for cream rouges, creams, lipsticks and nail enamels are recommended. Synthetic insol pigment dyes present a subject for further study in cosmetics.

S. Waldbott

Cholesterol in cosmetics. E. A. Lum. *Pharm. J.* 134, 291(1935); cf. *C. A.* 27, 5892, 28, 17731.—A tentative antiskunk formula contains almond oil 50%, anhyd lanolin 6.5, white beeswax 13.0, H₂O 26.0, borax 1.0, cholesterol 1.0, lecithin 1.5, Na benzoate 1 or nipagin 0.2%. The heated aq soln. of borax and preservative is slowly added to the mixed and melted fats while stirring until cool.

S. Waldbott

Constitution and action of drugs. F. L. Pyman. *Pharm. J.* 134, 619(1935).—The relation between chem. constitution and physiol. action was pointed out in an address on arsenicals, Bi compds and the chemotherapy of certain antiseptics, e. g., harmin derivatives (cf. *C. A.* 27, 5419; 28, 4481), plasmochin and atetrin (cf. *C. A.* 28, 8261¹, 8271¹, 37941¹, 48371¹), etc.

S. Waldbott

The British Pharmaceutical Codex, 1934; comments. Horace Finnemore. *Pharm. J.* 135, 131-2(1935).—For the prepn. of Easton's syrup, an improved procedure is suggested based on the use of formulas for soln. of ferrous phosphate and syrup of quinine and strychnine adopted in the Australian and New Zealand official formulary. For internal remedies, the unit method of prescribing, i. e., the quantities necessary for one dose, should be used. Other criticisms refer to elixirs, incompatibilities and certain special preps.

S. Waldbott

Troublesome emulsions. James Hall. *Pharm. J.* 135, 133(1935).—Improved processes are suggested for limentum terebinthinaceum, Brit. Pharm., haustus filices, emulsio petrolei cum laolini, emulsio petr. c. agar c. phenolphthalein of the National Formulary, and limentum alba, lotio calaminacea oleosa of Nat. Form. 2nd ed.

S. Waldbott

Chocolate and cacao products, their relation to pharmacy. A. Churchman. *Pharm. J.* 135, 134-5(1935).—The characters of the cacao bean and mfg. methods are described, with photographs. The uses of the shell, its theobromine content (cf. *C. A.* 12, 2633; 13, 3244; 14, 3114; 15, 1170, 16, 1995) and its high vitamin D content (*C. A.* 28, 5897¹) are referred to.

S. Waldbott

A method of ampoule filling. F. A. Hudson. *Pharm. J.* 135, 157(1935).—To avoid contamination of the filtered soln. by dust in filling ampoules contg 50 cc. or more, the flask contg. the filtered soln. is used in inverted position as the filling reservoir. Upon opening a pinchcock, the liquid runs into a corked cylinder below, graduated into 100 cc. From this, the liquid runs through a 1-ft. rubber tube and a surgical hollow needle into the ampoule. Before removing the needle, the ampoule with the needle above the liquid is raised to the level of the liquid in the cylinder; this causes the liquid in the needle to recede, and no liquid will adhere to the neck of the ampoule disturbing the sealing of it.

S. Waldbott

Structural standards for crude drugs. T. E. Wallis. *Pharm. J.* 135, 207-8(1935).—Structural standards for pharmacopoeial drugs, unground or powd., are classified and discussed. The lycopodium method (cf. *C. A.* 14, 93) permits approx. quant. examn. of powd. drugs.

S. Waldbott

Some new preparations for the hair. Frank Atkins. *Pharm. J.* 135, 531-2(1935).—The preps. and modes of uses are given for permanent waving solns., "friction lotions," setting lotions of the non-gummy and gummy types, hair fixatives for men, brillianines, fixative creams and perfume compns.

S. Waldbott

Propylene glycol extracts; stability of vegetable coloring matters. John Rae. *Pharm. J.* 135, 539(1935); cf. *C. A.* 29, 4901¹.—Exts. of 14 vegetable colors prepd. with propylene glycol were examd in 1% aq. solns. for their resistance to light during 6 months' exposure; stabilities of color in descending order were for henna 95%, curcuma 90, carmine and red pine 85, madder and logwood 70, cudbear 45, defatted cochineal 20 and saffron 10%. When 1 cc. of about N NH₄OH, NaOH or H₂SO₄ was added to the 1% soln., NH₄OH gave for carmine, red sanders and red pine 90%, Brazil wood 85, henna, rose leaves 80, litmus 65, cudbear 50, cochineal 10 and saffron 0%. With dil. H₂SO₄, only litmus (90%) and madder (70%) were quite permanent.

S. Waldbott

Bi salt [used in prepn. of cosmetics] (Fr. pat. 785,713) 19 Emulsifying agents, etc. [used in prepn. of cosmetics and pharmaceutical products] (Fr. pat. 785,678) 13

Castor-oil preparation for medicinal use. John C. Bird (to John Wyeth & Bro.) U. S. 2,021,044, Nov. 12. A medicine for internal use comprises castor oil emulsified with Al(OH)₃ gel.

Ricinoleate medicament for intestinal detoxification. Theodore H. Rider (to Wm. S. Merrell Co.) U. S. 2,019,933, Nov. 5. Mg and Ca ricinoleates are used for oral administration (suitably emulsified with mineral oil).

Antanemia product (incipiently self-digested and dehydrated and defatted whole-stomach material such as that from hog stomachs). Geo. B. Walden (to Eli Lilly and Co.). U. S. 2,020,267, Nov. 5. Various details are given for prepn. a product for treating pernicious anemia.

Quinine compounds. Hans P. Kaufmann. Brit. 433,261, Aug. 12, 1935. See Ger. 614,882 (*C. A.* 29, 8239¹).

Aliphatic diamines. Boot's Pure Drug Co. Ltd., 6 Frank L. Pyman and Hyman H. L. Levene. Brit. 433,086, Aug. 8, 1935. Diamines of formula (CH₂)_n(NRR')₂, where n is 7-13 and R and R' are alkyl groups which must not both be Et, are prepd. from compds. of formula (CH₂)_nX₂, where X is halogen, by heating with secondary amines of formula NRR'. Among examples, 1,10-bis-(diamylamino)decane is prepd. from 1,10-dibromo- or -dichloro-decane and diamylamine. The products are amebicides.

Derivative of 2-phenylquinoline-4-carboxylic acid. Hirsch Gregor Jacobson. Brit. 433,040, Aug. 2, 1935. See U. S. 2,006,020 (*C. A.* 29, 5602¹).

Cyclopentylbarbituric acids and their salts. Horace A. Shonle (to Eli Lilly & Co.) U. S. 2,019,936, Nov. 5. Various details and examples are given of the production of intermediates and of final products such as cyclopentyl-ethylbarbituric acid, m. 181-3° its Na, NH₄, methylammonium and diethylammonium salts, etc., suitable for therapeutic purposes.

Bz-Alkoxy-2-aminobenzo-thiazoles. Max Engelmann (to E. I. du Pont de Nemours & Co.). U. S. 2,019,529, Nov. 5. Cryst. compds. having more than 2 C atoms in the alkoxy group are obtained by a process (of which various examples are given, with details of procedure) involving reacting with a halogenating agent (such as Br to form the hydrobromide or sulfonyl chloride to form the hydrochloride of the product) upon the corresponding Bz-alkoxyphenylthiourea. 6-Isobutoxy-2-aminobenzo-thiazole m. about 140° and its hydrochloride m. about 171° and may be used as a local anesthetic, having less toxicity than cocaine. 6-Isomethoxy-2-aminobenzo-thiazole m. about 122° and its hydrochloride m. about 135°. 6-Isopropoxy-2-aminobenzo-thiazole m. about 135°. 4-Butoxy-2-aminobenzo-thiazole m. about 142-3° and its hydrobromide m. about 166-7°.

Substituted halo phenols. Emil Karmann and Louis W. Gates (to Lehn & Fink, Inc.). Brit. 432,955, July 29, 1935. See U. S. 1,935,911-12 (C. A. 28, 1472).

Cyclically disubstituted tetrazoles. Zoltan Földi (to the firm Chinoin Gyógyszer és Vegyszereti Termékek Gyára R. T. (Kereszty & Wolff)). U. S. 2,020,937, Nov. 12, 1935. See Ger. 611,692 (C. A. 29, 5995).

Complex salts of pyridine derivatives. Albert Rothmann. Ger. 665,526 and 566,694, July 9, 1935 (Cl. 12 p. 1,01). Water-soluble complex metal and metalloids salts of 2-amino-6-mercaptopyridine-4-carboxylic acid and 2,6-dimercaptopyridine-4-carboxylic acid are prep'd by the action of the oxide or hydroxide of the metal or metalloid on solns of the acids or their salts. The new complex salts are obtained from the resulting solns by evap'n or pptn. by an org solvent. Examples describe the prep'n of $(\text{C}_4\text{H}_5\text{O}_2\text{N}_2\text{S}_2\text{Na})_2\text{Ca}$, $\text{C}_4\text{H}_5\text{O}_2\text{N}_2\text{S}_2\text{KCl}$, $\text{C}_4\text{H}_5\text{O}_2\text{N}_2\text{S}_2\text{KAs}$, and other similar compds., the structural formulas being given in some cases, (565,526). Other mercapto- or polymercaptopyridine carboxylic acids may be used (566,694). The compds. are used in therapy.

Purified neoparsphenamine. George W. Raunz and Abraham I. Kremens (to Abbott Laboratories). U. S. 2,020,655, Nov. 12. An "improved neoparsphenamine" produced from Na formaldehydesulfoxylate and arsenamine, having a good color, low toxicity, high therapeutic efficiency and stability and which is substantially free from uncombined CH_3O , is obtained by including in the reaction mixt. a relatively small proportion of a reducing substance such as Na hyposulfite or NaHSO_3 which will convert any free CH_3O present into formaldehydesulfoxylate.

Ethereal sulfur-containing oils. Friedrich Boedecker. U. S. 2,021,530, Nov. 19. Oils such as mustard-seed oil, asafetida oil or garbe oil together with desoxycholic or apocholic acid form cryst. addn. products of odorless character and suitable for therapeutic purposes. Several examples are given.

Detoxified pollen extract. Edgar B. Carter (to Abbott Laboratories). U. S. 2,019,088, Nov. 5. A detoxified pollen ext. suitable for treatment of hay-fever is prep'd. by incubating a pollen ext. (suitably at a temp. of about 37.5° and for a time of about 2 weeks) with the addn. of about 0.1% of a 40% CH_3O soln or an equiv. amt. of methanamine or the like.

Antituberculosis extract. I. G. Farbernd. A.-G. Ger. 616,884, Aug. 7, 1935 (Cl. 30 k). Heat-killed tuberculous bacilli are boiled for 1 hr with 96% alc. The cooled ext. is filtered and the filtrate ext'd. with a readily volatile solvent such as CHCl_3 , pyridine, petr. ether, etc., and the ext. evap'd to dryness. The residue is heated for 1 hr with acetone and the insol. part, after removal of the acetone, is taken up in C_4H_6 or petr. ether and made up into a 1% soln for use as an antituberculosis ext.

Serum. Fvavoras J. Georgiou. Ger. 616,716, Aug. 3, 1935 (Cl. 30 k). A prep'n for treating malignant swellings such as cancer is obtained by pptg. serum from the blood of a highly pregnant animal by alc., sepg. and sterilizing the ppt., taking it up in a physiol. NaCl soln, and removing the last traces of alc. by evap'n. *in vacuo* at 60°. Examples are given, dog and rat serum being used.

Hormones. Soc. pour l'ind. chim. à Bâle. Ger. 616,612, Aug. 1, 1935 (Cl. 12 p. 17 10). The corpus luteum hormone is obtained in pure form by prep'g. a crude ext. of the organ with an org. solvent nonmiscible with water, and extg. this with strong mineral acid. The hormone is ppt'd. from the acid by adding water and re-ext'd. by an org. solvent nonmiscible with water. The solvent is then driven off. An example is given.

Follicle hormones. Schering-Kahlbaum A.-G. Brit. 432,851, July 26, 1935. Divided on 432,435 (C. A. 30, 250) and addn. to 432,435 and 432,474 (C. A. 30, 250). The hormones are isolated from urine or preps made therefrom, or from other starting materials, e. g.,

placenta ext. or exts. from vegetable matter, by 1st removing volatile phenols, e. g., by steam distn., dissolving the residue in a H_2O -immiscible solvent, e. g., Et_2O , extg. the soln. with alkali hydroxide soln., e. g., KOH, which takes up the hormones but not the neutral constituents, causing the hormones to react with an acylating agent, e. g., β -toluenesulfonyl chloride, isolating the acylation product, e. g., with Li_2O , and saponif. it to yield the hormones.

Purifying enzymes. Schering-Kahlbaum A.-G. Fr. 785,490, Aug. 10, 1935. Intermediate enzymes are ppt'd. from Lebedev juice or ext. or like preps. obtained from yeasts or other kinds of cells by regulating the pH value of the liquid, addn. if necessary, to an optimum value (4). The soln. is afterward purified by cataphoresis.

Bacterial solutions, endotoxins. Roderick F. Hunwick. U. S. 2,020,647, Nov. 12. See Brit. 425,216 (C. A. 29, 5601).

Cyclic esters. Wallace H. Carothers and Julian W. Hill (to E. I. du Pont de Nemours & Co.). U. S. 2,020,298, Nov. 12, Brit. 433,632, Aug. 19, 1935. Cyclic esters having rings of more than 7 atoms, suitable for use in perfumes, toilet waters, etc., are produced by depolymerizing the corresponding linear polyester; e. g., decamethylene carbonate is produced by depolymerizing polymeric decamethylene carbonate (suitably by heating in the presence of Na or Sn, etc.). Numerous examples are given.

Germicidal detergent and cosmetic preparations. Lever Brothers Co. Brit. 432,689, July 31, 1935. Addn. to 427,324 (C. A. 29, 6366). Germicidal soaps, cosmetics, etc., are made by mixing soaps or similar saponaceous substances with a Hig comp'd. of type $(\text{RHg})_2\text{R}'$, in which R is an aromatic nucleus, with or without side chains, in which the nuclear and side chain C atoms are not directly connected to any element other than C, H or Hg, and R' is a radical contg. 1 or more imido groups the N atom of which is directly connected to the RHg group. Hig comp'ds. of hydrazobenzene, guanidine, phthalimide, α -benzoylsulfonide, succinamide, pyrrole, naphthalimide, indole, isatin, carbazole, piperidine, 3-nitrophthalimide, diketopiperazine, acridone, pyrrolidine, emetine, 1,3-dimethylxanthine, barbituric acid, parabanic acid, ureic acid, theobromine, alloxan, quinonimide, allantoin and such dyes as auramine, indigo and indanthrene red violet are specified. Dyes and perfumes may be added. After mixing, the soap may be plodded, milled or stamped.

Skin protective coating composition. Omer McDaniel (to Mountain Varnish & Color Works). U. S. 2,021,131, Nov. 19. Lemenone 1, Na silicate 900, glycerol 1155, Na stearate 288 and water 1600 parts are used together.

Cosmetic composition. Albert Ebel, Sauerkohlfabrik and Max Platsch. Ger. 605,941, June 5, 1935 (Cl. 30 k. 13). A stable product for cleaning and feeding the skin is obtained by pulverizing fermented sauerkraut, removing the sap by pressing, drying, grinding and mixing with perfume, etc. The sap may be deodorized and preserved.

Shaving compositions. Fritz Feigl and Hugo Gleich. Austrian 142,762, Sept. 10, 1935 (Cl. 23 b). Solid, paste or liquid shaving compns. are improved by addn. of a secondary or tertiary phosphate of an org. base, e. g., $(\text{HOC}_2\text{H}_4)_3\text{N}$, in a proportion of 15-30% calcd. on the soap and other solids in the compns.

Hair waving. Elie Soussa. Fr. 785,878, Aug. 21, 1935. A soln. for application to the hair before permanent waving contains Na_2SO_3 35, NaHCO_3 20, Na borate 7, powd. soap 4 g. per l. of soln.

Nicotine. Soc. de participation à l'industrie cuprique. Fr. 784,837, July 25, 1935. Crude material contg. nicotine is treated with water contg. an oxide or carbonate of an alkali or alk. earth metal and then submitted to distn. with steam or a gas. The nicotine is absorbed by a dil. acid.

Nicotine removal from tobacco. Hall Tobacco Chemical Co. Fr. 784,795, July 24, 1935. Nicotine is removed or reduced by submitting tobacco to the action of ethylene oxide in the presence of moisture, or by treating the tobacco with an aq. soln. of ethylene oxide.

18—ACIDS, ALKALIES, SALTS AND OTHER HEAVY CHEMICALS

E. M. SYMINGTON

Manufacture of sulfuric acid from hydrogen sulfide. Wolfhart Seckel. *Chem. Fabrik* 1935, 416-18.—Gases contg. H_2S from coke ovens, hydrogenation processes, etc., are burned at 750-800° with excess air and moisture and without further treatment are passed at 350-450° over a V catalyst to convert SO_2 into SO_3 , and the H_2SO_4 is fractionally condensed. The yield is about 98% of theory, the acid contains 80-90% H_2SO_4 , and is pure enough for accumulator acid. No acid pumps are required, a fan draws the gases through the system, and little floor space and attention are required. About 30 kw-hrs and 13 cu m of cooling H_2O are required. About 35% of the S in crude NH_3 liquor can be recovered, the remainder at an addnl cost. *Cl C A* 29, 1592, 3783*, 4906; J. H. Moore

Leaching alunite with sulfuric acid. L. C. Pan. *Chem. Ind. (China)* 10, No. 1, 35-42 (1935).—The best strength of H_2SO_4 for leaching alunite calcined at 500° is about 15% by wt. Little advantage is gained by heating the leaching soln to 100°. The yield of alum by crystn is highest when the acidity is at a min. The size of the alum crystals formed is smallest from a soln contg 4.7% H_2SO_4 . Solns of 0.133 N and 3 N H_2SO_4 give about the same size of crystals, but the size increases as the acidity is further increased. *C. L. Tseng*

Conversion of chlorides to nitrates by means of nitric acid. R. Frankowski. *Przemysł Chem* 19, 154-6 (1935).—To dry $NaCl$, KCl and $BaCl_2$ from 1 N to 8 N HNO_3 , in proportions of 1 0.5, 1 1, 1 1.5 and 1 2, was added, the mixt evapd and yields were calcd in terms of the starting salts and of HNO_3 . For $NaCl$, the best yields on salt were obtained with 1 2 acid proportion and for the most dil acid. The most dil acid gave also the best yields with KCl and $BaCl_2$, the effect of concn being the least for $NaCl$ and the greatest for $BaCl_2$. The sepn of the products depends on temp coeffs of soly. Excess acid can be used with a second or even a third batch of the starting salt, to give better acid yield. Sepn of KNO_3 from KCl is easy. Results point to a successful com production of KNO_3 from KCl and synthetic HNO_3 . *A. C. Zachlin*

Production of hydrogen from natural gas. V. A. Karzhavin, N. P. Elektronov and B. M. Ovchinnikov. *Khimistrol* 7, 459-64 (1935); *cl C A* 26, 5399, 28, 3189*—A mixt of 1 cu m of natural gas (contg 87.4% CH_4) with 1.9 cu m. of water vapor reacted at about 1350° over porous prog treated with Ni catalyst produced 3.3 cu. m. of gas composed of CO_2 9, CO 22, H_2 64, CH_4 0.8 and N_2 4.2%. The semicon. procedure of conversion and app. are illustrated and described. *Chas. Blanc*

The rare gases. Mathias. *Refrigerating Eng* 30, 196-8 (1935).—A review of the industry and new applications are discussed in the cases of He, Ne, Ar, Kr and Xe. *A. H. Johnson*

Some properties of activated carbon. E. R. Sutcliffe. *India Rubber J.* 90, No. 17a (Intern No.) 37-8 (Oct 31, 1935).—A review and discussion, with special reference to the plant at Leigh, England, and the properties of the C-manufd there. *C. C. Davis*

Action of decolorizing earths. Edward Erdheim. *Przemysł Chem.* 19, 150-7 (1935).—Preliminary results show that fuller's earth NY and Montana Z, on extn after decolorization, act in a very different manner from that exhibited by activated charcoals. The decolorizing action of the earths is quite distinct from that of the charcoals. *A. C. Zachlin*

App. for cooling gases as in oxidation of NH_3 (U. S. pat. 2,019,533) 1. Effecting reactions [NH_3 synthesis] (Brit pat. 432,574) 13.

Hydrocyanic acid. Russell W. Mullar and Herbert P. A. Groll (to N. V. de Bataafsche Petroleum Maatschap-

py). Brit. 433,398, Aug. 14, 1935. See Fr. 774,011 (*C. A.* 29, 2316*).

Nitric acid. E. I. du Pont de Nemours & Co. Brit. 432,898, Aug. 6, 1935. Gases obtained in the demitration of residual acid from the manuf. of liquid nitric esters such as nitroglycerin are converted into HNO_3 by scrubbing in countercurrent with dil HNO_3 , in an app. resistant to the corrosive action of the gases, whereby the corrosive impurities are removed, and absorbing the treated gases in H_2O or dil HNO_3 in an absorption tower made of Cr-Fe alloy. App. is described.

Phosphoric acid. Marx in J. Udy (to Swann Research, Inc.) U. S. 2,020,976, Nov. 12. A phosphatic material such as phosphate rock, carbonaceous material such as coke and a flux such as silica are melted in a furnace under conditions to form a gas comprising P vapor together with impurities, and there is formed within the gas a dispersed phosphoric oxide-water reaction product by reaction of part of the P vapor, the reaction product is removed, and elemental P is recovered from the vapor. App. is described, including an elec furnace and elec pptn. app., etc.

Phosphoric acid from ammonium phosphate. Charles L. Levermore (to General Chemical Co.) U. S. 2,022,050, Nov. 26. NH_3 is driven off from an NH_4 phosphate such as $NH_4H_2PO_4$ at a temp. above about 300° while passing steam in contact with the material.

Sulfuric acid. Cyril B. Clark (to American Cyanamid Co.) U. S. 2,019,893, Nov. 5. An acid sludge, such as that produced by the H_2SO_4 treatment of petroleum oils, is subjected to thermal decompn at a temp at which SO_2 comds of the sludge are reduced to SO_3 , the SO_2 is removed from the zone of decompn. together with water vapor and gaseous substances contg. H, the gas stream is subjected to dehydration, substances contg. H, capable of reacting with O to form water, are removed to an extent such that the remaining H content, after adjustment of the gas stream to the O content necessary for catalytically oxidizing the SO_2 , is not greater than 3 mg. of H per cu. ft. of gas, and the gas stream is heated to a temp. at which it can be catalytically oxidized and is then catalytically converted to SO_3 . An arrangement of app. is described.

Dehydrating caustic alkalis. Arnold Hanchett (to Solvay Process Co.) U. S. 2,022,037, Nov. 26. An aq soln of NaOH or the like in regulated quantity is brought into contact with a quantity of substantially anhyd caustic of sufficient mass and temp. to vaporize the water from the liquid. App. is described.

Purifying caustic soda solutions. Pennsylvania Salt Manufacturing Co. Fr. 785,399, Aug. 8, 1935. NaCl is removed from concd solns. of NaOH by heating the latter to 70-80°, adding Na $_2$ SO $_4$ in amt depending on the desired degree of elimination of NaCl, mixing until the formation of an insol salt contg. NaCl and Na $_2$ SO $_4$ is complete, cooling to about 30° and agitating slowly until the state of equil. of the supersatd soln. is completely destroyed. The Na $_2$ SO $_4$ is added in an anhyd. finely divided state and in excess. The Na $_2$ SO $_4$ is recovered by adding sufficient water to dissolve the NaCl and NaOH.

Alkali metal phosphates. Louis Preisman (to General Chemical Co.) U. S. 2,021,699, Nov. 19. A mixt. of phosphatic material and an alkali metal sulfate is furnaceed in the presence of a reducing agent and from the furnaceed product is obtained an alkali metal phosphate and a mother liquor contg. alkali metal comds including alkali metal sulfate, and the mother liquor is treated with a phosphoric acid soln contg. sol. Ca phosphate for reaction with the sulfate.

Alkali metal tetraphosphates. Augustus H. Fiske and Charles S. Bryan (to Rumford Chemical Works). U. S. 2,019,665, Nov. 5. A tetraphosphate is formed by heating an alkali metal metaphosphate such as Na $_2$ PO $_3$ with an alkali such as NaOH (at a temp. of 150° or higher, preferably to a temp. of redness) and the products may be

used as *detergents* in the laundry, dyeing, or leather industries, for *softening water*, etc. U. S. 2,019,666 relates to the production of tetraphosphates by reaction of an alkali metal acid pyrophosphate such as $\text{Na}_2\text{H}_2\text{P}_2\text{O}_7$ with an alkali such as NaOH.

Pure aluminum-alkali double fluorides. Friedrich W. Hülcher and Veit Schwemmer (to Saline Ludwigshalle). U. S. 2,021,601, Nov. 19. Raw aluminous material such as bauxite contaminated with Fe and Si is treated with HF to dissolve Al, Fe and Si, and an alkali salt such as NaCl is added to the soln in only sufficient amount to ppt fluosilicic acid as alkali metal fluosilicate without use of a reducing agent, the pptd fluosilicate is sepd and an alkali metal salt such as NaCl is added to form a sol Fe salt and an insol Al double fluoride which is pptd and sepd.

Beryllium compounds. Carlo Adamoli. Ger. 616,671, Aug. 3, 1935 (Cl. 12m. 4). Addn to 541,544 (C. A. 27, 570). The method of 541,544, for obtaining Be compds. by treating finely ground Be minerals with CO_2 and water under high temp and normal or elevated pressure in the presence or absence of acid or basic catalysts, is modified by pre-treating the ground mineral with a small amt of alkali carbonate and alk earth oxide at 700-750°, to disintegrate the mineral. Thus, Be ore contg 0.6% BeO is ground and heated with Na_2CO_3 and CaO. The product is then heated to 850-900° with water and CO_2 to give basic BeCO_3 .

Stabilizing hypochlorites. Electrochlore (Soc. anon.) Fr. 785,562, Aug. 13, 1935. Solns of alkali or alk earth hypochlorites are kept out of contact with the air and any O in soln is removed.

Salts from polyhalite. Arthur Lambert (to Rita Vinay). U. S. 2,020,322, Nov. 12. Polyhalite is treated with an acid, such as hot 10% H_2SO_4 , the filtered soln. is neutralized with an excess of Na_2CO_3 , the resulting mixt. is filtered and the filtrate is treated with NH_3 and CO_2 to ppt NaHCO_3 , the soln is filtered and is further treated with an acid phosphate, if desired, and salts formed are crystd. Various modifications of procedure are described.

Magnesium products from brine. Wm. H. Farnsworth and Montel Montgomery (to Marine Chemicals Co., Ltd.). U. S. 2,021,501, Nov. 19. A brine contg convertible Mg salts such as sea water is treated with Ca(OH)₂, particles carrying a film of Mg(OH)_2 , formed separately from the main body of brine to be treated and which serve to effect pptn of Mg(OH)_2 .

Sulfates. Metallgesellschaft A-G (Conway Freiherr von Gurswald and Erich Stahl, inventors). Ger. 610,925, Sept. 18, 1935 (Cl. 12m. 7). Addns to 571,494 (C. A. 27, 3041). See U. S. 1,992,681 (C. A. 29, 2671). According to Ger. 612,113, Sept. 18, 1935, the process of Ger. 610,925 is improved when the gases passed into the mixt. in a finely divided state are passed at such a rate and in such a state of subdivision that the mixt. is caused to foam. Methods of procedure are indicated, and examples are given. According to Ger. 618,890, Sept. 18, 1935, the process of Ger. 610,925 is applied to the manuf. of $(\text{NH}_4)_2\text{SO}_4$ from the products, mainly NH_4HSO_4 , obtained by treating SO_2 or gases contg SO_2 in the presence of water and preferably of air, with NH_3 (or gases contg NH_3) in the proportion of 1 mol of NH_3 to 0.5-1 mol of SO_2 . The addnl NH_3 required for the manuf. of $(\text{NH}_4)_2\text{SO}_4$ may be added before or during the oxidation Sp. processes are described.

Packaging acid sulfates such as bisulfates. Leo Löwenstein. U. S. 2,020,072, Nov. 5. An outer container is used of material such as metal or impregnated paper contg alkali metal carbonate compd. such as a bicarbonate capable of reacting with the sulfate, together with an inner container which may be formed of paper and is completely surrounded by the bicarbonate or the like.

Reaction of chlorine with metal bearing solids such as in making aluminum chloride. Sidney G. Osborne and Jasper M. Rowland (to Hooker Electrochemical Co.). U. S. 2,020,431, Nov. 12. Relatively coarsely comminuted ungraded solid material such as aluminous material for making AlCl_3 is introduced into a stream of gas

contg. Cl flowing upwardly in a reaction chamber (of a described app.) of gradually increasing and abruptly decreasing cross-sectional area, and the rate of supply of solids and gases is adjusted to cause a progressive reduction in velocity and to maintain at substantially the point of greatest cross-section of the reaction chamber a zone in which the velocity is sufficient to support the solids only after they have been reduced in size to relatively fine particles consisting principally of materials unreactable with the Cl.

Alumina. Charles B. Willmore and Conrad C. Callis (to Aluminum Co. of America). U. S. 2,019,553, Nov. 5. Aluminous material such as calcined bauxite is treated with HNO_3 in the presence of a F compd. such as CaF_2 , and the resulting Al nitrate is decomposed by heat to form alumina.

Alumina. Ralph B. Derr (to Aluminum Co. of America). U. S. 2,019,554, Nov. 5. Aluminous material such as bauxite tailings contg. Fe is digested with a soln. contg. HNO_3 and the resulting Al nitrate liquor is concd. and increased in basicity (suitably by evapn. of HNO_3) and is cooled to crystallize Al nitrate which may be heated to form alumina. Mother liquor from the Al nitrate crystn. is added to liquor from the digestion stage.

Alumina. Wilhelm Fulda, Erich Wiedbrauck and Rudolf R. B. Wittig (to Vereinigte Aluminium-Werke A-G and Th. Goldschmidt A-G). U. S. 2,021,548, Nov. 19. Clay or the like is disintegrated by calcination and treatment with an aq. soln. of SO_2 , thus forming an aq. soln. contg. Al sulfate; alumina is pptd. from the soln. by heating, the pptd. alumina is calcined, the calcined material is dissolved in alkali lye such as with NaOH and a pure alumina is pptd. from the resulting soln. by heating.

Alumina. The Electric Smelting & Aluminum Co. Ger. 619,129, Sept. 25, 1935 (Cl. 12m. 5). See Can. 324,768 (C. A. 26, 5390).

Alumina. I. G. Farben und A-G. Fr. 785,459, Aug. 10, 1935. Al_2O_3 which is easily filtered is made by causing NH_4HCO_3 to act on solid Al salts, sol. in water, e. g., $\text{Al(NO}_3)_3 \cdot 9\text{H}_2\text{O}$ or $\text{AlCl}_3 \cdot 6\text{H}_2\text{O}$ in the presence of a min. amt. of water.

Alums. Svend S. Svendsen (to Clay Reduction Co.). U. S. 2,022,012, Nov. 26. A material such as kaolin or bauxite contg. an alum-forming trivalent metal, silica, and a basic material capable of yielding a univalent sulfate is heated with NH_4F in the absence of water in the liquid state to form volatile NH_3 -Si-F compds. and with reactive sulfates such as $(\text{NH}_4)_2\text{SO}_4$ to produce sulfates of the trivalent and univalent bases; the volatile NH_3 -Si-F compds. are volatilized, and the alum produced is extd. from the residue. An arrangement of app. is described, and several examples are given.

Removing iron from aluminum salt solutions. J. R. Geigy A-G. Ger. 619,018, Sept. 20, 1935 (Cl. 12m. 6). Addn to 570,376 (C. A. 27, 2540). Acidified solns. of $\text{Al}_2(\text{SO}_4)_3$ contg. Fe are treated at an elevated temp. with the Ca or Ba salt of β naphthalenesulfonic acid during or after the reduction of the Fe to the ferrous form. The soln. is then cooled and filtered.

Ammonium chloride. Société d'études pour la fabrication et l'emploi des engrais chimiques. Brit. 432,770, Aug. 1, 1935. This corresponds to Fr. 779,317 (C. A. 29, 5608).

Calcium carbide containing calcium nitride. Soc. anon. pour l'exploitation des Brevets Jullien. Ger. 619,074, Sept. 21, 1935 (Cl. 12m. 30). See Fr. 750,039 (C. A. 28, 5877).

Calcium cyanamide. Bayerische Stickstoff-Werke A-G. Brit. 433,254, Aug. 12, 1935. This corresponds to Fr. 782,739 (C. A. 29, 70274).

Calcium cyanamide and phosphorus. Nikodem Caro and Albert R. Frank (Karl Briegleb, Ludwig Gscheidmeyer, Franz J. Kaess and Karl Zieke, inventors). Ger. 616,958, Aug. 30, 1935 (Cl. 12m. 9). Addn to 609,730 (C. A. 29, 5230). CaCN_2 and P are produced simultaneously by reducing $\text{Ca}_3(\text{PO}_4)_2$ with SiO₂-free carboniferous material such as peat or anthracite.

Lime from limestone. Wm. H. Knox, Jr. (to Victor Chemical Works). U. S. 2,021,663, Nov. 19. Limestone contg. about 20-300 parts of F per million parts of CaO is heated to drive off substantially all CO₂, and the heating is then continued at 1000-1500° for 1-12 hrs (the lower the temp. the longer the time) so that a lime is produced having a F content below 5 parts per million.

Hydrating lime. Carlos M. Bird. U. S. 2,020,098, Nov. 5. An app. is described in which milk of lime under pressure is added to unslaked lime at a plurality of hydration stages, in each of which the pressure is controlled, milk of lime from the same source being supplied for condensation of vapors resulting from the hydration, and milk of lime in excess of that required for hydration and condensation being returned to the source of supply.

Dicalcium phosphate and fertilizers containing it. Robert Suchy and Emil Reubke (to I. G. Farbenindustrie A.-G.). U. S. 2,021,527, Nov. 19. Raw tri-Ca phosphate is dissolved by treatment with a soln. contg. mono-Ca phosphate and free H₂PO₄ in such proportions that the resulting soln. still contains a substantial excess of H₂PO₄ over the ratio prevailing in mono-Ca phosphate, the resulting soln. is heated to the b. p. to ppt. di-Ca phosphate, the ppt. is sep'd from the soln. without substantial cooling, and there is added to the soln. the amount of H₂PO₄ required for converting a fresh batch of raw phosphate into di-Ca phosphate.

Hydrated ferric chloride. Edward T. Ladd (to Isco Chemical Co.). U. S. 2,021,791, Nov. 19. Water and Cl are introduced into a container contg. Fe, in such proportion as to produce a soln. contg. about 4.9 mols of water per mol of FeCl₃, and the product is withdrawn from the container. App. is described.

Ferroso-ferric oxide. Joseph W. Ayers. Brit. 433,333, Aug. 13, 1935. Black oxide of Fe is obtained from pptd. ferrous compds. by oxidation with air or other O-contg. gas at elevated temps., e. g., 220-300° T., and at pressures above about 40 lb. and up to, say, 100 lb. per sq. in. The ppt. may be obtained by treating FeSO₄ or FeCl₃ with an alkali carbonate or hydroxide, preferably in excess and pptn. may be at 125-200° T. An autoclave for the pptn. and oxidation is described.

Lead oxide. Paul Kemp and Emanuel Feuer. U. S. 2,019,530, Nov. 5. See Brit. 421,297 (C. A. 29, 3292²⁴).

Magnesium hydroxide. I. G. Farbenindustrie A.-G. Brit. 433,233, Aug. 12, 1935. See Fr. 780,141 (C. A. 29, 6002²⁹).

Removing soluble salts from magnesium hydroxide. Wm. H. Farnsworth (to Marne Chemicals Co., Ltd.). U. S. 2,019,488, Nov. 5. Filamentary floccs are formed from a hydrous slurry of Mg(OH)₂ (suitably by extrusion through small apertures) and the floccs are caused to be immersed in a body of wash water by which sol. salts are extd. without substantial change in the phys. form of the floccs and without substantial diffusion of the Mg(OH)₂ in the wash water; the floccs are then caused to merge into a substantially undist. mass. An arrangement of app. is described.

Magnesium sulfate solution. Kali-Forschungs-Anstalt G. m. b. H. (Benno Wandrowsky, inventor). Ger. 616,543, July 31, 1935 (Cl. 12m. 3). Highly concd. MgSO₄ solns. are obtained by treating the 33% solns. made by shaking kieserite with water, with a hydrated sulfate, e. g., kieserite contg. epsom salt, at 90-110°. An example is given.

Platinum oxides. Paul Lafitte and Pierre Grandadam. Fr. 785,082, Aug. 1, 1935. Pt is oxidized to PtO and PtO₂ by heating it in O to 100-560°, under pressure of 8-200 atm.

Cyclic manufacture of potassium carbonate from potassium chloride. Friedrich Rühsberg (to Kali-Chemie, A.-G.). U. S. 2,020,801, Nov. 12. In the cyclic manuf. of K₂CO₃ from KCl by the Engel-Precht method, the Mg carbonate trihydrate spent in the manuf. of Engel salt in the cycle is compensated by introduction of corresponding amounts of Engel salt into the cyclic process, which is decompd. together with the Engel salt produced in the

cycle, the regenerated MgCO₃ being introduced into the cycle.

Sodium azide. Westfälisch-Anhaltische Sprengstoff-A.-G. chem. Lab. Ger. 619,017, Sept. 20, 1935 (Cl. 12a. 30). A fine suspension of NaNH₂ in an inert liquid, e. g., a hydrocarbon oil, is treated with N₂O at about 150-180°.

Acid sodium pyrophosphate. Campbell R. McCullough (to Swann Research, Inc.). U. S. 2,021,012, Nov. 12. Mono-Na orthophosphate is heated to a temp. above 284° and at which substantially complete conversion to pyrophosphate will take place and in an atm. comprising water vapor of such concn. that the partial pressure of such water vapor is greater than atm. pressure and greater than that expressed by the relation $\log p = \frac{-5263}{T} +$

12.32, where p is the partial pressure of the water vapor in mm of Hg and T is the temp. of heating expressed in abs. degrees C. App. is described.

Zinc and sodium sulfides. Thomas A. Mitchell and Royal L. Sessions (to Hughes-Mitchell Processes Inc.). U. S. 2,020,323, Nov. 12. A black ash formed by heating BaSO₄ with C and contg. BaS is leached with a soln. of Na₂SO₄; pptd. BaSO₄ is filtered out, and the filtered soln. is caused to react with ZnSO₄ to form pptd. ZnS and leave Na₂SO₄ in soln. The leached black ash is reheated with more C to produce more Ba sulfide for the process, and the black ash is leached with the Na₂SO₄ obtained from the pptn. of the ZnS.

Zinc oxide. Carl H. Bunce, Clarence J. Lentz and Geo. T. Mahler (to New Jersey Zinc Co.). U. S. 2,021,284, Nov. 19. Various details of app. and operation are described for making ZnO by introducing a blast of air into a stream of Zn vapor and gaseous products of combustion issuing into an oxidizing chamber from the upper end portion of an elongated porous column consisting of an agglomerated charge of mixed zinciferous material and carbonaceous reducing agent, the base of the column being in communication with the atm. and the sides of the column being enclosed. Cf. C. A. 29, 3790⁹.

Zinc sulfide. Arne J. Myhren and Byron Marquis (to New Jersey Zinc Co.). U. S. 2,020,325, Nov. 12. See Can. 353,104 (C. A. 29, 8367⁹).

Zinc sulfide. American Zinc, Lead & Smelting Co. Fr. 785,594, Aug. 13, 1935. Basic ZnS is made by treating a soln. of ZnSO₄ with an alkali thiosulfate contg. Na₂S.

Purifying hydrogen peroxide. E. I. du Pont de Nemours & Co. Brit. 432,915, Aug. 6, 1935. Aq. solns. of H₂O₂ are purified by pptg. Sn(OH)₂, therein after adjusting the pH of the soln. so that a pH of over 1.4 is obtained during pptn., and removing the ppt. The pptn. may be effected by adding a sol. Sn compd., e. g., SnCl₄ or Na stannate. If the pptn. of Sn(OH)₂ tends to be incomplete, a small amt. of a sol. substance that furnishes multivalent pos. ions may be added to promote pptn. of Al compds., e. g., AlCl₃, potash alum, or Ba compd. may be thus used. Cf. C. A. 29, 8241⁹.

Stabilizing hydrogen peroxide solutions. E. I. du Pont de Nemours & Co., Harvey N. Gilbert and Joseph S. Reichert. Brit. 433,470, Aug. 15, 1935. H₂O₂ solns. having a pH not greater than 0.5 and preferably below 0.5 are stabilized by the addn. of a small amt. of a preformed compd. or compds. obtained by combining Sn with H₂PO₄. A suitable compd. may be prep'd by heating hydrated SnCl₄ with 85% H₂PO₄ for about 1 hr. at 300°. Cf. C. A. 29, 5230⁹.

Apparatus for distilling hydrogen peroxide from solutions of persulfate. Gesellschaft zur Verwertung Chemisch-Technischer Verfahren. Fr. 785,876, Aug. 21, 1935.

Removing acid from hydrogen peroxide solutions. Joseph S. Reichert (to E. I. du Pont de Nemours & Co.). U. S. 2,021,354, Nov. 19. A H₂O₂ of pH less than 1.8 and contg. H₂SO₄ is treated with Ba(OH)₂ to reduce the acidity, but not to a pH materially greater than 1.8, pptd. BaSO₄ is sep'd., alkali such as NH₄OH is added to bring the pH to 2.2-3.5, and Sn(OH)₂ is pptd. in the soln. and removed with assoc. catalytic impurities.

Sulfur dioxide. Metallgesellschaft A.-G. Brit. 432,-

714, July 25, 1935 SO_2 is obtained from refuse H_2SO_4 , such as obtained from the refining of mineral oil by introducing it together with carbonaceous fuels and air into a rotary furnace where the fuel and the C content of the refuse acid are eliminated by combustion App is described

Sulfur dioxide Christian J Hansen Ger 616,824, Aug 6, 1935 (Cl 12/ 21) SO_2 is obtained from gases such as foundry waste gases by washing the gases with a thiocyanate soln. The SO_2 is then driven from the thiocyanate soln by heating under ordinary or reduced pressure. Preferably NH_4CNS soln is used

Sulfur dioxide recovery from mixed gases Frederick E Lee, Robert Lepsoe and Francis H. Chapman (to Consolidated Mining and Smelting Co. of Canada, Ltd.) U S 2,021,555, Nov 19 For the recovery of SO_2 and production of cryst. Al sulfate, the SO_2 in a gas is combined with NH_3 monosulfite, in one or more absorption stages (the monosulfite soln being obtained from the reaction of NH_3 with NH_4 bisulfite soln) and solns resulting are decompd. with H_2SO_4 to liberate a pure SO_2 . Various details of a cyclic process are described.

Sulfur trioxide from acid sludge. Wm C Mast (to Chemical Construction Corp.) U S 2,021,372, Nov 19 Sludge such as that from the use of H_2SO_4 for purifying petroleum fractions is subjected to thermal decompn with the production of a gas contg SO_2 , water and hydrocarbons, water and condensable hydrocarbons are condensed out, sufficient air is introduced for combustion of the hydrocarbons and they are burned in a furnace with sufficient addnl. fuel such as oil to maintain ignition temp. The gases entering the furnace are caused to pass in heat-exchange relation to, but not in direct contact with, the combustion gases, the combustion gases are treated to condense water vapor and the purifier gases are converted in a H_2SO_4 converter App is described

Hydrogen N V de Bataafsche Petroleum Maatschappij Ger 616,976, Aug 9, 1935 (Cl 12/ 101) H or gases contg H are obtained by heating CH_4 or gases contg CH_4 to temps above 800° in the presence of catalysts comprising compds of oxides of metals of the Ie group with acid forming metal oxides of the 4th, 5th and 6th groups, of m p over 800° . Examples of the catalysts are titanates, vanadates and tungstates of Ni, Fe and Co

Gases containing hydrogen International Hydrogenation Patents Co Ltd Fr 785,617, Aug 14, 1935 Gases which have been used for the destructive hydrogenation of carbonaceous materials are preliminarily purified and washed at a low temp by means of liquefied hydrocarbons which are gaseous at ordinary temp. The hydrocarbons introduced into the gases by the operation of washing are removed by washing the gases with oils in which the hydrocarbons are readily sol

Purifying hydrogen Lee S Twomey U S 2,022,165, Nov 26 H is liquefied and asocd impurities such as those from water gas are frozen, the liquefied H is collected in a pool from which solid particles settle as sediment, and purified H is evapd from the upper part of the pool App is described

Krypton and xenon L'air liquide (Soc. anon pour l'etude et l'exploitation des procedes Georges Claude) Brit 432,644, July 31, 1935 Kr and Xe are obtained from atm. air by rectifying air cooled to near its liquefaction point by washing liquid in amt. sufficient to condense practically all the Kr and Xe, but less than sufficient to condense the max. amt. of O, the washing liquid may be about 10% of the air treated App is described Cf C A. 29, 3792

Lithium recovery from its ores Walter Rosett and Francis R. Buchowsky U S 2,020,954, Nov 12 A comminuted Li ore such as lepidolite is intimately mixed with a Ca-contg. material such as CaCO_3 which yields CaO , at least in part, on roasting, the mixt. is roasted

at $800\text{--}1000^\circ$ until clinkered, the coarse clinker is reduced to a suitable size for leaching, leached with hot water until free of alkali salts, Ca is pptd. as a carbonate, the liquor is filtered from the ppt. and is treated with an acid such as HCl , H_2SO_4 or HNO_3 to form the desired salt of Li

Sulfur Metallgesellschaft A-G Fr. 784,942, July 29, 1935 SO_2 is withdrawn from gases contg. a small amt. thereof by a mixt. of org. bases, such as xylidine, with water, in the presence of substances capable of decomposing the difficultly sol. sulfates of the org. bases formed as side reactions. The SO_2 is driven off again by heating, caused to react at $800\text{--}1200^\circ$ with a carbonaceous reducing agent, submitted to a complementary treatment at $400\text{--}700^\circ$ by catalysts to destroy attached S compds, and the S is pptd. by a high-tension electrostatic field.

Removing oxygen from gas mixtures Arthur B Ray (to Carbide and Carbon Chemicals Corp.) U S 2,019,632, Nov. 5 For removing O from large volumes of gas mixts. contg. not more than about 4% of O, the gas mixt. is brought into contact with highly reactive carbon heated to about 600° for a time only sufficient to combine substantially all O into compds. other than CO

Rotary furnace for producing carbon by catalytic decomposition of carbon monoxide. Georg Gros and Theodor W. Pfirrmann Ger 619,137, Sept. 23, 1935 (Cl 23f. 14) Addn. to 565,053 (C. A. 27, 1110)

Carbon black Edmund Billings and Harold H. Offutt (to Godfrey L. Cabot, Inc.) U S reissue 19,750, Nov 12 A reissue of original pat. 1,957,314 (C. A. 28, 4190*)

Active carbon Franz Krczil Austrian 142,780, Sept. 10, 1935 (Cl 85c). In the manuf. of active C by carbonizing crude org. materials contg. water, e. g., peat or nutshells, and activating the carbon by means of gases, use is made of a system comprising a no. of activating vessels, the gases contg. water vapor evolved from the first vessel of the series being passed through the other vessel or vessels without intermediate condensation

Active charcoal Franz Krczil Fr. 785,427, Aug 9, 1935 Wood, sawdust, lignin or peat is impregnated with an activating agent such as a soln. of ZnCl_2 or H_3PO_4 , and is submitted in the presence of a carbonizing substance such as H_2SO_4 to a temp. above 100° until a moldable mass is obtained. The mass is molded under pressure, and heated if necessary, dried and baked at activation temp., if desired in the presence of activating gases

Adsorbents Moric Pickl Austrian 142,753, Sept. 10, 1935 (Cl 12d). Raschig rings made from compressed hygroscopic salts are used as adsorbents for drying gases. Raschig rings of compressed silica gel are used for drying gases or for recovering volatile solvents

Porous sound absorbing material Dorne N. Halstead U S 2,021,350, Nov 19 Porous articles such as sound-absorbing pads contain a binder such as starch, bitumen or cement and aggregations of felted fibers which are waterproofed and have voids between them. Various details of manuf. are described

Catalytic material Paul S. Greer (to Carbide and Carbon Chemicals Corp.) U S 2,020,411, Nov. 12 For producing a catalyst comprising a metal such as Cu or Ni supported on inert carrier material such as siliceous material, the carrier is immersed in a hot soln. of a sol. metal salt such as $\text{Cu}(\text{NO}_3)_2$, cooled to a point of incipient crysln, then drained and dried, roasted with a blast of preheated air to convert the salt material to oxide and the material may then be subjected to reduction to complete the formation of the desired catalyst

Catalytic gas reactions Studien- und Verwertungs-Ges. m. b. H. Fr. 784,885, July 27, 1935 The catalytic mass is divided into thin layers of uniform thickness and the reaction takes place in spaces formed by the exterior walls of chambers contg. a circulating liquid used to control the temp.

19—GLASS, CLAY PRODUCTS, REFRACTORIES AND ENAMELED METALS

C. K. BARTON AND C. H. ASBEE

Fundamental research in glass Bernard P. Dudding. *Ceram. Ind.* 24, 342 (1935).

The inaugural lecture of the course on the physical chemistry of glass at the University of Liege P. Gilard. *Verre silicaté* vol. 6, 414-19 (1935).—A discussion of the value of phys. chemistry in glass making. H. S. W.

The kinetics of the photochemical change of glasses through ultraviolet radiation and their regeneration by heat A. Klemm and E. Berger. *Glastech. Ber.* 13, 349-68 (1935).—The solarization of glasses and regeneration by heat appear to be reversible processes which follow the same law. The change in transmission on solarization with the logarithm of time is approx. proportional to the 4th power of the abs. temp. It is also proportional to the difference of the initial and final transmissions and depends also on the wave length. The logarithm of the time necessary to reach the final value likewise depends on the wave length and is proportional to the 4th power of the abs. temp., decreasing rapidly with increasing temp. Thermoluminescence is not observed in Ce-contg. glasses and is therefore not essential to the regeneration processes. Thirty-one references. J. I. Hyde.

Chemical properties of glass Geo. W. Moore. *Ceram. Ind.* 19, 293 (1935).

The use of cadmium sulfide and selenium in making ruby glass Wm. J. Mathews. *Ceram. Ind.* 24, 334, 336, 342 (1935).

Combination furnace for flat glass Thomas B. Hart. *Ceram. Ind.* 24, 340 (1935).

Colored fire-polished opaque glass Rudolf Hehlbaum. *Spektrum* 67, 731-2, 747-9 (1934).—The polished surface of the glass is a natural polish which is assumed as the glass solidifies. This surface is harder and more resistant to mech. and chem. action than glass polished mechanically. The density of the surface is such that moisture will not penetrate. Fire-polished opaque glass was found quite resistant to the action of acids, alkalis, etc. Other properties of this glass are high resistance to pressure, good adherence to mortars and ease of production. Many uses and applications are suggested. The av. compn of this glass is given as SiO_2 72, CaO 3, Al_2O_3 5, NaO 15 and CaF and the remainder 2%. Manuf. and production of this glass are described. C. B. Jenni.

A study of sagger clays and sagger bodies Raymond A. Hendl. *J. Research Natl. Bur. Standards* 15, 235-70 (1935) (Research Paper No. 827). cf. C. A. 28, 2781.—*Filter-press clays and 22 conc. bodies have been tested for thermal and mech. properties. Any sagger body having a total linear expansion from room temp. to 250° of 0.15% or greater cannot be expected to have a high resistance to thermal shock. The life of the sagger is more sensitive to changes in thermal expansion than to changes in extensibility or strength. Great increases in modulus of elasticity may accompany changes in gross sizes from coarse to fine, or a higher temp. of heating, with but little change in porosity. Porous grog, or loosely bonded grog, imparts greater resistance to thermal shock than dense grog. Plastic deformation at 1000° is less in fine-grogged bodies and decreases with increase of heating temp. Adding MgO either as talc or as magnesite leads to increased sagger life, but the amt. must be limited.* P. S. Roller.

Carbon brick. M. A. Uralov and A. S. Berezhnov. *Ukrain. Nauch.-Issled. Inst. Ozerapovne Khimichesk. Uprav. No. 31*, 76 pp (1934); *Referativnyi Sbornik* No. 1372 (1935).—Details of production are given. The typical compn. is: coke 80, tar 15.7, anthracene oil 3.6 and bitumen 1.7%. The brick are fired in special furnaces or in saggers in ordinary furnaces with overhead flame to 1100° and in some cases to 1430°. Specifications of carbon brick are given. M. V. Kondodov.

Production of bottom brick for Ajax electric furnaces. *Referativnyi Sbornik* No. 1098 (1934).—Ural font contg. SiO_2

97.45, Al_2O_3 0.90, FeO 1.27, MgO , CaO , TiO_2 traces and loss on ignition 0.04% was used for refractories for Ajax furnaces. They withstood 2000 brass and red brass melts. Details of production are given. M. V. K.

Production of dynamite brick from bauxite N. P. Kuchel. *Tekhn. Zh.* 7099, Ser. 70, 4 pp., *Referativnyi Sbornik* No. 1224 (1935).—Tikhvin bauxites contg. hydromillite and diaspore were used in the production of dynamite brick. The brick were made from raw and calcined bauxite, and fired to 1335° for 3 hrs. They did not shrink on firing, had a 10% water absorption, and a resistance to pressure of 630 kg./sq. cm. Their resistance to sudden temp. changes was much greater than that of grog and silica brick. These brick were tested as refractories for Krupp furnaces and contained 30% corundum after use, the rest being grog (kaolin) and bonding clay. The abrasion loss was small. The softening under load began at 1530°; at 1690° the brick contracted 4%; the refractoriness was 1820°. M. V. Kondodov.

Destruction of grog brick by carbon monoxide P. P. Dudnikov. *Novyi Izhivsk* No. 26, 11 (1934); *Referativnyi Sbornik* No. 612 (1934).—It was found that (1) Fe_2O_3 in the clay changes into oxide when fired. (2) Iron oxide acts as a catalyst during the reaction $2CO \rightleftharpoons CO_2 + C$ and promotes the course of reaction to the right side. Fe_2O_3 is reduced to FeO . The pptd. C deposits in the pores of the brick and destroys them. The iron spots show the beginning of the destruction. (3) The oxidation of CO to CO_2 with the pptn. of C occurs at 450° to 500°. At higher temp. the equil. moves to the left side of the equation and C does not ppt. (4) With a definite iron content and degree of multilayering, the vol. porosity becomes an important factor in the stability of the products. (5) An addn. of small amt. of $CuSO_4$ to the mix increases the resistance of grog brick to the effects of CO . It is recommended therefore: (a) to reduce the iron content of the brick to 1 or 1.5%. (b) that the remaining iron be uniformly distributed in the brick; (c) porosity should be not over 18%; (d) the brick should be fired between 1300° and 1350° in a reducing atm.; the FeO formed increases the d. of the body and promotes the formation of mullite. A "protective liver" is thus formed which increases the chem. resistance of the brick. M. V. Kondodov.

Optical instruments in the study and control of ceramics Everett W. Melson. *Ceram. Ind.* 24, 263-2, 264 (1935).

Special ceramic bodies Marcel Leungue. *Verre silicaté* vol. 6, 337-9, 372-4, 383-6 (1935).—Properties and uses of such refractories as Al_2O_3 , corundum, spinel, Be , ZrO_2 , MeO , ThO_2 and $ZrSiO_4$ are given. H. S. W.

Use of syenite in ceramic bodies C. J. Koenig. *Ceram. Ind.* 24, 338-9 (1935).—Bibliography.

Causes of reddish and other discolorations in ceramic bodies, which can be removed by a second firing Günter Hammer and Lotte Schulz. *Fer. dest. keram. Ges.* 16, 70-3 (1935).—Addnl. evidence is presented in support of the chlorination theory. Cl impregnates the body and does not combine with the body material. H. G. S.

Drying problems of the ceramic industry. John L. Carruthers. *Trans. Am. Soc. Mech. Engrs.* 57, 489-92 (1935).

Red and yellow colors in ceramics. I. Red colors. H. Kohl. *Fer. dest. keram. Ges.* 16, 103-9 (1935).—The Ostwald standards are used in a study of ceramic colors. These standards are compared, the Pt-Bk photometer is used. All ceramic reds were remarkable because of their high content of black and their low content of full color, which seldom exceeded 50% even with selenium red. Copper reds, pinks, chrome-alumina pinks, reds contg. neodmium phosphate, high-fire porcelain pinks, uranium reds and enamel colors, iron reds, purple, coral reds and cadmium-selenium reds were analyzed. Selen-

ium reds were found to be more resistant to acids than coral reds. Iron reds showed a moderate resistance. Ordinary purples were found to be good. Special acidproof purples showed complete resistance. H. G. Schurecht

Ceramics in the telephone. A. G. Johnson and L. I. Shaw. *Ind Eng Chem* 27, 1326-32 (1935) G. G.

Teeth from ceramic material. R. Riecke and W. Bilke. *Ber. deut. keram. Ges.* 16, 91-104 (1935) —Bodies used for false teeth are incorrectly called porcelain, they are composed of mixts of feldspar and quartz. The relations between compns and phys properties were studied. In general, in pure feldspar-quartz frits the thermal expansion increases with an increase in feldspar contents with a min at 40% quartz. Substitution of quartz sand for gang quartz resulted in a slight increase in thermal expansion, probably because of the lower soly. of the sand. Addns. of 5% uncalcined kaolin increased the expansion slightly. Kaolin fritted with the body reduced the expansion in proportion to the amt added. Adding unfritted feldspar to the fritted body produced no effect on expansion. Rapidly cooled bodies showed marked stresses as compared with slowly cooled bodies, the crit. temp. being about 700°. Increasing the quartz content and substituting sand for gang quartz reduced the transparency in the pure feldspar-quartz frits. The addn. of kaolin and of unfritted components produced a similar effect. Mech strength was max with about 40% quartz in feldspar-quartz mixts. The strength was reduced by adding sand instead of quartz, unfritted kaolin or feldspar. Increased strength was usually accompanied by a decrease in translucency. H. G. Schurecht

Alsmag 196—a new ceramic insulating material for high frequency purposes. Hans Thurnauer. *Radio Eng* 15, 15-16, 20 (1935) —A group of steatite materials possessing accuracy of dimensions and low cost has been developed. Steatite is a ceramic material based on the minerals lava, talc or soapstone, which differ principally in cryst. structure. The finely pulverized raw materials are mixed with fluxes and dried or fired as required. The steatite bodies possess high elec resistance and very low dielec loss. The phys and elec properties of various materials used as insulators for high frequency purposes are tabulated. In Alsmag 196 porosity has been cut down to nil even in pressed pieces, the power factor is nearly as low as that of transparent fused quartz. Uses for this new steatite product include receivers and transmitters where high-frequency app., low dielec losses and high dielec strength are required. W. H. Boynton

Effect of grain size and of firing schedule on properties of feldspar as a vitrifying agent. Edmund A. Durbin and Arthur S. Watts. *Ceram. Age* 26, 135-6 (1935) —Decreasing the grain size of the feldspar produces increased vitrification in a whiteware body. The more gradual the temp. increase, the more nearly the glassy phase represents a satn. of clay and flint in the feldspar solvent. Herbert S. Willson

Air-compressor faults. E. I. Lloyd. *Glass* 12, 461-2 (1935).

Refractory clays of Ohio. E. J. Bognar. *Ceram. Age* 26, 183-6, 194-5 (1935). Herbert S. Willson

German raw materials for the preparation of magnesia refractories. A. Berge. *Keram. Rundschau* 43, 471-3 (1935) —The utilization of carnallite is described. P. S. Roller

Silicon carbide refractories and their application in boiler furnaces. J. Walker. *Steam Eng* 3, 341-2 (1934), *Referatkarles Silikaliteratur* No. 713 (1934) —SiC refractories are excellent for boiler furnaces. They do not deform at high temp. under load, they resist the attack of slag with a low Fe or Ca content, however, they are attacked by liquid slag high in basic oxides. Because of their hardness they resist erosion by flue gases. M. V. Kondoidy

Chromite lining for industrial furnaces. Grigor'ev. *Zhurn.-So Ser* 79, No. 1828, *Referatkarles Silikaliteratur* No. 624 (1934) —For the production of chromite refractory mortar, chromite (80 to 95%) is mixed with aluminous cement (5 to 2%) and a little water. This mixt shows a

1 high refractoriness, good resistance to pressure, considerable chem. resistance and does not shrink. M. V. K.

Caustic magnesia lining for arc furnaces. V. Bogolubov. *Novosti Tekhniki* No. 37, 1-2 (1934); *Referatkarles Silikaliteratur* No. 606 (1934) —In contrast with sintered magnesite (firing temp. 1615° to 1750°), caustic magnesia (fired at 800° to 1000°) shows hydraulic properties. Chemically and physically the 2 kinds are similar with the exception that caustic magnesia has a finer crystal lattice.

2 Its advantage lies in the fact that it crystallizes more easily than sintered magnesite. The rammed linings, used in electrometallurgy, contg. tar, molasses or water glass are unsatisfactory. The Moscow Steel Inst. developed a rammed mix for arc furnaces contg. 80% sintered and 20% caustic, which recrystallizes with every melting and changes finally into a monolithic structure resisting highly oxidizing melts. Such linings were used successfully in Herault arcs for melting steel and ferrochrome. M. V. K.

3 Test for refractory for glass melting pots. E. Bayer. *Keram. Rundschau* 43, 544-5 (1935). —A 5-cm. cube of refractory is placed under a small load in a crucible contg. glass at 1000-1300°. Characteristic differences are found in the deformation, speed and degree of soln. P. S. Roller

Gas permeability of refractories. N. Lomskii and S. German. *Ukrain. Nauch.-Issledovatel. Inst. Ognenoporo. Kisloloporo. 30*, 24 pp. (1934), *Referatkarles Silikaliteratur* No. 1000 (1934), cf. C. A. 29, 1221* —A simple app. for measuring gas permeability of refractories is described. The coeff. of gas permeabilities at room temp., of grog and silica brick, fluctuated between 1.40 and 3.919 and 0.146 and 0.807, resp. The difference in pressure was not more than 6 or 7%. Attempts were also made to det. gas permeability between 20° and 8000°. It was found that an absolutely uniform heating of the sample is required when measuring permeability at high temps., that the temp. of the gas must be detd. before its conduction through the product, and that loss of gas must be prevented. M. V. Kondoidy

Sintering and melting processes in porcelain glazes. R. Riecke and C. Tanne. *Ber. deut. keram. Ges.* 16, 147-58 (1935) —The porosities and linear shrinkages of glazes were detd. for different firing temps. The whole melting process, the sintering temp. and the duration of the sintering temp. were found to be as important as the melting temp. The melting behavior of a glaze of a given chem. compn. may differ considerably according to the raw material used. This point was studied on 5 glazes with different chem. compns and compounded with different amts. of feldspar, marble, kaolin and sand. H. G. S.

Insulator porcelain testing. Horst v. Treufels. *Ber. deut. keram. Ges.* 16, 74-80 (1935) —Porcelain insulators were shown to develop fatigue. H. G. Schurecht

Pin holes in glazed ware. Maurice Barrett. *Brit. Clayworker* 44, 226-8 (1935) —Defects may be caused by the following: gas evolution from a sulfate radical, high Zn content, plaster from the molds, org. matter, high Al₂O₃ content, Fe, pyrites or SnO₂. The kiln should be free from CO₂ or steam. Finer grinding of the clay and grog will reduce the tendency to pin hole. Dust and dirt should be avoided. BaCO₃ can be used to an advantage. Washing with H₂O and the application of compressed air are effective as remedies. E. C. Petrie

Opacifiers used in the vitreous enamel industry. W. A. Liles. *Foundry Trade J.* 53, 351-4 (1935) D. S.

Pickling in enameling. M. Pecaux. *Verre industriel* 5nd 6, 428 (1935) Herbert S. Willson

Adherence of ground enamels containing cobalt and nickel oxides. Friedrich Heimes. *Ceram. Age* 26, 480-2 (1935), cf. C. A. 29, 3478*. Herbert S. Willson

Specifications for enameled cooking vessels. Richard Aldinger. *Keram. Rundschau* 43, 431-3, 498 (1935) —Resistance to heat, boiling solns. and impact is discussed. Cf. C. A. 28, 6961*. P. S. Roller

Glass-lined equipment for the food industries (Barnes) 12 Kaolin and clay (Vasel) 8 Kinetics of solid phase reactions of certain carbonates with mullite, silica and

alumina (Pole, Taylor) 2. App. for sepg. dust and other light material from heavier matter, e. g., from abrasive after its use in sand-blast app. (Brit. pat. 432,222) 1.

Glass. Erich Heinz. U. S. 2,020,467, Nov. 12 In compounding glasses of the usual soda-lime type, there is added to the usual glass-batch ingredients a prefused Ba borosilicate flux having a compn. which comprises about 8-20% of B_2O_3 and about 15-30% BaO together with silica in proportions at least chemically equiv. to the B_2O_3 and BaO.

Glass Corning Glass Works. Fr. 784,667, July 22, 1935. Glass useful for rods and mountings of elec. lamps contains 2-3 times as much K_2O as Na_2O , the proportion of B_2O_3 is 1-1.1 and BaO 6.5-7.3%. An example contains SiO_2 55-60, Na_2O 3-4, K_2O 19-21.5, BaO 6.5-7.3 and B_2O_3 1-1.1%.

Cellular glass Soc. anon. des manufactures des glaces et produits chimiques de St. Gobain, Chauny & C^{ie} Brit. 433,423, Aug. 14, 1935. Articles of cellular glass are made by placing molten glass that is seedy or bubbly in a mold and creating a partial vacuum in the mold whereby the glass is caused to swell and take the shape of the mold. App. is described.

Apparatus for circulating the glass in gathering basins of glass furnaces Alexander F. McNish U. S. 2,021,013, Nov. 12. Structural, mech. and operative details.

Automatic glass-gathering and -shaping machine for manufacture of bottles or the like Etienne Fechoz U. S. 2,020,462, Nov. 12. Mech. and operative details.

Apparatus for feeding mold charges of molten glass Edwin E. Slack, Jr. U. S. 2,021,623, Nov. 19. Various mech. and operative details.

Apparatus for feeding molten glass to molds Geo. R. Haub U. S. 2,020,143, Nov. 5. Structural, mech. and operative details.

Apparatus for gathering glass blanks for the manufacture of bottles or jars August Kadow and Willard L. Van Ness (to Libbey Glass Mfg. Co.) U. S. 2,020,032, Nov. 5. Mech. and operative details.

Forming hollow glass blanks such as bottles or jars August Kadow (to Libbey Glass Mfg. Co.) U. S. 2,020,031, Nov. 5. Various details of app. and operation.

Apparatus for manufacture of hollow glass products such as bottles or flacons. Emile Rourant (to Soc. anon. d'études et de constructions d'appareils mécaniques pour la verrerie) U. S. 2,021,670, Nov. 19. Various mech. and operative details.

Evacuated blown glass articles such as double-walled jars Roy E. Swan. U. S. 2,020,590, Nov. 12. Various details of app. and operation are described.

Means for feeding predetermined weights of molten glass. John Thomas Wood. Ger. 619,306, Sept. 28, 1935 (Cl. 32a. 5). This corresponds to Brit. 389,923 (C. A. 27, 5918).

Fitter or shaper for glass articles suitable for truing glass tumblers. John C. E. Schwab (to Hazel-Atlas Glass Co.) U. S. 2,019,736, Nov. 5. Mech. features.

Marvering glass to fit a mold prior to entering the mold Thomas Stenhouse (to Hazel-Atlas Glass Co.) U. S. 2,020,623, Nov. 12. A charge of glass substantially circular in cross section is dropped vertically and passes by its own momentum through a shaping die which shapes it to fit a mold, as in the formation of articles such as bottles. App. is described.

Glass-working apparatus suitable for fusing tubes into lamp bulbs, etc. Alvin R. Knoepfel (to General Elec. Vapor Co.) U. S. 2,020,729, Nov. 12. Mech. and operative details.

Apparatus for supporting glass plates while they are case hardened Lloyd V. Black (to Pittsburgh Plate Glass Co.) U. S. 2,019,595, Nov. 5. Structural and mech. features.

Apparatus for edging glass sheets and plates by grinding. Wm. Owen (to Pittsburgh Plate Glass Co.) U. S. 2,021,193, Nov. 19. Structural, mech. and operative details.

Glass furnaces Fours et appareils Stein (Soc. anon.) and Charles Royer. Fr. 785,143, Aug. 2, 1935.

Electric furnace suitable for melting glass. John Ferguson. U. S. 2,022,112, Nov. 26. Structural features. Induction heater for fusing and refining glass. Forges et ateliers de constructions électriques de Jeumont. Fr. 785,564, Aug. 13, 1935.

Canal cooling furnace for glassware. Otto Maetz and Hermann Heinrichs. Ger. 616,606, Aug. 1, 1935 (Cl. 32a. 29).

Drawing kiln and associated apparatus for sheet-glass manufacture Karl G. Kutchka (to Pittsburgh Plate Glass Co.) U. S. 2,021,180, Nov. 19. Various structural and operative details.

Leer, with heating, tempering and cooling zones for treating glassware. Geo. W. Batchell. U. S. 2,019,839, Nov. 5. Structural and mech. features.

Apparatus for tempering sheets of glass. Compagnie réunies des glaces et verres spéciaux du nord de la France. Fr. 784,733, July 23, 1935.

Mirrors Duro-Ray Ltd. Fr. 785,270, Aug. 6, 1935. Colloidal Ag is deposited on the surface of glass, then a film of Cu and finally a protective coating of Pb.

Silvering Duro-Ray Ltd. and Albert M. Barnes Brit. 432,687, July 30, 1935. In silvering glass or similar transparent or translucent materials, films of colloidal Ag only are formed to a predet. linear thickness on their surfaces to facilitate the electrodeposition of metals for protective purposes. Sufficient NH_4OH is added to an aq. $AgNO_3$ soln. to redissolve the pptd. Ag_2O , an aq. $NaOH$ soln. is added and sufficient NH_4OH to redissolve any pptd. Ag_2O , the mixt. is added to a concn. corresponding to 5 g. $AgNO_3$ and 4.68 g. $NaOH$ per l. and equal vols. of the resultant soln. and an aq. soln. of cane sugar and tartaric acid are fed through nozzles so as to mix to form a single jet which falls on the glass, etc. The Ag deposit is backed by an electrolytic deposit of Pb. The electrolyte may be an aq. soln. of $Pb(ClO_4)_2$, contg. 37.5 g. Pb and 0.05 g. $HClO_4$ per l. Clove oil or peptone may be added to reduce the grain size of the deposited Pb to a min.

Colored optical glass Murray R. Scott (to Bausch & Lomb Optical Co.) U. S. 2,021,244, Nov. 19. A colored optical glass which is suitable for spectacle lenses has a n of 1.50-1.55 and a dispersion, as expressed by ν , between 61.0 and 58.5 and contains compds. of Pb, Mn and Ti.

Glass permeable to ultraviolet rays. Chemische Fabrik Joh. A. Benckiser G. m. b. H. and Fritz Draibach. Fr. 785,966, Aug. 23, 1935. Orthophosphates of Be, Ca, Mg, Na or mixts. of these phosphates are used exclusively in making glass of good permeability to ultraviolet rays.

Laminated ("safety") glass Jean Haas (to Société générale d'optique (Soc. anon. des anciens établissements Huot & C^{ie} et jumelles Flammarion)) U. S. 2,020,178, Nov. 5. A viscous material is forced upwardly under pressure between glass sheets to be united. App. is described.

Safety glass Deutsche Celluloid-Fabrik. Fr. 785,422, Aug. 9, 1935. Plates of glass are coated by projection with an aq. paste or emulsion of a polymerization product, the water is removed and the plates of glass are brought together and joined by heat and pressure.

Purifying clay. English Clays, Lovering, Pochin & Co. Ltd. and Reginald J. Davies Brit. 433,416, Aug. 14, 1935. A dil. soln. of sulfite lye with or without an addn. of alk. electrolyte is used as a deflocculating agent in the purification of clay.

Molding clay pipes, etc. Wm. M. W. Sutton. Brit. 432,579, July 30, 1935. Clay and similar single-piece pipes, conduits, etc., are formed with holes or slots in the thickness of the walls so that when the pipe is subsequently fired, the slots provide air ducts for circulation of hot air and so reduce the time required for firing.

Fire-clay sewer pipe, etc. Willard K. Carter and Geo. H. Duncombe, Jr. (to National Aluminate Corp.) U. S. 2,019,619, Nov. 5. Fire clay is tempered with water contg. an amt. of Na aluminate not more than about 1% the wt. of the clay and the resulting plastic mixt. is molded, dried, and fired at a temp. equiv. to about cone 8.

Firebrick John M. McKinley and Willard K. Carter

(to National Aluminate Corp.). U. S. 2,019,618, Nov. 5. Highly heat-resistant, strong firebrick of decreased porosity and firing shrinkage and of good resistance to spalling are produced by mixing fire clay with aggregates such as ground brickbats and an amt. of Na aluminate substantially equal to 1-5% the amt. of the clay, and with water to form a plastic mass, shaping, drying and firing.

Coloring bricks Wm S Damhorst U. S. 2,020,137, Nov. 5. The cavity walls of a brick-forming mold (as used in connection with the sand-mold process of making soft-mold brick) are covered with a relatively thin coat of a mix formed of fine sand, fire-clay dust and coloring materials such as "manganese," "metallic red" or powder Zn (this mix being applied while dry to the wet mold walls) and plastic clay is forced into the mold cavity under heavy pressure (various other details of treatment and final burning being also described).

Tamping-mechanism for brick making machines. Wm G Chapman and Dunns' Engineering Works Ltd. Brit. 433,187, Aug. 9, 1935.

Rotary mold-table machines and method for molding bricks, tiles, etc. Geo Head Brit. 432,799, July 29, 1935.

Apparatus for applying color to tiles, etc. Harry F Wood and Wm Coulter. Brit. 432,193, July 18, 1935. The tiles are carried along on a horizontal band or conveyor beneath 1 or more color containers having a plurality of color outlet nozzles from which small quantities of color are deposited on the tile surfaces, the color, before it sets, being subjected to an air or like blast from a plurality of nozzles so as to spread the color or to mix different colors on the surface of the tiles.

Ceramic articles Walter J. Scott (to Western Elec. Co.) U. S. 2,020,476, Nov. 12. An article such as a telephone dial number plate is formed with a base having a groove in such proximity to an edge as to form a sharp ridge at the edge and with a ceramic coating extending to the ridge. The base may be formed of iron or steel plated with Cu and Ni.

Ceramic articles such as telephone dial number plates Walter J. Scott and Sumner R. Mason (to Western Elec. Co.) U. S. 2,020,477, Nov. 12. A ferrous metal base is plated with Cu, then plated with Ni, and an enamel coating is applied over the Ni.

Red glaze for ceramic products Andrew Malnovsky and Albert L. Bennett (to Mahinite Products, Inc.) U. S. 2,020,559, Nov. 12. A brilliant glaze is provided by applying a glazing material containing a selenium stain and a frit containing B_2O_3 about 7.5-15 and PbO about 10-22%, not more than about 5% Al_2O_3 , and practically free from Sn, the balance being mainly SiO_2 , and then heating to cause the glazing material to reach a maturing temp in a time between 10 min and 4 hrs, then cooling.

Bismuth salt Le progrès scientifique Fr. 785,713, Aug. 7, 1935. A bismuth salt which is soluble in mineral and fat oils in all proportions is made by causing a Bi salt or oxide to react with diallylactic acid at about 40°. The product may be used in cosmetics for making colors called "Luster" and in the prepn of cosmetics.

Fusing metals into pottery Karl Schindhelm Ger. 613,327, May 17, 1935 (Cl. 80b 10 02). Adds to 610,422 (C. A. 29, 6099*).

Tunnel kiln Warmestelle Steine und Erden G. m. b. H. (Karl Beckenbach, inventor) Ger. 612,524, July 20, 1935 (Cl. 80c 5). A kiln or furnace for firing earthenware, roasting or sintering ores, etc., is described.

Continuous tunnel kiln suitable for treating ceramic ware Philip D. H. Dressler (to Swindell Dressler Corp.) U. S. 2,020,140, Nov. 5. Structural and operative details.

Kiln for drying and burning bricks, tiles, etc. Alois Habla U. S. 2,020,641, Nov. 12. Structural and operative details.

Preventing formation of carbon deposits on bricks of regenerators, etc. Hans Wolf and Hermann Leuchs (to I. G. Farbenindustrie A.-G.). U. S. 2,020,713, Nov. 12. Ceramic masses such as those used for regenerators contain Fe or Fe oxide and also contain a Cu compound

responding to a Cu content in the material of not over 0.2% (suitably about 0.12%).

Electric furnace suitable for producing fused refractory and abrasive materials Raymond C. Benner and Geo. J. Easter (to Carborundum Co.). U. S. 2,021,221, Nov. 19. A carbon resistor is embedded in a charge of material which is to be fused by heat from the resistor, the resistor being surrounded by a high-frequency elec. heating coil for heating its central portion and being connected with leads for passing an elec. current of lower frequency through the carbon to heat its terminal portions preferentially when it is desired to release it from the charge of material. Various operative details are described.

Refractory compositions Camillo Konopicky. Brit. 432,303, July 24, 1935. Sintered ferruginous MgO , in which the total quantity of fluxing agents is greater than 2 but not greater than about 12%, is produced by adjusting the relative proportions of CaO , SiO_2 and Al_2O_3 in the ferruginous MgO , e. g., by adding these oxides or MgO -material congt. them, so that the said proportions fall within an area indicated on a ternary diagram and then firing the mixt. The Fe_2O_3 preferably amounts to at least 1.5 times the CaO . Among examples, 1.5 parts of a sintering magnesite congt. CaO 3.4, SiO_2 0.7, Al_2O_3 0.7 and Fe_2O_3 9.1% is added to 1 part of a magnesite congt. CaO 0.4, SiO_2 3.2, Al_2O_3 0.6 and Fe_2O_3 0.2%.

Refractory materials Harbison-Walker Refractories Co. Fr. 784,832, July 25, 1935. Between the grains of magnesite refractory material is formed a binder congt. a network of forsterite in amt. such that the material is made mechanically resistant to high temps as compared with material not congt. the network. The forsterite is formed *in situ* on heating.

Siliceous refractories John M. McKinley and Willard K. Carter (Carter to National Aluminate Corp., and McKinley to North American Refractories Co.) U. S. 2,019,542, Nov. 5. Gansiter particles are mixed with an aq. dispersion of Ba acetate, hydroxide, nitrate, peroxide or carbonate and the mixt. is molded, dried and fired to produce a product which is suitable for furnace linings, etc.

Refractory material suitable for metallurgical furnaces etc. Geo. D. Cam (to Republic Steel Corp.) U. S. 2,021,222, Nov. 19. About 5-15 parts of olivine congt. MgO about 48, SiO_2 42 and FeO 2-20% is used with about 5-15 parts of chromite congt. FeO , Cr_2O_3 , and about 5-15 parts of calcined dolomite congt. CaO and MgO .

Refractory cylindrical filter suitable for filtering liquid in refrigerating systems Walter A. Kuenzli and Clyde E. Ploeger (to Servel, Inc.) U. S. 2,021,452, Nov. 19. Various structural details.

Porous articles such as plates for surface combustion Reinhold Reichmann (to Siemens & Halske A.-G.) U. S. 2,021,520, Nov. 19. Prefired refractory material is sintered with grains of the material, the sintering mixt. is mixed with a slip consisting of finely divided calcined metallic oxide material activated with dil. acid to form a moldable crumbly mass, this material is molded under pressure and sintered at a temp. above 1600°.

Refractory and abrasive materials The Carborundum Co. Fr. 784,820, July 25, 1935. A product is obtained by fusing Cr_2O_3 and Al_2O_3 to form a solid soln. The content of MgO present should not be above 1.5%. Cf. C. A. 29, 7037.

Coated abrasive articles Richard Paul Carlton (to Minnesota Mining and Manufacturing Co.) Brit. 433,128, Aug. 6, 1935. In mfg. sand paper, emery cloth, etc., particles of the abrasive are propelled into position by subjecting them to the combined action of mech. and elec. or magnetic forces which move them against the force of gravity so that they are deposited with their longer dimensions perpendicular to the surface of the article. App. is described.

Abrasive articles such as leather-buffing wheels surfaced with embossed abrasive fabric Oliver Lanier (to Carborundum Co.) U. S. 2,021,160, Nov. 19. Structural details.

Enamel. Vereinigte chemische Fabriken Kneidl, Heller & Co. Ger. 610,534, July 31, 1935 (Cl. 48: 2 02). A turbidity-producing agent for enamel is obtained by fusing $ZrSiO_4$ with an equimol. amt. of CaO , SrO , BaO , MgO or ZnO , and a flux and grinding the cooled product. A readily fusible glass may be used as flux.

Enamel ware. Oscar Hommel (to Enameters Guild, Inc.). U. S. 2,019,676, Nov. 5. Material such as a steel utensil for cooking is provided with an enamel coating of wavy surface and variegated color by covering the surface of the article with a coating of a plurality of vitrifiable preps., of which one is a feldspathic glass of sp. gr. of about 2.5 and one color and another consists essentially of a metallic salt, such as Pb borate or silicate, of a sp. gr. exceeding 3, and of another color (the coating preps. being applied in variegated distribution, and fired).

Porcelain enameled articles of changeable color. Richard H. Türk. (to Porcelain Enamel and Mfg. Co. of Baltimore). U. S. 2,021,819, Nov. 19. A coating of enamel is applied to a base, and enamel frit particles are applied to the enamel coating, in one direction against the facets of the enamel particles there is applied an enamel of one color stable at the firing temp., and there is then applied in a reverse direction against the reverse facets of the enamel particles an enamel of another color stable at the firing temp.; a light dusting of another enamel is applied,

and the article is fired so that it retains a rough surface and changeable color.

Vitreous material. Albert Wm. H. Wedlock and Micallex (Parent) Co. Ltd. Brit. 432,421, July 26, 1935. A vitreous material that adheres firmly to metal is prep'd by admixing a dried and finely ground ceramic material, which must contain a proportion of cryolite (I) and alkali carbonates, with mica and (or) asbestos. A preferred ceramic compn. is 1 20 , B_2O_3 , (or), K_2CO_3 , 13 , Na_2CO_3 , 0 , H_2BO_3 , 45% . This is dried at 500° , the resulting frit is ground to pass a 120 mesh per linear sieve, the ground frit is mixed with mica ground to the same fineness in the proportion $40/60$, 8% of H_2O is added as a spray and the mass is pressed and heated slowly to about 640° , the temp. being kept below the dehydration point of the mica.

Vitreous articles with a multi-color finish. Franz Nowak (to Porcelain Enamel and Mfg. Co. of Baltimore). U. S. 2,021,820, Nov. 19. Fired vitreous enameled articles such as those of sheet iron having a multi-color effect are produced by applying to the article particles such as those of an enamel frit which are fusible at the firing temp. and on cooling form a vitreous coating, and applying to such particles, in different directions, coatings of different colors stable at the firing temp., then firing to effect fusion and produce a surface which on cooling has a multi-color effect. Various examples are given.

20—CEMENT AND OTHER BUILDING MATERIALS

J. C. WITT

Cold application of asphalt roads. J. Oberbach. *Bitumen* 5, 137-43 (1935).—Technical and economic advantages of cold asphaltic construction are discussed. Typical mixes and applications are also reviewed.

C. B. Jenni

Methods for making bitumen dispersions for paving streets. E. H. Kadmer. *Seifenindustrie-Ztg.* 62, 813-14, 833-4 (1935); cf. C. A. 29, 8309².

J. W. Perry

Road emulsions and their new uses. R. G. Smith. *J. Inst. Engrs. Australia* 7, 361-9 (1935).—An app. is described for measuring the amt. of stability against displacement resulting from various thicknesses of film of asphalt coating. The app. consists of 3 metal blocks and a base, as illustrated in the paper. The blocks are of metal with surfaces finished to true planes to eliminate mechanical and frictional resistance between adjacent surfaces. Two blocks correspond to coarse base stone and the third corresponds to the key stone between the other 2 pieces of base stone in a typical penetration pavement. The base plate corresponds to the subgrade. Details of operation are given. The use of emulsion asphalt, at greater costs than hot asphalt, is justified, for with it pavements are obtained having strengths obtainable in no other way. The emulsion has indisputable value in road building, whether penetration, road mix, or premixed types. Mixing or slow-setting emulsions are made with emulsions which mix with rock, sand or clay aggregates. The types of road built with these types of emulsions are: (1) treated type, (2) cold premix type and (3) hot premix type. The latest and most far-reaching development of emulsions is the stabilization of road bases. Soil stabilization refers to changes in soil characteristics in which the capillarity of the soil and its affinity for water are reduced to a point which will insure required bearing strength in the soil under actual conditions of exposure in the subgrade. The stabilization involves the uniform distribution of minute particles of asphalt throughout the entire clay mass. In soil stabilization the soil is simply rendered resistant to water from capillarity thereby retaining the bearing strength characteristic of the same soil when in a dry compacted condition. Expts. are described. W. H. B.

Xyloth. Heinrich Wiesenthal. *Kunststoffe* 25, 256-7 (1935).—Raw materials, production methods and final products are discussed.

J. W. Perry

Testing of building lime. Otto Graf. *Tomind.-Ztg.* 59, 1137-9 (1935).

Rubber, bitumens and road surfaces. (Pistor) 14. Corrosive effect of ground water on concrete (Karttunen) 14. Cements (Brit. pat. 432,493) 13. Preserving rubber latex [compn. for surfacing floors] (Brit. pat. 433,116) 30. Vacuum app. and method for impregnating timber, etc (Brit. pat. 432,552) 1.

Cement. Charles H. Breerwood (to Valley Forge Cement Co.). U. S. 2,021,623, Nov. 19. A cement raw material mixt. of a desired analysis is prep'd. from inferior argillaceous limestones, deficient in $CaCO_3$ and excessive in silica (some of the silica being in a form too coarse for favorable combination with the Ca in the process of burning to clinker), by crushing the stone to a size suitable for calcination, followed by calcining sufficiently to convert substantially all the $CaCO_3$ to CaO but short of a degree causing C and silica reactions, converting the Ca compds. to powder without materially reducing the coarse silica, segg. the fine stone from the coarse silica, discarding the latter, recovering the fine constituents and proportioning them with other fines of different analysis to give a cement product of desired analysis. An arrangement of app. is described. Cf. C. A. 29, 5624¹.

Cement. Bruno Neuhof. Ger. 595,924, June 18, 1935 (Cl. 80b 1 09). The setting of hydraulic cement is delayed by adding size or size-forming agents. A mixt. of potato meal and $NaOH$ or sulfite waste lye may be used as size producers.

Cement. Fried. Krupp Grusonwerk A.-G. Ger. 616,754, Aug. 3, 1935 (Cl. 80c 14.10). A heat-exchanger for the manuf. of cement is described.

Rotary cement kiln. Mikael Vogel-Jørgensen. Fr. 784,084, July 22, 1935.

Rotary kiln for making cement. Johan S. Tasting. Fr. 783,488, Aug. 10, 1935.

Shaft furnace for cement. Fried. Krupp Grusonwerk A.-G. Fr. 785,813, Aug. 20, 1935. Clinker which been fired in amt. of at least $1/4$ th of the total charge, is uniformly distributed in the charge.

Cement, mortar, concrete, etc. Wilhelm Klie. Ger. 610,407, Oct. 2, 1935 (Cl. 80b 1 06). Cements and ce-

itself) in which has been incorporated halogen either as such or in the form of a hydracid is added before the hydrogenation. The absorbent material may be treated with the anhyd acid or with a soln. of the halogen in an org. solvent.

Hydrogenating carbonaceous materials. I. G. Farbenindustrie A-G. Brit. 432,638, July 25, 1935. In the production of valuable hydrocarbons by the heat-treatment of carbonaceous materials, particularly in presence of hydrogenating gases, and of finely divided catalysts or surface-active materials suspended in the reaction materials, a part of the materials contg. catalyst is returned to the preheater from a settling vessel that is arranged behind the preheater and before a reaction chamber or is connected with any place in the preheater behind the point of return. App. is described.

Apparatus (with a hot air and steam supply) for the combustion of fuels such as coal in boiler furnaces. Frank A. Chambers and Charles F. McGinley. U. S. 2,020,173, Nov. 5. Various structural and operative details.

Fractionating coal by flotation. Ernst Bierbrauer and Josef Popperle. Ger. 619,239, Sept. 26, 1935 (Cl. 1c 10.01). An aq. sludge of finely ground coal is treated with a water sol. oxidizing agent, e. g., HNO_3 , H_2O_2 , or KMnO_4 . The humous and bituminous constituents, which are the reactive substances required for subsequent coking or hydrogenation, are thus caused to sink, together with the inorg. constituents, while the inert org. substances (mainly fibrous coal) remain in suspension; they can be sepd. in known manner by addn. of PhOH , PhNH_2 , or other foaming agent. The residue of reactive org. substances and inorg. constituents is treated with a coal-tar oil, whereby the reactive substances are brought into suspension, and sepn. is then effected by a second flotation treatment. The first flotation may be assisted by adding to the mixt. a hydrophilic aliphatic or aromatic compd., e. g., hydroquinone. Alternatively, humic acid, lignin-sulfonic acid or a deriv. thereof may be added.

Apparatus for separating heavy impurities from coal sludges. Hoesch-Köln Neussens A.-G. für Bergbau und Hüttenbetrieb. Ger. 619,451, Oct. 2, 1935 (Cl. 1a 10). The sludge traverses a channel, the bottom of which is formed by an endless rubber band having transverse projections for trapping the heavier impurities. The band is moved periodically in the opposite direction to the sludge.

Screening devices, especially for coal. Cwilym E. A. Thomas and Emlyn Anthracite Colliery Ltd. Brit. 432,240, July 23, 1935.

Beater for use in apparatus such as that for pulverizing coal, etc. James W. Armour (to Riley Stoker Corp.). U. S. 2,021,762, Nov. 19. Structural and mech. details.

Briquetting coal. Robert J. Piersol. U. S. 2,021,020, Nov. 12. Strong stable briquets are formed without the aid of added binders, from bituminous coal contg. considerable amounts of volatile matter, by heating the coal to remove a portion of the volatile matter, cooling to 150–350° and subjecting the coal, at such temp., in a die, to a single impact blow of about 1500–3000 foot pounds for each 0.1 lb. of coal compacted, to form a dense briquet. App. is described.

Steam generator. Wilson L. McLaughlin, Herrold L. McLaughlin and Virg. Ballou (H. L. McLaughlin and V. Ballou to National Pure Water Corp.). U. S. 2,020,369, Nov. 12. Structural features.

Apparatus for purifying steam coming from a boiler. Wilbur H. Armacost (to The Superheater Co.). Brit. 408,912, Apr. 19, 1934, 410,037, May 10, 1934, 431,037, June 28, 1935.

Apparatus for deconcentrating or purifying boiler steam. James A. Powell and Wilbur H. Armacost (to The Superheater Co.). Brit. 410,036, May 10, 1934.

Treating exhaust gases from internal-combustion engines, etc. Joseph S. Kaufman. U. S. 2,021,690, Nov. 19. Water vapor in exhaust gases is continuously condensed into liquid and the liquid is continuously subjected to contact with Fe heated to a temp. (suitably

about 200–500°) sufficient to vaporize instantly the liquid into wet steam in the presence of the gases. The steam reacts with CO to form CO_2 . App. is described.

Purifying gases. Gordon Nonhebel, John L. Pearson and Imperial Chemical Industries Ltd. Brit. 433,039, July 29, 1935. In purifying gases from oxides of S and any smoke or ash present by scrubbing with a recirculated aq. washing medium that is continuously replenished with CaO , chalk, or Mg limestone and removing the insol. solids that collect in the system by purging off a part only of the recirculating liquor without settling the bulk of the liquor, the liquor after leaving the scrubber is treated so as to remove practically the whole of the supersatn. due to CaSO_4 and CaSO_3 before recirculation by delaying the return of the liquor to the scrubber for a definite min. time sufficient to enable desupersatn. to be completed. Scaling of the scrubber surfaces is thus prevented. App. is described.

Washing flue gases. Gordon Nonhebel, John L. Pearson and Imperial Chemical Industries Ltd. Brit. 433,373, Aug. 6, 1935. In washing flue gases with a recirculated liquor to which CaO or chalk is added in amt. approx. equal to the S oxides and other strongly acid gases, e. g., HCl , the addn. of CaO or chalk is regulated by detg. the p_{H} of the scrubber exit liquor continuously or at intervals and adding, at a point after that of the detn. of the p_{H} , sufficient CaO or chalk to keep the p_{H} within the range 6–6.4, preferably 6.2, with CaO neutralization, or 6–6.3, preferably 6.1, with chalk neutralization. App. is described.

Water gas generators. Norman F. Parker and John Strong. Fr. 785,471, Aug. 10, 1935. Regulating means. **Purifier for generator-gas plant.** Humboldt-Deutz-motoren A.-G. Ger. 616,908, Aug. 7, 1935 (Cl. 26d 1.20).

Air gas producer. Hermann Blau. Ger. 616,554, July 31, 1935 (Cl. 26c 1). App. for satg. air with the vapor of readily volatilized liquid hydrocarbons is described.

Apparatus for producing gaseous mixture such as illuminating and heating gas from liquefied fuel gases, etc. Roswell W. Thomas (to Phillips Petroleum Co.). U. S. 2,021,271, Nov. 19. Various structural and operative details.

Apparatus for producing high- and low-grade gases from liquid and solid fuels such as for operating automotive vehicles. Robert Falconer and Eduardo Collignon. U. S. 2,021,055, Nov. 12. Various structural and operative details.

Removing weak acids from gases. I. G. Farbenind. A.-G. Fr. 785,276, Aug. 6, 1935. H_2S and CO_2 are removed from gases contg. them by washing the gases with bases, the mol. of which contains at least 2 atoms of N and is of the formula $\text{A}_1(\text{A}_2)\text{N}_2\text{XN}(\text{A}_3)\text{A}_4$, in which X is an aliphatic radical which may also contain one simple or substituted aminogen group, and at least 1 of the A groups denotes an alkyl or aryl group capable of contg. OH or a simple or substituted NH_2 , or 2 of the A groups joined to different N atoms form an alkylene group, while each of the other A groups is H or alkyl or aryl. Examples of such compds. are $\text{CH}_3\text{NHCH}_2\text{CH}_2\text{NHC}_2\text{H}_5$, $\text{MeN-CH}_2\text{CH}_2\text{NHC}_2\text{H}_5$, $\text{HOCH}_2\text{CH}_2\text{NHC}_2\text{H}_5$, $\text{CH}_3\text{CH}_2\text{NHC}_2\text{H}_5$, $\text{H}_2\text{NCH}_2\text{CH}_2\text{NMeC}_2\text{H}_5$, $\text{HOCH}_2\text{CH}_2\text{NCH}_2\text{CH}_2\text{NH}_2$, piperazine, pyrazine, and their derivs., etc.

Removing hydrogen sulfide from gaseous mixtures. Bert H. Lincoln (to Continental Oil Co.). U. S. 2,021,865, Nov. 19. The gas is brought into contact with sulfurous acid in an enlarged zone in the presence of activated C, so that a portion of the H_2S is converted into water and elemental S, the gas is then sepd. from the reaction products and is passed countercurrent to H_2SO_4 to convert remaining H_2S into water and S, and the treated gas is washed. App. is described.

Removing sulfur dioxide from flue gases. Charles F. Goodeve. U. S. 2,021,548, Nov. 19. The gases are treated with an acid soln. of Fe sulfate and then with an alk. suspension of Fe hydrosulfide. An arrangement of app. is described.

Sulfur dioxide. Ingenium Hechenbleikner (to Chemical Construction Corp.). U. S. 2,021,725, Nov. 19. S or a sulfurous material is burned to produce high-temp. combustion gases contg. SO_2 and heat is transferred from the gases, by direct contact, to a material such as acid sludge from petroleum refining from which SO_2 is liberated by heating to below its temp. of combustion so that substantially all the SO_2 is liberated from such material and mingled with the gaseous combustion products. App is described.

Means for compressing coal in discontinuously operated coke ovens. Gustav Hilger. Ger. 613,062, May 10, 1935 (Cl. 10a 15). Addn to 610,658 (C. A. 29, 5638¹).

Refining benzene. Aktiebolaget Separator-Nobel

Fr. 785,078, Aug. 1, 1935. Benzene is mixed with H_2SO_4 of 60–65°Bé and, after sufficient contact, the acid and resin are sepd from the benzene in a centrifuge without interruption.

Coking coal. Carl Stull G. m. b. H. Ger. 619,454, Oct. 1, 1935 (Cl. 10a. 19 01). Means is described for producing channels in the compressed charge and for withdrawing distn. products through the channels. Cl. C. A. 29, 3143⁴.

Coking-retort oven. Joseph Becker (to Koppers Co. of Del.) U. S. 2,019,483, Nov. 5. Various details.

Coking-retort oven. Joseph van Ackeren (to Koppers Co. of Del.) U. S. 2,020,919, Nov. 12. Various structural and operative details.

22—PETROLEUM, LUBRICANTS, ASPHALT AND WOOD PRODUCTS

W. F. PARAGHER

Petroleum-bearing rocks in France. lignites of Minervois. V. Charrin. *Mat. grasses* 27, 10029–31 (1935). — Analysis of 2 samples gave the following av. results: H_2O 9.16, ash 8.00, volatile 47.85, fixed C 44.15, S 5.80, N 0.83%, and calorific value 6225 cal. Carbonization in a lab. Fischer retort gave anhyd. filtered tar (condensed at 15°) 14.75, semicoke 73.40, H_2O , gas and loss 11.91%, vol. of gas evolved 95 cu. m. per ton. The semicoke had the following compn: ash 21.50, volatile 21.00, fixed C 63.50, N 1.10, S (mostly in the form of CaSO_4) 3.70%, calorific value 6000 cal. Com. scale carbonization tests carried out in a Salerni retort indicated that the following yields per metric ton could be obtained: semicoke 700 kg., gas 100 cu. m., anhyd. primary tar 140 kg. Fractionation of the tar yielded the following products: motor spirit (d_{40} 0.825, flash pt. below atm. temp.) 7.60, solar oils (d_{40} 0.871, flash pt. 71°, S 4.45%, calorific value 10,205) 11.76, gas oils (d_{40} 0.913, flash pt. 130°, S 3.65%, calorific value 10,074) 10.70, light lubricating oils (d_{40} 0.944, flash pt. 152°, burning pt. 183°, calorific value 9.978, S 3.37%, Engler viscosity at 20° 2.97, at 50° 1.44, solidifying pt. 4°) 6.85, heavy lubricating oils (d_{40} 0.941, flash pt. 192°, burning pt. 233°, solidifying pt. 1°, Engler viscosity at 50° 3.60, at 100° 1.31) 6.00, hard paraffin (m 51.2°) 4.52, medium rectified cresols (d_{40} 1.026, flash pt. 98°, burning pt. 110°, S 0.46%, calorific value 8307) 3.88, heavy cresols (m 21.7°, volatile 0.234, alk. ash 1.20, fixed C 6.50, S 3.07, petr. ether-sol 40.30, C_6H_6 -sol 83.90, insol. 7.60%, calorific value 7182) 8.27, pyridine bases 2.74, asphalt (d_{40} 1.172, m 119.4°, benzene-insol 32.85%, calorific value 8097) 20.50, loss 15.12%.

A. Papineau-Couture.

Aromatization by catalysis of fractions of Bakr (Sarak-hany) gasoline. N. D. Zelinskii and N. I. Shulkin. *Bull. acad. sci. U. R. S. S.* 1935, 229–37 (in English 237). *Ind. Eng. Chem.* 27, 1209–11 (1935); cf. C. A. 29, 2721¹. — Cyclohexane and its derivs. (about 50%) in gasoline fractions b. 75–125° and 118–140° are almost completely dehydrogenated to aromatic compds. by passage with H at 300° over Ni on Al_2O_3 or Pt on charcoal. The catalysts remove the traces of S present, but are not poisoned thereby. The aromatic contents of mixts. detd. by the H_2SO_4 and the PhNH₂ methods agree.

H. A. Beatty.

Viscosity of diluted oils and of oil mixtures. E. Erdheim. *Mat. grasses* 27, 10600–2 (1935). — See C. A. 29, 7630¹.

A. Papineau-Couture.

Rational scale for classifying motor fuels. Max Seruys. *Compt. rend.* 201, 815–17 (1935). — Of 2 gasolines of the same octane no. but different calorific powers, the one of lower power gives rise to knock more readily than the other; the power obtainable, moreover, is not proportional to the calorific value. To compare the utilizable power of 2 gasolines, it is proposed to value them by their "synthetic indexes"; this index is the ratio of the max. power produced by the gasoline to that produced by a standard fuel in a standard motor under definite conditions of temp., compression, etc., both fuels being fed at

the knock limit and giving the same percentage of CO in the exhaust. C. A. Silberrad.

Fuels for aircraft engines. E. L. Bass. *J. Roy. Aeronaut. Soc.* 39, 879–962 (1935), cf. C. A. 29, 908¹. — B discusses only volatile fuels. In his exptl. work on the E 35 engine, cylinder-head and exhaust-gas pyrometers were used in studying detonation. The effects of mixt. strength, fuel-antiknock characteristics, intake-mixt. temp. and ignition timing were observed. B also reviews the following fuel characteristics: boiling range and its relation to starting, distribution, and ice formation, vapor pressure, l. p.; sp. gr.; viscosity; calorific value; and impurities. The possible use of iso-octane as a blending agent in aviation gasolines is considered. M. W. Schwarz.

Influence of various additions to the fuel of injection motors. Marius Aubert, Pierre Clerget and Roger Duchêne. *Compt. rend.* 201, 879–81 (1935), cf. C. A. 29, 1615¹. — The marked effect of EtNO_3 in suppressing knock and diminishing ignition delay is demonstrated with 5% and larger addns. C. A. Silberrad.

Behavior in the engine, storage stability, and storage losses of gasoline. Nikolaus Mayer. *Chem.-Ztg.* 59, 843–5 (1935). — An elementary discussion is given of the factors affecting the behavior of gasoline in the engine, based chiefly on American literature references. Storage stability and losses occurring during storage in tanks are discussed, and definitions are given of the terms potential gum, inhibitor, induction time, gum-inhibiting index and solv. index. D. F. Brown.

Gum in gasoline. A. A. Vuorela. *Suomen Kemistilehti* 8A, 115–18 (1935). — Peroxides, the first products of oxidation of unsatd. compds., form at rates that are greatly affected by small quantities of pos. and neg. catalysts and by the temp. The decompn. of peroxides is probably the source of gum in many instances. The end products are polymerized acids and higher aldehydes and ketones. Gum formation during storage can be prevented for long periods by the addn. of oxidation inhibitors. The deterioration of color can be retarded by some secondary anti-catalysts. E. E. Julkola.

Use of vegetable oils, and more particularly olive oil, for the lubrication of motors. Emile Robbe. *Mat. grasses* 27, 10588–8, 10615–17 (1935). — A discussion of the properties required in motor lubricants and of the suitability of various vegetable oils, especially olive oil, for use in motors. A. Papineau-Couture.

Gas in the "oil laundry." (Recovery of automotive lubricating oil.) L. H. Ronnick. *Industrial Gas* 14, No. 5, 20, 22 (1935). — A machine for refining used oil is made in 5-gallon units, with a batch process. The used oil is mixed with a special refining clay and then forced by air pressure into a gas-heated chamber. When the temp. reaches 618°F., the gas is shut off thermostatically. During the heating, the light ends are distd. and condensed. Steam is then passed through the oil until the temp. falls to 520°F. The oil is drained from the still into a lower chamber, from which it is forced by air at 15–20 lb. gauge pressure through two layers of heavy paper. A new filter

pad is used for each batch. The reclaimed oil has approx. the original viscosity and is claimed to be better than the original oil.

R. W. Ryan

Unusual cutaneous symptoms associated with retention of arsenic. Binford Thorne and C. N. Myers. *Arch. Dermatol. Syphilol.* 32, 181-95 (1935).—A case of As poisoning from handling clay in an oil-refining plant is included. The unburned clay contained 1.19 mg As per 100 g.

O. Hartley

Wood turpentine oil from *Pinus formosana* Hayata. I and II. Veiga Sebe. *J. Chem. Soc. Japan* 56, 1118-41 (1935).—The oil obtained by steam distn showed d_4^{20} 0.8636, n_D^{20} 1.4708, $[\alpha]_D^{20} = -33.80^\circ$, ester value 11.8 (after acetylation 31.02) and acid no. 0.62. It contained 74-5% terpenes and 20% terpene alcs. and their esters. Presence of α - and β -pinene, camphene, cineol, p -cymene, γ -terpinene, α - and β -phellandrene, limonene, dipentene, borneol (I), camphor, α -terpinol (II), fenchyl alc. (III) and acetates of I, II and III is shown. The oil contained no sylvesterene, terpinolene or fenchene. Diterpenes consisted mostly of *thumbeolene* (IV), $C_{20}H_{32}$; slow oxidation of IV in air gave scale-like crystals, $C_{20}H_{30}O$, m. 131-2°. Distn. of wood grown at a high altitude gave an oil (0.05-0.06%), with d_4^{20} 0.8824, n_D^{20} 1.4700, $[\alpha]_D^{20} = +6.23^\circ$, acid no. 2.2, ester value 31.0 (after acetylation 96.1). It contained nearly the same constituents as the l-retatory oil, but a sesquiterpene alc. *sessugoyol* (V), $C_{15}H_{26}O$, m. 137-75°, b. 160-65°, b_{760} 285-9°, with $[\alpha]_D^{20} = +93.38^\circ$ was found. V is a dicyclic alc. and turns to dicyclic sesquiterpene by reduction with HCO_2H or H_2SO_4 . Catalytic reduction of V gives *dihydroseessugoyol*, $C_{15}H_{28}O$ (VI), m. 121°. Acetate of V b. 152-5°, d_4^{20} 0.9922, has n_D^{20} 1.4902, $[\alpha]_D^{20} = +22.19^\circ$, ester value 205. Oxidation of VI with CrO_3 turns it to a viscous sirup, $C_{15}H_{24}O$, b. 158-60°, with d_4^{20} 0.9627, n_D^{20} 1.4807.

K. Kitsuata

The utilization of the larch tree in the U. S. S. R. I. S. Matyuk. *Bull. Applied Botany, Genetics Plant Breeding* (U. S. S. R.), Ser. A, No. 14, 185-94 (1934).—A compilation of data on the turpentine and cellulose content of the larch.

J. S. Joffe

Rubber and bitumens (Barron) 30. Mineral-oil sulfonic acids (Sceda, et al.) 10. Resin acid in the oleoresin of *Pinus sylvestris* (Pischchumuka) 10. App. for removing solid deposits from the mouth of conduits such as vapor outlets of oil-conversion app. (U. S. pat. 2,020,241) 1. Catalysts for hydrogenation (U. S. pat. 2,021,567) 10. Testing the adhesive properties of coatings such as asphalt (U. S. pat. 2,020,891) 13.

Refining petroleum products. Thomas T. Gray (to Gray Processes Corp.) U. S. 2,020,115, Nov. 5. For refining petroleum products such as cracked products contg. unstable hydrocarbon compds., the material in vapor phase is introduced into the lower portion of a treating zone, into the upper portion of which finely divided adsorptive material such as fuller's earth is introduced, and sufficient velocity is imparted to the vapor to retard the fall of the adsorptive material through the vapor. App. is described.

Removing elementary sulfur from petroleum oils. Walter A. Schulze and Lovell V. Chaney (to Philips Petroleum Co.) U. S. 2,020,661, Nov. 12. Oil contg. elementary S is brought into contact, at atm. temp., with an aq. soln. of a polysulfide lower than the tetrasulfide and which is one of the alkali metal or alk. earth metal polysulfides, and the resulting soln. is sep'd from the oil. Refining hydrocarbon vapors such as those of cracked products containing sulfur. Jacques C. Morrell and Gustav Egloff (to Universal Oil Products Co.) U. S. 2,021,739, Nov. 19. The vapors are treated with an aq. soln. contg. free HOCl in the presence of a Zn halide such as $ZnCl_2$ in an amt. greater than that which will dissolve in the acid so that some of the zinc halide remains in the solid phase. U. S. 2,021,740 relates to a process in which the hydrocarbon vapors are brought into contact with an aq. soln. contg. a free oxygenated halogen acid such as

1 HOCl, $HClO_2$, $HBrO_3$, or HIO_3 , as the principal refining agent and in sufficient amt. to effect substantial desulfurization of the vapors.

Refining hydrocarbon oils with solvents. Louis A. Clarke (to Texas Co.) U. S. 2,020,290, Nov. 12. For refining a hydrocarbon oil such as a lubricating oil stock contg. relatively paraffinic and relatively nonparaffinic constituents including naphthenic, aromatic and unsatd. compds., to remove undesired relatively nonparaffinic constituents, the oil is ext'd with a relatively low-boiling aliphatic acyl deriv. of furan such as acetyl furan.

Purifying hydrocarbon oils. Anglo-Iranian Oil Co. Ltd. (formerly Anglo-Persian Oil Co. Ltd.), Ferdinand B. Thole and Stanley F. Burch. Brit. 433,197, Aug. 6, 1935. In the extn. of hydrocarbon oils with liquid SO_2 and similar solvents to remove aromatic and unsatd. substances, the ext. is cooled to 20-40°F. below the extn. temp., whereby paraffinic hydrocarbons are sep'd and removed. The resulting ext., rich in aromatic hydrocarbons, is freed from SO_2 and mixed with motor fuels as an antiknock ingredient. Kerosene is treated in counter current at 16°F. with liquid SO_2 , NH_3 or HCl and the resulting ext., mixed with addnl. solvent, if necessary, is chilled to -20°F. by evap. part of the solvent, the upper paraffinic layer is drawn off and the ext., after removal of SO_2 , is washed with NaOH soln. and then fractionated.

Hydrocarbon-oil conversion. Robert E. Wilson (to Standard Oil Co. of Ind.) U. S. 2,021,471, Nov. 19. For producing material within the gasoline b. p. range, an oil such as a crude or residuum oil is heated in a pipe coil or the like to a conversion temp. above 425° under a pressure above 50 atm., passed into an enlarged chamber maintained under a lower pressure but above 100 lb. per sq. in. and at a conversion temp. but not above that of the oil from the coil. Unvaporized products and vapors are separately removed and the pressure on them is separately reduced, and the unvaporized products, reduced to a temp. below that of the vapors, are passed into a reduced pressure chamber to which also pass vapors from the enlarged chamber which are introduced at a lower level for countercurrent contact. App. is described.

Hydrocarbon oils. Standard Oil Development Co. Fr. 785,348, Aug. 7, 1935. The coloration of kerosenes, lighting oils, etc., is prevented during storage by the addn. of a cyclic org. acid, such as salicylic, anthranilic, protocatechuic, gallic acid and anthracenecarboxylic acids contg. NH_3 or OH .

Cracking hydrocarbon oils. Wm. M. Stratford (to Texas Co.) U. S. 2,020,086, Nov. 5. Hot residue is intermittently withdrawn from a pressure-cracking vessel maintained at cracking temps. and under superatm. pressure and the residue is directed into a surge chamber in which the pressure is materially lower than that of the cracking vessel, residue is transferred at a const. rate from the surge chamber to a stripping still, and vapors are removed from the surge chamber to prevent rise in pressure above a predet'd point, the vapors are condensed to form a distillate, and vapors from the stripping still are conducted to a fractionating tower and the distillate mentioned is introduced into the tower as reflux condensate.

App. is described. Cracking hydrocarbon oils. Boyd W. Morgan (to Universal Oil Products Co.) U. S. 2,020,653, Nov. 12. Oil is heated to a cracking temp. under pressure while flowing in a restricted stream through a heating zone such as a pipe coil and is discharged into the upper portion of an enlarged vertical reaction zone maintained under cracking conditions of temp. and pressure and through which both vapors and unvaporized oil pass downwardly, the unvaporized oil and a portion of the vapors are removed as a mixt. from the bottom of the reaction zone at a rate adequate to prevent any appreciable accumulation of liquid in the reaction zone; the major portion of the vapors is separately removed, unadmixed with unvaporized oil, from the lower portion of the reaction zone but at a point above its bottom; the mixt. withdrawn from the bottom of the reaction zone is introduced into a sepy. zone main-

tained under lower pressure than the reaction zone and there sepd. into vapors and residue, and the said "major portion" of vapors is introduced into the sepg zone at a point above the point of introduction of the mixt mentioned so as to prevent contact of these vapors with said unvaporized oil while combining them with the vapors sepd. in the sepg. zone; the combined vapors are roughly fractionated in the upper portion of the sepg zone to remove high coke-forming components from them, the combined vapors are then removed from the sepg zone and further fractionated to condense insufficiently cracked fractions and resulting reflux condensate is subjected to further cracking treatment, fractionated vapors being finally condensed. App is described.

Cracking hydrocarbon oils Andrew M Wood (to Universal Oil Products Co.) U S 2,021,761, Nov 19 Oil such as a fuel oil is passed through a heating coil in a furnace and vapors are sepd from the oil stream at spaced points along the coil, and incondensable hydrocarbon gas is injected into the oil stream at points immediately following the points of vapor sepn and in the direction of oil flow. App is described.

Cracking hydrocarbons Holding Luxembourgaise pour produits liquides charbons-huiles Fr 784,801, July 25, 1935 Oils, tars, suspensions of coal in oil, etc., are passed under pressure through the annular space between 2 concentric vessels one of which is heated, the liquids being forced to move circularly as well as upwardly on the heated surface. App is described.

Cracking hydrocarbon materials Harry S Reed and Ralph D Lame U S 2,022,054, Nov 26 Material such as a high-boiling oil is subjected to a preliminary heating under pressure and at a temp below its cracking temp, it is passed through a small expansion valved aperture into a tumbling barrel-mill retort and there cracked by heating to a higher temp under a lower pressure while subjected to the combined action of angular grinding elements and of balls such as those of white iron which distribute heat and prevent carbon deposits adhering to the inner surface of the retort; powd material is discharged from the retort so that the process need not be interrupted for cleaning the retort. App. is described.

Cracking oils Georg Zotos Brit 432,736, Aug 1, 1935. In processes for cracking oils wherein the oil is cracked by direct contact with superheated gases or vapors, the temp. of the reaction chamber is controlled by flowing the oil over a heat-exchanger through which the materials to be superheated are passed on their way to the superheater. App. is described.

Vessels such as those for oil cracking with linings of corrosion-resisting metal plates Henry Anderson (to Universal Oil Products Co.) U S 2,020,630, Nov. 12. Structural details.

Dewaxing hydrocarbon oils Robert E Manley and Wm P Gee (to Texas Co.) U S 2,020,693, Nov 12. In the dewaxing of a hydrocarbon oil by filtration in the presence of a comminuted solid filter-aid material such as fuller's earth with obtainment of a filter cake contg. wax hydrocarbons and the filter-aid, the filter-aid material is recovered from the filter cake and reconditioned for further use in treating wax-bearing oil by reducing the filter cake to a substantially fluid mass by admixture with a liquid to form a slurry; the substantially fluid mass is introduced into a vessel contg. a body of water at a temp. such that the waxy hydrocarbons are brought to a substantially liquid condition and form a layer on the surface of the water; steam is injected at substantially the surface of the body of water so that the filter-aid material is displaced from the hydrocarbons into the body of water and the filter-aid material is removed with assoc. water, and dried. App. is described. Cf. C. A. 29, 5260¹.

Removing paraffin from oils. The Sharples Specialty Co. Fr. 784,513, July 23, 1935. The oil is dissd. with a mixt. of a chloro deriv. of a hydrocarbon, e. g., ethylene dichloride, about 75, and a hydrocarbon of a relatively low d. e. g., $C_{12}H_{26}$, about 25%, and the paraffin is then

sepd. by centrifuging at a temp. sufficiently low to ppt. the greater part of the paraffin. App. is described.

Removing paraffin from oils N V de Bataafsche Petroleum Maatschappij. Fr. 785,008, July 31, 1935. See Brit. 430,485 (C. A. 29, 8310¹).

Removing paraffin from oils The Sharples Specialty Co. Fr 785,229, Aug 5, 1935 Paraffin is sepd. from mineral oils by repeated coolings and centrifugings, the oil being heated to about 15° between each operation so as to redissolve at least part of the paraffin. By this means accumulation of small particles which cannot be removed easily by centrifuging is avoided.

Bubble tower apparatus suitable for use in oil refining. Charles H Leach U S 2,020,895, Nov. 12. Structural and operative details.

Treating mineral-oil distillates Adrianus J van Peski (to Shell Development Co.) U S 2,019,772, Nov. 5.

A cracked mineral-oil distillate lighter than a lubricating oil and contg unsepd hydrocarbons and undesirable compds tending to polymerize and condense with formation of readily oxidizable products is subjected to a light polymerizing treatment with use of a quantity of a normally solid polymerizing catalyst such as $AlCl_3$ which is not substantially greater than that necessary to remove undesirable compds without substantially removing unsepd hydrocarbons, and in the presence of a nitro hydrocarbon such as nitromethane and after removing resulting polymers, etc., the remaining oil is subjected to a further polymerizing treatment. App is described.

Refining mineral oils with selective solvents for naphthenic and paraffinic constituents Malcolm H Tuttle (to Max B Miller & Co.) U S reissue 19,763, Nov 19 A reissue of original pat No 1,912,349 (C A 27, 4070).

Apparatus for placing explosive charges in oil wells or the like Chester A Mathey and Paul F Lewis (to American Glycine Co.) U S 2,021,632, Nov. 19 Various mech. and operative details.

Plugging strata in wells such as oil wells Harvey T Kennedy and Howard C Lawton (to Gulf Research & Development Corp.) U S 2,019,908, Nov. 5 There is injected into the strata a liquid halogen compd of S_2 or Te_2 such as $SiCl_4$ or $TeCl_4$ to react with water and produce an insol ppt. in the strata. Cf. C. A. 29, 8317¹.

Sulfonated oils, etc. Frich A Wermicke Brit. 432,797, Aug 2, 1935 See Fr. 771,401 (C. A. 29, 919¹).

Highly viscous oil I G Farbenund. A.-G (Mathias Pier and August Fieschhut, inventors) Ger. 616,833, Aug. 6, 1935 (Cl. 23c. 1). Paraffins or waxes, etc., are subjected to a silent elec discharge or are halogenated and condensed, or are dehydrogenated, split and condensed or polymerized. The products so obtained are treated with liquefied hydrocarbons with critical temps below 250°, at high temps and pressure, to give a viscous oil. Thus, the product obtained by volatilizing cerezin is dissolved in liquid propane and the soln shaken at 90-95° to give a highly viscous oil useful as cylinder oil.

Oil-distilling, -rectifying and -reclaiming apparatus suitable for treating oil used in internal-combustion engines Oliver W Pettit U S 2,020,570, Nov. 12. Various structural and operative details.

Motor fuel Ernest F. Pevere (to Texas Co.) U. S. 2,021,088, Nov 12 The antiknock properties of hydrocarbon liquid motor fuels is improved by adding about 0.5% or more of ethylenediamine or of a hydrate of ethylenediamine.

Gasoline Gasoline Products Co., Inc. Fr. 785,023, Aug. 22, 1935 Relatively heavy hydrocarbons of high b. p. are converted to relatively light hydrocarbons of low b. p. by bringing the former into direct contact, for heat exchange, with the decomposed vapors while preventing them from coming in contact with the residual parts of the decomposed products; causing the unvaporized parts of the heavy hydrocarbons, in admixt. with the heavy condensate formed by partial condensation of the decomposed vapors, to pass into a primary heating zone, in which they are brought to decompn temp. and submitted to conversion; introducing the resulting decom-

posed products into a vaporization zone in which the vapors sep from a liquid residue and these vapors serve for the preliminary heating of the heavy hydrocarbons; causing the uncondensed vapors, after contact with the heavy hydrocarbons, to pass into a fractionating zone in which they sep into light vapors and a reflux condensate; removing and condensing the light vapors and causing the reflux condensate to pass to a 2nd heating zone in which it is brought to decomp. temp and submitted to conversion, and introducing the resulting decomposed products into the vaporization zone with the decomposed products from the primary heating zone. App. is described.

Inhibiting gum formation in cracked gasoline. Herbert G. M. Fischer and Clifford E. Gustafson (to Gasolene Antioxidant Co.) U. S. 2,019,899, Nov. 5. The gasoline is mixed with about 0.1% or less of an inhibitor, such as α -naphthol or α -naphthylamine, comprising α -substituted aromatic condensed ring hydrocarbons in which adjacent nuclei have 2 C atoms in common, some of the hydrocarbons have an amino substituent and others a hydroxy substituent. Cf. C. A. 29, 49337.

Fluid conduit suitable for use with gasoline and oil. Joseph J. Mascuch U. S. 2,019,540, Nov. 5. Structural details.

Purifying aqueous sodium hydroxide solutions containing mercaptides, such as those used for washing gasoline. Robert E. Burk and Everett C. Hughes (to Standard Oil Co. of Ohio). U. S. 2,020,932, Nov. 12. A mercaptide-contg. soln. of NaOH is washed with S and an org. solvent, such as naphtha, which is immiscible with NaOH soln. and in which both S and the reaction product of S with the mercaptide are sol. and the org. solvent soln. is sep. from the aq. NaOH soln.

Electric system for controlling removal of water settings from oil tanks, etc. James A. Jonas U. S. 2,021,655, Nov. 19. Various structural, elec. and operative details.

Lubricating oils. I. G. Farbenindustrie A.-G. Brit. 433,061, Aug. 8, 1935. Liquid hydrocarbons poor in H are treated with a silent elec. discharge and the resulting products that are still poor in H are hydrogenated under elevated temp. and pressure in the presence of a catalyst. Tar or mineral oils, or distillates thereof, or products obtained by destructive hydrogenation or extn. of solid carbonaceous materials may be treated. The initial materials are preferably freed from asphalt and readily polymerizable substances by distn. or pptn. with gas oil, paraffin oil, benzene or liquefied hydrocarbons, or by treatment with H at 150–300°. The content of O compds. should not exceed 5%. A lubricating oil distillate obtained by destructively hydrogenating brown coal and dewaxing and fractionating the product is treated at low pressure in an ozonization or "voltageing" tube at 2000–8000 v. and at a frequency of 500–10,000 Hertz. Diluents, e. g., illuminating oil, may be added. The resulting viscous oil is led at 250–500° over pellets of W sulfide with H under 230 atm pressure. The resulting oil has a low pour point and high viscosity index.

Lubricating oil. Standard Oil Development Co. Fr. 785,839, Aug. 20, 1935. Esters (1–4%) obtained from acids of low mol. wt. and alcs. of high mol. wt. are added to lubricating oils. The alcs. may be those obtained by reducing acids found in natural oils or by oxidizing waxes or paraffins.

Refining petroleum lubricating oils. John M. Musselman (to Standard Oil Co. of Ohio). U. S. 2,020,954, Nov. 12. A mid-continent lubricating stock of about 68 viscosity index is subjected to the simultaneous action of 10% of $AlCl_3$ and 10% of fuller's earth for a half hr. at a temp. of about 175°.

Lubricating oils and greases. Standard Oil Development Co. Brit. 433,257, Aug. 12, 1935. Fr. 785,390, Aug. 8, 1935. Lubricating oils and greases especially for use at high temps. are mixed with an organo metallic compd. contg. a metal of the 2nd, 3rd or 5th group of the periodic system, particularly Hg, Zn, Cd, Al, Ti, Bi or Sb. The compds. contain alkyl, aryl or aralkyl groups which may also contain OH and amino groups. Suitable

compds. are Ph_3Bi , cresyl Ph Zn, $(\alpha-C_6H_5)_2SbPr$, ditolyl Hg, diphenylchloroarsine, C_6H_5HgI , $PhSb$, Mg phenylacetate, cresyl zinc chloride, bromide or acetate, or sulfides, polysulfides, selenides and tellurides.

Hydrocarbon lubricating oils. Curt Schumann and Hanns Ufer (to I. G. Farbenind. A.-G.). U. S. 2,020,703, Nov. 12. The setting point of material such as a hydrocarbon lubricating oil is lowered by adding about 10% (more or less) of a polymerization product of a vinyl ether of an unsat. alc. such as that of oleic alc. (the polymerization product used having a mol. wt. of at least 1000).

Hydrocarbon polymerization products, lubricating oils. Standard Oil Development Co. Brit. 432,310, July 24, 1935.

Purifying and dewaxing oils. Standard Oil Co. Brit. 432,478, July 22, 1935. Mineral oils, e. g., lubricating oils, are treated with 1 or more solvents that remove naphthenic constituents, e. g., phenols, xylidine, furfural, pyridine, Et chloroacetate, cellosolve acetate, α -naphthol, ethylenediamine, glycol acetate, benzonitrile and also with a solvent for the paraffinic constituents, e. g., C_6H_6 , C_6H_8 , C_6H_{10} , C_6H_{12} , C_6H_{14} , iso-butane, iso-pentane, C_6H_6 , C_6H_8 , C_6H_{10} , $MeCl$, CF_3Cl , petroleum ether, naphtha, gasoline, and the resulting paraffinic and naphthenic layers are sep. App. is described.

Dewaxing lubricating oils to produce a low-pour test oil. Merrill Kiser (to Indian Refining Co.) U. S. 2,020,066, Nov. 5. For dewaxing a hydrocarbon oil, acetone, toluene and C_6H_6 are added in such proportions that on cooling to a temp. below that at which the wax is pptd. C_6H_6 is pptd. in cryst. form; the must. is then cooled to effect successive pptn. of wax constituents and of C_6H_6 and the pptd. materials are sep. by filtration of the oil.

Lubricants. The Atlantic Refining Co. Fr. 784,803, July 25, 1935. A lubricant contains a mineral oil and an org. compd. of P, which may be chlorinated, e. g., Pennsylvania lubricating oil 90 and Bu_3PO , or chlorinated tri-cresyl phosphate 10%.

Lubricants. International Hydrogenation Patents Co. Ltd. Fr. 785,651, Aug. 16, 1935. Lubricating compns. comprise a mineral lubricating oil and a "hydroformed" naphtha prep. by destructive hydrogenation of carbonaceous material of high mol. wt. (petroleum ext.) at above 450°.

Hydrocarbon lubricants. Carl Wulff and Wilhelm Breners (to I. G. Farbenind. A.-G.). U. S. 2,020,714, Nov. 12. A small proportion (suitably about 0.5–10%) of a polymerization product having a mol. wt. of at least 1000 and derived from a vinyl compd. contg. O, such as stearic acid vinyl ester, is used with a hydrocarbon lubricating oil or the like for increasing the viscosity and lowering the setting point.

Lubricant suitable for use under high pressures. Bruce B. Farrington and Robert L. Humphreys (to Standard Oil Co. of Calif.) U. S. 2,020,021, Nov. 5. About 1–5% of a thiocarbonate such as amyl benzyl dithiocarbonate or diphenyl monothiocarbonate is mixed with a lubricating oil.

Apparatus for testing lubricants under high pressure and rubbing speed. Gerrit D. Boerlage (to Shell Development Co.). U. S. 2,019,948, Nov. 5. Mech. and operative details.

Apparatus for testing the frictional resistance of lubricants. Geo. L. Neely and Eldred E. Edwards (to Standard Oil Co. of Calif.). U. S. 2,020,565, Nov. 12. Structural, mech. and operative details.

Removing asphalt from oils. Standard Oil Development Co. Fr. 785,349, Aug. 7, 1935. Asphalt is pptd. from oils by adding a primary, secondary or tertiary aliphatic alc. of 4 or more C atoms or a cyclic alc. of a light petroleum hydrocarbon, and a pptg. agent comprising practically anhyd. $MeOH$, $EtOH$, $PrOH$, iso- $PrOH$, di- or tri-hydric aliphatic alcs. or ketones, sepp. the oil phase from the asphalt phase and eliminating the diluent and pptg. agent from the oil phase. A supplementary amt. of pptg. agent, such as $MeOH$, may be added to the sep.

oil phase to effect a further sepn. The oil may be finally treated with PbOH or other selective solvent to improve its lubricating properties.

Asphalt solutions Alexander Wacker Gesellschaft für elektrochemische Industrie G. m. b. H. Brit. 432,406, July 25, 1935. See Fr. 780,112 (C. A. 29, 60144)

Phosphatide preparations suitable for making asphalt emulsions or for use in the textile industries, etc. Albert

Schwieger (to American Lecithin Co.). U. S. 2,020,062, Nov. 12. Phosphatide prepn., such as those from soybeans or fish roes are produced in dry form with an admixt. of at least 10% NaOH.

Extracting rosin from resinous wood Leavitt N. Bent (to Hercules Powder Co.). U. S. reissue 19,749, Nov. 12. A reissue of original pat. No. 1,888,025 (C. A. 27, 1503)

23—CELLULOSE AND PAPER

CARLETON E. CURRAN

Sorption of water vapor on cellulosic materials Edgar Libby and O. Maass. Can. J. Research 13B, 1-10 (1935).—A direct method used for measuring the adsorption of water vapor on cellulosic materials and in which a no. of improvements have been made is described. It is ensured that no vapors other than water are present no matter how long a time is required for the establishment of equilibrium. The adsorption and desorption isotherms of standard cellulose, spruce wood, surgical cotton, Kodak rag cellulose and bleached sulfite have been measured, and the data which indicate the time required for the establishment of true equilibrium have been given. The data of Urcuhart and Williams (C. A. 18, 1754) for standard cellulose determined by an indirect method have been shown to be correct.

J. W. Shupley
Transparent containers from cellulose acetate Tr Baumgartel. Kunststoffe 25, 283-4 (1935).—Production methods are briefly reviewed.

J. W. Perry
Effect of the hemicellulose content of caustic soda solutions used for soaking in the manufacture of viscose II. Soyer. Rustia 10, 499 (1935).—Exptl. data are given to show the disadvantages of the presence of hemicellulose in NaOH liquors used for soaking cellulose in viscose manuf. and the advisability of using liquors containing as little hemicellulose as possible.

Preparation of viscose crepe M. Coynaud and J. Constant. Rustia 8, 447, 523-7, 605-9, 683-7, 765-9, 853-9, 935-67, 1033-9 (1935); 9, 27-31, 115-19, 197, 199, 273, 275, 583-93, 669, 671, 737, 739, 833-9, 897, 899 (1934); 10, 101, 103, 315, 317, 383-7, 459, 491 (1935).—A monograph.

A. Papineau-Couture
Specific gravity of pulpwood. Rudolf Sieber. Papierfabr. 33, Tech. Teil, 305-9, 313-19 (1935).—Using Niehammer's method (C. A. 26, 593), S. in collaboration with a group of pulp and paper mills examined 12,204 samples of German (spruce) pulpwood and 8095 samples of spruce from other sources. In the following summary, the figures in parentheses give the no. of samples, while the others are the mean sp. grs. based on oven-dried wood: Central German woods (893) 0.447; South German woods (2054) 0.452; "Fichtelgebirge" and Bavarian forest woods (1074) 0.459; East Prussian woods (92) 0.42; Austrian woods (554) 0.457; Czechoslovakian woods (3187) 0.445; Roumanian woods (93) 0.394; Russian woods (3127) 0.447; Polish woods (586) 0.438; Baltic woods (430) 0.450; Finnish woods (368) 0.453; Swedish woods (450) 0.453. The mean sp. gr. for all spruce samples examined was 0.448. These figures are for representative boles used in the paper industry. A composite graph shows that the sp. gr. range varies from 0.30 to 0.62. In general when the sp. gr. is plotted against the width of the annual rings, smooth curves result, the d of the wood dropping as the ring width increases. However, the same ring width may lead to very different sp. grs. depending on the formation of the crown and the root system of an individual tree. The mean sp. gr. of 699 samples of Scots pine was 0.505. That of 608 samples of aspen was 0.454. S. gives 19 graphs.

A. Papineau-Couture
A new control method for (following the course of) the digestion in sulfite pulp production. Celestin Haider,

Papierfabr. 33, Tech. Teil, 321-9, 332-5, 341-4, 347-51 (1935).—This method depends on a rapid, quant. sepn. of Ca lignosulfonate I from SO₂ and the sugars of sulfite liquor. After a series of orientating expts., which are fully described, the following technique was developed: the liquor drawn from the digester is treated very gradually with CaCO₃ in excess, heated to 80-100°, and shaken vigorously until no further CO₂ is evolved. The mixt. is then filtered or centrifuged until the liquor is clear. After cooling to 20°, 2-cc. portions of this soln. are pipetted off, and each is treated with 8 cc. 95% alc. (added in 0.5-cc. portions with const. stirring). When the pptn. of I is complete, the mixt. is centrifuged at 1000 r. p. m. for 5 min., and the alc. soln. decanted. The solid residue is stirred to a paste with 95% alc. (amts. not specified) and the decantation repeated. When I contains little residual sugar, the addn. of 0.01-0.02 g. Kieselsol may be required to effect complete flocculation. The combined mother liquors contain the sugars. The solid residue I, freed from alc. by heating *in vacuo* and finally at 100-5°, is dissolved in 4 cc. H₂O at 20°, and the w of the soln. detd. by means of an immersion refractometer, each graduation of which corresponds to a definite wt. of I. A table shows the relation between g. I of I and the refractometer readings. Corrections for vol. changes and slight losses due to soly. in alc. are also noted. From these, a simple formula was devised permitting the computation of g. I per 0.1 l. of the original liquor. Known solns. of I (with and without sugar) indicate that errors range from -4.0 to +2.3% (until the I content drops to 0.625 g. per 100 cc. in the original liquor). By making w readings on the SO₂-free liquor, and subsequently detg. I, H. was also able to est. the sugar content of such liquors. These agree (within ± 5%) with values found by Glassmann's Hg-(CN)₂ reduction method (cf. Ber. 39, 503 (1906)). The courses of 7 digestions (yielding pulps with Sieber no. ranging from 22 to 62) were followed by using the above procedure. The results are tabulated and expressed graphically. The percentage of I in the spent liquor is correlated with the percentage of lignin and the Sieber no. of the pulp, and, provided a graph has once been drawn for a certain digester and a definite set of cooking conditions (in which the Sieber no. has been plotted against the I content), the former may always thereafter be estd. at any desired stage of the digestion, by detg. the I in the sulfite liquor. Eighty references.

Louis E. Wise
The German pulp and paper industry viewed from the standpoint of domestically available raw materials. Roll and Runkel. Zellstoff-Faser 32, 145-51 (1935).—At present about 3 million solid measures (fm.) of German wood are used as raw materials by the paper industry, whose requirements approximate 8 million fm. R. shows that this deficiency can be met largely in Germany by increasing pulp yields, utilizing other raw materials (like beech) and those wood wastes that are now used in mfg. building boards and for fuel, and by substituting Scots pine for spruce in mfg. mine timbers. These questions are discussed in some detail from the viewpoint of the forester and the industrialist. Thirty-eight references.

Paper industry of Japan. D. N. Tyagar. Bumazhaya Prom 14, No. 9, 69-73 (1935). Chas. Blanc
Stock used for the manufacture of paper impregnated

with synthetic resin Fritz Ohl *Wochs. Papierfabr.* 66, Tech. Teil, 696-8(1935).—The best paper used in the manu. of *elec. insulating board* usually contains strong, carefully washed soda pulp. A typical paper showed the following properties (the first figures being those taken in the machine direction, while those in the cross direction are listed in parentheses): breaking length, 9600 m. (6500 m.), double folds, 3000 (2500), stretch 3% (6%); bursting strength 3 kg./sq. cm. A satisfactory sample of 50 g./sq. m. Manila paper (which is less frequently used) was 0.06 mm. thick, showed 6300 m. breaking length, 3% stretch, 3000 double folds and 2.8 kg./sq. cm. bursting strength. When plates or boards are formed, both sides of the sheet are impregnated and a series of stacked sheets are laminated together under heat and pressure. The paper should have a relatively high d. and absorptive capacity, and should be smooth on one side only. Rosin but not latex size may be used. When molded articles are to be formed, paper of lower absorptivity and wt./sq. m. may be employed and only one side is impregnated.

Cellulose Max Baczewski Austrian 142,761, Sept. 10, 1935 (Cl. 55c). In the manu. of cellulose from wood, straw, peat, etc., by the sulfate, sulfite or soda process, a wetting agent which is inert to cellulose and stable under the reaction conditions, e. g., a sulfone ester of a higher polyhydric aliphatic alc., is added to the digesting liquid and (or) to any of the solns. ordinarily used for pretreating the cellulose material.

Alkali cellulose Oscar Kohorn (trading as Oscar Kohorn & Co. Maschinenfabrik) and Rudolf Brandes. Brit. 433,414, Aug. 14, 1935. See Fr. 782,396 (C. A. 29, 7073²).

Alkali cellulose I. G. Farben und A.-G. Fr. 784,955, July 30, 1935. The lye and moist cellulose are mixed in a fiber separator, mixer or sulfuration drum, the d. of the cellulose representing more than 25% of the mixt. The lye is finely divided as a fog and the mixt. is cooled below 20° during the mercerizing.

Bleaching cellulose materials. Imperial Chemical Industries Ltd. Fr. 785,002, July 31, 1935. Wood pulp, etc., is treated with a sulfonic acid or sulfonic acid ester, such as cetyl sulfonic acid, oleyl ester of β hydroxyethanesulfonic acid, and sulfonic esters of decyl, dodecyl and octadecyl alcs., or their alkali or NH_4 salts, before, during or after treatment with a bleaching agent.

Cellulose foils L'accessoire de precision Brit. 432,772, Aug. 1, 1935. Transparent nonmisting partitions suitable for gas-mask windows, optical instruments, etc., are prep'd by completely satg. a foil of regenerated cellulose with a liquid so that the foil cannot swell further and fastening it while said to a frame like structure so that contraction on drying is prevented or minimized. In a modification, the said foil is fastened over the whole of the contacting surface of a transparent rigid carrier such as a sheet of glass, safety glass, celluloid, etc., by means of an adhesive, e. g., a soln. of gelatin in dil. AcOH and alc. The foil is preferably satd. by immersion in H_2O at about 50° for 15 min.

Cellulose products Henry Dreyfus U. S. 2,019,598, Nov. 5. The cellulose and lignin components of material such as spruce chips are sep'd. by impregnating the material under pressure with an aq. soln. comprising bisulfites such

as those of an alkali, Turkey-red oil and free SO_2 , in which the proportion of free SO_2 to combined SO_2 is less than 1.2, and cooking the impregnated material at temps. of 100-160°. Cf. C. A. 29, 589³.

Finishing and softening cellulose products Deutsche Hydrierwerke A.-G. Fr. 784,966, July 30, 1935. Ether or esters of glycerol or other polyhydric alcs. or cyclic ethers which contain one or more atoms of O in the ring or aliphatic alcs. of high mol. wt. or mixts. of more than one of these are used. Examples are Me, lauric, decetyl, diphenyl and triphenyl ethers of glycerol, acetate, laurate or adipic ester of glycerol, triacetin, acetone-glycerol, acetone-arabitol, acetophenone-glycerol, trihydrofurfuryl acetate, furfuryl benzoate and cyclohexanone-glycerol phthalate, cetyl, lauric, octadecyl and myristic alcs.

Films of cellulose derivatives Kodak-Pathé. Fr. 785,639, Aug. 14, 1935. One of the faces of films made from org. esters of cellulose is superficially hydrolyzed to prevent curling. In photographic films the face other than that coated with emulsion is hydrolyzed.

Purifying cellulose ethers David Trull and Imperial Chemical Industries Ltd. Brit. 433,397, Aug. 14, 1935. Cellulose aralkyl ethers are purified by treatment, preferably at elevated temps. with a medium contg. an alkali metal bisulfite, said medium being capable of swelling but not dissolving the cellulose ether. In an example, benzylcellulose is treated with 2 consecutive portions of a mixt. of a satd. aq. soln. of NaHSO_3 , alc. and C_6H_6 , then washed until the pH of the washings is 8-10. The purified ether, when made into a plastic and tinted with titanox. and a mixt. of Rhodamine GS and Rhodamine 6GBS, may be used to manu. dental blanks.

Esterifying fibrous cellulose Carl J. Malm and Charles L. Fletcher (to Eastman Kodak Co.) U. S. 2,019,920, Nov. 5. Cellulose such as cotton linters is pretreated with a lower aliphatic acid (such as propionic and acetic acids in the production of cellulose acetate-propionate) and is then esterified and there is added, after the mixing of the esterifying materials but before soln., an unsubstituted aliphatic ether having a b. p. above 70° such as isomyl ether which serves to expedite the process. Cf. C. A. 29, 4174¹.

Cellulose ester compositions for films or sheets Stewart J. Carroll and Henry B. Smith (to Eastman Kodak Co.) U. S. 2,019,892, Nov. 5. A cellulose ester such as cellulose acetate is plasticized with butyl or isomyl carbamate.

Stabilizing organic acid esters of cellulose Carl J. Malm and Charles L. Fletcher (to Eastman Kodak Co.) U. S. 2,019,921, Nov. 5. An ester such as cellulose acetate is treated, at a temp. of about 35-65°, in a bath essentially consisting of acetic, propionic or butyric acid and a liquid aliphatic hydrocarbon material such as a petroleum distillate having a b. p. of about 65-90°.

Cellulose acetate compositions Geo. W. Seymour (to Celanese Corp. of America) U. S. 2,020,338, Nov. 12. Ethylene formal is used as a volatile solvent with cellulose acetate having an acetyl value above 56% in forming products such as filaments or films, etc.

Precipitating cellulose acetate from "acid dope." Hobart O. Davidson (to Viscose Co.) U. S. 2,021,937, Nov. 19. An "acid dope" from acetylation of cellulose is extruded as a stream below the surface of a bath of dil. aq. pptg. liquid, and the ppt. is simultaneously sheared into pellets of uniform size. App. is described.

Decorative foil from "cellulose dope." Harold K. Haviland (to Celluloid Corp.) U. S. 2,020,684, Nov. 12. Differently colored "dopes" such as those of cellulose acetate are introduced at various points into various sections of a hopper from which the "dope" is cast.

Use of p-phenylacetophenone as a crystalline material with cellulose acetate or the like. Thomas F. Murray, Jr. (to Eastman Kodak Co.) U. S. 2,019,720, Nov. 5. About 20% of p-phenylacetophenone may be used with cellulose acetate in forming sheets, etc., of cryst. or nacreous appearance.

Apparatus (with adjustable rollers) for manufacture of

films and foils from cellulose acetate solutions, etc. Edward Kinella (to Celanese Corp. of America). U. S. 2,020,687, Nov. 12. Structural, mech. and operative details.

Cellulose triacetate. Ernst Berl. Fr 785,462, Aug. 10, 1925. A partial reformation of the acetyl index of cellulose triacetate is effected by heating it with an alc capable of causing it to swell or having a solvent action thereon in the presence of a small amt of esterification catalyst such as H_2PO_4 or H_2SO_4 . The alc is preferably a simple alc, such as $EtOH$, $PrOH$, $iso-BuOH$ or $AmOH$, or a glycol or a cyclic alc such as benzyl alc or cyclohexanol.

Reupening cellulose triacetate. The Dretillers Co. Ltd., Harold A. Auden, Hanns P. Staudinger and Philip Eaglesfield. Brit 433,785, Aug. 16, 1935. Cellulose triacetate (I) is treated to modify its soly by subjecting it to regulated heating in solid form, i. e., without first dissolving or suspending in a liquid medium, with a substantial quantity of an alc having a swelling but no solvent action, e. g., Et , Pr , $iso-Bu$, Am alcs or ethyleneglycol, or of an alc having a solvent action, e. g., cyclohexanol, benzyl alc, to serve as a retro-acetylating agent thereof in the presence of a small amt of an esterifying agent, e. g., H_2PO_4 , H_2SO_4 . The extent of the de-esterification is controlled by the time of treatment, temp and nature of the alc and catalyst. Among examples, (1) I is treated 2.5 hrs at 100° with $BuOH$ 150 and 80% H_2PO_4 , 15 parts, the sepd acetate is substantially unchanged in Ac value, is still insol in Me_2CO but the viscosity in methylene chloride is increased by about 20%, and (2) I is treated for 45 hrs at 40° with $BuOH$ 100 and 20% $HClO_4$, 2 parts, the acetate, after sepn, is completely sol in Me_2CO .

Benzylcellulose. Alfred S. Leveley and Frederick C. Randall (to Imperial Chemical Industries Ltd.). U. S. 2,019,529, Nov. 5. A water-sol, high mol wt alkylated naphthalenesulfonic acid or Turkey-red oil is incorporated with a mass resulting from benzoylation to facilitate washing and purification.

Benzylcellulose. Edward Ditt (to Hercules Powder Co.). U. S. 2,020,691, Nov. 12. In sepg benzylcellulose from a crude benzylcellulose reaction mass, a water-sol, soap is added and the materials are formed into a foamy mass by malaxation before extrn with org solvents such as $MeOH$ and water.

Centrifugal machine for nitrating cellulose. C. G. Haubold A.-G. Ger 619,499, Oct. 1, 1935 (Cl 826.4).

Carrier supports for making films from cellulose derivatives, gelatin and other plastic substances. Gennady Frenkel. Brit. 432,846, Aug. 2, 1935.

Laminated opaque regenerated cellulose material. Roger N. Wallach (to Sylvania Industrial Corp.). U. S. 2,022,061, Nov. 26. A flexible material comprises a transparent sheet of regenerated cellulose having on each side a heat-fusible coating and laminated on each side with a sheet of regenerated cellulose impregnated with a substance rendering it opaque and giving it a mat appearance (the sheets being held together by the heat-fusible coating).

Viscose and cuprammonium cellulose spinning solutions and their products such as filaments or films. Rudolph S. Bley (to North American Rayon Corp.). U. S. 2,021,849, Nov. 19. An alkylated naphthalene such as an ethyl- or butyl-naphthalene is added, for the production of a soft-luster product. Various examples are given.

Clarifying viscose centrifugally. Henri Walch (to De Laval Separator Co.). U. S. 2,019,944, Nov. 5. The viscose is rapidly heated to a temp. below its point of instantaneous coagulation, and in this condition is clarified in a high-speed centrifugal purifier, and is subsequently cooled at a rate controlled according to the saline index which is to be given to the viscose. App. is described.

Spinning nozzles for supplying viscose for the manufacture of films. Ernest Bleibler. Brit. 432,880, Aug. 6, 1935.

Device for equalizing variations in the rate of flow of spinning solutions delivered by spinning pumps. Hans Dannenberg (to I. G. Farbenind. A.-G.). U. S. 2,020,

633, Nov. 12. A thick-walled rubber tube forms part of the duct conveying the soln. from the pump to the spinning nozzle, the tube having a wall thicker than its bore and its exterior being subject to atm. pressure.

Colored viscose articles. La soie artificielle de Valenciennes and Leonard M. Glazener. Fr. 785,752, Aug. 19, 1935. An azo component is added to the spinning soln. and the dye developed by coupling after spinning, or diazotization and coupling may take place after the spinning.

Desulfuring viscose rayon. Vereinigte Glanzstoff Fabriken A.-G. Brit 432,992, July 31, 1935. The freshly spun filament from an acid spinning bath is washed, immediately after its pptn, with dild, and as far as possible, salt free H_2SO_4 in individual filaments over a filament stretch of several meters, then washed preferably with hot H_2O and dried in known manner. Any S left may be easily removed, e. g., by a simple cleaning with soap such as is often involved in the dyeing or prepn of the products. App. is described.

System for drying rayon cakes. Algemeene Kunstzijde Unie N. V. Ger 617,958, Aug. 29, 1935 (Cl 29a 8 08). Addn to 562,001 (C 27, 843).

Artificial products such as rayon. Leon Lilienfeld U. S. 2,021,843, Nov. 19. A product obtained from treating viscose with a trithiocarbonic acid ester of a polyhydroxylic alc is formed, in soln in a solvent, into a shape such as a filament and then treated with a reagent which has both a coagulating and a plasticizing effect. Numerous examples and details are given. U. S. 2,021,864 relates to a process in which viscose is treated with at least one halogen-contg. org. reagent (other than a halohydrin or a halofatty alc) which reacts on viscose to cause substitution of a hydroxyl H atom in the cellulose radical by an org. radical, the resulting soln. being then shaped and treated with a coagulating and plasticizing material. Numerous examples are given.

Colored rayon. Courtaulds Ltd. Fr 785,343, Aug. 7, 1935. Colored rayon is produced by spinning viscose contg. a leuco deriv. of a vat dye, the dye being kept in soln in the viscose by the addn of a glycol ether, e. g., Et or Me ether of ethylene- or diethylene-glycol.

Wet treatment of formed rayon filaments. August Hartmann, Walter Hoeslinghoff and Karl Meyer-Gaus (to American Bemberg Corp.). U. S. 2,020,657, Nov. 5. Various details of app. and operation.

Artificial materials such as threads or films. Leon Lilienfeld U. S. 2,021,861, Nov. 19. A soln of a hydroxyalkyl cellulose xanthate is formed into the desired shape and the shaped soln. is treated with a coagulating agent. Numerous examples are given. U. S. 2,021,862 relates to a process in which a product obtained from viscose and a halogen deriv. of a polyhydroxylic alc, such as a chlorohydrin is shaped and treated with a coagulating agent which has a plasticizing effect on the coagulated material. Numerous examples are given.

Artificial filaments, etc. British Celanese Ltd. and Percy I. C. Sower. Brit 433,793, Aug. 21, 1935. Filaments, ribbons, etc., having a basis of cellulose acetate or other org. deriv. of cellulose are obtained by a wet spinning process in which the shaped materials are coagulated in a medium contg. a solvent or plasticizer for the cellulose deriv., and the wet materials are stretched and then allowed to shrink under the action of the solvent or plasticizer. In an example, cellulose acetate soln. is extruded into an glycol monoacetate and the coagulated filaments pass round a stretching roller and under a 2nd roller dipping into a bath of H_2O , then round a 3rd roller rotating more slowly than the 1st so as to allow shrinkage and finally to a take-up device.

Artificial filaments, yarns, films, etc. British Celanese Ltd. Brit. 433,219, Aug. 12, 1935. A soln. of an org. deriv. of cellulose contg. an oil, e. g., mineral oils, petroleum jelly, olive or castor oil and (or) a precipitant, e. g., xylene, gasoline, $PhMe$, C_6H_6 , kerosene, together with a soap and (or) tetrahydronaphthalene is spun. The soln. may contain also sulfonated oils or sulfonated aromatic

acids, fillers, pigments, dyes, lakes, fire retardants, plasticizers and sizes

Manufacture of artificial filaments such as those formed from cellulose acetate, etc. by the evaporative spinning method. Edward Kinsella and Reginald H. J. Riley (to Celanese Corp. of America) U. S. 2,019,609, Nov. 5 Various details of app. and operation

Apparatus (comprising a series of digesters) for the continuous manufacture of cellulose. Lubomir Lemberger Austrian 142,891, Sept. 25, 1935 (Cl. 55c)

Centrifugal apparatus for recovering fibers, etc., from waste waters from the manufacture of paper Firma J. M. Voith Austrian 142,807, Sept. 25, 1935 (Cl. 55a)

Apparatus for pulping wood Johannes Tamaschke Ger. 593,533, Sept. 17, 1935 (Cl. 55a. 1 01)

Apparatus for testing paper pulp. Alfred Schopper, U. S. 2,022,010, Nov. 20 Various structural, mech., and operative details of an app. with a strainer vessel.

Treating paper pulp for delignification before bleaching James S. Boone (to Hooker Electrochemical Co.) U. S. 2,021,612, Nov. 19 An aq. suspension of material such as wood pulp is treated with an elemental halogen such as Cl₂ in the presence of CaCO₃ and lime, the lime being proportioned to the halogen so as to maintain a nonalk. condition in the suspension. App. is described.

Apparatus for introducing reagents into liquid suspensions as in adding chlorine to aqueous paper pulp suspensions. Kenneth E. Stuart (to Hooker Electrochemical Co.) U. S. 2,021,616, Nov. 19 Various structural and operative details

Tubing of fibrous material such as sulfite screenings and ground wood pulp Edmund Burke. U. S. 2,019,890, Nov. 5. A tube which is suitable for various purposes is constructed of a single band of feltlike fibrous material spirally wound upon itself and compacted into the form of a series of continuously overlapping convolutions. App. and various mfg. details are described.

Paper Harold R. Rafton (to Raftold Process Corp.) U. S. 2,020,324, Nov. 12. In the manuf. of sized paper filled with alk. filler, there is applied to a fibrous web contg. alk. filler substantially water-insol. thermoplastic sizing material, such as paraffin in soln. or emulsion, in sufficient amt. to have a sizing effect on the paper.

Paper-making apparatus and sizing device Wm. P. McCorkindale (to McCorkindale Co.) U. S. 2,021,125, Nov. 12 Various structural and operative details

Device for use with paper making apparatus for indicating variations in weight of the paper. Ambrose Idall U. S. 2,020,001, Nov. 3 Various structural, mech. and operative details

Automatic control devices for paper-machine driers Norman B. Gibbs U. S. 2,020,056, Nov. 5 Various mech. and operative features.

Vertical type drier for paper webs Carl E. Berry (to Reloit Iron Works). U. S. 2,019,649, Nov. 5 Structural, mech. and operative details

Apparatus for supplying web material as in making pasteboard box-blanks Cutler D. Knowlton (to Hoag-Sprague Corp.) U. S. 2,020,419, Nov. 12. Structural and mech. features

Endless cloths or wire fabrics for use in paper making, etc. Hans Kurtz U. S. 2,020,894, Nov. 12 Various mfg. details are described.

Apparatus for testing the smoothness of paper or like sheet materials Ralph A. Masten (to International Paper Co.) U. S. 2,019,541, Nov. 5 The material is held against a smooth surface between which and the sample to be tested air is passed at substantially const. pressure, and the time required for a unit quantity of air to pass is indicated

Hollander for comminuting scrap paper Maschinen-

bau-Werkstätte Niefen G. m. b. H. Ger. 619,102, Sept. 24, 1935 (Cl. 55c. 8 10).

Hollander knife rolls Albert Elsenhans Ger. 619,427, Sept. 30, 1935 (Cl. 55c. 4 10) Structural features are described.

Sizing fibrous material for making paper, etc. Aktiebolaget Defibrator. Brit. 432,914, Aug. 6, 1935 See Fr. 768,181 (C. A. 29, 603).

Sizing paper. Louis L. Larson (to E. I. du Pont de Nemours & Co.) U. S. 2,022,004, Nov. 26 For increasing the water repellency of absorbent materials such as paper, they are treated with an aq. emulsion of polyhydric alc.-polybasic acid resin having an acid no. of 25 to 64 and contg. in combined form about 65-90% of a polyhydric alc. ester of an aliphatic monocarboxylic acid of the formula RCOOH, in which R is an alkyl radical contg. not less than 15 C atoms, such as a product from glycerol, stearic acid and phthalic anhydride

Apparatus for moistening paper bands Jagenbergwerke A.-G. Ger. 618,773, Aug. 10, 1935 (Cl. 55c. 3)

Watermarking composition John C. Boyer (to National Liting Exchange). U. S. 2,021,141, Nov. 19 An emulsion of a suitable printing ink consistency comprises Canadian balsam 8-20, turpentine 5-17, finely divided substantially colorless mineral matter such as diatomaceous silica 8-25 and castor oil 12-30%, emulsified with a slightly alk. aq. soln. of borax and contains a substantially colorless indicator such as phenolphthalein reactive to both acids and alkalis, so that the compn. is suitable for "safety paper" for checks, etc.

Crinkled paper, etc. Rudolf Heilmann. U. S. 2,019,903, Nov. 5 Various mech. and mfg. details are described

Paper for checks, etc. Begolt Louis Levet-Arnaud. Fr. 785,574, Aug. 13, 1935 The falsification of documents is prevented by introducing into the paper used or applying to its surface substances contg. one or more heterocyclic rings having one or more S atoms, in combination or not with oxidation catalysts or substances favoring oxidation. Thus, dehydrothio-p-toluidine, accompanied or not by alkali ferrocyanide and sulfite, may be used. These may be added to the ink used instead of applying them to the paper

Laminated printing paper. Carl Winkler. Ger. 619,052-3, Sept. 20, 1935 (Cl. 55f. 15.20). A paper sheet, supersized sufficiently to be impermeable to printing ink, is interposed between sheets of ordinary sized paper (619,052). According to Ger. 619,053, the supersized middle sheet may contain pond. cork.

Cigarette paper La Cellophane, Soc. anon. Fr. 785,202, Aug. 3, 1935 A paper which burns without odor or smoke is made of viscose to which is added paraffin oil or liquid petrolatum oil

Wrapping paper for cigarettes, etc. Philip Hornstein U. S. 2,020,646, Nov. 12 A cigarette paper which will retain its shape during and after the burning of the cigarette filler and which is substantially impervious to nicotine is produced by adding finely ground asbestos to the pulp, boiling to produce a homogeneous mass and adding gum acacia during the boiling

Paper board with identification marks Charles C. Colbert, Geo. E. Preston and Lloyd C. Daly U. S. 2,019,845, Nov. 5. Identification marks are placed under a clay coating and are adapted to be rendered apparent by wetting the clay coated side of the board.

Coating fibrous materials such as paper cartons to render them water repellent and antiseptic Irwin Stone. U. S. 2,021,137, Nov. 10. A wax coating such as a paraffin and oil mixt. is used contg. a small proportion (suitably about 0.1%) of 8-hydroxyquinoline, its benzoate, palmitate or acetyl deriv. or the like

24—EXPLOSIVES AND EXPLOSIONS

CHARLES E. MUNROE AND C. G. STORM

A photographic investigation of flame movements in gaseous explosions VII The phenomenon of spin in

detonation Wm. A. Bone, Reginald P. Fraser and Wm. H. Wheeler Trans. Roy. Soc. (London) A253, 29-68

(1935); cf. C. A. 26, 1788—The phenomenon of spin in gaseous detonations previously described (C. A. 26, 1788) has been further investigated with an improved form of the Fraser high-speed camera which permits accurate measurement of flame speeds occurring in as short a time as 0.00001 sec. The expl. work has been done under a variety of conditions to study the influence of tube diam. and shapes, and of elec. and magnetic fields, upon detonation in a $2\text{CO} + \text{O}_2$ medium. The explosive mixt. was investigated both moist and dry, and both with and without the successive adds. of electrolytic gas. The results of these recent expls. lead to the new conception of the detonation wave in gaseous explosions as a more or less stable assocn. of an intensely radiating flame-front with an invisible shock wave immediately ahead of it. The detonation wave is the propagation through the gas of an intense combustion set up in the shock wave by radiation from an assoc. flame front, spin occurring whenever the radiation from an attenuated flame-front causes localized intensive excitation of mols. in the shock wave. As a consequence the head of detonation begins to rotate and follow a spiral course along the walls of the explosion tube. All influences that destroy the spinning head (elec. and magnetic fields) cause the spin to cease and also the sep. of the flame-front from the assoc. shock wave so that the flame-speed falls and detonation ceases. The phenomenon is restored by reducing the distance between the still radiating flame-front and its formerly assoc. shock wave. Selected photographs illustrate the phenomena described.

Explosives, blasting cartridges Soc anon d'Arendonck Brit 432,850, Aug 2, 1935 Potassic feldspar is used to prevent ignition of inflammable gases or materials in blasting. It is preferably mixed with a K salt or known ingredients, e.g., CaF_2 , NaCl , CaCO_3 . A binder may also be added, e.g., clay, portland cement, plaster of Paris. One example contains orthoclase 55, K_2SO_4 35 and plaster of Paris or clay 10%. The compn. is preferably made into a sleeve surrounding the explosive but may be incorporated, e.g., up to 30%, in the explosive which may be a mixt. of nitroglycerin 11, dinitrotoluene 1, NaCl 22, NH_4NO_3 59, cellulose 6.85 and lamp black 0.15 parts.

Blasting cartridges James Taylor and Imperial Chemical Industries Ltd Brit. 431,935, July 15, 1935 In cartridges comprising a gas-generating charge in a pressure-resistant casing that vents the gases at a certain pressure, the charge consists of a mixt. of an alkali metal nitrite with 1 or more NH_4 salts, which may be powd. or granular and may include small amts of other ingredients, e.g., moisture, borax, mineral jelly. In Brit. 431,936, July 15, 1935, the charge consists of a liquid medium including constituents capable of exothermic gas-evolving decompn., e.g., a soln. of NH_4NO_3 and (or) NH_4NO_2 , or mixts of alkali metal nitrates or nitrites with 1 or more NH_4 salts and (or) urea, or a mixt. of H_2O_2 and alc., together with means for initiating the decompn.

Blasting cartridges Alfred E. Lance Brit. 432,308, July 24, 1935 An absorbent for liquid O for blasting

cartridges comprises cellulose materials, e.g., sawdust, cork, peat, mixed with hydrocarbons having high b. ps. but of pasty consistency at ordinary temps., e.g., petroleum jelly, "Vaseline." Up to 20% hydrocarbon may be used and other ingredients may be added, e.g., MgCO_3 , kieselguhr, in amt. from 10 to 15% to prolong the life of the cartridge while reducing its strength, or Al or Fe-Si to increase its strength. NaCl and salts contg. H_2O of crystn. may be used as temp.-reducing ingredients.

Blasting cartridges The Lightfoot Refrigeration Co. Ltd and Alfred E. Lance Brit 432,338, July 24, 1935. An absorbent for liquid O for the cartridges comprises cellulose materials, e.g., sawdust, peat, cork, graded to pass through a 36-mesh screen but not through a 60-mesh screen. Metallic ingredients, e.g., Al, Fe-Si, when included, are similarly graded. Other ingredients, e.g., MgCO_3 , kieselguhr, may also be used to the extent of 10-15%.

Priming compositions Joseph D McNutt (to Winchester Repeating Arms Co.) Brit 432,096, July 19, 1935 Alkali or alk. earth salts of dinitrophenylazide are used in priming compns. instead of the Pb salt as described in Brit 406,228 (C. A. 28, 4603). The K salt is prepd. by dissolving diazodinitrophenol in Me_2CO and adding an aq. soln. of KN_3 , the temp. being maintained below 50° . The K salt is pptd. and filtered. Other salts are prepd. similarly. Cf. C. A. 29, 6274.

Smoke-producing and wind-indicating cartridges Francis Rankin and Imperial Chemical Industries Ltd. Brit 432,438, July 20, 1935 A cartridge for discharge from a firearm from an aircraft toward the ground comprises, in addn. to the smoke-producing compn., a compn. that is ignited with the smoke-producing compn. when the cartridge is discharged and remains incandescent for a sufficient time to enable it to reignite the smoke-producing compn. if this is extinguished on landing. The incandescing compn. may be a mixt. of equal parts of Si, Fe-Si, Ca silicide or Zr with KNO_3 , NaNO_3 , KClO_4 , or KMnO_4 , baked hard.

Safety detonating device for use in torpedoing oil wells Haskell M. Greene U. S. 2,020,410, Nov. 12 Various structural details of a device including clockwork and an elec. control.

Lead salts of dinitrosalicylic acid Willi Brün (to Remington Arms Co.) U. S. 2,021,407, Nov. 19 Normal and acidic Pb salts of dinitrosalicylic acid are produced by adding a soln. of a Pb salt such as the nitrate, acetate or tartrate to a soln. formed from dinitrosalicylic acid and NaOH . The normal Pb dinitrosalicylate has a sensitiveness to shock substantially equal to that of Hg fulminate.

Miners' safety lamps Thomas A. Jones Brit 433,577, Aug. 16, 1935

Miners' and other safety lamps Ernest A. Hailwood Brit 430,721, June 24, 1935, divided on 432,962 and addn. to 419,594 (C. A. 29, 3164), 431,718, July 15, 1935, and 432,062, July 31, 1935

Paper matches Nels H. Nelson U. S. 2,022,088, Nov. 26 Various details of app. and operation

L. A. OLNEY

Further notes on the suitability of metals for dyeing machinery. J. G. Grundy. *J. Soc. Dyers Colourists* 51, 377-84 (1935); cf. C. A. 23, 2829—An investigation to det. the advantages of stainless steels for dyeing machinery as compared with wood, Fe, Cu, bronze, brass, monel metal, etc. Staybrite FDP differs in compn. from the original Staybrite in having a content of 0.50-1.0% Ti. This brand has no deleterious effect on dyes. Staybrite FMB differs from the FST and FDP brands in having a content of 2.3% Mo. Tables show the behavior of different metals under various treatments. W. H. Boynton

The dyeing of bathing suits O. Fuchs *Texts* 13,

559 (1935)—Attention is drawn to a no. of dyes of J. R. Geigy, Basel, which are suitable for this class of goods.

A. Papineau-Couture

Effect of bleaching and dyeing conditions on the fastness to light of dyeing on albene Jean Rolland. *Texts* 13, 401; *Rusta* 10, 447 (1935)—Dyeings on albene (lusterless acetate rayon) which has been bleached with KMnO_4 and Na_2SO_3 are affected by light, because of incomplete elimination of Na_2SO_3 . This defect is overcome by using $\text{H}_2\text{C}_2\text{O}_4$ instead of Na_2SO_3 . This treatment is shown to have an adverse influence on the tensile strength and elongation of the fabric.

A. Papineau-Couture

The fading of dyed textiles—factors which influence it: instruments for testing fastness A. C. Goodings *Am. Dyestuff Repr.* 24, 663-5. *Am. Silk Rayon J.* 54, 33-4, 54-5 (Nov., 1935).—Sunlight, humidity and temp. are among factors influencing the fading of dyed textiles. Instruments for testing color fastness are discussed.

Notes on the inner and outer layers of silk cocoons. R. Trunokaye *J. Soc. Dyers Colourists* 51, 384-7 (1935).—It is shown that the outer layer filaments contain more sericin A than the inner ones, and less sericin B in the outer layer than in the inner. Several photomicrographs are shown.

Dull finishing of rayon knitted fabric F. P. W. Williams *Am. Dyestuff Repr.* 24, 643-4 (1935).

After-treatment of rayon crepe prints (drying) Allan P. Kirk *Am. Silk Rayon J.* 54, 29-31 (Nov., 1935), cf. *C. A.* 29, 6765⁴.—The 3 stages in the drying of any print are (1) the dripping stage, (2) the moist stage and (3) the completely dry stage. The first is represented by the goods immediately after washing, the second by the hydroxide or suction-dried state and the last by the stentered and widthed state. The tentering stage is the most important from the crepeing and widthing point of view.

Cotton filling materials David Hilfmarb *Am. Dyestuff Repr.* 24, 671-4 (1935); cf. *C. A.* 29, 6766⁴.—Cotton fibers for stuffing purposes include a great variety, but cotton furnishes the largest share. Cotton fibers for filling are classified as (1) linters, (2) new cotton mill processing wastes, (3) new reclaimed wastes from fabrics and (4) second hand reclaimed waste from fabrics, particularly shoddy. Phys. inspection and microscopic and chem. testing reveal the sources of the wastes.

Bleaching cotton piece goods with hydrogen peroxide R. E. Rupp *Cotton* 99, 45-8 (Nov., 1935).—The bleaching of cotton piece goods with H_2O_2 is described. The preliminary alk. boil is shown to be of major importance. The bleaching depends further on the time, temp and concns of both H_2O_2 and alkali.

Crease-resisting fabrics I. H. H. Chester *Am. Dyestuff Repr.* 24, 553-7, 622-4, 632-3, 645-50, 665 (1935).

Warp sizing I. Paul Seydel. *Cotton* 99, 43-4 (Nov., 1935).—Waxes, nitrogenous substances and mineral contents of cotton are discussed.

The use of methyl green for detecting traces of alkali in fibrous materials Ellis Clayton *J. Soc. Dyers Colourists* 51, 387-8 (1935).—A dil. soln of methyl green (0.1% No. 684), especially when used at a temp. of 80-100°, is a good reagent for the detection of minute traces of alkali in textile fibers. A standard 0.1% soln in dist. water was prepd. One cc. of this soln in 200 cc. dist. water was practically unaffected when boiled in a Pt basin for 30 sec., with similar results when repeated in the presence of 0.25 g. purified wool. One cc. of a 0.1% soln of methyl green, 200 cc. dist. water and 0.25 cc. 0.01 N NaOH became decolorized almost completely on boiling.

The arsenic problem. Report of a case of probable arsenic dermatitis from wearing apparel Maurice J. Reuter *Arch. Dermatol. Syphilis* 31, 811-18 (1935).—Analysis of the suit cloth causing the dermatitis showed 0.013 mg. As per g. material, apparently incorporated in the aniline black dye used.

Treatment of sponge towels P. Barsy *Tiba* 13, 403 (1935).—Brief practical operating directions.

Treatment of horsehair R. Monravel *Tiba* 13, 409, 411 (1935).—Practical operating directions on the bleaching of horsehair, based on 20 yrs' experience.

Chlorinated rubber in protective coatings (Redfarn) 30 Benzimidazole derivs (Fr. pat. 784,869) 10 Naphthalene derivs (Fr. pat. 785,588) 10 Impregnating

wooden spools, shuttles, etc., with resinous substances (U. S. pat. 2,020,172) 20 Phosphatide preps for use in the textile industries (U. S. pat. 2,020,662) 22 Preserving rubber latex [compn. for covering fabrics] (Brit. pat. 433, 116) 30

Dyes Société pour l'ind. chim. à Bâle. Brit. 433,090, Aug. 8, 1935. A negatively substituted monophthaloylcarbazole, e. g., nitro and halo derivs. of a phthaloylcarbazole, phthaloyl-naphthylcarbazole or phthaloyl-diphenylcarbazole, is caused to react with a nitrogenous compd. capable of being vatted and contg. at least 1 H attached to N, e. g., amino derivs. of anthraquinone, benzanthrone, mesobenzodanthrone, anthanthrone, dibenzopyrenequinone, anthraquinonecaradone and a pyranthrone, and the reaction product is treated with an acid condensing agent, e. g., H_2SO_4 , $ClSO_3H$, $AlCl_3$ alone or with a tertiary base or NH_3 . The products may be further halogenated, if desired. For an example, cf. Swiss 171,369 (C. A. 29, 5665⁹).

Dyes. I. G. Farbenind. A.-G. (Georg Kränzlein, Heinrich Greune and Branz Brunnerger, inventors). Ger. 616,661, Aug. 2, 1935 (Cl. 22e. 7 02). Water-sol. dyes are prep'd by heating compds. without sulfo groups of the general formula $CO \text{ C(NHR) CX.CO C(NHR) CX}$

(benzene ring) with strong H_2SO_4 , $ClSO_3H$ or oleum, in the presence or absence of diluent, H_2BO_3 or an oxidation agent. In the above general formula X represents H or halogen, R a univalent aromatic residue of the benzene, naphthalene, anthracene, carbazole, or diphenylamine series, contg. no OH and COOH groups in the o-position to each other. In an example 2,5-diamino-3,6-dichloro-1,4-benzoquinone is heated to 95° with H_2SO_4/H_2O and K_2MnO_4 to give a dye coloring animal, vegetable and artificial fibers in brown shades.

Dyes Chemische Fabrik vorm Sandoz Fr. 785,404, Aug. 10, 1935. Sol. dyes of the anthraquinone series are prep'd by condensing, in an appropriate medium, and by means of an oxidizing agent, a 1-arylaminoanthraquinone substituted in any manner but sulfonated at least once in the anthraquinone ring, and in which the position para to the imino group in the phenyl ring is free. Two mols. combine forming a benzidine linkage between the anthraquinone radicals. The anthraquinone radical may be replaced by an anthrapyridone, anthrapyrindone or anthrapyrindimide radical. Examples are given Cf. C. A. 20, 293⁹, 294⁹.

Mixtures of dyes I. G. Farbenind. A.-G. Fr. 785,269, Aug. 6, 1935. Mixts. of dyes contg. at least one dye of the azabenzanthrone series, the mol. of which contains also at least one acridine ring, with other dyes or dye constituents are used. Thus 8-azabenzanthrone- α -aminoanthraquinone is mixed with the dyes of U. S. 1,207,982 (C. A. 11, 332) or 1,452,505 (C. A. 17, 2196).

Azo dyes Herbert Kracker (to General Aniline Works). U. S. 2,019,914, Nov. 5. Dyes producing orange to red shades of good fastness to light are formed from components such as diazotized 1-amino-2-halobenzenes-6-carboxylic acid alkyl esters and β -naphthol, pyrazolone derivs., etc. Numerous examples are given.

Azo dyes I. G. Farbenindustrie A.-G. Brit. 432,599, July 30, 1935. Dyes are made by coupling diazotized aromatic amines not contg. SO_3H or COOH with N-aryl-amino nitriles not contg. SO_3H or COOH and of formula, $X(Y)NRCN$, where R is CH_3 or a series of CH_2 groups the H atoms of which may be substituted by alkyl, aryl or aralkyl, X is H or alkyl, hydroxyalkyl, aryl or aralkyl and Y is aryl, which may be substituted. Among examples, (1) diazotized 2-chloro-4-nitroaniline is coupled with N-ethyl-N-phenyl- β -aminopropionitrile, and (2) diazotized 5-nitro-2-aminophenol is coupled with N-ethyl-N-methyl- β -aminopropionitrile.

Azo dyes I. G. Farbenindustrie A.-G. Brit. 433,201, Aug. 6, 1935. See Fr. 708,913 (C. A. 29, 000⁹). The derivs. of 8-hydroxyquinoline should be free from COOH groups and the diazotized halo amino benzenes should also be free from COOH groups.

Azo dyes. I. G. Farbenind A.-G. (Richard Fleischhauer, inventor). Ger. 610,620, Aug. 1, 1935 (Cl. 22a.9). Addn to 615,799 (C. A. 29, 8352⁹). The method of 615,799 is modified by replacing one or both mols. of the diazotized *p*-nitro- or *p*-acylamino-arylamines by the corresponding *m*-comps. Thus, 1-amino-4-nitrobenzene is diazotized and coupled with 1-amino-8-naphthol-4,6-disulfonic acid. The resulting monoazo dye is coupled with the diazo compd from 4-nitro-2-amino-1-methoxybenzene in soda-alk. soln. The isolated disazo dye is reduced with Na₂S and the product salted out, filtered and washed. The resulting dye is tetrazotized and treated with excess of Na₂CO₃ and 1,3-diaminobenzene. The resulting dye colors vegetable fibers in black shades which are rendered wash-fast by treatment with CH₃O and are rendered wash-fast and greenish by treatment with CH₃O and a Cu salt. Other examples are given.

Azo dyes I. G. Farbenind A.-G. (Hans Krzizalla and Walter Lambacher, inventors). Ger. 617,848, Aug. 27, 1935 (Cl. 22a.1). Addn to 590,190 (C. A. 28, 2193⁹). 8-Hydroxyquinoline and its substitution products are converted into complex metal compds by the methods ordinarily used in making metal compds of azo dyes. The products are then coupled with diazo compds not contg a group capable of combining with metals. Metalliferous dyes identical with those obtainable by the process of Ger. 590,190 are produced. Sp. processes are described.

Azo dyes I. G. Farbenind A.-G. Fr. 784,909, July 29, 1935. Dyes are prepd by causing aromatic NO₂ compds to react with aromatic diamine or aminohydroxy compds in alk. medium, with the exclusion of NO₂ compds giving rise to the formation of stilbene, dinitrostilbene and dinitrodiaryls compds. A reducing agent of weak action may be added. Thus, *p*-nitrobenzoic acid and *p*-phenylenediamine are heated in aq. NaOH. On cooling 4-aminoazobenzene-4'-carboxylic acid crystallizes. By acidification 4,4'-diaminoazobenzene seps and by reduction gives *p*-phenylenediamine again. Other examples are given.

Azo dyes I. G. Farbenind A.-G. Fr. 784,910, July 29, 1935. Dyes contg in the ortho position to the azo group (in the diazotization or coupling component) an aminoarylamino or aminoarylaminoarylamino group are prepd. by condensing azo dyes contg an amino group in the position ortho to the azo group with a nitroaryl halide, reducing the NO₂ to NH₂, repeating if necessary the condensation and reduction and transforming if desired, the aminoazo dyes to other derivs. Thus, *o*-aminoazobenzene-3'-sulfonic acid is condensed in water with *p*-nitrobenzoyl chloride in the presence of AcONa or NaOH, to *p*-nitrobenzoyl-*o*-aminoazobenzene-3'-sulfonic acid which is reduced to the NH₂ compd. and this is treated with aminobenzoic chloride. The product dyes cotton yellow shades, and on diazotization and coupling with 1-phenyl-3-methyl-5-pyrazolone a yellow and with β -naphthol an orange shade is obtained. Other examples are given.

Azo dyes. I. G. Farbenind A.-G. Fr. 785,303, Aug. 7, 1935. Cellulosic fibers are dyed by treating them with a suspension of the coupling component in a fine state of division and afterward developing the dye in a bath contg a diazo compd. Between the 2 steps a drying or treatment in an alk. bath may take place. Thus, a paste of 1-(2',3'-hydroxynaphthylamino)-3,4,5-trichlorobenzene with the condensation product of β -naphthalenesulfonic acid and CH₃O is dried, ground and dispersed in water. Cotton is impregnated with the dispersion, treated in a bath contg NaOH and dried. On developing with diazotized 2,6-dichloro-1-aminobenzene a scarlet dyeing is obtained.

Azo dyes I. G. Farbenind A.-G. Fr. 785,334, Aug. 7, 1935. Azo dyes insol in water are produced from diazoazo compds sol in water and suitable coupling components for ice dyes, the development of the dye being carried out in neutral or feebly alk. medium, provided that the coupling component is brought on to the fiber in the free OH form. The coupling component may be

applied in alk. medium and then treated with an acid or acid-forming substance in amt. sufficient to produce a neutral or feebly alk. reaction. The development is carried out at 80-100° in the presence of moisture.

Azo dye. I. G. Farbenind A.-G. Fr. 785,621, Aug. 14, 1935. A bright red fast dye is prepd. by diazotizing 1-amino-2-methoxy-5-trifluoromethylbenzene and coupling with 1-(2',3'-hydroxynaphthylamino)-3-methyl-4-methoxybenzene.

Azo dyes I. G. Farbenind A.-G. Fr. 785,692, Aug. 10, 1935. Diazotized aromatic amines contg. no SO₂H or COOH groups are combined with (*N*-arylamino)-carboxylic nitriles also contg. no SO₂H or COOH groups and of the formula X(Y)NRCN, where R is CH₃ or a chain of CH₂ groups, X is H, alkyl, hydroxyalkyl, aryl or aralkyl and Y is aryl. Thus, *p*-nitroaniline \rightarrow (*N*-phenyl- β -amino)propionic nitrile dyes acetate silk orange-yellow. 1-Amino-2-chloro-4-nitrobenzene \rightarrow (*N*-ethyl-*N*-phenyl- β -amino)propionic acid and *p*-nitroaniline \rightarrow (*N*-hydroxyethyl-*N*-(*m*-methylphenyl)amino)acetic nitrile dye acetate silk scarlet-red.

Azo dyes I. G. Farbenind A.-G. Fr. 785,742, Aug. 17, 1935. Diazotized *o*-amino-phenols contg. 1 or more NO₂ groups, one of which occupies the position para to the amino group and which may also contain any other substituents except SO₂H and COOH groups are coupled with *N*-hydroxyalkyl derivs. of *m*-toluidine which contain also a supplementary alkyl or hydroxyalkyl group attached to the N. Thus, 5-nitro-2-aminophenol \rightarrow *N*-hydroxyethyl-*N*-methyl-*m*-toluidine dyes acetate silk an intense ruby red. Other examples are given.

Azo dyes. Soc. pour l'ind. chim. à Bâle. Fr. 784,570, July 27, 1935. Amino diphenylene dioxides are diazotized and coupled with components such as arylides of acetoacetic acid, or of β -ketonic acids, pyrazolones and their sulfonic acids, β -naphthol, sulfonic acids of α - and β -naphthol, aminonaphthols, aminonaphtholsulfonic acids and arylides of 2,3-hydroxynaphthols.

Azo dyes. Soc. pour l'ind. chim. à Bâle. Fr. 785,294, Aug. 6, 1935. Compds. of the formula C(OR')CH C-

(NH₂) C(OR') CH CN(X)SO₂Y, (R' and R² are alkyl

groups, the same or different, X is H, an aryl, alkyl or aralkyl radical, Y is an aromatic radical which may be substituted) are diazotized and coupled with any coupling components. Thus, 4-*p*-toluenesulfonylethylmethylamino-1-amino-2,6-diethoxybenzene \rightarrow 1-*p*-toluenesulfonamido-8-hydroxynaphthalene-3,6-disulfonic acid dyes wool fast violet shades in an acid bath. Other examples are given.

Azo dyes. Soc. pour l'ind. chim. à Bâle. Fr. 785,958, Aug. 23, 1935. Dyes are prepd. by coupling diazotized 4-nitro-2-cyano-1-aminobenzene, which may also contain other substituents, with components of the formula XN(R')R² (X is a C₆H₅ or C₆H₄ ring, substituted if desired, R' and R² are H, alkyl, aryl or aralkyl), the coupling taking place under such conditions that it is the N(R')R² group which provokes coupling, then alkylating or acylating the dyes obtained. Thus, 2-cyano-4-nitro-1-aminobenzene \rightarrow (*N*-ethyl-*N*-methoxyethylamino)benzene dyes acetate silk pure violet-red shades. Several examples are given.

Complex metal compounds of azo dyes. Hans Krzizalla and Karl Holzach (to General Aniline Works). U. S. 2,019,915, Nov. 5. Complex metal compds. of azo dyes are obtained by treating with agents supplying metals such azo dyes as are obtainable by coupling diazotized *o*-amino phenols or *o*-amino naphthols which contain at least a substituent selected from the class consisting of halogen, the nitro and the sulfo group, with a tetrahydro- β -naphthol. Particularly suitable *o*-amino phenols are those contg. several of the substituents mentioned. Still further substituents may be present, if desired. Suitable coupling components are tetrahydro- β -naphthol itself and derivs. thereof such as 2-hydroxytetrahydro- β -naphthalene-3-sulfonic acid. Suitable agents supplying metals are those supplying Cr, Cu, Fe, Ni, Co, Mn, Ti and V.

The dyes may be employed for various purposes, e. g., for lacquering purposes, etc., and may be subjected to the said treatment in substance or on the fiber. Several examples are given.

Disazo dyes containing copper. I. G. Farbenund A.-G. (Karl Wiedemann and Heinrich Klingenstein, inventors). Ger. 616,676, Aug. 3, 1935 (Cl. 22a 6). A dye contg Cu is prep'd by treating disazo compound from 1 mol of tetrazotized aromatic diamines, which contain an alkoxy group in the *o*-position to each amino group, and 2 mols. of a dihydroxynaphthalene-mono- or -disulfonic acid, with Cu-yeilding agents. Thus 4,4'-diamino-3,3'-dimethoxybiphenyl is tetrazotized and coupled with 1,8-dihydroxynaphthalene-3,6-disulfonic acid. The resulting dye is heated with CuSO₄ to give a dye coloring cotton and viscose in fast blue shades. Another example is given.

Cupriferous disazo dyes. Imperial Chemical Industries Ltd. and Mordecai Mendoza. Brit. 433,454, Aug. 12, 1935. A Cu-contg dye is made by treating the dye hydrazide \rightleftharpoons 1,8-aminonaphthol-2,4-disulfonic acid (Chlorazol sky blue FF) with a hot ammoniacal soln. of a Cu salt until the alkyl groups have been split off. It yields greenish blue shades on cellulose material, fast to light and soap.

Vat dyes. I. G. Farbenund A.-G. (Wilhelm Bauer, inventor). Ger. 619,080, Sept. 21, 1935 (Cl. 22b 3 08). New vat dyes (generally brown) are prep'd by the action of anhyd. acid-condensing agents, e. g., H₂SO₄ or AlCl₃, on the known dyes obtainable by introducing a 1-amino-4(or 5)-arylaminoanthraquinone residue into the benzene ring of an anthraquinone-2,1-(N)-benzotene(or naphthalene)-acridone, which must be unsubstituted in the benzene ring in a position adjacent to that at which the aminoarylaminoanthraquinone residue is introduced. If the reaction is effected with H₂SO₄ or like reagent at atm. temp., an intermediate product is obtained which must be oxidized to convert it into the dye. Reaction at a raised temp., e. g., 50-80°, yields the dye directly. Examples are given. The products are readily sol in alk. hyposulfite vats, and are particularly suitable for use in printing processes in assocn. with rongalite and potash.

Vat dyes. I. G. Farbenund A.-G. (Werner Zerweck and Ernst Honold, inventors). Ger. 619,403, Oct. 1, 1935 (Cl. 22b 3 03). Addn. to 602,336 (C. A. 29, 611). 600,481 (C. A. 29, 10509). New dyes, generally yellow or red, are obtained by forming amides from *o*-amino compds of the anthraquinone series and arylene oxazole carboxylic acids substituted by an anthraquinonyl residue. The process may be effected by condensing *o*-aminoanthraquinones with the acid halides, or *o*-haloanthraquinones with the acid amines. The acids are obtainable by condensing anthraquinone aldehydes with *o*-aminohydroxyaryl carboxylic acids. Examples are given.

Dyes of the anthraquinone series. Joseph Deinet (to E. I. du Pont de Nemours & Co.). U. S. 2,010,846, Nov. 5, 1935. Dyes which give bright orange and other shades are formed by fusing a 2-methylantraquinone compd. with S monobromide at temps. above 150° or heating in an inert solvent such as C₁₂H₁₄Cl₂ at a higher temp.

Anthraquinone dyes. I. G. Farbenindustrie A.-G. Brit. 432,647, July 31, 1935. 1-Amino-4-haloanthraquinone-2-sulfonic acids contg an acylamino group in 5- or 8-position are condensed with amines that contain at least 1 H atom attached to the amino N atom. Among examples, 1-amino-5-acetylamino-4-bromoanthraquinone-2-sulfonic acid is condensed with NH₃, MeNH₂, PhNH₂, hexahydroaniline, *p*-aminoacetamide, 1,4-dimethoxy-2-amino-1,3-diaminobenzene and monoacetylbenzidine. The products dye wool from an acid bath blue to green shades.

Dioxazine dyes. I. G. Farbenund A.-G. Fr. 785,719, Aug. 17, 1935. Dyes are prep'd by condensing a diarylaminoquinone deriv. (by condensing a 1,4-benzoquinone with an aminoazo dye which may contain sulfonic groups in a high-boiling solvent) by heating it to a high temp. in a high-boiling solvent in the presence or not of an oxidizing agent, a metal chloride or acylating agent or more than one of these, and sulfonating the products obtained.

1 Thus, the product obtained by condensing *p*-aminoazobenzene and toluquinone is boiled in PhNO₂ with the addn. of sulfonyl chloride of *m*-nitrobenzene, and afterward sulfonated. The product dyes viscose silk violet shades. Other examples are given. Cf. C. A. 29, 1654¹⁴.

Indigo. Wm. R. Waldron (to E. I. du Pont de Nemours & Co.). U. S. 2,020,387, Nov. 12, 1935. Indigo which has especially good properties with respect to color and covering power is produced by subjecting alkali metal indoxyls to partial oxidation by means of alkali metal hypochlorites and completing the oxidation by means of air.

Oxazine dyes. I. G. Farbenindustrie A.-G. Brit. 433,215, Aug. 12, 1935. Dyes are prep'd by condensing a hydroxycarbazole having a free *o*-position to the OH with a nitrosobenzene having an alkylated amino group in *p*-position and a free *o*-position to the NO. In examples, (1) 2-hydroxycarbazole (I) is condensed with nitrosodimethylamine-HCl in boiling alc., the product dyes tanned cotton blue shades, and (2) *p*-nitrosodimethylaniline-HCl is condensed with I, 9-methyl-2-hydroxycarbazole and 2-hydroxy-3-carboxycarbazole. Cf. C. A. 29, 613³.

Sulfur dyes. Max Wyler (to Imperial Chemical Industries Ltd.). U. S. 2,020,345, Nov. 12, 1935. Anilinoacetamide, *o*-toluenopropionitrile or other suitable compd. of the general formula aryl-NHCH₂CH₂Y in which aryl represents an aryl radical of the benzene of naphthalene series having a free *p*-position, X represents H or a lower alkyl radical, and Y represents a -CN, -CONH₂, or -CSNH₂ radical, is treated with nitrosophenol, quinone-chloramide or autophenol, and the resulting product is thionated, forming dyes which dye blue shades.

Printing pastes. I. G. Farbenund A.-G. Fr. 785,822, Aug. 20, 1935. Mercaptobenzothiazoles and mercaptobenzimidazoles are added to the pastes to increase the coloring power and accelerate the rapidity of fixation of vat and S dyes.

Intermediates and dyes. I. G. Farbenund A.-G. Fr. 784,606, July 22, 1935. Carboxylic acids of the formula HOOCR' (R' is alkylene, R' is alkyl, alkoxyalkyl, aralkyl or a hydroaromatic group) are condensed with *p*- or *m*-nitro amines of the C₁₂H₁₄ series, the NO₂ is reduced to NH₂, the NH₂ is diazotized and coupled with an arylamide of an aromatic *o*-hydroxy carboxylic acid coupling in the ortho position with respect to the OH group. Examples are given of the prep'n. of 5-nitro- (m. 147°) and 5-amino-4-methyl-2-methoxyacetylamino-1,3-dimethoxybenzene, m. 155°, 6-nitro- (m. 78-9°) and 6-amino-3-methoxyethoxyacetylamino-2,5-diethoxybenzene, m. 58-9°, 6-nitro- (m. 87-8°) and 6-amino-3-benzoyloxyacetylamino-2,5-diethoxybenzene, m. 98°, 6-nitro- (m. 102-3°) and 6-amino-3-cyclohexyloxyacetylamino-2,5-diethoxybenzene, and of dyes obtained therefrom.

Dyeing. Heinrich Karrer & Co. Ger. 547,532, July 31, 1935 (Cl. 8m 3 02). Textile goods are dyed in cops or on spools by aq. solns. of ester salts of vat dyes contg oxidizing agents, neutral and alk. salts. The dye is developed by an acid bath. Thus, cotton yarn in cops or spools is treated with a bath contg. ester salts of indanthrene brilliant green B (Schultz Dye Table 7 1269), NaNO₂, NaCl, Na₂SO₄, NH₄OH and calcined soda. The yarn is washed and the dye developed with H₂SO₄.

Substantive dyeings. I. G. Farbenund A.-G. Fr. 785,043, July 31, 1935. Substantive dyeings on vegetable fibers are improved by using for the subsequent treatment aliphatic multivalent amines of high degree of polymerization, contg trivalent N, using them in the form of salts of inorg. or org. acids. Thus cotton is dyed with "Sirus-blue BR," then treated with a soln. contg a small amt. of a polyamine of high polymerization degree and HCOOH and rinsed. The dyeing does not exude or bleach in non-alk. baths.

Dyeing animal fibers. Société pour l'ind. chim. à Bâle. Brit. 433,230, Aug. 12, 1935. The fibers are dyed with Cr compds. of mordant-dyeing sulfonated azo dyes with an addn. to the bath of less than 1%, on the wt. of

the goods, of a quaternary NH_4 compd. obtained by treating with an alkylating or aralkylating agent a N -alkyl or N -aralkyl benzimidazole substituted at the μ -C atom by an aliphatic residue contg. at least 8 C atoms (cf. Brit. 419,010, *C. A.* 29, 22634). In an example, 100 parts of wool are dyed in an aq. bath contg. Neolan violet 5R, H_2SO_4 and 0.02 part of μ -heptadecyl- N,N -dibenzylbenzimidazolium chloride, the wool being introduced at 60° and the temp. being raised to the boil in 20 min. and so maintained for 45 min.

Dyeing fibrous materials such as cotton. Paul Bolen (to American Lecithin Co.) U. S. 2,020,496, Nov. 12. The material to be dyed is immersed in a reduced alk. soln. contg. lecithin and prep'd from a dye such as a carbazole or sulfur dye which is sol. only in an alk. medium with an alk. reducing agent such as Na hyposulfite. Various examples are given.

Dyeing cellulose, cotton, etc. I. G. Farberind A.-G. Fr. 783,489, Aug. 10, 1935. Sulfonic acids of fluorindines prep'd, e. g., by the process of Fr. 777,702 (*C. A.* 29, 41861) are substantive dyes for cotton, cellulose, etc. Examples are given of the prep'n of dyes by oxidizing azobenzene prep'd from (1) p -aminodiphenyl and p -nitrosophenol and (2) p -aminopyrene and p -quinone-diamine, and of the use of these dyes.

Dyeing cellulosic material with acid wool or basic dyes. Gustav Adolf Widmer and Edward Wallace Pierce (to Société pour l'industrie chimique à Bâle) Brit. 433,143, Aug. 6, 1935. Cotton, rayon, linen, jute, ramie, etc., as loose or woven material or as paper, is treated with an aq. soln. of a methylol compd. or compds obtained by condensing CH_2O with dicyandiamide and (or) guanidine and (or) heat-treated urea, the methylol product is then hardened by heat and the material is thereafter dyed or printed, e. g., with acid or basic dyes. The process of Brit. 433,210 (below) is excluded. An aq. mixt. of the components may be used instead of the methylol compd. or compds. Examples are given of the prep'n. of compds by (a) heating a mixt. of guanidine carbonate and aq. CH_2O , (b) heating urea at 160–170° for about 12 hrs. and heating the residue with aq. CH_2O , (c) heating a mixt. of dicyandiamide and aq. CH_2O , (d, e and f) adding an aq. soln. of dimethylolurea to the products of (a), (b) and (c), resp. Cotton is immersed in a dil. aq. soln. of the compd. or compds., pressed until double its original wt., heated 2 min. at 165°, soaked 5 min. at 55°, rinsed, dried and dyed with Benzyl green B from a HCOOH soln. at 55°. In 433,210, Aug. 9, 1935, the cellulosic material is treated before or during the application of the dyes with a carbamide- CH_2O condensation product and with an org. base when acid dyes are used or with an org. acid, other than tannin or tannic acid, when basic dyes are used. Among examples, cotton fabric is impregnated by immersion 5–10 min. at room temp. in an aq. soln. contg. dimethylolurea and sufficient AcOH to give a pH of 4.5, pressed until double its original wt., dried, printed with a paste contg. British gum thickening and ethylenediamine, dried, heated by ironing with a hot iron for 2 min., dyed by treatment for 45 min. in a soln. contg. HCOOH and the dye obtained by methylating a tech. mixt. of the alkali salts of p -diaminoanthranquin-2-sulfonic acid and p -diaminocrysanthinesulfonic acid (cf. Brit. 308,713 (*C. A.* 24, 503)), rinsed at about 50° and dried, whereby the printed areas are colored a deep blue, fast to light.

Dyeing and printing. I. G. Farberind A.-G. Fr. 783,421, Aug. 9, 1935. Salts of sulfonic acid leuco-esters of vat dyes of the benzanthrone series are stabilized by water sol. salts of mercaptans, e. g., of mercaptobenzo-thiazole, 3-methoxyphenylmercaptan, thioglycolic acid, xanthogenic acid, thiosalicylic acid, dihydrocarbamie acid or its aryl derivs. (*C. A.* 29, 41881).

Printing textiles. Imperial Chemical Industries Ltd. Fr. 783,532, Aug. 12, 1935. White reserves are obtained using sulfonic esters of leuco vat dyes having an affinity for cotton, by incorporating in the printing paste a reserve formed of a salt of a primary, secondary or tertiary amine or a quaternary NH_4 halide, and superprinting or overlaying and developing the dye. Examples of reserves

are benzylpyridinium chloride, dimethylbenzylphenylammonium chloride and cetyltrimethylammonium chloride.

Printing rayon. Société pour l'ind. chim. à Bâle. Brit. 433,100, Aug. 8, 1935. See Fr. 770,844; Swiss 173,042 (*C. A.* 29, 86744). The dyes must contain no SO_3H or COOH groups.

Coloring textile materials containing organic cellulose derivatives such as cellulose acetate. Henry C. Olpin and Geo. H. Ellis (to Celanese Corp. of America). U. S. 2,019,620, Nov. 5. The materials are treated with 4-chloro-2-nitro-1-ethanolaminobenzene or other suitable aromatic compds. free from azo groups and contg. as the sole chromophoric groupings nuclear nitro groups and also contg. hydroxyalkylamino groups. U. S. 2,019,627 relates to a process of dyeing material such as cellulose acetate with aromatic compds. such as a 1-amino-2-nitro-4-acylamino benzene or the like. Various examples are given.

Fixing dyes on fibers. The Calico Printers' Association Ltd. Ir. 784,692, July 22, 1935. Dyes are made fast to washing on silk, rayon, cotton, etc., by impregnating the dyed or printed fibers with the constituents of a synthetic resin, then drying them and heating to a relatively high temp. for a relatively short time.

Apparatus for dyeing. Hildred Charlesworth. Brit. 433,802, Aug. 21, 1935. An inner shell or roller is provided in a perforated roller for a fabric-steaming machine to cut down the internal capacity of the roller in order to save steam and also time in filling and emptying the roller during the operation of the machine.

Machine for dyeing fabric in the piece. Max Siegenheim and Richard Dirks. Ger. 616,542, July 31, 1935 (*Cl. 8a* 950).

Apparatus for dyeing or bleaching textiles in lengths. Gustave Cotel. Fr. 785,994, Aug. 23, 1935.

Apparatus for dyeing and bleaching knitted goods. Gustave Cotel. Fr. 784,985, July 30, 1935.

Machine for printing fabrics. Allgemeine Elektrizitäts-Gesellschaft (Herbert Stein, inventor). Ger. 616,804, Aug. 7, 1935 (*Cl. 8c* 703).

Dyeing spool. Thomas T. Davies. U. S. 2,021,050, Nov. 12. Structural details.

Roller-reversing mechanism for dye-vat rollers. Ernest Farrell. Brit. 433,739, Aug. 20, 1935.

Apparatus for washing, impregnating, dyeing, etc., rayon. Robert Jeanpierre. Fr. 785,182, Aug. 3, 1935.

Toothed-drum machine for scutching leaves of Phormium tenax and other leaves and stems of bast plants. Berthold Burlin. Brit. 432,467, July 26, 1935.

Degumming ramie, etc. Charles E. Gage. Brit. 433,205, Aug. 6, 1935. The plant stalks or semi-prep'd fibers of ramie, sisal, hemp, etc., are submitted successively to maceration, treatment with an aq. soln. of NaOH , linsed oil, turpentine and NH_3 in the proportions of 5, 3, 3 and 4% by wt. and at 160–190°F., treatment with an aq. soln. of common soap 3 and linsed oil 3% at not less than 120°F., neutralization in HCl and, after drying, treatment in a softening machine comprising relatively reciprocating plates.

Treatment of animal fibers. Rosa Wiesner. Austrian 142,784, Sept. 10, 1935 (*Cl. 29b*). Hair and other animal fibers are prep'd. for felting by treatment in a bath contg. H_2O_2 , HNO_3 and a metal compd. which does not act as a carrier of O, e. g., $\text{Zn}(\text{NO}_3)_2$. The proportion of metal compd. in the bath must be more than about 10%. Cf. Ger. 527,012 (*C. A.* 25, 4719).

Fulling wool. Böhme Fettchemie-Ges. m. b. H. Ger. 619,182, Sept. 24, 1935 (*Cl. 8a* 2). Acid processes of fulling wool are improved by adding to the fulling liquid a sulfonic ester of a higher aliphatic alc., e. g., octadecyl alc.

Treating filaments and yarns. British Celanese Ltd. Brit. 433,110, Aug. 8, 1935. Filaments, etc., are treated by applying an antistatic dressing and spraying the dressed filaments or yarns with a coating of lubricant. App. is described. Cf. *C. A.* 29, 76734.

Treating yarns with liquids. British Celanese Ltd.

Nov. 5. The material is treated with a substratum of poly character composed of vulcanizable rubber material and coloring matter, and over this substratum there is applied a preservative and bonding emulsion composed of latex and a mordant comprising a vulcanizable oil and resin, and the assembled materials are together subjected to a vulcanizing operation.

Preserving fish nets. *Chemische Fabrik von I. E. Devrient A.-G.* Ger. 610,112, Sept. 21, 1935 (Cl. 8k 3). The known treatment with tanning baths is improved by adding to the baths an alk. inorg. compd. and, as a bactericide, a water-insol. compd. of Cu or Hg, with or without a dispersing agent, e. g., sulfite cellulose lye. Sp. baths are described.

Sizing fabrics. *Firma Louis Blumer* Ger. 616,805, Aug. 7, 1935 (Cl. 8k 1). Addn. to 605,573 (C. A. 29, 1939). The method of 605,573 for obtaining substances for finishing fabrics, especially rayon fabrics, by condensing polybasic acids, polyhydric alcs. and castor oil, is modified by wholly or partly replacing the later oil by other oils, fats, fatty acids or resin acids. Thus, phthalic acid anhydride, coconut oil fatty acid, stearic acid and glycerol, or maleic acid anhydride, colophony, glycerol and castor oil, are condensed to give a finishing agent.

Apparatus for drying and cleaning cotton, cottonseed, etc. *Jesse J. Fowler*. U. S. 2,019,608, Nov. 5. Various structural, mech. and operative details.

Apparatus for cleansing and extracting fabrics such as clothes by dry cleaning, etc. *James B. Kirby* (to Apex Electrical Mfg. Co.) U. S. 2,019,571, Nov. 5. Structural, mech. and operative details.

Dry cleaning. *Compagnie des produits chimiques et électrometallurgiques Alais, Fröges et Camargue* Fr. 785,864, Aug. 21, 1935. Mixts. of dichloroethane (up to 75%) and trichloroethylene are used.

Phosphatide compositions. *Hansa-Mühle A.-G.* (Bruno Rewald, inventor). Ger. 619,235, Sept. 25, 1935 (Cl. 23c. 2). Crude phosphatides are partly or completely freed from oil by extra with an org. solvent, e. g., acetone, which may also displace water (if present) from the phosphatides. The latter are then mixed with an emulsifying agent, e. g., sulfonated castor oil, and the residual solvent is evapd. The products are stable in air and are easily convertible into emulsions useful in the textile, leather and foodstuff industries.

Mats. *Franz Schürholz G. m. b. H.* Brit. 433,667, Aug. 19, 1935. Coconut fiber mats or matting are treated after weaving on their upper and (or) lower surfaces with rubber latex. Mats cut from such matting may have the cut edges treated with latex. The latex may contain fillers, e. g., chalk, talc, casein, powd. Al, Al₂O₃, and vulcanizing agents.

Temperature indicator suitable for contact with metal ironing or calendaring devices or the like to determine their temperature. *George H. Ellis and Alexander J. Wesson* (to Celanese Corp. of America) U. S. 2,020,676, Nov. 12. A device is used comprising a solid mass contg. a relatively infusible filling material such as chalk and a substance such as anthracene which is converted into a fluid form at a predet. temp. thus permitting transfer of the filling material from the mass to a surface having at least that temp. to form a visible but readily removable trace at the point of contact.

Fireproofing textiles, paper, etc. *Michel Marini* Fr. 785,915, Aug. 22, 1935. An insol. coating which prevents contact with the air is formed on the textile or paper by applying thereto a gel of colloidal oxides such as α - and β -stannic acids, tungstic, molybdic or silicic acid and then drying the gel. A 2nd coating may be applied which liberates a gas preventing combustion, e. g., (NH₄)₂PO₄.

26—PAINTS, VARNISHES AND NATURAL RESINS

A. H. SABIN AND CARLTON H. ROSE

Painting in Egypt. *C. T. Mason*. *Am. Paint J.* 20, 13-14 (Dec. 2, 1935).

A method of comparing the odor of drying paints. *Henry A. Gardner*. *Natl. Paint, Varnish & Lacquer Assoc., Circ.* No. 496, 388-9 (1935).—The odor of drying paint can be compared by painting the inside of an ordinary gallon can provided with a no. of small holes on the side, near the bottom, and a larger hole in the cover of the can. For masking the odor of drying paint, one part of industrial perfume to 2000 parts of paint is usually sufficient. Vanillin has been found useful for this purpose.

Applied paint and varnish chemistry for the chemist and the layman. *Benjamin Joachim*. *Am. Paint J.* 20, 45-7 (Dec. 2, 1935); cf. *C. A.* 29, 7675.—The use of synthetic phenolic resins in enamels is classed under the heads of architectural, marine and industrial. Each class is discussed.

Fluorescence analysis applied to paints and varnish. *A. Kufferath*. *Farbe u. Lack* 1935, 473-4.—A discussion of recent work on the use of luminescence analysis to investigate the various raw materials and finished products of the protective coating industry.

The manufacture of artists' colors. *D. H. S. Forbes*. *Paint Manuf.* 5, 352-4 (1935).—A brief review.

Black pigments in paint and ink manufacture. *H. M. Langton*. *Paint Manuf.* 5, 348-50 (1935).—A paper dealing with phys. properties, particle size, anticorrosive paints and inks.

Dehydration of pigments and pigment pastes by electro-osmosis. *J. F. Sacher*. *Farbe u. Lack* 1935, 543-4.—A review of German patents.

Color and constitution. *L. Dittmar*. *Farbe u. Lack* 1935, 471-2.—A brief discussion of the chem. constitution of a no. of inorg. pigments.

A new "laminal" reinforcing pigment. *F. C. Atwood*.

Official Digest Fed. Paint & Varnish Production Clubs, No. 148, 328-33 (1935), cf. *C. A.* 29, 5680.—Film strength of paints is attained by a judicious mixt. of pigments of various shapes and sizes. Large particles have relatively low hiding power, regardless of their n; hence they need not impart opacity. On the other hand, if colorless and transparent, they do not interfere with hiding and coloring pigments. Laminal pigments should be ideal for reinforcing purposes. Graphite and Al bronze have the disadvantages of color, leaching or reactivity. A specially prep'd mica and its use in different types of paint are described.

New York Production Club presents study of pigment wetting and dispersion. *Austin O. Allen, et al.* *Am. Paint J.* 19, *Convention Daily*, 14-15, 16, 17 (Oct. 31, 1935); *Paint Varnish Production Mgr.* 13, 40-5 (Nov., 1935), *Paint, Oil and Chem. Rev.* 97, No. 23, 81-6.—A preliminary paper. Sixty commercially available pigments were divided into 11 classes and representatives of each of these classes taken for the tests. Fifteen pigments from white to black in color were made into paint with 13 wetting agents. The procedure is outlined and the pigment vehicle ratios are tabulated. The wetting agents are evaluated and zinc naphthenate and lecithin are given the highest grading. The pigments are tested in 4 groups as shown by their wettability. Consistency setting, color, drying, odor and working properties must be considered in evaluation of the agents. The correct selection of the wetting agent will materially reduce the time factor in the expensive grinding operation. In addn. certain other properties of the pigmented product such as setting, brushing, leveling and flow are frequently improved by wetting agents.

A study of hydrogen-ion concentrations of some aqueous pigment extracts. *L. P. Hart*. *Natl. Paint, Varnish & Lacquer Assoc., Circ.* No. 492, 202-7 (1935).—The pH values of aq. suspensions of pigments may be of signifi-

cance in paint technology. The pH values of 80 representative pigments were detd. electrometrically on the supernatant liquids from suspensions of 5 g. of pigment in 100 g. of freshly distd. water. The glass electrode was used. G. G. Sward

Chrome yellow and its production by some new methods R. Heublyum *Peintures, Pigments, Vernis* 12, 132-3, 155-8 (1935)—A no. of newly developed methods are reviewed. J. W. Perry

Some physicochemical aspects of the iron blues A. Wooler *Faint Manuf.* 5, 328-31 (1935)—A brief discussion of reactions, reaction conditions, and varieties, raw materials and manuf. processes. Formulas are given for a medium bronze soda blue and a super-non-bronze blue. W. H. Boynton

Lithopone in white enamel manufacture Fritz Ohl *Paint Manuf.* 5, 302-4 (1935).—Lithopone is used as a white pigment in spirit and other acid varnishes. It prevents livering. A white enamel contg. 75% lithopone and 25% ZnO equals the best com. enamel. Active lithopone pigment, lithoxon, is used in oil enamel manuf. A peculiarity of lithoxon-pigmented enamels is the slight thickening up shortly after manuf. With 20% ZnO and a flow-improving agent such as benzoic acid or crotonic acid this difficulty is removed. W. H. Boynton

Zinc pigments in relation to southern climatic conditions S. Werthan *Official Digest Fed. Paint & Varnish Production Clubs* No 148, 321-8 (1935).—See C. A. 30, 305. G. G. Sward

Zinc oxide—its properties and uses in paint manufacture J. Stewart Remington *Paint Manuf.* 5, 202-5, 306-8, 355-7 (1935); cf. C. A. 29, 6775—Factors affecting the wetting of pigments, or oil absorption, are (a) viscosity of the vehicle, (b) pigment-vehicle ratio, and (c) force of flocculation. Three stages of flocculation of ZnO are illustrated by diagram. Gloss paints and oil absorption are discussed. Properties of a well-made enamel are tested, also recipes contg. synthetic varnishes. Yellowing is frequently caused by the mediums employed, and ZnO, if well made and of uniform particle size, is satisfactory. The time of wetting of pigments depends upon wetting forces, viscosity of vehicles, the amt of mech. work done upon the mixt. and the particle size; and the forces of wetting between pigment and vehicle have a decided influence on the true consistency. W. H. B.

Petroleum thinner vs turpentine J. W. Brock *Can. Chem. Met.* 19, 297-8 (1935) W. H. Boynton

Future of natural resins T. Hedley Barry. *Oil Colour Trades J.* 88, 1625, 1627 (1935)—Congo copal, terpenes, dammars and kauri gum are discussed. W. H. Boynton

Paints and painting to protect [food] equipment and plant interior (Buhr) (Sheeler) 12. Dispersions such as those of pigments (U. S. pat. 2,021,143) 9. Protecting metals [with varnish] (Ir. pat. 784,998) 9. Spraying liquids in air [in paint spray booths] to effect its purification (U. S. pat. 2,021,281) 1. Testing the adhesive properties of coatings such as paint or lacquer (U. S. pat. 2,020,891) 13

Mixing device suitable for remixing settled pigments in cans of paint Joseph Taccogna U. S. 2,021,209, Nov. 19. Mech. details.

Lithopone. Gustave A. Kummer (to New Jersey Zinc Co.) U. S. 2,021,420, Nov. 19. For making high-strength lithopone, crude lithopone is pptd. by reaction of BaS with $ZnSO_4$ and is sepd. from assoc. soln. Crude ZnS is pptd. from a sepg. body of soln. by reaction between $ZnCl_2$ and BaS, the crude ZnS is sepd. from assoc. liquor, and is mixed with the crude lithopone, and the resulting mixt. is calcined. Cf. C. A. 29, 8367.

Zinc sulfide pigment Leon S. Holstein and Geo. F. A. Stutz (to New Jersey Zinc Co.) U. S. 2,020,313, Nov. 12. Finely divided ZnS-bearing material such as zinc blende ore is heated and mixed with concd. H_2SO_4 in excess of the chem. equiv. proportion for the ZnS and other metal sulfides present, under conditions which pro-

duce active evolution of H_2S and formation of $ZnSO_4$, without objectionable formation of elemental S, a purified aq. soln. of the $ZnSO_4$ is prepd. and the purified and concd. H_2S from the process is used to produce a ZnS ppt. from the $ZnSO_4$. An arrangement of app. is described.

Zinc sulfide pigment. Arne J. Myhren and Byron Marquis (to New Jersey Zinc Co.) U. S. 2,020,902, Nov. 12. See Can. 353,104 (C. A. 29, 8307).

Zinc sulfide pigment. Geo. F. A. Stutz and Arne J. Myhren (to New Jersey Zinc Co.) U. S. 2,020,918, Nov. 12. Bubbles of H_2S gas are introduced into a body of mixed $ZnSO_4$ and H_2SO_4 soln. to form a slurry of ZnS ppt. and the mixed liquor under treatment is moved concurrently to the bubbles of H_2S so that the soln. is brought into contact with H_2S of progressively increasing concn., the ZnS ppt. is aged in the resulting impoverished soln. and then removed from the soln.

Paint vehicle from mineral oil Giovanni Fiore U. S. 2,020,936, Nov. 12. For producing an oxidizable oil, a mineral oil is heated to a temp. not substantially above 100° (suitably about 100°), mixed with up to about 1/2 its quantity of a vegetable oil such as *Sesamum Indicum* oil and a current of O_2 is blown through the material for about an hr. while maintaining a temp. of about 100° , a mixt. of HNO_3 1 and alc. 2 parts is added in a quantity about 33-50% the quantity of the oils, and a drier such as spirits of turpentine is also added.

Suction filter for printing inks Paul Buschmann (Heinrich Zimmer, inventor) Ger. 602,593, July 15, 1935 (Cl. 12d 23).

Preventing offset in printing Jens A. Paasche. Fr. 784,826, July 25, 1935. Offset is prevented by atomizing a soln. or suspension of a solid substance in a volatile liquid onto the printed sheet. An example contains gum arabic 20, wood alc. 60 and CCl_4 20%. App. is described.

Printing half tone designs on colored base material such as leather or fabrics Owen R. Huggins and Foster D. Snell (to Decorative Development, Inc.) U. S. 2,021,418, Nov. 19. Solid color areas are discharged from the base material, such areas being coincident with a half tone design to be applied to the material, and the discharged areas are printed with a half-tone design produced by photomechanical reproduction, both discharge and printing being effected under pressure.

Coating-compositions John P. Henbahren Brit 432,403, July 25, 1935. Rubber is dissolved, in the manuf. of paints, etc., by heating a mixt. of a neutral oil and rosin to $300^\circ F$, adding a drier, e. g., Co. linoleate, further heating to $540^\circ F$., adding rubber and heating until the rubber has dissolved.

Resistance coatings and deposits. Radioaktengesellschaft D. S. Loewe Brit 433,790, Aug. 21, 1935 C, preferably as soot, is mixed, preferably in a ball mill, with a varnish base such as acetate or cellulose varnish or oil paint contg. Zn white, and the mixt. is applied to a support, e. g., of glass, hard paper, ceramic material or mica, by painting or spraying or by an inkling-wheel. The coating is then sintered at $300-400^\circ$ by slow heating until the resistance becomes const.

Lacquers formed from a urea-formaldehyde reaction product Martin Luther, Wilhelm Pungs, Robert Gressbach and Claus Heuck (to Nynte Corp.) U. S. 2,019,865, Nov. 5. Comps. such as dimethylol urea, dimethylol thiourea, mono-methylol thiourea or their mixts. are condensed in the presence of a practically anhyd. org. solvent such as EtOH, etc., while heating until a clear soln. is formed and then heating the soln. at least until a resinous condensation product is formed which can be pptd. from the soln. by addition of ethyl ether.

Lacquers and plastic masses I. G. Farbenindustrie A. G. Brit 432,762, Aug. 1, 1935. These contain the usual fundamental substances for such materials, together with a resinous, from viscous liquid to solid, chlorination product of an aromatic hydrocarbon contg. at least 1 CH_3 group as a member of a ring. Hydrocarbons from which such products may be made are tetra- and deca-hydronaphthalene, acenaphthene, fluorene, benzanthrene and

indene, and the compns. may contain drying oils, chlorinated rubber and other solid conversion products of rubber, synthetic resins, cellulose esters and ethers and resins such as dammar, manila, congo, mastic, etc. Pigments and fillers may be present. Among examples, (1) a lacquer contains 1 t cellulose, PhMe, BuOH, alc. and chlorinated acenaphthene and (2) an impregnating liquid contains chlorinated indene or benzanthrene, polyvinyl chloride, Me₂CO, PhMe and cyclohexane.

Cellulose acetate composition suitable for films or lacquers. Kennth M. Irey (to Commercial Solvents Corp.) U. S. 2,020,247, Nov. 6. Cellulose acetate is used with a plasticizing agent produced by the esterification of phthalic anhydride 1.5-2.0 mols with about 1 mol of ethylene glycol with addn. of a monohydric alc. such as BuOH before the esterification is complete and further heating with addn. glycol to effect condensation by reaction between the remaining free carboxyl and hydroxyl groups.

Coating composition containing synthetic resin, etc. Ernest G. Peterson (to Hercules Powder Co.). U. S. 2,022,149, Nov. 26. A compn. suitable for coating comprises raw linseed oil and a synthetic resin comprising the reaction product of a polyhydric alc. such as glycerol, terpinene-maleic anhydride and a fatty acid.

Two-tone metallic finish. Theodore A. Neuhaus (to Glidden Co.) U. S. 2,021,162, Nov. 10. A surface

presenting both porous and non-porous areas of a base coat such as an ordinary black and crackle lacquer is coated with a top-coat contg. a metallic powder such as Al and a dye so that the top-coat dries to the dyed metallic color over the non-porous areas and to the undyed metallic color over the porous areas.

Floor coverings. Johannes Ruder. Brit. 433,150, Aug. 9, 1935. A foundation material is impregnated from the underside with a moisture-repellent substance, e. g., stearin, a mixt. of stearin and boiled linseed oil, goudron, i. e., lubricating oil residues to which asphalt may be added, and from the upperside with boiled linseed oil to which a thickened oil, i. e., air-blown boiled linseed oil which may contain a drier or paint, may be added and the upper surface is then coated with a plurality of layers of boiled linseed oil and fillers, e. g., wood, cork, paper meal, straw meal, to which coloring materials may be added. To provide a brilliant surface, the product may be coated with a mixt. of copal or amber varnish, boiled linseed oil and turpentine.

Compositions for linoleum, etc. John P. Henharen. U. S. 2,021,063, Nov. 12. A material suitable for use in making linoleum, olecloth, floor and wall coverings, insulation and the like is obtained by heating common rosin to about 150°, adding a drier such as Co linoleate and heating to about 250°, adding rubber and stirring until the rubber is dissolved.

27—FATS, FATTY OILS, WAXES AND SOAPS

K. SCHIERUBEL

The interchange of ester radicals of fats. Hans G. Meyer. *Allgem. Oel- u. Fett-Ztg.* 32, 397-401 (1935).—The Bu and Me esters of fat acids and Ac esters of fatty acids were prep'd. from the acids and alcs. derived from several fats. The characteristics of these as compared with the original fat are tabulated. These esters are purer than the original fat and M. suggests they are convenient for many tech. applications. The prep'n of Me esters is more difficult than that of the Bu and Ac.

M. M. Piskur. Determining the free hydroxyl groups of fat acids and fatty alcohols. C. Steiner. *Chem.-Ztg.* 59, 795-6 (1935).—With the use of the Ac value and the sapon value of the acetylated fat acids and alcs., S. has formulated a series of equations for use as aids in detg. the av. no. of free OH groups per mol. of fat acid or fatty alc. in various fat-acid mixts. or fatty alc. mixts.

M. M. Piskur. Filter cloths for the oil and fat industries. Josef Heter. *Allgem. Oel- u. Fett-Ztg.* 32, 395-7 (1935).—Several com. filter cloths were tested with oils contg. bleaching earths. There was considerable variation in the durability of those made with cotton. The poorest camel-hair filter cloth was 4 times more durable than the best cotton one which was 1/2 cheaper. Since the material to be filtered is usually acid, H. recommends the use of animal-fiber filter cloths.

M. M. Piskur. Some African oil seeds. Anon. *Bull. Imp. Inst.* 33, 271-93 (1935).—Po-jok fruits from Sierra Leone. The tree was identified as *Afroliconia elaeagnifolia* Millbr. (Nat. Ord. Ro-aceae). Examn. of 6 samples of fruit gave the following results: av. wt. of a fruit 7.3-11.8 g., av. wt. of 1 kernel 4.6-7.2 g., shell in fruits 31.4-44.0, kernels 58.0-68.6, H₂O in kernels 5.9-9.0, oil in kernels (as received) 41.7-68.3, oil on H₂O-free kernels 45.8-63.8, oil on fruits (as received) 32.6-39.4%. The oils extd. from these samples, and also one prep'd. in Sierra Leone in 1917 had the following characteristics: d₄²⁰ 0.9335-0.9360, n_D²⁰ 1.5020-1.5110, acid value 0.4-10.3, sapon value 188.0-192.5, I value (Wys, 3 hrs.) 139.9-157.1, unsaponifiable matter 0.3-1.0%, solidifying pt. of fatty acids 30.0-50.3°, heating at 300° caused formation of jelly in 16-20 min. in some samples and no jelly at the end of 30 min. in others, I test (addn. of 5 cc. of satd. soln. of I in CHCl₃ and allowing to stand) jelly formed in a few min. in 1 sample, no gelation in 20 hrs. or more in the other

samples. The viscous, golden yellow oil, with odor resembling that of tung oil, deposits stearin on standing; it had marked drying properties, but its suitability in the manuf. of paints and varnishes could be det'd only by means of tech. tests. The small no. of trees and slow growth in Sierra Leone would preclude its com. utilization. *Balanites aegyptiaca* fruits from Uganda.—Fruits stated to have been obtained from the Madi area of the Gulu district of Uganda had an av. wt. of 5.7 g. and the kernels 0.7 g. The kernels contained 6.4% H₂O, and yielded on extn. with light petroleum 46.8% of golden yellow oil, equiv. to 50% on the dry kernels and 5.9% on the whole fruits; the residual meal had a bitter unpleasant taste, contained a saponin-reacting principle, and a principle giving faint pos. reactions with the usual alkaloidal reagents. The oil had the following characteristics: d₄²⁰ 0.9220, n_D²⁰ 1.4640, acid value 0.0, sapon. value 191.6, I value (Wys, 3 hrs.) 98.0, unsaponifiable matter 0.3%, solidifying pt. of fatty acids 36.0°. The residual meal had the following compn. (figures in parentheses give the compn. calcd. to 7% fat): H₂O 8.9 (8.3), crude proteins 48.8 (45.7), fat 0.6 (7.0), N-free ext. 30.3 (28.3), crude fiber 5.9 (5.5), ash 5.5 (5.2), nutrient ratio 1:0.65 (1:0.97), food units 154 (160). Owing to the difficulty of expg. the kernels from the shell it is doubtful whether the oil could be profitably produced commercially, though it could be employed for soap-making and probably also for edible purposes. The residual meal would be suitable only as fertilizer. *Ximenia americana* fruits from S. Africa.—The fruits had an av. wt. of 2.2 g. and consisted of 41.2% pulp and shell and 58.8% kernels which contained 5.1% H₂O and yielded, on extn. with light petroleum, 60.6% of oil, equiv. to 63.9% on the dry basis and 35.6% on the whole fruits. Owing to its viscous character, the oil could probably not be successfully obtained by pressing. Oil extd. with petr. ether had a relatively high unsaponifiable content consisting mainly of a rubber-like substance, while that extd. with Me₂CO had a considerably lower unsaponifiable content contg. a much lower proportion of rubber-like substances. The oils extd. with petr. ether and Me₂CO, resp., had the following characteristics: d₄²⁰ 0.9362, 0.9227, n_D²⁰ 1.4700, 1.4688, acid value 2.6, 0.7, sapon. value 169.7, 173.4, I value (Wys, 3 hrs.) 93.7, 94.0, unsaponifiable matter 2.4, 0.6%. The residual meal after extn. with petr. ether had the following compn.:

H₂O 10.6, crude proteins 44.6, oil 1.9, N-free ext. 33.0, crude fiber 5.2, ash 4.7%, cyanogenic glucosides none, nutrient ratio 1.08, food units 149. The Me₂CO-extd. oil might be suitable for soap making, and possibly, after refining, for edible purposes. Under present conditions it is doubtful whether *Ximena* kernels could be profitably exploited as a source of oil, except possibly for local markets. *Sterculia foetida* seeds from the Gold Coast.—The so-called "fruits" of *Sterculia foetida* are in reality seeds possessing a 3 layered seed coat. The av. wt. per seed was 2 g. The seed consisted of: outer seed-coat layer (gray, thin papery) 3.6, middle layer (pinkish brown and pulpy) 16.2, inner layer (very dark reddish brown and horny) 26.2, kernel 54.0%. Both the middle layer of the seed coat and the kernel contained oil, the total yield, expressed on the entire seeds, being 34.2%. The middle layer of the seed coat contained 7.9% H₂O and 43.2% (40.9% on the dry basis) of oil with the following characteristics: d₄²⁰ 0.8552, n_D 1.4615, acid value 4.5, sapon value 198.1, I value (Wijs, 3 hrs) 84.5, unsaponifiable matter 0.7%. The kernel contained 8.0% H₂O and 50.4% (53.6% on the dry basis) of oil with the following characteristics: d₄²⁰ 0.9281, n_D 1.4650, acid value 0.6, sapon value 191.1, I value (Wijs, 3 hrs) 83.6, unsaponifiable matter 0.6%, solidifying point of fatty acids 30.8°. Both oils gave a pos. Helphen test, the kernel oil more strongly. The kernel oil polymerized in 6.5 min. at 245°; the seed-coat oil failed to polymerize in 15 min. at 290°, but thickened somewhat and darkened. The residual meals from the seed-coat layer and from the kernel, resp., had the following compn.: H₂O 11.3, 9.9, crude proteins 9.5, 31.7; fat 4.4, 7.2, N-free ext. 49.3, 43.5, crude fiber 21.6, 2.6, ash 7.3, 5.1%; nutrient ratio 1:6.3, 1:1.9, food units, 84, 141. It is unlikely that, in working on a com. scale, the kernel meal could be obtained free from the horny inner layer of the seed coat, and the large percentage of indigestible fiber in the latter would preclude the use of such material as a stock food. Owing to the structure of the seeds, it is improbable that the middle layer of the seed coat and kernel could be effectively sepd. and the 2 different oils expressed from them. The oil from the total seed would be suitable for soap making, and possibly also for edible purposes. *Lophira alata* fruits from Uganda—Fruits of *Lophira alata* Banks (locally known as "Liku") from the Madi area of the Gulu district had an av. wt. of 0.76 g., and the kernels 0.42 g. The kernels contained 12.7% H₂O, and on extn. with light petroleum yielded 36.9% (42.3% on dry kernels, 20.3% on entire fruits) of pale yellow, semi-solid fat having the following characteristics: d₄²⁰ 0.8604, m. p. (open-tube method) 24.5°, n_D 1.4610, acid value 7.0, sapon value 187.9, I value (Wijs, 3 hrs) 73.2, unsaponifiable matter 1.3%, solidifying point of fatty acids 43.8°. The residual meal possessed a strong, bitter taste, contained 5.34% N, with the usual alkaloidal reagents gave faint pos. reactions which were not typical of alkaloids, and contained a saponin. The oil would be suitable for soap making, and possibly for edible purposes after refining. The meal would be suitable for use only as a fertilizer. *Ocoba pulchra* fruits from South Africa.—The present sample contained less oil than the previously examd. one from Rhodesia (C. A. 19, 1957), but the oils and residual meals from the 2 samples were of similar compn. *Lulu* (shea) kernels and butter from the Sudan, cf. C. A. 28, 1561°. The butter prep'd in the Sudan, and also that prep'd at the Imp. Inst. from kernels obtained from the Sudan, had const. generally similar to those previously recorded, except that the butter prep'd in the Sudan had a somewhat low m. p.; the unsaponifiable matter contents in the samples were lower than those usually present in West African shea kernels. *Salvadora persica* fruits from the Sudan.—The fruit, weighing 7 g. per 100, were composed of 61.2% pulp and 38.8% seed, contained 12.3% H₂O and 13.3% oil, equiv. to 15.2% on the dry basis and to 34.3% on the seeds. Extn. with light petroleum gave a hard, bright yellow fat having the following characteristics: d₄²⁰ 0.8669, n_D 1.4500, m. p. (open-tube method) 34.3°, acid value 1.3, sapon value 247.5, I value (Wijs, 3 hrs)

17.6, unsaponifiable matter 0.9%, solidifying point of fatty acids 28.8°. The oil was similar to that of the seeds previously examd. (*Bull. Imp. Inst.* 11, 61(1913)); after refining it would be suitable for edible purposes, but it is doubtful whether, under present conditions, it could be profitably used. A Papineau-Couture.

The sulfonation of fish oil. Welwart. *Seifensieder-Zig.* 62, 707-8, 731-2(1935).—A review. Thirteen references. J. W. Perry.

African beeswax. Anon. *Bull. Imp. Inst.* 33, 294-303 (1935).—Two samples from the Gambia were of normal compn. and had the usual phys. and chem. characteristics of African beeswax. One sample from Tanganyika was of normal compn. and had the usual phys. and chem. characteristics of African beeswax except for a somewhat higher I value and lower clouding temp. (Salamon and Seaber test), but no great significance attaches to these exceptions. One sample from Kenya had analytical characteristics in agreement with those previously recorded for East African beeswax, with the exception of the d. (0.9707 as compared with 0.9489-0.9650), acid value (13.1 as compared with 17.3-21.6), ester value (87.1 as compared with 66.2-80.8) and ratio no. (6.6 as compared with 3.6-4.2). Comparison of a sample of crude and a sample of refined wax from the same source showed that the departures from generally accepted characteristics is due to the compn. of the crude wax, and not to a change in compn. on refining.

A Papineau-Couture. Historical (note on) the bleaching of beeswax. Georg Buchner. *Seifensieder-Zig.* 62, 831-2(1935).—The development of modern methods is traced. J. W. Perry.

The emulsifying properties of white wax and borax. Robert Bushby. *Pharm. J.* 135, 345(1935).—By the interaction of borax with fatty acid, whether cerotic or stearic acid, the resulting Na soap usually causes an oil-in-water emulsion. When 25% H₂O (14.5% white wax, about 60% liquid paraffin) and not over 15% borax is used, a water-in-oil emulsion is formed which becomes less stable as the borax content approaches 1%. The change of phases is not dependent on the white wax; it takes place in precisely the same manner with a mixt. of paraffin hydrocarbons. S. Waldbott.

From the notebook of the soap manufacturer. Karl Pfaff. *Rieschloff Ind. u. Kosmetik* 10, 180-1(1935).—Palm-oil soaps, filled curd soaps and soaps with crude coconut or palm kernel oils are discussed. H. M. B.

The calculation of the amount of alkali required for saponification. G. Knigge. *Seifensieder-Zig.* 62, 941-2, 963-4(1935); cf. C. A. 29, 1670°.—Sample calcs. are given and a paper by Krings (C. A. 29, 6783°) is criticized. J. W. Perry.

Free and actual soap alkali. Th. Ruemele. *Allgem. Oel- u. Fett-Zig.* 32, 409-12(1935).—A review. M. M. Fiskur.

Starch as a filler for soap. Hans Nitschke. *Seifensieder-Zig.* 62, 840-1(1935), cf. C. A. 29, 6783°.—A Central American soap maker discusses his experiences. Up to 15% starch can be incorporated in soap without adversely affecting the quality. J. W. Perry.

Lobelia perfume compositions for soap. Fritz Schulz. *Seifensieder-Zig.* 62, 929-30(1935); cf. C. A. 29, 8233°.—Six recipes are given. J. W. Perry.

Shampoos. Ralph H. Auch. *Soap* 11, No. 11, 26-9, 53, No. 12, 32-5(1935).—The compn., clarification, perfuming, analysis and packaging of shampoos are discussed. E. Scherubel.

Vegetable oils for the lubrication of motors (Robbe) 22. Wetting, etc., agents—soaps (Brit. pat. 433,305) 13.

Oils and fats. Sidney Musher. *Fr.* 785,927, Aug. 22, 1935. These are preserved from rancidity by incorporating therewith or infusing thereto a vegetable material such as barley, oats, maize, soybean seed, cotton seed or tournesol. The vegetable material is removed after the treatment.

Steam-heated vessel for melting fats. Waagner-Burb. A.-G. Austrian 142,908, Oct. 10, 1935 (Cl. 23a).

Fatty acids and their salts; soaps. I. G. Farbenindustrie A.-G. Brit. 417,780, Aug. 14, 1935. The acids or salts thereof are obtained by heating oxidation products of liquid or solid nonaromatic hydrocarbons to above 200° in the presence of H₂ under pressure and in the presence of alk. substances, during or after the sapon, and then removing the unsaponifiable products. The acids may be obtained by acidifying with mineral acid. During the heating, any H₂O present or formed may be removed. The oxidation products may be treated while dissolved in org. solvents. Among examples, paraffin oil or wax oxidation products or soaps therefrom are heated under pressure with NaOH in an atm. of H₂ produced in some cases by the addn of Zn dust, with or without a Ni catalyst and the unsaponifiable substances are removed by means of MeOH, iso-PrOH or benzene.

Removing the "catalyst taste" from hydrogenated oils. Dietrich Hildsch U. S. 2,021,552, Nov. 10 Hydrogenated oils such as those from fish oils and oils from other sea animals and from drying vegetable oils are treated with an alk. compd such as NH₃, carbonate or carbamate, alkali metal bicarbonate, diethanolamine or triethanolamine (suitably at a temp. of about 70-110°) until evolution of gas ceases. Cf. C. A. 29, 8130¹

Sulfonatable material suitable for making Turkey-red oil substitutes, etc. Melvin De Groot and Bernhard Kelsor (to Tretolite Co.) U. S. 2,020,998, Nov. 12 An unsat., saponifiable, fatty material is produced, e. g., from sardine oil, by oxidizing with air at 150-250° until there is a drop in η to a value of not over two-thirds the original η and a corresponding increase in the acetyl value, and then subjecting the oxidized material to ther-

mal decompn. at 270-330° with a loss in wt. of not over 12% U. S. 2,020,999 relates to sulfo derivs. of material such as thus produced and which may be neutralized with NH₄OH.

Alcohols. Deutsche Hydrierwerke A.-G. (Walther Schrauth, inventor). Ger. 616,705, Aug. 3, 1935 (Cl. 12a, 6 02). High-mol. alcoh. are obtained by sapon. waxes, which may have been hydrogenated, with solid or highly coned alk. alkalis or alk. earths at 150-250°. The sapon. product may be subjected to distn. or extrn. processes. In an example, sperm oil is heated with Ca(OH)₂ at 220° for 6 hrs. The product is a 40% yield of alk. with a fish-like smell and a 60% yield of a valve-like odorless fatty acid.

Soap Benjamin Clayton and Ralph E. Burns (to Refining, Inc.) U. S. 2,019,775, Nov. 6 In a continuous process, reactive soap-forming materials are mixed in proper proportions and sufficient pressure is exerted on the mixt. to cause it to flow through a restricted heating zone where it is heated to accelerate reaction, the soap escapes through a discharge orifice the frictional resistance of which tends to build up a considerable pressure in the heating zone; the soap is cooled, after it leaves the heating zone and while still under pressure, sufficiently partially to solidify it, and a modifier such as a filler or perfume is added during the cooling, and the finished soap is extruded and cut into bars. App. is described, and U. S. 2,019,776 relates especially to such app.

Soap-frame stripper. John Woerner (to Cincinnati Soap Co.) U. S. 2,020,755, Nov. 12 Structural, mech. and operative details.

28—SUGAR, STARCH AND GUMS

J. K. DALRY

Heat balance in Italian sugar factories. Gino Carboni. *Ind. saccar. ital.* 28, 395-407 (1935).

Utility of η determinations in the sugar industry. Ph. Orth. *Bull. assoc. chim.* 52, 722-52 (1935).—Practical expts. have shown that in the control of factory operations where the η is below 6 or above 8.5, and in detg. of the alkyl. of highly buffered materials like molasses, the old titration method is preferable because of its greater sensitivity. However, in the sulfitation of beet juices or sirups to a η below 8, and in the control of cane-sugar manuf. and of refining the detn. of η is better. The colorimetric η method is preferable for sugar products, because certain nonsugars in them disturb measurements with both the H and the quinhydrone electrode, and because with unbuffered solns. the elec. method requires special equipment. But the elec. method should be used to check the buffer solns. required for the color comparisons. The η detns. must always be made under the same conditions of temp., diln., etc., in order that comparable results can be obtained. In the lab. test tubes should be used for the comparisons, but in the factory the spot-plate method is usually sufficient. F. W. Zerban

The first "half-shadow" polarimeter. Noël Deerr. *Intern. Sugar J.* 37, 421-2 (1935).—An historical note.

Sucrose, beet pulp and adsorption. I. Péron and Maréchal. *Bull. assoc. chim.* 52, 775-8 (1935).—When sucrose is detd. in a beet pulp by the usual methods, without and with the addn. of a known quantity of sucrose, the difference between the 2 results is less than the quantity of sucrose added, and the difference becomes greater the more sucrose is added. II. P. Cazaubon. *Ibid.* 778-9. The above phenomenon can be explained by adsorption of sucrose on the beet pulp, and also by the retarding effect of the added sucrose on the diffusion from unruptured cells into the extn. liquid. F. W. Zerban

Survey of the inhibiting properties of English beet sugars (on the acid corrosion of steel). T. N. Morris. *Dept. Sci. Ind. Research, Rept. Food Investigation Board* 1934, 183-5 (1935).—Samples of beet sugars, including

some brown unrefined sugars and molasses, were tested against a standard pure cane sugar and a specially pure com. cane sugar. It was shown that the inhibiting property is generally distributed in beet sugars and is particularly abundant in beet molasses and brown beet sugars. Various kinds of fruits were packed in double-lacquered cans with (a) a pure white sugar possessing neither inhibiting nor accelerating properties and (b) 3 parts of the same sugar mixed with 1 part of brown beet sugar possessing strong inhibiting properties. The cans were examd. periodically for H₂ swells and perforations. In every case (except 1, where the loss due to swelling had attained serious dimensions) there was an advantage in using the sugar which definitely contained an inhibitor to acid corrosion.

A. Papineau-Couture. Lowered value of abnormally formed beets and losses resulting from injured roots. Ferdinand Kryž. *Z. Zuckerind. Czechoslovak Rep.* 59, 454-6 (1935).—See C. A. 29, 6157¹.

The abnormal appearance of bloated beets during 1933. Josef Páizer. *Z. Zuckerind. Czechoslovak Rep.* 60, 1-10 (1935).—See C. A. 29, 4121¹.

Effects of freezing temperatures on sugar cane in the Florida Everglades. B. A. Bourne. *11a. Agr. Expt. Sta., Bull.* 278, 2-12 (1935).—Field samples of 75 sep. mid-stalk cores were extd. in a powerful hand press and preserved in glass jars with a little HgCl₂. A special tool is required for making the so-called "core-punch" samplings. The hand press gave an extn. yield of 60% of the total juice. A small hand refractometer was found very useful in detg. the sol. solids in the cane juice. Frozen cane gave satisfactory yields of sugar since the deterioration is relatively slow. The absence of the common sugar-lique difficulties usually caused by the decompn. of frozen cane and the formation of mannitol, dextran and AcOH was noted in connection with the handling of a cane crop over a 75-day period after freezing. C. R. Fellers

An improved instrument for testing rind hardness in sugar cane. K. L. Khanna. *Agr. Live-stock India* 5, 160-8 (1935).—The instrument consists of a measured

capacity spring incased in a cylindrical barrel and resting on a piston point which has an extended rod with a hole at its free end to hold the needle point. The pointer which indicates the pressure exerted is fixed to the piston and moves in a groove cut in the barrel. The diam. of the piercing point is 0.75 mm. The instrument is also very useful for studying the cohesion and penetrability of soils.

K. D. Jacob

Ash in raw cane sugars. Louis Sattler, John E. Mull and Irving Longe. *Facts about Sugar* 30, 377-8 (1935); cf. *C. A.* 21, 2244, 24, 1242.—The formulas previously given for the d_{20}^{20} of ash by measurements of elec. cond. apply only to filtered solids of raw sugars. If the solids are not filtered, the following formulas are to be used: percentage of total ash = $0.001566 K - 0.0001954 K_1 + 0.4160$, percentage of ash in the water-sol. portion of the sugar = $0.001558 K - 0.0002024 K_1 + 0.4174$. The results are within 0.05 of the chem. ash, in most cases within 0.03. If greater accuracy is desired, filtered solids should be used.

F. W. Zerban

Purity difference between first-expressed cane juice and sirup. Carlos L. Locsin. *Intern. Sugar J.* 37, 431-3 (1935).—Two reasons are given for the difference between the crusher juice and sirup purities. One is the higher glucose ratio of the crusher juice than of the clarified juice or sirup. The other is the combined effect of the following factors: (1) double clarification of the impure fractions, (2) use of small resettlers, (3) application of hot mud for maceration on the mill, (4) quick removal of the light mill juices from the maceration system and (5) heating the combined primary mud and secondary juice to 215-220°F., the reaction of the secondary clarified when discharged being 6.7 to 6.8 μ .

D. P. Langlois

Refractometric estimation of dissolved solids in sugar sirups containing invert sugar. H. C. S. D. Whalley. *Intern. Sugar J.* 37, 353-5 (1935).—Solids by refractometer and solids by drying taken on sirups containing invert sugar show differences which are partly or wholly due to the assumption that dextrose and levulose have refractive indices identical with those of sucrose at the same concns. Pure sucrose sirups of known concn. and weight were used; refractive indices were taken before and after different degrees of inversion with 0.2 N HCl. The results showed that the refractometer solids read too low for the partially inverted sirups. The mean value detd. was 0.021% for each one % of invert sugar present. Inversion with invertase gave a value of 0.022% for each one % of invert sugar present. Synthetic mixts. of pure sucrose, pure dextrose and pure levulose gave a difference in refractometer solids of only 0.009% for each one % of invert sugar present. This difference in behavior is assumed to be due to the fact that the sugars prepd. from starch and molasses are not identical with those from the inversion of cane sugar.

D. P. Langlois

[Report on] sugar technology. [Classification of re-factory processes.] W. L. McCleery. Hawaiian Sugar Planters' Assoc., *Proc. 54th Ann. Meeting (Rept. Comm. on Chem. Expt. Sta.)* 1934, 91-105, cf. *C. A.* 28, 7051.—In exp'l. runs on a factory scale, clarification was not markedly improved by the use of Na aluminate. With Zn hypophosphite there was marked decoloration but the juices darkened rapidly afterward; the best results were obtained in combination with double superphosphate. Promising results were obtained by treating the juice with more than the usual amt. of lime and pptg. the excess lime with CO_2 . Treatment of the mixed juice with SO_2 produced a marked increase in clarity, accompanied by a decrease in color, the juice settled rapidly and while there was a moderate increase in the vol. of settlings, the settlings filtered well with a firm washable cake. Mon-ammonium phosphate "A" was superior to double superphosphate in all respects except for the clarity of the juice and in this respect the improvement with the latter did not compensate for other disadvantages. Mon-ammonium phosphate "B" and $(NH_4)_2HPO_4$ were not suited for clarification purposes. (The terms "mon-ammonium phosphate A" and "mon-ammonium phosphate B" apparently refer to the com-

materials sold under the names of Ammophos A and Ammophos B.)

K. D. Jacob

Reducing substances in diffusion juice. Renato Salam and Mario Testoni. *Ind. saccar. ital.* 28, 460-1 (1935).—The difference between the total reducing sugars, as invert, minus twice the levulose content (by reduction of Ost's soln.) varies with the quality and the state of preservation of the beets. The larger this difference for stored beets, the greater is the degradation of non-sugar substances, pectins, etc.

L. Cusachs

The pH -CaO diagram of juices. D. Meneghini and I. Sorago. *Ind. saccar. ital.* 28, 443-53 (1935).—Knowledge of the pH -CaO relation over a whole season for each beet factory juice and refinery liquor enables a more systematic control over mfg. operations. In the raw juice, pH and purity values run parallel. The Sb electrode was used.

L. Cusachs

The manufacture of "invert sirup" from surplus cane. Colin W. Waddell. *Intern. Sugar J.* 37, 392-3 (1935); cf. *C. A.* 29, 6785.—The process is to grind cane, partly clarify the juice, add acid, invert sufficient sucrose to prevent crystal and conc. to a sirup of about 86° Brix. The acid is added to the juice and inversion is carried out in the evaporators. The sirup is neutralized after leaving the evaporators and before going to the pans. A sirup having an invert/sucrose ratio of 210 or greater was found to be safe from crystal.

D. P. Langlois

Regenerative evaporation by thermocompressors. L. A. Tromp. *Intern. Sugar J.* 37, 386-9 (1935).—Several diagrams are given illustrating the use of thermocompressors in sugar-factory evapn.

D. P. Langlois

The optimal coagulation with lime: the influence of natural alkalinity. J. Dedeck and J. Valatko. *Zucker-und. Cechoslovak Rep.* 59, 499-71 (1935).—See *C. A.* 29, 6479.

F. M.

Detection of adulteration in maple sirup. A simplified rapid method based on electrical conductivity. Augustus Conlin. *Ind. Eng. Chem., Anal. Ed.* 7, 429-7 (1935).—A modification of the method of Snell (cf. *C. A.* 7, 4021) was used with 7200 sirups. Values from 40 to 200 were observed. Sirups with values under 100 were considered adulterated. Canadian sirups showed higher values than American, and darker sirups higher values than light-colored sirups.

Amy Le Vesconte

Investigation of the aromatic materials in maple sugar. J. Risi and A. Labrie. *Can. J. Research* 13B, 175-84 (1935).—The aromatic substances occurring in maple sirup and sugar are partly solid and partly resinous, the former congs. vanillin and vanillic acid and the latter yielding guaiacol. The aromatic substances in the sap are increased by the process of boiling. The yellow or brown coloration of the sirup is not essentially due to the production of caramel but to the formation of phenols. The bark of the maple contains "acrose" which hydrolyzes coniferin and amygdalin. Maple sap contains an amylase type of enzyme which transforms starch into a disaccharide at relatively low temps. The wood of the maple contains very little coniferin and this is transformed into resinous substances of the nature of lignin early in Sept. Maple seeds do not contain coniferin but do contain the same aromatic substances as the sirup. It is suggested that coniferin may be the mother substance of the vanillin. The aroma observed during the boiling of maple sap is due principally to the formation of hadronal and partially to small quantities of other aromatic compounds. Destructive sublimation of hadronal produces vanillin, vanillic acid and guaiacol just as does the aromatic ext. of maple sirup. Hadronal probably does not occur in the free state in the wood but is synthetically formed from lignin by catalytic action.

J. W. Shupley

Determination of fiber % cane by an indirect method. Saktrapda Sanjay. *Intern. Sugar J.* 37, 390-1 (1935).—The fiber % cane is at present calcd. from the formula: $F = 101 - 101W/(100 - B)$, where F = fiber % cane, W = water % cane and B = the Brix of the expressed juice. For more precise results S. proposes a different value for B . This value is the Brix of the abs. juice which is obtained by multiplying the Brix of the primary (or

crusher) juice by a dry milling factor. This factor is obtained by dividing the Brix of the mixed juice by that of the primary (or crusher) juice.

D. P. Langlois

The unfermentable sugar content of cane molasses F. Reindel and A. Frey. *Intern. Sugar J.* 37, 384-5 (1935).—Previous investigators have described a product of the reaction of bases on *d*-glucose and *d*-fructose to which they have given the name "glucose." They believed it to be identical with the unfermentable sugar residue of cane molasses. More recently it has been proposed that this residue is not a simple sugar but a mixt of sugars. The authors give explt evidence in support of the latter claim. The residue from completely fermented molasses was fractionated with abs alc and a fermentable sugar was sepd. Furthermore 2 osazones were sepd, one m 194.195° which suggested galactose, the other m 204-206° which points to glucose or fructose.

D. P. Langlois

Production of high-test molasses Victorino M. Kilayko. *Sugar News* 16, 386-8 (1935).—Data are given of heavy invert sugar from cane juice.

L. Cusachs

The molasses question and the saline coefficient R. Dutilloy. *Bull. Assoc. Chim.* 52, 760-6 (1935).—The saline coeff is not a reliable criterion of the exhaustion of (beet) molasses. The latter should be judged by the ratio of the molasses wt to that of white sugar produced. This ratio should not exceed 0.33, except in abnormally dry yrs.

F. W. Zerbán

The amber sorghum from Minnesota as a source of sugar and alcohol. Cesare Grossi. *Ind. Sacchar* 28, 408-15 (1935).—The agr. results are promising, and the plant offers possibilities as a source of alc, acetone, Bu alc, and cellulose.

L. Cusachs

Juiciness and sweetness in sorghum stalks. G. N. Rangaswami Ayyangar. *Madras Agr J.* 23, 350-2 (1935).—The juice from sweet-stalked varieties was higher in Brix value and sucrose content and lower in Cl than was the juice from varieties which produced pithy and insipid stalks.

K. D. Jacob

Cane ecology (Hardy) 15. Effects of soil liming on sugar cane (Rodriguez) 15. Soil conditions detg. response of sugar cane to fertilization with potash (Turner) 15

7 Rept. on chemistry [growth-failure of cane—arsenic in refined sugar] (Hance) 15.

Sugar. Spreckels Sugar Co. Fr. 785,491, Aug. 10, 1935. App. is described for recovering sugar from soln. in which the rate of feed of CaO is regulated with respect to the rate of flow of the soln. itself. The proportion is such that after leaving the point of admission of the CaO the soln. contains practically the whole of the CaO necessary to ppt the sugar. The particles of CaO are broken up in the soln. Cf. C. A. 29, 83984.

Sugar syrup. Starkefabrik Kyritz G. m. b. H. Ger. 618,985, Aug. 9, 1935 (Cl. 89: 1 01). Freshly converted sugar syrup is refined by treatment with alkali to give a *pn* value of above 6. After removal of the pptd impurities, the syrup is acidified to a *pn* value of 4.5-6.7, filtered and coned. The syrup is preferably made alk by Ca(OH)₂ and acidified by (CO₂H) or H₂SO₄.

Defecating diffusion juices. Rudolf Picka. Brit. 432,403, July 25, 1935. See Fr. 781,232 (C. A. 29, 64624).

Sugar recovery. Spreckels Sugar Co. Fr. 785,368, Aug. 8, 1935. Sugar is recovered from dild. molasses, etc., as Ca sucrate in increased amt by treating the soln. so as to reduce to a fine state the sucrate which it contains. By this means the insol. layer of Ca sucrate on the particles is broken and fresh ppts may be formed.

Recovery of nonsugars from molasses, etc. Gustave T. Reich. U. S. 2,022,093, Nov. 26. Materials such as molasses, malted grain products, sugar wastes, sweet waters and fruit juices, suitably dild., are treated with isopropyl alc until a sepn of the materials into layers (one of which contains nonsugars in sufficiently refined condition for processing) is effected.

Dextrose. International Patents Development Co. Fr. 785,057, Aug. 1, 1935. Very pure cryst dextrose is obtained in a vessel maintained under const. vacuum, fresh soln. being added to the vessel during the stage when the dextrose deposits from the soln. on the nuclear crystals at a speed greater than the speed of evapn of the water, so as to reduce gradually the b. p. At the end of the operation the soln. is dild. with water.

29—LEATHER AND GLUE

ALLEN ROGERS

Scientific development of the leather industry. Alphonse Fievez. *Bourse aux cours de Belg.* 1935, No. 10, *Chir. tech.* 24, 318-20 (1935).—An address.

H. B. M.

Corrosion of metals by contact with leather R. F. Innes. *J. Intern. Soc. Leather Trades Chem.* 19, 549-63 (1935).—Leathers tanned with single tanning materials (Cr, syntan sulfite cellulose and 8 vegetable tannins) were kept in contact with metal strips (steel, Cu, Zn, Sn, Duralumin, brass and bronze) for 38 weeks at relative humidities of 50, 70 and 90%, at room temp, and at 70% relative humidity at 37°. Corrosion was judged from appearance. Of the metals tested, Sn was most resistant and Cu and its alloys were the least. Of the leathers tested, that tanned with syntan caused greatest corrosion, probably because of an abnormally low *pn* value, followed by leathers tanned with sumac and myrobalans. Leathers tanned with oak bark, gambier, mimosa, quebracho and sulfite cellulose caused least corrosion. Aside from the syntan leather, there was no direct relationship between leather *pn* value and corrosion. The amt. of corrosion increased with increasing temp. or humidity. Corrosion was increased when leathers were oiled with cod-liver oil contg. about 12% free fatty acids, and decreased but not eliminated when leathers were oiled with petrolatum. Cf. Kubelka, et al., C. A. 30, 321⁸.

H. B. Merrill

Chlorinated rubber in leather finishing. M. C. Lamb and W. F. Chapman. *J. Intern. Soc. Leather Trades Chem.* 19, 563-9 (1935).—A satisfactory finish is prepd. from chlorinated rubber dissolved in xylene, plasticized

with either dibutyl phthalate or tricresyl phosphate, with the addn. of synthetic resins to give improved adhesion.

H. B. Merrill

7 Phosphatide compns. [products used in the leather industry] (Ger. pat. 619,235) 25. Vacuum app. and method for tanning, etc. (Brit. pat. 432,552) 1.

Preserving wet hides. Max Stern. Ger. 594,821, June 28, 1935 and Ger. 595,897, July 25, 1935 (Cl. 28a: 1). See Brit. 422,821 (C. A. 29, 4620⁹).

Degreasing skins. John H. Connor and Matthew M. Merritt (to The Tanning Process Co.). Brit. 432,631, July 22, 1935. Skins, hides and leather are degreased by treatment with a grease solvent which, after the treatment and while in contact with the skin, is caused to form an emulsion in H₂O. A substance, e. g., a fat-liquoring oil, sulfonated or not, of animal or vegetable origin, may be added to the solvent, e. g., kerosene, to assist the subsequent formation of the emulsion. Cf. C. A. 28, 3938⁸.

Apparatus for drying furs and skins pinned to boards. Harry S. Wood. U. S. 2,020,392, Nov. 12. Various structural details.

Tanning. Herman A. Herzog (to A. C. Lawrence Leather Co.). U. S. 2,019,568, Nov. 5. Skins such as cowhides, etc., are tanned by treatment with a W compd. in acid soln. such as may be formed from Na tungstate and HOAc and then with Al₂(SO₄)₃. Cf. C. A. 29, 636⁹.

Tanning. Franz Hassler. Ger. 588,074, Sept. 17,

1935 (Cl 12q 20 04) See U S 2,012,928 (C. A. 29, 17116*).

Tanning agents I G Farber and A G Fr. 785,792, Aug 19, 1935 Sulfonation products of Ph, or its derivs, particularly OH derivs, are used. The derivs may be condensed by treatment with CH_3O before or after sulfonation.

Dyeing leather Soc pour l'ind chim à Bâle Fr. 784,829, July 25, 1935 Cu compds of azo dyes of the formula $\text{R}_1 \rightarrow \text{R}_2 \rightarrow \text{R}_3 \rightarrow \text{R}_4$ (R_1 is a tetrazo compd of a biphenyl radical contg at least one SO_2H group, R_2 is an aryl group contg at least 2 OH groups capable of coupling twice, R_3 a diazo compd contg groups capable

of forming lakes and R_4 a coupling component) are used for dyeing leather. Thus, the Cu compd of 2-amino-1-hydroxybenzene-4 sulfonic acid \rightarrow 1,3-dihydroxybenzene \rightarrow 4,4'-diaminodiphenyl-2,2'-disulfonic acid \rightarrow 1,3-dihydroxybenzene dyes leather a brown-yellow. Several examples are given.

Fat-liquoring leather Imperial Chemical Industries Ltd, Richard Greenhalgh and Geo S J. White Brit 432,636, July 22, 1935 Compos for fat-liquoring and oiling-off leather are prep'd by mixing fish or other marine animal oils and mineral and other oils with an unsatd fat acid and adding NH_3 . The mixt is applied to leather, with or without H_2O , to form an emulsion.

30—RUBBER AND ALLIED SUBSTANCES

C C DAVIS

Possible developments in the rubber industry Alan Calver *India-Rubber J.* 90, No 17a(Intern No), 32-4(Oct 31, 1935)—A discussion, with particular reference to the plantation industry. C C Davis

Some incompletely solved rubber problems J. R. Scott *India-Rubber J.* 90, No 17a(Intern No), 2-5(Oct 31, 1935)—A crit discussion of the swelling of vulcanized rubber in certain org liquids and of the phenomena of plasticity. C C Davis

The training of young men in the rubber industry V H Wentworth *Trans Inst Rubber Ind.* 11, 241-50 (1935)—Particular attention is paid to chemists. C C Davis

The extraction of the rubber from rubber bearing plants by means of solvents V Provorov *Sovetskii Kauchuk* 1935, No 3, 26-34—A detailed description of the conditions of extn of rubber from chondrilla, guayule and kender by means of alc, benzene, toluene, etc. A Pestoff

The distribution of rubber in rubber-bearing plants A Prokof'ev *Sovetskii Kauchuk* 1935, No 1, 19-23—*Tau-saguz*—The main mass of rubber is in the roots. Plants one year old have 1-8% and 2-3 years old 8-30% of rubber in the roots. *Kok-saguz*—The roots are the source of the rubber. Plants one year old have 5% and a few 10% of rubber. *Krum-saguz*—The roots have the main mass of rubber. Wild plants have 5-6% rubber, cultivated plants one year old 0.7-0.8% and seldom 1-2% rubber. *Teks-saguz* (*Scorzonera acanthoclada*)—The roots accumulate the rubber to 5-6% *Guayule*—The roots and stem have the mass of rubber, leaves only traces. Plants one year or two years old have 5-10% rubber and 8-18% of tars. Cross sections of the plants are given. A Pestoff

The complete utilization of rubber bearing plants D Kraft *Sovetskii Kauchuk* 1935, No 4, 44—The guayule contains 6-8% rubber, 12% tars, terpenes and etheral oils. The roots of tau-saguz and kok-saguz contain 15% water, 10-14% rubber, 4-6% tars, 35-40% inulin, 3-4% sugars, 5-6% pectin and 15% lignin. A Pestoff

Obtaining natural latex from rubber-bearing plants. A Ignat'ev *Sovetskii Kauchuk* 1935, No 3, 22-6—The quantity of latex obtained from *Kok-saguz* was the equiv. of 30-40% of total rubber in the roots. The latex particles from tau-saguz and kok-saguz 3-4 months old are round and those from plants 7 months and older are oblong (11.5-4 microns long). The concn of the latex was 30-59%, with pH value 5-5.2. The mol. wt. of kok-saguz from latex is 200,000 (according to the formula of Staudinger). *Kok-saguz* contains 35-40% carbohydrates, mostly inulin. A Pestoff

The natural stabilizers of latex. W H Stevens *India-Rubber J.* 90, No 17a(Intern No), 36-7(Oct 31, 1935)—Since certain rubber latexes require no preservative, the identification of the natural stabilizing agent which they probably contain, and application of the latter to *Hevea* latex, represents an important tech problem. *Abarana* (gutta-percha) latex without preservative was shipped

from Brazil to England with no coagulation, and examn showed a pH value of 4.0. It was not coagulated by alkalis nor by acidification of such alk latex. Acidification of a mixt of *Abarana* latex and NH_3 -preserved *Hevea* latex did not cause coagulation, indicating that the stabilizing power is transferable. In electrophoresis, deposition took place on the cathode. *Abarana* latex showed active Brownian movement, and in general resembled *Hevea* latex microscopically. It creamed rapidly, with a fairly clear serum with brownish sediment, and the system could be redispersed by agitation, before and after dialysis. It was coagulated by acetone or alc, and gave the following percentage values: total solids 37.1, dry crepe (by acetone) 33.6, diffusate (70 hrs) 3.4, 0.984, acetone ext. of dry crepe 2.2, N in dry crepe 0.20, gutta hydrocarbon (by difference) 31.2. The N was distributed thus (in percentage on the latex and dry material, resp): total solids 0.33, 0.89, crepe 0.20, 0.59, diffusate 0.17, 4.97. This indicates that some of the diffusible N is coagulated by the acetone and is not removed on washing the crepe. A solution of this problem might lead to the better production of acid *Hevea* latex, and its adaptation to useful ends. C C Davis

Investigation of the structure of rubber by means of electron diffraction K I Krulov. *J Exptl Theoret Phys.* (U S S R) 5, 524-33(1935)—Electronographs of rubber show much more detail than the corresponding x-ray pictures. A debyeograph of unstretched rubber gives 3 amorphous rings with identity periods of 4.15, 2.05 and 1.25 Å. With stretched rubber, interference points appear and the whole picture is that of a fiber diagram. The elementary cell of rubber is orthorhombic with $a = 12.3$, $b = 8.3$, $c = 8.1$ Å. Chloroprene rubber, even when not stretched, gives a point-interference diagram indicating 8 chloroprene nuclei per elementary cell, with dimensions $a = 10.93$ and $b = 8.23$ Å and 3 amorphous rings with identity periods of 2.23, 1.47 and 1.18 Å. Duprene gave a multipoint electronograph. F H Rathmann

Rationalization of the hardness testing of rubber. J R Scott *Trans Inst Rubber Ind.* 11, 224-40(1935)—Testing rubber for hardness is at present in an unsatisfactory state because of the multiplicity of instruments which give different readings for the same sample. Attention is drawn to the need of standardizing this test. The force which must be applied to a ball to indent the surface of a large mass of rubber depends on the elastic modulus of the rubber (at small deformations), the radius of the ball and the ratio of the depth of indentation to this radius. The relation of the force to the modulus and the ball radius, with the 3rd factor const., is deduced theoretically. Expts to det the following relationships are described: (1) modulus and force to cause a given indentation, (2) force and depth of indentation, (3) ball radius and depth of indentation. The expts confirm relation (1) and that between force and modulus, and show how the force is related to the depth of indentation. By means of the relation between indentation, modulus, force and ball radius, the elastic modulus of rubber for small elongations or compressions can be calcd from hardness tests. Though

the method is only approx., it is precise enough for many practical purposes, and therefore forms a useful means of detg. moduli in cases where ordinary tensile or compression tests are impracticable. The results make it possible to interconvert the readings of any hardness instruments which use spherical indentors under definite loads, whether or not applied in addn. to a small "zero" load.

C. C. Davis

Chlorinated rubber in protective coatings C A Redfern. *Silk and Rayon* 9, 492-3 (1935)—The advantages and limitations of chlorinated rubber in protective coatings are described.

M Harris

Crystals and fusion in stretched rubber Peter A Thiesen and Werner Wittstadt. *Z. physik. Chem.* B29, 359-62 (1935)—Upon stretching vulcanized rubber, the rearrangement of the mol. in the lattice does not stop after the stretching has ceased and the final orientation depends on the temp. Within a wide temp. range, there is a fixed ratio between crystals and a glassy enamel for each temp. The proportion of crystal material decreases with increase in temp. The change is reversible and the equl. depends on the pressure

G M Murphy

The changes in the process of contact transformation of ethyl alcohol into butadiene, in connection with fatigue of the catalyst Yu A Gorin, O M Nelmark and F N Kogan. *Sintet. Kauchuk* 1935, No. 5, 6-10—Fatigue of the catalyst proceeded in 2 ways: (1) the C, formed by thermal decompn. of the org. mols., deposited on the catalyst in the form of a "carbon net," closing the dehydrating centers of the catalyst, and (2) regeneration of the catalyst, by means of burning this C with hot air (500°), changed the cryst. structure of the catalyst surface. These 2 phenomena resulted in an increase of H and decrease in ethylene in the gas products, an increase of unchanged EIOH, aldehydes, hydrocarbons and BuOH in the liquid products, and a lowered yield of butadiene. Tables and graphs are given

A Pestoff

Plastics based on rubber, with special reference to Rubbone. W. H. Stevens and H. P. Stevens. *Trans. Inst. Rubber Ind.* 11, 182-96 (1935).—Substantially the same as C. A. 29, 4625^a, 8400^a, with some minor additions.

C. C. Davis

Risks in the rubber industry E. R. A. Merewether. *Trans. Inst. Rubber Ind.* 11, 162-77 (1935)—The paper deals with risks associated with (1) machinery, electricity, fire and explosion, (2) raw materials (NH₄, Pb, Hg and Sb compds., asphalt, C, inorg. fillers and dusting agents, org. accelerators, solvents), (3) finishing processes, e. g., sand-blasting; (4) radioactive substances, and (5) lab. work.

C. C. Davis

Fire risks and their prevention D W Wood. *Trans. Inst. Rubber Ind.* 11, 150-61 (1935).—The paper deals primarily with the rubber industry, and discusses building sites, plant design, construction, power and light, heating, raw materials, processes, reclaiming, solvent recovery, static electricity and fire-extinguishing methods.

C. C. Davis

Rubber, bitumens and road surfaces Harry Barron. *India-Rubber J.* 90, No. 17a (Intern No.), 21-31 (Oct. 31, 1935).—A crit. review and discussion, dealing with (1) bituminous materials (definitions, types, properties, tech. uses); (2) applications of bituminous materials to rubber manuf. (history, applications, elec. properties, hard rubber, aging, identification) and (3) rubber in bitumens, and road-surface problems (emulsions of asphaltic bitumens and tar, bituminous road surfaces, asphaltic macadam, rock asphalt, desirable features of road materials, the use of emulsions, tests for road emulsions, rubber-bitumen mixts., rubber solns., dispersion of rubber in molten bitumens, use of latex, latex-bitumen and emulsions). Sixty references.

C. C. Davis

Porosity in vulcanized rubber. Walter H. Bodger. *Trans. Inst. Rubber Ind.* 11, 197-223 (1935).—The work was undertaken to develop quant. methods for measuring

porosity in vulcanized rubber, to study the individual factors responsible, and to develop methods of overcoming it in practice. Of the methods developed for assessing the degree of porosity, which included visual examn., tensile strength, change in acetone ext. on aging, permeability and d, the percentage diminution in d. is the most satisfactory. The permeability to moisture, acetone ext. of the aged sample and visual examn. also give some indication of the degree of porosity. Severe over-mastication, particularly on cold rolls, increases the entrapment of gases during mixing. If the mech. pressure applied during vulcanization is low, the diminution in vol. which proceeds with vulcanization causes a further lowering of the pressure, some of the entrapped gases are liberated, the rubber is partially "set up," free escape is inhibited and pores develop. The effect of over-mastication can also be brought about by heat treatment or oxidation of raw rubber. Mech. work expended on a rubber mixt., such as sheeting at friction speed, calendaring thick, or extrusion of thick articles, may increase porosity under suitable conditions. Softeners increase porosity in the same way as does over-mastication, whereas stiffening fillers tend to prevent porosity. When no mech. pressure is applied during vulcanization, porosity is likely, but a slight pressure may cause even worse porosity by preventing the free escape of gases during the soft stage before vulcanization progresses. The degree of porosity depends on the conditions during the initial stages of vulcanization, and is a useful indication of setting-up when scorching tests are being carried out. It is not influenced by the action of heat, in the later stages of vulcanization, on the rubber-S or oxygenated rubber complexes. Moisture from the ingredients, processing or method of vulcanization increases porosity under appropriate conditions. Ultra-accelerators or high temps. of vulcanization tend to increase the porosity of mixts. which are sensitive, since the escaping gases are more completely entrapped by a rapid setting-up of the rubber. Some applications of the results of the methods developed for overcoming porosity in practice are given, including increase in mech. pressure, avoidance of soft mixts., drying of fillers, mastication at high temp., multiple-ply calendaring, etc.

Self-vulcanizing cements. B. Iabritziev, G. Buiko and E. Pakhomova. *India-Rubber J.* 90, No. 17a (Intern No.), 9-16 (Oct. 31, 1935); cf. C. A. 29, 2301^a.—Self-vulcanizing cements are considered to be those which after evapn. become vulcanized within 1 day or 2 days at room temp. Tests of tetramethylthiuram disulfide, piperidinum pentamethylendithiocarbamate, Pipsoil X and Zn butylxanthate (I) showed that I has the lowest crit. temp., so it was used in all the expts. *p*-Toluidine (II) lowered its crit. temp. and was used as an activator. The technic was to prep. dry films 0.18-0.20 in. thick from C.I.I. cements, vulcanize these in water at 80° for various times and test the mech. properties of the vulcanizates. ZnO had a strong activating effect, the best mech. properties being obtained with 3% (based on the rubber). Zn stearate was without influence. Stearic acid diminished the tensile strength. The best percentage of S, in consideration of the rate of vulcanization and phys. properties, was 3 (based on the rubber). Over 4% of S accelerated only slightly more than did 4%, and impaired the mech. properties. II not only accelerated greatly, but improved, the mech. properties; 2% gave the optimum results. Aging tests in a Geer oven at 70° showed that II is an antioxidant. Tests of the adhesion of various films between rubber and leather and rubber and cotton duck under various conditions of temp., time and moisture, the object of which was to study the behavior of films in footwear manuf., are described. In general, lab. tests of the adhesion (judged by the force of sepn.) gave only an approx. indication of the behavior of cements in practice. Measurements of the changes in viscosity during storage of cements of different formulas showed that it is dangerous to keep mixed cements many hrs., and the 2-part method, with blending just before use, is highly recommended. Storage in 2 parts does not impair the subsequent adhesion. Above a certain concn., I and II

react, with liberation of S, so this must be avoided. The formula finally recommended is smoked sheet rubber (III) 100, pptd S 3, 13, II 2, ZnO 3; to be stored as 2 solas as follow: (1) III 100, S 8, II 2, ZnO 3, (2) III 100, I 6, II 2, ZnO 3. Cements of this type are of advantage in cementing power transmission belts, repairing automobile tubes, cementing soles to uppers in the shoe industry, other shoe construction problems and many repairing problems. C. C. Davis

Rubber products used in food manuf. (Juve) 12. Effect of rubber in the life of the rubber-bearing plant (Bosse) 11D. Chlorinated rubber in leather finishing (Lamb, Chapman) 29. Activated C (Sutcliffe) 18. Aralkyl triethoxycarbonates [for use as rubber-vulcanization accelerators] (U. S. pat. 2,021,726) 10. Elec. insulating compps (Ger. pat. 619,253) 13. Elastic fabric (U. S. pat. 2,021,352) 25. C black (U. S. pat. 19,750) 18. Preservative coatings on cloth, leather, etc. (U. S. pat. 2,019,531) 25. Polishing devices comprising resilient rubber (U. Concentrating latex. Rubber Producers Research Association, George Martin, Wilfrid S. Davey and Lionel Lindell-Stewart. Brit. 433,303, Aug. 8, 1935. Latex is concd by removing from the bulk thereof portions which are warmed and exposed to the open atm on heated surfaces to expel their H₂O content before being returned to the bulk. App. is described.

Preserving rubber latex. Alfred T. B. Kell. Brit. 433,116, Aug. 12, 1935. The latex is preserved by adding to it in aq. soln. Na or K silicate and K₂CO₃. When certain fillers, e. g., compps. of Na, K and Zn, are compounded with the latex, HCl also may be added. In an example, K silicate 10 and K₂CO₃ 2 are dissolved in H₂O that is acidulated with 1% of HCl 4 parts. Then 5% of this soln., calcd. on the solid rubber content of the latex, is added to the latex. A cement-like filling compp. is made thus: K silicate 15, lithopone 5 and magnesite 0.5 parts are mixed and added to CaCO₃ 30, pptd. SiO₂ 10 and hydrated Mg silicate 5 parts and the whole is ground with 10 parts of the above stabilizing soln. This latex-cement compp., which may contain 20 parts latex to 80 cement, may be used for covering fabrics, surfacing floors, etc.

Latex and regenerated rubber. International Latex Processes Ltd., Arthur E. Barnard and William E. Messer. Fr. 785,751, Aug. 19, 1935. A stable compp. contg. natural rubber latex and a soap dispersion of regenerated rubber is obtained by making a dispersion having the same osmotic pressure as natural latex and mixing the 2.

Latex-treated tubing. Joseph A. Kennedy (to Anaconda Wire & Cable Co.). U. S. 2,019,709, Nov. 5. A tubing which resists oil, water, etc., is prep'd by spraying an *impermeable layer* such as one of latex or asphalt over the inner raceway of the tube (which has an inner tube of interconnected flexible strands), spraying an aq. dispersion of latex over the exterior of the inner tube and applying a protective covering such as lacquer over the outer latex coating. App. is described.

Rubber compositions. John Talbot. Brit. 432,551, July 30, 1935. Rubber, balata, etc., are rendered fire-proof by adding 5-16% of Ph₃PO₄, trisecyl phosphate, Ph₃BO₃ or a mixt. of Ph₃PO₄ and trisecyl phosphate. The esters are preferably added as emulsions at the time of masticating with the usual fillers, S, etc.

Rubber compositions. International Latex Processes, Ltd. Ger. 619,408, Oct. 1, 1935 (Cl. 39b 5). See Brit. 404,665 (C. A. 28, 3939i).

Halogenating rubber. Metallgesellschaft A.-G. Fr. 785,257, Aug. 6, 1935. A soln. of rubber is introduced slowly into a vessel contg. a halogenating agent in amt. sufficient to halogenate rapidly the rubber introduced above the middle halogenation stage which is the critical pt. for the stability of the soln. The solns. of the products

1 prep'd are stabilized by incorporating therewith min. proportions of a polyhydric phenol such as pyrogallol or resorcinol or an oil such as wood or linseed oil.

Chlorinating rubber. Thurm & Beschke Kommandit-Gesellschaft (personally responsible partner, Herbert Turnauer). Brit. 433,246, Aug. 12, 1935. See Fr. 777,865 (C. A. 29, 4631i).

Chlorinating and vulcanizing rubber. International Latex Processes Ltd. Brit. 433,252, Aug. 12, 1935. Cl. is introduced into a previously vulcanized latex at least until pptn. of discrete particles of chlorinated rubber takes place. Further chlorination may be effected in the liquid or the ppt. sep'd, e. g., by filtration or decantation, and further chlorinated in a closed chamber before or after drying.

Chlorinated rubber. Eugen Moloney (to the firm Chemische Fabrik Buckau). U. S. 2,020,076, Nov. 5. In the production of a rubber chloride soln. by chlorinating a rubber soln., there is added, prior to the final pptn. of the resulting rubber chloride, a small amt. of an alkali metal or alk. earth metal hypochlorite, which serves to lower the viscosity.

Chlorinated rubber. John McGavack (to United States Rubber Co.). U. S. 2,021,318, Nov. 19. Latex is vulcanized and Cl. is introduced into the vulcanized latex.

Chlorinated rubber. Frederick P. Leach, Wilfrid D. Spencer and Imperial Chemical Industries Ltd. Brit. 430,906, June 20, 1935. Solid chlorinated rubber is obtained from solns. thereof by bringing the soln. into contact with an excess of a liquid precipitant maintained in agitation by means of a stirring arrangement; the precipitant is without chem. action on chlorinated rubber and mixes with the solvent in the soln. to produce a mixt. having substantially no solvent power for the chlorinated rubber. The soln. of chlorinated rubber may be squirted as a thin stream or in finely divided form through nozzles onto the surface or below the surface of the precipitant. In an example, a soln. of chlorinated rubber in CCl₄ is brought into contact with a lower aliphatic alc., e. g., MeOH, the ppt. may be removed and washed with MeOH described in Brit. 433,196 (following abstr.). CCl₄ and MeOH may be recovered from their mixt. by distg. to obtain a const.-boiling mixt. and a residue of alc. and distg. the residue to obtain pure alc., the const.-boiling mixt. is treated with H₂O to obtain a CCl₄ layer and an aq. alc. layer, which are sep'd., the aq. alc. layer being dist'd. to obtain pure alc.

Chlorinated rubber. Kenneth S. Jackson and Imperial Chemical Industries Ltd. Brit. 433,196, Aug. 12, 1935. Products of improved stability are obtained by pptg. solid chlorinated rubber from solns. thereof, e. g., in CCl₄, by addn. of MeOH, sepg. the pptd. solid and bringing it into intimate contact with a further quantity of MeOH. Films of chlorinated rubber may be obtained by evapg. solns. of the product in solvents, e. g., C₆H₆, in which a plasticizing agent, e. g., up to 33% of di-Bu phthalate on the wt. of the chlorinated rubber, has been incorporated.

Chlorinated rubber. Rubber Producers Research Association, Geo. F. Bloomfield and Ernest H. Farmer. Brit. 433,082, Aug. 8, 1935. Org. hypochlorites, e. g., Et or Me hypochlorite, are added to rubber in soln. to obtain a product having some of the resilience of rubber and many of the properties of chlorinated rubber, e. g., low viscosity and chem. inertness. The process comprises (1) prep'n. of a dil. soln. of HClO by usual methods, (2) shaking this with half its vol. of an inert solvent, e. g., C₆H₆, xylene, CCl₄, contg. 10-15% of alc., drying the solvent layer, e. g., with CaCl₂, and adding to a rubber soln. and (3) concg. the soln. after at least 24 hrs. under reduced pressure, at preferably not exceeding 40°.

Chlorinated rubber. Terence N. Montgomery and Imperial Chemical Industries Ltd. Brit. 433,313, Aug. 13, 1935. Solid chlorinated rubber is produced directly by subjecting finely divided rubber in the absence of solvents simultaneously to an abrading action and to the action of Cl₂ gas. The fine powder of chlorinated rubber may be removed by sieving or air blowing or, in a continuous process, by the current of Cl.

Films of chlorinated rubber. Joseph G. Moore and Imperial Chemical Industries Ltd. Brit. 432,803, Aug. 2, 1935. In mfg. films by running a soln. of chlorinated rubber onto a supporting surface, expg. the solvent and stripping the film, the removal of the film is facilitated by precoating the surface with a substratum insol in the solvent for the chlorinated rubber but sol. in a liquid having no action on the chlorinated rubber. Glue, gelatin and Na silicate are suitable.

Preserving chlorinated rubber. Joseph G. Moore and Imperial Chemical Industries Ltd. Brit. 432,805, Aug. 10, 1935. Chlorinated rubber is preserved by adding an org. peroxide sol., therein, e. g., H₂ peroxide or hydroperoxide.

Preserving rubber. Albert M. Clifford (to Wingfoot Corp.). U. S. 2,020,291, Nov. 12. About 0.1-5.0% of a β -hydroxyphenyl naphthylamine or other suitable aryl naphthylamine having at least one hydroxy group substituted on an aromatic nucleus is added to a rubber compn. as a preservative.

Preserving rubber. The Rubber Service Laboratories Co. Ir. 785,783, Aug. 19, 1935. See Can. 131,115 (C. A. 29, 81059).

Apparatus for plastifying crude rubber and mixtures thereof. Società Italiana Pirelli. Ir. 785,420, Aug. 9, and 785,481, Aug. 10, 1935.

Sponge rubber. Charles I. Lemming (to Roth Rubber Co.). U. S. 2,019,489, Nov. 5. Rubber is mixed with a "blowing agent" such as NaHCO₃ or (NH₄)₂CO₃ and with a vulkanizing agent including an accelerator, the compn. is shaped without curing, and the shaped mass is submerged in a heated liquid bath such as water at a temp. (suitably about 100°) and for a time sufficient to vulkanize quickly the surface and then to blow and complete the vulkanization while retaining the desired shape of the product.

Sponge like or cellular rubber products. Wilfred H. Chapman, Eric W. B. Owen and Donald W. Pounder (to Dunlop Rubber Co. Ltd.). U. S. 2,020,094, Nov. 12. A foam is formed from an aq. rubber dispersion and the pressure around the foam is decreased so as to expand the cells, and the expanded material is vulkanized.

Dipped rubber articles. John R. Gimmeter. U. S. 2,021,289, Nov. 19. Various details of app. and operation.

Molding hollow rubber dolls, toy animals, etc. Iordyee C. Jones. Brit. 432,371, July 25, 1935.

Rubber threads. International Latex Processes Ltd. and Ugo Pestalozza. Ir. 785,012, July 31, 1935. An aq. dispersion of rubber is disposed in grooves and caused to solidify by heating.

Cutting rubber threads from sheet rubber. Dunlop Rubber Co. Ltd. and John Healey. Brit. 432,801, Aug. 2, 1935. The sheet is subjected to pressure adjacent the knife. The process is applicable to both the intermittent and continuous spiral cut methods in which the sheet is wrapped around a rotating drum.

Jet box and associated apparatus for forming threads or filaments of rubber from aqueous dispersions. Edward A. Murphy (to Dunlop Rubber Co. Ltd.). U. S. 2,019,543, Nov. 5. Structural and operative details.

Apparatus for making rubber strip. International Latex Processes Ltd. Ger. 619,266, Sept. 26, 1935 (Cl. 30a 10 03). See Brit. 400,147 (C. A. 28, 22104).

Rubber conversion products. I. G. Farbenind. A.-G. (Julius Söll and Albert Koch, inventors). Ger. 619,211, Sept. 25, 1935 (Cl. 30b. 3). Addn. to 615,050 (C. A. 29, 64719). Rubber is treated with H₂ under conditions which are mild in comparison with those recommended in Ger. 615,050. Thus, a benzene soln. of rubber may be warmed for 14 days with an ethereal soln. of H₂, or rubber sheets may be kneaded with aq. H₂ and then heated in an autoclave to 100° for 16 hrs. The products, unlike those described in Ger. 615,050, are sol. in org. solvents, and their solns. may be used as leathers or as adhesives for uniting rubber sheets to metal surfaces.

Carboy cushions of reclaimed rubber. Richard W. Lahey and Harry A. Kast (to American Cyanamid & Chemical Corp.). U. S. 2,021,878, Nov. 19. Carboy cushions are formed of reclaimed rubber so as to have speci-

fied desirable and durable cushioning properties at temps. of about -18° to 34° (various details of manuf. being given).

Rubber mat for running boards or the like. William F. Schacht. U. S. 2,021,623, Nov. 19. A body portion of completely vulkanized rubber carrying a substantially unvulcanized facing contg. sufficient compounding ingredients such as S, etc., to prevent "creeping" of the mat on the board, the exposed surface of the facing being readily sol. by rubber solvent, and a protective layer covers the facing.

Vehicle bodies. Società Italiana Pirelli. Brit. 432,699, July 31, 1935. A vehicle body, or parts thereof, is constructed of a rigid stratified material composed of layers of hard rubber- or ebonite-treated fabric united by vulkanization.

Metal coats on rubber. Max Owlschungen. Brit. 432,242, July 23, 1935. See Austrian 140,200 (C. A. 29, 31904).

Fireproofing rubber. H. & I. de Poux & Cie. Fr. 785,108, Aug. 22, 1935. A product capable of fixing, under the effect of heat of combustion, on to the free bonds of rubber mols. so as to form an incombustible compd., and finally liberate gases or vapors which prevent combustion, is incorporated with rubber during its prepn. Comps. of Cl. I or preferably Br, e. g., NH₄Br, may be used, the proportion of NH₄Br for spongy rubber being 30-50%.

Fireproofing rubber, etc. John Latbot. Ir. 785,548, Aug. 12, 1935. Rubber, etc., is treated chemically by a neutral ester of an inorg. acid, e. g., triphenyl- or tri-*o*-cresyl-phosphate or triphenyl borate.

Vulcanization accelerators. Wingfoot Corp. Ir. 785,104, Aug. 2, 1935. Thiaryl esters of secondary aliphatic dithiocarbamic acids, made by causing a salt of the acid to react with a halogenated aryl thiazole, are used. Ex. samples are given of the prepn. and use of 5-nitrobenzothiazole-1-dicyclohexyl dithiocarbamate, m. 188.9°, and 5-nitrobenzothiazole-1-*N*-ethyl cyclohexyl dithiocarbamate, m. 146.7°.

Furoyl-substituted mercaptobenzothiazoles (rubber vulkanization accelerators). Sylvester M. Evans (to Rubber Service Laboratories Co.). U. S. 2,020,051, Nov. 5. A furoyl halide such as the chloride and a mercaptobenzothiazole are caused to react in an aq. medium contg. a small amount of an inert org. solvent such as C₆H₆ at a temp. below the b. p. but above the freezing point of the solvent (suitably about 10-15°). Several examples are given.

Vulcanizing rubber. The B. F. Goodrich Co. Ir. 785,805, Aug. 20, 1935. Rubber is vulkanized in the presence of a thiuram sulfide in which 1 aryl radicals have been introduced, e. g., diphenyl-di- β -naphthyl disulfide, m. 217°.

Molding and vulkanizing ebonite articles. Società Italiana Pirelli. Brit. 432,800, July 31, 1935. Glossy ebonite articles are produced by molding and vulkanizing a mixt. of crude ebonite stock in a specular surfaced mold, the operation being effected in stages by successively reducing the vol. of the mold to that of the finished article.

Apparatus for vulkanizing inner tubes, etc. Thomas H. Williams (to National Rubber Machinery Co.). U. S. 2,020,169, Nov. 12. Mech. features.

Molding press suitable for vulkanizing rubber articles. Henry C. Hostwick (to Akron Standard Mold Co.). U. S. 2,019,888, Nov. 5. Structural, mech. and operative details.

Vulcanizing mold for rubber tubes. Charles E. Maynard (to Fisk Rubber Corp.). U. S. 2,021,373, Nov. 19. Structural, mech. and operative details.

Vulcanizing long lengths of material, etc. Kooperativa 1örbundet, Loringen U. P. A. Brit. 432,675, July 31, 1935. In the manuf. of floor or like covering material as slabs, long lengths or mats from vulkanizable material, this is advanced between and by means of 2 endless bands driven at the same or approx. the same speed to a vulkanizing app. to be shaped between the bands under pressure and at the temp. necessary for vulkanization; the bands are guided over drums, guide rollers and (or)

other guiding members bearing on the material, whereby the shaped material is cooled between the bands while the same or approx the same pressure is maintained on the material as that exerted during the vulcanization process and while the bands are guided over sep cooling drums, guide rollers or other cooled guiding members. App is described.

Vulcanizing long lengths electrically. Aktieselskapet den Norske Remfabrik Brit 432,943, Aug. 6, 1935. Rubber belts, etc, are vulcanized by wrapping them on a drum with an interposed preheated steel ribbon under controlled tension and maintaining the temp of the ribbon by the passage of an elec current App is described

1 Process for forming and vulcanizing marbled erasers and other rubber goods from a plurality of one-color rubber sheets Josef Anton Talalay Brit. 432,884, Aug. 6, 1935

2 Devulcanizing rubber. Charles H Campbell U S 2,021,046, Nov. 12 In devulcanizing ground vulcanized rubber scrap, an oil including essentially benzene, toluene, xylene and a heavy solvent such as a heavy naphtha solvent is introduced into a digester in the presence of a desulfurizing agent such as NaOH which upon the application of heat, moisture and pressure causes the rubber particles to swell and soften and thus permits the desulfurizing agent used to react upon the S present in the vulcanized rubber.

CHEMICAL ABSTRACTS

Vol. 30

FEBRUARY 10, 1936

No. 3

I—APPARATUS, PLANT EQUIPMENT AND UNIT OPERATIONS

W. L. BADGER

Aluminum, a German material for construction of apparatus H. Röhring *Chem. Fabrik* 1935, 487 b.—A discussion of the suitability of Al for various app., of methods to increase its resistance to corrosion and to facilitate welding, with 7 cuts and 10 references.

Ebonite as a construction material in chemical industry Alfred Salmons-Karsten *Quim. e ind.* 12, 188-90 (1935).—Descriptive.

Usefulness of some Ukrainian granites for acid resisting construction A. I. Kogan and L. E. Shvartzburg *Khim. i tekhnol.* 7, 429-31 (1935). cf. *C. A.* 29, 5007.—Various tests of the granites from different quarries showed that they can be successfully used for acid-resisting construction in place of andesite.

The Dräger carbon monoxide filter III Gerhard Stampe and Otto Sommer *Dräger-Mitteil.* No. 180, 2987-9 (1935).—Improvements in the CO-gas mask filter are described.

New method of quantitative extraction A. Kulman, *Mashinnoye Zhelozhe* 11, 498-502 (1935), cf. *Pishch. chernaya Prom.* No. 8 (1929).—Several lab. app. for extrn. of solids are illustrated and described.

Removing glass stoppers F. Bentley. *Pharm. J.* 135, 237 (1935).—A single or repeated application of a mix. of chloral hydrate 10, glycerol 5, H_2O 5 and HCl (25%) 3 g. is recommended.

A modern dust collector A study of the principles governing its design and operation Herman van Tongeren. *Mech. Eng.* 57, 753-9 (1935).

A simple thermoregulator. H. P. Bloxam. *J. Sci. Instruments* 22, 361-3 (1935).—A portable and a built-in bimetallic type of app. are described, with 2 cuts. They are suitable for temps. up to 300° and are accurate to $\pm 2-3^\circ$ in long runs, but closer control is possible in short runs.

Kjeldahl flasks and other vessels from arsenic free glass Georg Lockemann *Z. anal. Chem.* 103, 81-2 (1935); cf. *C. A.* 29, 2990, 3767.—A new glass made by the Jena Glaswerke Schott u. Gen. and marked "arsenic-free" has proved suitable for all digestions with H_2SO_4 or solns. of bases without danger of getting appreciable As into soln. The new glass, because no As_2O_3 was used in its manuf., contains air bubbles but is not fragile and no trouble results from heating over a free flame.

An ionization gage for the detection of molecular rays M. J. Copley, T. E. Phipps and Julian Glasser. *Rev. Sci. Instruments* 6, 371 (1935).

Wetted surface in ring-packed towers F. Mayo, T. G. Hunter and A. W. Nash. *J. Soc. Chem. Ind.* 54, 375-837 (1935).—The degree of wetting of rings made of paper ($1/8$ " and 1 " size) was detd. by estg. the area colored when a dye soln. was run over the packing; the wetting of the tower wall (2 ", 3 " and 6 " diams.) was similarly detd. The liquid flow was found to tend toward the walls in such towers. The wetting increased with increasing liquid flow, but was not affected by gas velocity (up to the flooding point). The liquid film thickness was estd. to be independent of the liquor rate. Cf. Baker, Chilton and Vernon, *C. A.* 29, 3877.

Crystallization of melts. III Julius Meyer and Willy Pfaff *Z. anorg. allgem. Chem.* 224, 305-14 (1935); cf. *C. A.* 29, 5727.—The crystn. of supercooled liquids

depends upon the no. of crystn. seeds and crystn. velocity. This is studied for H_2O and single crystals of ice are obtained by crystn. at about -29° . Benzene is studied in a similar manner.

Superiority of a Kaudsen type vacuum gage for large metal systems with organic vapor pumps, its design and operation Jesse W. M. DuMond and W. M. Pickels, Jr. *Rev. Sci. Instruments* 6, 362-70 (1935).

Bureau of Mines multiple-diaphragm recording sub-surface-pressure gage W. B. Berwald, H. A. Buss and C. E. Kestle, Jr. *Bur. Mines, Rept. of Investigations* No. 3291, 19 pp. (1935).

New device for the toxicological determination of arsenic E. Kohn-Abrest. *Ann. f. d. 28*, 537-9 (1935).—The app. includes various simplifications but its chief feature resides in the use of a quartz tube heated electrically to 850° (by means of a Lhomme and Darcy element) which ensures complete decompn. of the AsH_3 and formation of remarkably uniform rings. As little as 0.01 mg. As can be detected, and formation of the ring is complete in 30 min. A series of standard rings can be formed on the same tube by successively displacing the heating element along the quartz tube. The rings can be identified by dissolving in HNO_3 , evapng the HNO_3 completely and treating for 10 min. on the water bath with a HCl soln. of Na hypophosphite.

Drying methyl chloride E. W. McGovern. *Power* 79, 579-80 (1935).—Water in $MeCl$ in a refrigeration system causes freezing of lines and corrosion. The system can be dried by flushing with $MeOH$, blowing out with dry air or $MeCl$ gas, followed by chem. drying after charging. The drying agent should be coarse granules and used with an efficient filter such as felt or mineral wool to prevent passage of finely divided or disintegrated material into the refrigeration system. It is not practical to reactivate any of the drying agents; contamination by oil makes reactivation impractical. $CaCl_2$ has been used efficiently, but it induces corrosion especially in the expansion valve; it should not be allowed to absorb more than 16.2% by wt. of H_2O . CaO is satisfactory; its max. H_2O -absorbing capacity is 32.1%; it prevents corrosion by neutralizing acid, its only disadvantage is its tendency to disintegrate on hydrating. Soda lime and activated Al_2O_3 are satisfactory. $Mg(ClO)_2$ or $Ba(ClO)_2$ should not be used.

The drying of solids A review of plant and theory. Alfred H. Loveless. *Ind. Chem.* 11, 427-33 (1935).

Heat transfer coefficients on inclined tubes. D. F. Jurgensen, Jr., and G. H. Montillon. *Ind. Eng. Chem.* 27, 1466-75 (1935).—An exptl. single-tube condenser was used to study liquid and condensing film coeffs. The app. was arranged to permit ready change of angle with the horizontal. There are significant differences in liquid film coeffs. for liquid flowing upward and liquid flowing downward through the heating tube when the value of Reynold's no. was below about 20,000. For higher values the differences are not noticeable. This is ascribed to the lessening of the natural convection effect as the liquid velocity is increased by forces other than convection. The results are shown graphically. Steam-film coeffs. obtained by several investigators have been correlated with that of the authors and included in a comparison with theoretical coeffs. predicted from the equation of Parr

(*The Engineer* 131, 559(1921)). Deviations from theoretical become larger as the angle of inclination approaches 90° M. C. Rogers

Velocity of bubbles in vertical tubes Morrough P. O'Brien and James E. Goshue. *Ind. Eng. Chem.* 27, 1436-40(1935)—Information about flow of bubbles through liquids in vertical tubes is necessary for consideration of gas-oil or air water lifts. Exptl work has been carried out in glass tubes of 1.18, 2.24 and 6.0 in internal diam and lengths from 5 to 26 ft. Water and two colorless petroleum oils were used. Bubbles were of sizes above those for which Stokes' law is valid. When compared with other work these results show fair agreement for bubbles of radius of about 3 mm. The disagreement for bubbles of smaller sizes is attributed to a condition similar to that of the transition from laminar to turbulent flow in pipes. When the bubble radius is increased above this value, the tube walls have a noticeable effect. In general, the increase in size of bubbles increases their rates of flow until a certain max is reached, beyond which no change in size will produce an increase in velocity. The data obtained indicate that the Gibson (*Phil. Mag.* [6], 26, 932-65(1913)) formula for this limiting velocity is high for small tubes and low for large tubes M. C. Rogers

Experiments on the vertical flow of gas-liquid mixtures in glass pipes J. E. Goshue *Am Inst Mining Met Engrs Contribution No* 90, 15 pp (1935). A H. E.

Flow of water in piping studied with movie camera Edgar C. Ambrosius and John C. Reed. *Heating, Piping, Air Conditioning* 7, 578-80(1935)—A thin flat sheet of very intense light was projected through the horizontal diametral plane of a glass pipe. The light was reflected from small globules of an insol mixt having the same d as that of the H₂O M. W. Schwartz

Further notes on power used in crushing John S. Owens *Bull Inst Mining Met* No 357, 1-21(1935); cf C A. 29, 3950²—Discussion Alden H. Emery

A new type of rotary furnace for fusion methods F. J. Kohlmeier *Metall u Erz* 32, 511-19, 543(1935).

Fume exhaust systems B. F. Postman *Heating, Piping, Air Conditioning* 7, 572-4(1935) M. W. S.

Thermostat Mme S. Lallemand *Bull soc chim biol* 17, 1470-1(1935)—A thermostat intended to operate at a temp below room temp, c. g., 18°, is supplied with a slow stream of water from a source colder than the temp to be maintained. Before entering the bath the water passes through a small chamber where it is warmed by an immersed lamp bulb which is switched on and off by the thermoregulator. One cut L. E. Gilson

Apparatus for carrying out chemical gas reactions Metalgesellschaft A-G (Ludolf Plass and Walther Deutsch, inventors) *Ger* 617,878, Aug 27, 1935 (Cl 124 4). The reactions are carried out by the aid of an elec. field.

Fractionations in column stills. Gustav A. Kramer (to Shell Development Co.) U. S. 2,022,803, Dec. 3 For the automatic control of a fractionating column to obtain a product of predetd purity and definite const. compn, vapor components are sep'd from liquid within the column and the vapor and liquid are separately withdrawn from the column, the withdrawn vapors are substantially totally condensed and a portion of the condensate is returned to the column as reflux in a controlled amt. in accordance with the temp. difference gradient of the high part of the column. App. is described.

Still Coyac fils & Cie *Fr.* 788,630, Sept. 6, 1935. Openings are made at the bends of the coil for cleaning, the coil being in the form of a series of straight tubes joined at alternate ends.

Balance with a weighing chain Robert G. Ainsworth and Alfred W. Ainsworth (to William Ainsworth & Sons, Inc.) U. S. 2,022,306, Nov. 20 Structural details.

Apparatus for sampling heaped materials Franz Schröder (Julius Hillmann, inventor) *Ger* 620,425, Oct. 21, 1935 (Cl. 422, 17).

Cooling-towers Stewart C. Coey. *Brit.* 433,113, Aug 8, 1935

Liquid treating apparatus The Pfaudder Co. *Brit* 433,559, Aug 16, 1935 The app comprises a tank having an opening in its wall for an agitator shaft which is supported by means of bearings, adjustable transversely of the tank opening to align the shaft therewith, and also by means of a bushing, adjustable transversely of the shaft to align the bushing with the shaft.

Apparatus for homogenizing liquids John A. Clark (to Manton-Gaulin Mfg Co.) U. S. 2,023,043, Dec. 3 Various structural, mech. and operative details.

Arrangement for indicating liquid levels Electrical Improvements Ltd and Charles L. Blackburn *Brit* 433,123, Aug 9, 1935

Electrical indicating instrument suitable for showing liquid levels in tanks Theodore J. Smulski (to Anderson Co.) U. S. 2,022,441, Nov. 20 Various elec., structural and operative details.

Portable tank valve suitable for use with combustible or other liquids or vapors under pressure. Harrison V. Snodgrass U. S. 2,021,969, Nov. 20 Various structural details.

Liquid seal for apparatus such as chemical mixing and agitating apparatus Fred W. Paffen (to Celanese Corp of America) U. S. 2,022,384, Nov. 20 Structural details.

Apparatus for proportioned supply of reagents as in supplying chemicals to water mains Henry J. Savage U. S. 2,023,532, Dec. 10 Structural and operative details.

Vacuum-jacketed vessels Jesse T. Littleton (to Corning Glass Works) *Brit* 433,588, Aug. 16, 1935. A vessel of glass is formed of sep. walls, the glass of the inner wall having a lower coeff. of expansion than that of the outer wall, whereby stresses induced by the annealing operation after the mouths have been joined by fusion are counteracted by the evacuation of the jacket. Cl C. A. 29, 3489².

Self-starting siphoning device suitable for use with bottles Theodore J. Simpson U. S. 2,022,927, Dec. 3 Structural details.

Viscometer with a diaphragm and friction tube, etc Moses E. Cheney and Aleck W. Meston (to Moto Meter Gauge & Equipment Corp.) U. S. 2,023,309, Dec. 3 Various structural details.

Electric relay system for controlling automatically the composition of baths to which reagents are continuously fed Siemens-Schuckertwerke A-G *Ger* 620,325, Oct. 19, 1935 (Cl. 12f. 4).

Temperature regulators Karl Baumann and Associated Electrical Industries Ltd. *Brit* 433,149, Aug 9, 1935. In a fluid heater, e.g., steam, superheater, the temp. at the outlet is automatically controlled by a control member at the outlet and by a control member at an intermediate point in the fluid path, the effect of the 1st member being 3 times as great as that of the latter for equal changes in the temp. of the 2 members.

Thermocouple pyrometer John L. Orchard (to Cambridge Instrument Co., Ltd.) U. S. 2,022,515, Nov. 20 Structural details.

Air-filtering and -conditioning apparatus Charles P. Erschen and Richard C. Jeperington (to Air Conditioning Equipment Corp.) U. S. 2,022,463, Nov. 20 Various structural and operative details.

Apparatus for filtering and conditioning air. John W. Manley. *Brit* 434,674, Sept. 6, 1935

Filter for arsenics, toxic fumes, etc Riccardo Spasiani *Fr.* 788,646, Sept. 6, 1935. A filter suitable for gas masks contains feathers, down or finely cut natural sponge in combination with microscopical grains of amber, lacquer or resins.

Rotary-filter apparatus for cleaning, moistening and cooling air Eugen Steiner *Ger* 620,409, Oct. 22, 1935 (Cl. 36d, 1.30).

Rotary leaf apparatus suitable for filtering materials under pressure Wm L. Chapman (to Vallec Rotary

Filters Co.). U. S. 2,022,403, Nov. 26. Various structural, mech. and operative details.

Rotating filter for liquids Schlichtermann & Kremer-Baum A-G fur Aufbereitung. Ger. 617,783, Aug. 20, 1935 (Cl. 124. 15 02).

Apparatus with sponge-packed cells suitable for filtering liquids Manco Cordoro Santiago. U. S. 2,022,521, Nov. 26. Various structural and operative details.

Filtering device for separating solids from liquids Mag Mühlenbau und Industrie A-G Ger. 617,970, Aug. 30, 1935 (Cl. 124. 13).

Apparatus for filtering rapidly settling sludges Maschinenfabrik Buckau R. Wolf A-G Ger. 617,977, Sept. 18, 1935 (Cl. 124. 30).

Funnel for filtering precipitates, etc., from liquids Jenaer Glaswerk Schott & Gen Ger. 617,783, Aug. 27, 1935 (Cl. 124. 21). The funnel has a capillary delivery tube and three raised portions on its inner face spaced at 120° from each other.

Filter press. Herbert T. Leo U. S. 2,022,670, Dec. 3.

Filter leaf Wm H. Bachelder (to Standard Oil Co. of Ind.). U. S. 2,023,010, Dec. 10.

Fractionating columns Henry W. Howes Brit. 433,770, Aug. 20, 1935. A Young and Thomas fractionating column comprises a top section, a bottom section and 1 or more standard center sections, adjacent sections being connected by interchangeable ground joints.

Centrifugal separators Ange Nyrop and Koefoed, Hauberg, Mørstrand & Helweg, Aktieselskabet Titan Brit. 431,203, Aug. 28, 1935. The cream of a sap, e. g., rubber latex, is produced in a separator where the relation of the feed of the sap to the discharge of the heavy slum can be regulated and held.

Centrifugal separators Gutehoffnungshütte Oberhausen A-G Brit. 434,693, Sept. 6, 1935. Liquid from wet or sludgy material in a centrifugal separator is discharged through a hollow body tapering toward the drum wall and the peripheral opening.

Centrifugal separators having tightly connected inlets and outlets and with apparatus, such as pumps, for raising the pressure, provided at the inlet and outlets Aktebolaget Separator. Brit. 434,006, Aug. 23, 1935.

Arrangement for the closed supply of liquid to a centrifugal separator through the hollow spindle of the bowl Aktebolaget Separator. Brit. 434,008, Aug. 23, 1935.

Centrifugal bowls Aktebolaget Separator-Nobel Brit. 433,608, Aug. 19, 1935.

Centrifugal bowls for separating heavy sludge and solids from lighter liquids Geo J. Strezyński (to De Laval Separator Co.). U. S. 2,022,814-15-16-17, Dec. 3. Various details of app. suitable for sepg. foets and wax from oil, etc.

Magnetic separators. Electromagnets Ltd and Wm E. Box Brit. 433,615, Aug. 9, 1935. Supported above electromagnets mounted on a base plate secured to a frame which is pivoted at its upper end to standards and bolted at its lower end to standards is a trough provided with transversely arranged armatures which cooperate with the pole pieces of the magnets. The trough is oscillated transversely by eccentrics.

Magnetic separators. Electromagnets Ltd and Wm E. Box. Brit. 433,616, Aug. 9, 1935. A rotary magnetic separator drum comprises a central core having radial arms forming the cores of electromagnets and being of greater thickness than intermediate arms, the windings for the electromagnets being arranged in the spaces between the arms.

Magnetic separator. Robert C. Forrer and Mines domaniales de potasse d'Alsace. Ger. 620,391, Oct. 21, 1935 (Cl. 15. 3). Addn to 602,170 (C. A. 29, 3869).

Magnetic separators of the trough or tray type. Electromagnets Ltd and Wm E. Box. Brit. 433,458, Aug. 9, 1935. Inclined flaps or baffles of para- or dia-magnetic materials are arranged above pole pieces of electromagnets so as to intercept pieces of material that may ricochet from 1 of the pole pieces.

Pneumatic separators. Albin B. Helbig and Victor B. Reichwald. Brit. 434,467, Sept. 2, 1935.

Apparatus for separating mixtures of liquids of different specific weights. I. G. Farbenind. A.-G. Fr. 786,930, Sept. 14, 1935.

Apparatus for sitting or straining materials suspended in liquid, such as wood pulp. Walther Voith, Hermann Voith and Hanns Voith (trading as a firm of) J. M. Voith). Brit. 434,000, Aug. 26, 1935.

Apparatus for mixing gases such as butane and air, etc. John K. Heller (to Utility Development Co.). U. S. 2,023,809, Dec. 10. Various structural and operative details.

Gas-analysis apparatus Oliver W. Johnson and Philip S. Williams U. S. 2,023,731, Dec. 10. Gas such as that contg. hydrocarbons is passed through an app. contg. combustion filaments. Various structural and operative details are described.

Apparatus for gas analysis. The Asiatic Petroleum Co. Ltd and John K. Joyce Brit. 434,970, Aug. 23, 1935.

The app. comprises a chamber contg. a solid reagent for removing a component from the gas, internally actuated means for passing a given vol. of gas through the chamber, and a vacuum gage for measuring the reduction in pressure.

Centrifugal gas-cleaners Charles H. W. Cheltnam and Cyril H. Cheltnam Brit. 433,647, Aug. 19, 1935. To prevent turbulence in a separator of the cyclone type having a tangential entry, a rotary motion is imparted to the dust-laden gas before its entry so that it rotates in the same direction as the vortex ring it joins.

Method and means for gas scrubbing Dana W. Flowers. Brit. 433,977, Aug. 23, 1935. In treating gas with liquid, the gas is passed through a radially bladed high-speed centrifugal blower through the hub of which liquid is introduced so as to be projected in sheet form along the blade surfaces and to traverse a space between the blade ends and the blower wall in the form of large drops.

Method and apparatus for conditioning gases and vapors Babcock & Wilcox Co. Brit. 431,457, Sept. 2, 1935. Gas is passed into contact with a no. of perforate ring or wall-like masses presenting progressively decreasing flow areas to the gas, films of liquid being formed on the solid surfaces of the masses and flowing down to the lower level of each mass, whence accretions of liquid are removed.

Continuous system for adsorbing gases or vapors and regenerating the adsorbent. Carbo-Norit-Union-Verwaltungs-G m b H Ger. 620,388, Oct. 21, 1935 (Cl. 12c. 3 022).

Apparatus for the physical or chemical wet treatment of gases Jules M. Revy. Fr. 786,804, Sept. 11, 1935.

Drying agents for gases Soc. de recherches et d'exploitations pétrolières. Ger. 620,397, Oct. 21, 1935 (Cl. 12c. 3 01). See Fr. 700,511 (C. A. 25, 3781).

System for fractionating natural gas and other gas mixtures by liquefaction. Ges. fur Linde's Eismischungen A.-G. Ger. 620,077, Oct. 14, 1933 (Cl. 17c. 2 02).

Effecting reactions between solids and gases such as pyrites and sulfur chloride. Ernest W. Wescott (to Sulphide Corp.). U. S. 2,023,942, Dec. 10. A comminuted solid material is fed into one end of a rotating horizontal drum contg. a loosely packed body of pebbles and is treated countercurrentwise with a reactive gas. Various details of app. are described.

Apparatus for drying volatile solids Hermann Sandkuhl. Ger. 620,227, Oct. 17, 1935 (Cl. 12a. 6). The app. comprises a closed inclined tube which is heated in sections and up which the solid is moved. A condenser is attached to the lower end of the tube. Specified applications of the app. include (1) the recovery of isoborneol from a crude product contg. camphene 4 and water 10%, (2) treatment of salicylic acid, after it has been crystd. from alc., to recover dry acid and alc., (3) the drying of boric acid.

Apparatus for aerating liquids. J. Stone & Co. Ltd and Donald Elder. Brit. 433,857, Aug. 19, 1935. The app. comprises a tower in which the liquid is aerated, a supplementary chamber to which the liquid is supplied under pressure and in which the liquid collects under pressure.

sure of a gas cushion, and spraying or atomizing devices connecting the chamber and tower and to which gas is supplied under pressure

Rotary and bling furnaces Metallgesellschaft A-G Brit 433,669, Aug 19, 1935 A rotary or rocking furnace, particularly for refining Cu, is mounted on rollers secured to a turntable so that it can be rotated at least 180° about a vertical axis to enable it to be charged and (or) fired at both ends

Furnace (with conveyor rollers) John Fallon U.S. 2,021,913, Nov 26 Structural and mech. features of a "roller hearth" type furnace are described

Fusion furnaces Akt-Ges. Brown, Boveri & Cie Fr 788,983, Sept 14, 1935 Method of charging is described

Muffle furnace Gibbons Brothers Ltd and Thomas E. Bridgford Ger 620,090, Oct 14, 1935 (Cl. 24c 9). This corresponds to Brit 384,788 (C. A. 27, 5588)

Apparatus for regulated combustion of atomized oil in furnaces Aldo Macchi (to General Elec. Co.) U.S. 2,022,512, Nov 26 Various structural and operative details U.S. 2,022,513 also relates to oil-burning app.

Furnace floors Rolfe Shellenberger (to Babcock & Wilcox Co. Ltd.) Brit 431,518, Sept 3, 1935 In a furnace adapted to retain at the bottom a pool of molten slag, the furnace floor comprises metallic blocks secured to spaced cooling tubes and means positioned externally of the blocks and co-operating with the tubes to form narrow slag-solidifying passages communicating with the joints between the blocks

Furnace wall cooled by tubes through which water or mercury vapor, etc., may be passed Joseph S. Bennett (to American Engineering Co.) U.S. 2,023,302, Dec 3 Various structural details

Furnace-charging truck Edgar E. Brosius Ger 620,408, Oct 21, 1935 (Cl. 18c 11.20) See Brit 370,764 (C. A. 27, 2353)

Conveyor rolls for charging and discharging annealing furnaces Siemens-Schuckertwerke A-G (Johann Schnepf, Otto Gunther, and Alois Schmitt, inventors). Ger 620,452, Oct 21, 1935 (Cl. 18c 11.20)

Apparatus for removing dust from furnace gases Axel Larsen Fr 787,028, Sept 16, 1935

Plate heat-exchangers Søren Jørgen Jensen Brit 433,604, Aug 7, 1935

Tubular heat-exchange apparatus suitable for water-tube boilers or heaters Henri A. Richard U.S. 2,023,646, Dec 10 Structural features

Concentric-tube heat exchangers Michael Fröh Brit 433,847, Aug 21, 1935

Straight-tube heat-exchangers Thomas G. Thomas. Brit 433,743, Aug 13, 1935

U-tube heat exchangers Wm. Y. Lewis Brit. 474,023, Aug 21, 1935

Heat transfer apparatus suitable for heating air by furnace gases Ali Lysheim (to Aktiebolaget Ljungströms Angturbin). U.S. 2,023,965, Dec. 10 Various structural details

Air-conditioning apparatus Edward W. Roessler (to General Elec. Co.) U.S. 2,022,523, Nov. 26. Structural and operative details.

Air-conditioning apparatus Ira W. Rowell. U.S. 2,022,740, Dec 3 Various structural and operative details

Air-conditioning apparatus Leonard C. Smith (to Heating Ventilating & Air Conditioning Co.). U.S. 2,023,492, Dec 10 Various structural and operative details

Air-conditioning apparatus Leopold Lithman U.S. 2,023,602, Dec 10. Various structural and operative details

Air-conditioning apparatus John H. Textorius and Joseph F. Broderick. U.S. 2,023,623, Dec 10 Various structural and operative details

Air heating and -conditioning apparatus Geo. Herberster (to Cleveland Cooperative Stove Co.). U.S. 2,023,130, Dec 3 Various structural features

Air heating and -conditioning apparatus Clarence M.

Woolley (to American Radiator Co.). U.S. 2,022,332-3, Nov 26 Structural, mech and operative details
Apparatus for humidifying air. Wm. Feldermann U.S. 2,022,415, Nov. 26 Various structural, mech and operative details.

Apparatus for humidifying air. Albert J. Loepsinger (to American Moistening Co.). U.S. 2,022,680, Dec 3 Structural and operative details

Apparatus and process for drying and conditioning air for supply to a living room, or for drying purposes or for the evaporative cooling of water Edmund Altenkirch Brit 431,639, Aug 19, 1935

Apparatus for purifying and regulating the humidity of air. Ludwig Matthaei and Josef O. Zeuzern. Fr. 786,647, Sept 6, 1935 App. is described in which air is treated with short-wave rays such as ultraviolet rays and with a pulverized liquid. Means is provided for cooling the air

Humidifier for air suitable for use with warm-air furnaces Pierce A. Weyl. U.S. 2,022,394, Nov. 26 Structural and operative details.

Apparatus for incorporating a liquid with a gas as in air conditioning Pierre G. Vicard U.S. 2,023,061, Dec 3 Structural and operative details are described of an app. having a rotary device carrying a series of blades with sharp cutting edges

Apparatus for heating, cooling, drying or moistening air Frigidaire Ltd and Arthur T. Hawkins Brit. 434,281, Aug 29, 1935

Valve and method for releasing the pressure on mixtures containing liquid and solid substances under high pressure, such as occurs in autoclaves, etc., where the parts are subjected to considerable corrosion and abrasion Friedrich Uhde and Kurt Bredtschneider. Brit 433,496, Aug 16, 1935

Apparatus for making dispersions Wm. H. Ashton Brit 433,583, Aug 16, 1935 Dispersions of 2 or more substances are made by subjecting them to compressional wave vibrations of sonic frequencies, e.g., 8000 cycles, and sufficient amplitude to cause cavitation in the mixt. App. is described

Apparatus for cleaning liquid conduits such as beer pipes by use of cleansing solutions Hans M. Erdmann (to Saronia, Inc.) U.S. 2,022,882, Dec 3 Various structural and operative details

Apparatus for treating molten material as with fluids in a multi-chambered ladle Oskar Blume U.S. 2,022,755, Dec 3 Numerous structural, mech and operative details

Apparatus for drying and grinding materials such as blood or fruit pulps. Wm. B. Senseman (to Raymond Bros Impact Pulverizer Co.). U.S. 2,023,247, Dec 3 Structural, mech and operative details employing heated gases

Pneumatic conveyor for transferring material in bulk from a hopper through a pipe by means of an air jet Eusebe J. L. F. Constantin Brit. 434,408, Aug. 30, 1935

Apparatus for condensing mercury vapor Joseph F. Tapie U.S. 2,021,903, Nov 26 Structural and operative details are described of an app. cooled by water and subjected to a partial vacuum

Mixing or grinding rolls, with heating or cooling means Gebrüder Buhler. Ger. 620,040, Nov 7, 1935 (Cl. 50b 4) Structural features are described

Crushing mills Thomas A. Long and Wm. W. Potts Brit 433,765, Aug 20, 1935

Rotary-drum ball or rod mill Carl G. H. Löwenhielm U.S. 2,023,131, Dec 3 Structural and mech details

Control of the combustion of oil atomized with steam John J. Harman (to Walworth Patents Inc.) U.S. 2,023,074, Dec 3 Various details of app and operation

Apparatus for treatment of substantially immiscible liquids as in treating oil fractions with sulfuric acid Gustav A. Kramer (to Shell Development Co.) U.S. 2,022,205, Nov 26 Various structural and operative details

Electric system for remote control of pressure such as that in gas mains Philip B. R. Baas (to Brooklyn

Borough Gas Co.). U. S. 2,023,503, Dec. 10. Various elec. and operative details.

Apparatus for testing the permeability of porous materials such as paper by air suction. Rudolf Schopper. U. S. 2,021,948, Nov. 26. Various structural and operative details.

Liquid seal and vent for tanks, etc., containing volatile solvents such as those used for "dry cleaning." John Mahoney (to American Laundry Machinery Co.) U. S. 2,023,634, Dec. 10. Details are described of an app. which automatically drains condensate back to a tank

or the like after a predetd. amount of the condensate has collected when formed from escaped vapors.

Apparatus for producing solid carbon dioxide. Harlon A. Bullock. U. S. 2,023,703, Dec. 3. Structural and operative details.

Liquefier suitable for use with solid carbon dioxide. Frank C. Seck. U. S. 2,021,997, Nov. 26. Various structural details.

Apparatus for separating oil from refrigerants such as sulfur dioxide. Albert A. Ralston (to General Elec. Co.). U. S. 2,023,241, Dec. 3. Structural details.

The atomic weight of hydrogen. E. Moles. *Annales soc. espah. fis. quim.* 33, 721-8(1935). —The value 1.00778, derived by M. in 1925, according to recent results of investigations of isotopes, corresponds not to normal H, but to H electrolytically produced. H low in deuterium. If normal H is regarded as the isotope mixt. in ordinary, pure, distd. water, the ratio is D:H 1.5550 = 110, according to recent detns. by others. However, almost simultaneously and independently, Bethe (C. A. 29, 3908⁹) and Oliphant, Kempton and Rutherford (C. A. 29, 4668⁹) concluded that for B and Be nuclei, in comparison with mass spectroscopic detns., the mass ratio H:O = 3 × 10⁻⁴ (approx.) is not true, and consequently in both publications the isotope mass of the light elements must be recalcd. on O = 16. H then = 1.0081, D = 2.0142. Recently Aston, by new, mass-spectroscopic detns., found H = 1.0081, D = 2.0148. From these concordant results, and with the above D:H ratio, the phys. at. wt. of normal H is 1.00828, which in a chem. conversion scale corresponds to a factor of 1.00022, H = 1.00906 = 0.00035. This value, considerably higher than that assumed today, requires a chem. revision, now in progress. The old literature value, about corresponding to normal H, leads to a higher value. E. M. S.

Revision of the atomic weight of germanium. I. Analysis of germanium tetrabromide. O. Hönigschmid, K. Wintersberger and F. Wittner. *Z. anorg. allgem. Chem.* 225, 81-9(1935). —GeBr₄ was prepd. from spectroscopically pure Ge and fractionated in a high vacuum in an app. previously described (C. A. 28, 7085⁷). Detn. of

the ratio GeBr₄:4Ag gave Ge = 72.59.

L. R. Rushton

Revision of the atomic weight of tantalum. Analysis of tantalum pentachloride. O. Hönigschmid and R. Schlee. *Z. anorg. allgem. Chem.* 225, 64-8(1935); cf. C. A. 29, 2037¹. —Tantalite was extd. with strong HCl to remove most of the Fe, then dissolved in HF, K₂TaF₇ prepd. and recrystd. 5 times. Ta₂O₅ was then pptd. and ignited. Spark and x-ray spectra showed that it was free of Co, Th, Zr, etc., but contained Fe. It was fused with soda, dissolved in H₂O and pptd. with (NH₄)₂S. TaCl₅ was prepd. and distd. 3 times in Cl₂, then sublimed *in vacuo*. The pure TaCl₅ was dissolved in EtOH and pptd. with NH₄OH. The ratio TaCl₅:5Ag was detd. in the soln. in which the ppt. remained suspended. The av. of 6 detns. gave Ta = 180.88 ± 0.01. E. R. Rushton.

The group relation between the Mulliken and Slater-Pauling theories of valence. J. H. Van Vleck. *J. Chem. Physics* 3, 803-6(1935). —By means of the group theory of characters, an intimate relation is shown between Mulliken's (I) mol. orbitals and the Slater-Pauling (II) directed wave functions. A simple transformation from an irreducible to a reducible representation makes possible a transition from (I) to (II). Consequently the same formal valence rules are usually given by either method, and wave functions of the central atom which are nonbonding in Mulliken's procedure are likewise never employed in constructing Pauling's "hybridized" linear combinations. G. M. P.

A summary of experimental activation energies of elementary reactions between hydrogen and the halogens. J. Carrell Morris and Robert N. Pease. *J. Chem. Physics* 3, 796-802(1935). —Exptl. data on reactions between H and the halogens are analyzed to give values of the activation energies of the intermediate reactions involved. These are compared with values calcd. by Eyring and Wheeler. G. M. P.

Effect of thermal agitation on atomic arrangement in alloys. II. W. L. Bragg and E. J. Williams. *Proc. Roy. Soc. (London)* A151, 540-66(1935); cf. C. A. 28, 5794³. —Treatment and discussion of the previous paper are compared with the treatments of Bethe, Borelius, Gorsky and Dehlinger. Changes in internal energy due to transformation in the alloys CuZn and Cu₃Au were estd. by sp.-heat measurements. These measurements are compared with theoretical results. Expressions are given for the dependence of crit. temp. upon compn. C. B. Jenni.

Effect of thermal agitation on atomic arrangement in alloys. III. E. J. Williams. *Proc. Roy. Soc. (London)* A152, 231-52(1935), cf. preceding abstr. —The equl. equation for the general case is derived in detail from the standpoint of the Boltzmann distribution formula and from that of the principle of min. free energy. This assumes that the energy assocd. with the at. arrangement is uniquely detd. by the superlattice order. The relation between entropy and the internal energy is developed. When f(S) is plotted against S, curves are obtained from which the existence of stable and metastable arrangements can be predicted. The entropy and energy corresponding to the solution given by Bethe are discussed (it is assumed

the energy of the at. arrangement is detd by the order of nearest neighbors), and a method of estg the quant. relation of Bethe's treatment to that of Bragg and Williams is given. With CuZn as an example it is shown that both types of treatment lead to very nearly the same result, which is in accord with exptl observations.

Howard A. Smith

The molecular structure of sulfur dioxide, carbon disulfide and carbonyl sulfide. Paul C. Cross and L. O. Brockway. *J Chem Physics* 3, 821-4 (1935).—By use of the electron diffraction method (C. A. 29, 677) the following interat distances were found: SO_2 , $\text{C—S} = 1.40 \pm 0.02$ Å, CS_2 , $\text{C—S} = 1.54 \pm 0.03$ Å; COS , $\text{C—O} = 1.16 \pm 0.02$ Å, $\text{C—S} = 1.56 \pm 0.03$ Å. The types of bond arrangement compatible with these interat distances are discussed. The SO_2 mol resonates between the structures having single-double and double-single bonds between the S and the O atoms, with a bond angle of $122^\circ \pm 5^\circ$. CS_2 is a linear mol with the structure having the 2 double bonds predominating over those having a single and a triple bond. In COS the double-double bond arrangement and the structure having the triple C—O bond predominate.

G M P

Thermodynamic properties of sulfur compounds. II. Sulfur dioxide, carbon disulfide and carbonyl sulfide. Paul C. Cross. *J Chem Physics* 3, 825-7 (1935), cf C A 29, 2832 and preceding abstr.—The thermodynamic properties of SO_2 , CS_2 and COS are calcd from the mol consts obtained by electron diffraction and from Raman and infrared spectra. $-(F^\circ - E^\circ)/T_{298.15} = 50.95$, 48.28, 47.39; $S^\circ_{298.15} = 59.40$, 56.84 (gas), 55.34, resp. The results are applied to several reactions involving these compds. The free energies of formation of $\text{CS}_2(l)$ and COS at 298.1°K are +15.24 and -40.48 kg.-cal, resp.

G M P

The molecular structure of nickel carbonyl. L. O. Brockway and Paul C. Cross. *J Chem Physics* 3, 828-33 (1935).—Electron diffraction by the vapor of Ni(CO)_4 indicates a mol model in which the CO groups have a tetrahedral arrangement about the Ni atom with the distances $\text{Ni—C} = 1.82 \pm 0.03$ Å and $\text{C—O} = 1.15$ Å. These distances are compatible with resonance between 2 electronic structures in which the C—O bond resonates between triple and double electron pair bonds and the Ni—C bond between single and double electron pair bonds. Ni(CO)_4 is the first quadrivalent compd of neutral Ni whose structure has been detd, and its tetrahedral configuration is contrasted with the square arrangement of bonds in the quadrivalent compds of Ni^{2+} .

G M P

Electron diffraction by chloroform and its molecular structure. Urban and tetrahedral models. Charles Degard. *Compt rend* 201, 951-2 (1935), cf C A 29, 6501.—The mol structure of CHCl_3 was reexamined by the method of electron diffraction, and the results deduced therefrom were shown to be consistent with both the ordinary tetrahedral formula, and Urban's coordinatc formula, CCl_2HCl , within the limits of error.

C A Silberrad

Magnetic birefringence of nitric oxide. Henri Buzette and Tsai Belling. *Compt rend* 201, 955-6 (1935).—The Cotton-Mouton const, C_m , of NO for λ 5780 is 456×10^{-14} at 15° and 143 kg./sq cm pressure. C_m/d is const, and the birefringence varies inversely as λ .

C A Silberrad

Magneto-optical rotation of uranyl salts. S. S. Bhatnagar, P. L. Kapur and N. R. Verma. *J. Indian Chem Soc* 12, 514-18 (1935).—The mol rotations of uranyl chloride, nitrate and sulfate were found to be 1.22 ± 0.6 , -5.85 ± 0.4 , and -8.5 ± 0.5 , resp, giving a value of -8.0 ± 0.6 for the uranyl ion in the first 2 cases and -11.46 ± 0.5 with the sulfate ion. Complete analysis showed the formulas of the salts to be UO_2Cl_2 , $\text{UO}_2(\text{NO}_3)_2$ and $2\text{UO}_2\text{SO}_4$, H_2SO_4 , $6\text{H}_2\text{O}$.

H E Phipps

A modified photographic method for substances of small rotatory dispersion. R. Padmanabhan. *J. Indian Chem Soc* 12, 559-63 (1935); cf preceding abstr.—The optical rotatory dispersion of a substance whose optical

activity does not change much with wave length was detd in conjunction with a substance (like quartz) whose rotatory and dispersive power is more nearly normal. By using the difference between this value and that of the latter substance alone, fairly accurate results could be obtained on the former type of compd. Some data are given for β -pinene.

H E Phipps

Valence strength and the magnetism of complex salts. J. H. Van Vleck. *J. Chem. Physics* 3, 807-13 (1935).—Certain complex salts, notably the iron cyanides and the cobaltammines, have magnetic susceptibilities much lower than those predicted by the Bose-Stoner "spin only" formula. This was interpreted by Pauling on the basis of directed wave function (C. A. 25, 2910, 28, 3629). Alternative explanations are possible with the crystal potential model of Schlapp and Penney (C. A. 26, 5233, 27, 1804) or with Mulliken's method of mol orbitals (C. A. 26, 4237). The 3 theories give results so similar that no preference can be established between them. Covalent bonds, as in cyanides, seem to be more effective in suppressing magnetism than are ionic ones, as in fluorides, but so far the evidence is empirical rather than theoretical.

G M P

The principal magnetic susceptibilities of $\text{K}_2\text{Fe(CN)}_6$. J. B. Howard. *J Chem Physics* 3, 813-17 (1935).—The magnitudes, anisotropy and temp dependence of the principal magnetic susceptibilities of $\text{K}_2\text{Fe(CN)}_6$ are calcd by the method of crystal potentials, and agree well with exptl data (cf Jackson, C. A. 27, 4143-4).

G M P

Magnetic moment of the manganese ion. L. C. Jackson. *Proc Phys Soc (London)* 47, 1029-31 (1935).—The μ susceptibility of carefully purified manganic acetylacetonate was detd by the Faraday method at 12 temps from 292° down to 17°K . When corrected for the diamagnetism of the org groups in the mol, the mol susceptibility obeys the Weiss law, $\chi(T + 55) = \text{const}$, down to about 70°K , below which temp χ increases somewhat more rapidly than is indicated by this relation. These results give 4.98 as the magneton no for Mn^{++} , which agrees excellently with the requirements of the Bose-Stoner theory.

W. W. Stiller

Diamagnetic study of structure by a new plan. Francis W. Gray and James H. Cruickshank. *Trans Faraday Soc* 31, 1491-1510 (1935).—When the results of Pauling and of Pascal are corrected according to the most recent values for the fundamental phys consts, they furnish a theoretical and an exptl standard, resp, for diamagnetism. These 2 standards can be reconciled and applied to the study of mol structure. Calcn of the "depression" of diamagnetism due to bonds of different types is essential in this method. Frequently fractional values are assigned to the charge on an atom. This is merely statistical and implies that the atom has one integral charge for a definite fraction of the time and a different integral charge for the remainder. A comparison between theoretical diamagnetisms calcd. for different possible structures for a compd and the exptl value indicates which of the suggested structures is the correct one. This method is illustrated by consideration of the structures of benzene, naphthalene, acid carbonyl group, H_2O , and H_2O_2 . With benzene, some properties seem to require the double-bonded Kekule structure while others are best explained by the internal-ionic. The diamagnetic analysis indicates that the mol exists in each of these states for half the time. Resonance phenomena are also explained satisfactorily. The theoretical significance is given for Pascal's empirical rules. Tables of screening nos, ionic diamagnetisms and residual charges are given.

W. W. Stiller

Diamagnetic susceptibilities of salts forming ions with inert-gas configurations. II. The alkali halides. G. W. Brindley and P. E. Hoare. *Proc. Roy. Soc. (London)* A152, 342-53 (1935), cf C. A. 29, 1299.—Values of the mol diamagnetic susceptibilities are given for the halides of Li, Rb and Cs. These new data, combined with results previously reported for the halides of Na and K, are used to test the additivity of diamagnetic susceptibilities. This law fails for LiCl , LiBr , LiI , CsCl , CsBr and CsI .

but holds within exptl. error for the remaining compds. Possible causes for this are discussed; the discrepancies may be due to deformation of the ions, produced by unusually close approach of the neg. ions in the Li salts, and by change of crystal structure in the Cs salts. By assuming 0.7×10^{-4} as the ionic susceptibility of Li^+ in LiI , the following ionic susceptibilities in crystals of the rock salt type are calculated: $\text{Na}^+ = 6.1$, $\text{K}^+ = 14.6$, $\text{Rb}^+ = 22.0$, $\text{Cs}^+ = 35.1$, $\text{I}^- = 9.4$, $\text{Cl}^- = 24.2$, $\text{Br}^- = 34.5$, $\text{I}^- = 50.6$, all $\times 10^{-4}$. W. W. Stiefel

Diamagnetism of the trivalent bismuth ion S. S. Bhatnagar and Bhim Sam Bahl *Current Sci.* 4, 234 (1935).—In an earlier calcn. (cf. *C. A.* 30, 339) based on a modified Slater method, $-x \times 10^4 = 43.80$ was obtained for the trivalent Bi ion. By use of the orthodox Slater formula 42.23 is now obtained and by a modification suggested by Angus, 42.00. The agreement with the exptl. value, 41.24, is considered satisfactory. The difference between the calcd. values for Bi^{3+} and Bi^{5+} is of the same order of magnitude as that found by Kido for a no. of other ions. W. W. Stiefel

The diamagnetism of ions in the solid state and in solution Hermann Lahlénbrach *Amer. Physik.* 24, 453-8 (1935).—Irvold and Sogn (*C. A.* 29, 7137) found that the diamagnetic susceptibilities of certain salts calcd. by Wiedemann's addn. rule from measurements on aq. solns. are greater than those calcd. for the same salts when LiOH is the solvent. Irvold and Sogn (*C. A.* 29, 7137) observed also that in general the susceptibility of a salt measured in the solid state is less than that calcd. by the addn. rule from measurements on aq. solns. The work of Cabrera and δ demonstrated that, when used as a solvent, H_2O is in a different state of polymerization and consequently its diamagnetism is not the same as that of pure H_2O . These seeming failures of the addn. law are attributed to failure to allow for this change in diamagnetism of H_2O when used as solvent. W. W. Stiefel

The dipole moment of tetralin. M. A. Govinda Rao and S. Satyanarayana Rao. *Proc. Indian Acad. Sci.* 2A, 232-5 (1935).—The moment of tetralin as measured in C_6H_6 is only 0.4 to 0.5×10^{-18} , and not 1.66×10^{-18} , as previously believed. The origin of this small but finite moment is discussed. Harold Gershinowitz

The discontinuity in the dielectric constant of liquids and their saturated vapors at the critical temperature J. Maréchal and O. Maass. *Can. J. Research* 13B, 290-7 (1935).—A dielec. cell which was specially adapted to a study of the dielec. const. of liquid and gas over a large temp. range, including the crit. temp. region, is described. The dielec. const. of Me_2O (liquid and satd. vapor) and propylene (liquid and satd. vapor), from room temp. to 8° above the crit. temp., are given. The dielec. const. of liquid and gas are not identical at the crit. temp. These results with previous work in this lab. on the discontinuity in properties of the medium above and below the point of disappearance of the meniscus. J. W. S.

The motion of a heavy drop in an acoustic field S. V. Gorbachev and A. B. Severny. *Kolloid-Z.* 73, 140-54 (1935).—The distance between centers of 2 liquid drops (5% aq. H_2SO_4 soln.) suspended from thin glass threads was studied as a function of (1) the frequency of an acoustic field which was applied both parallel and perpendicular to their line of centers and (2) the velocity and direction of a stream of air. From theoretical as well as exptl. considerations it is concluded that the complicated motion executed by a drop in an acoustic field may be described as similar to that of a uniformly progressing overtone subject to a ponderomotive effect. Two drops in the plane of the sound waves attract each other and may coalesce at sufficiently high (ultra-sonic) frequencies. O. T. Q.

Density and compressibility of silicane and silicoethane. K. L. Ramaswamy and G. Gundu Rao. *Proc. Indian Acad. Sci.* 2A, 213-20 (1935).—An app. for simultaneous measurements of d and approx. compressibilities at ordinary and low temp. is described. Density and compressibility of mono-silane at different temps.

and of disilane at the ordinary temp. were measured. The α , β , γ , δ of Si (23.10 ± 0.03) obtained from the corrected mol. wts. is compared with the existing values. Harold Gershinowitz

Effect of molecular association on infrared absorption. Alfredo Maione *Nuovo cimento* 12, 441-3 (1935); cf. *C. A.* 30, 237.—The absorption coeff. of the $\text{C}_6\text{H}_5\text{OH}$ band at 3μ is increased by adding C_6H_6 . Conclusion: Absorption is diminished by mol. assocn. J. B. A.

Variation of the molecular refraction of ethyl alcohol in mixtures with benzene Paolo Trautteur. *Nuovo cimento* 12, 444-7 (1935).—The n , d , and mol. refraction of mixts. of $\text{C}_6\text{H}_5\text{OH}$ and C_6H_6 are linear with compn. No evidence of assocn. is found (cf. preceding abstract). J. B. Austin

Evaporation as a mechanical division to molecules. P. A. Zolotarev. *Trans. Inst. Chem. Tech. Ivanovo (U. S. S. R.)* 1, 50-3 (1935).—A discussion with math. treatment of the energy consumption in the evapn. of H_2O , N_2O , Me_2CO and EtOH is based on the Rittenger formula. Chas. Blanc

Variation in the viscosity of liquid methane and ethylene with temperature N. S. Rudenko and L. V. Shubnikov. *Fizsk. Z. Sovyetunion* 8, 170-84 (1935).—The viscosity of liquid CH_4 was measured over the temp. range 90° to 111°K , and that of liquid ethylene over the range 110° to 169°K . Helen S. Hopfield

A capillary viscometer for anomalous liquids Vladislav L. Daneš. *Kolloid-Z.* 73, 174-81 (1935).—D. describes an overflow viscometer designed for measuring the viscosity of anomalous liquids. It has the special advantage of being applicable over a million-fold range of streaming velocities. The movement of liquid is followed by weighing the overflow in a definite interval of time. Tables and graphs of data are given for water, 0.0024 N and 0.048 N NH_4 oleate sol. and 0.3% sinus yellow GG sol. at 18° and the dil. oleate sol., the log of the vol. transferred per sec. was approx. a linear function of the log of the applied pressure, the line being approx. parallel to that for pure water. The more concd. oleate and the sinus yellow sols. gave a line concave to the log P axis. O. T. Q.

Metal-cuprous oxide contact resistance. Jean Rouleau. *Compt. rend.* 201, 947-8 (1935).—By a special arrangement the Cu-Cu₂O contact resistance is shown to depend on (a) the age of the surface, (b) temp., (c) sp. resistance of the Cu₂O, and (d) treatment of the surface. With (a), (b), and (d) const. it is proportional to (c); variation in (c), e. g., attack by dil. acid, alkali or salts, affects only the factor of proportionality. For high resistance the surface must be cryst. C. A. Silberrad

The conductance of salt crystals. W. H. Rodenbush and T. G. Cooke. *J. Chem. Physics* 3, 834 (1935).—An expression is derived for the cond. of salt crystals. Jost's equation (*C. A.* 27, 4457) is considered inadequate to account for the behavior of various salts at different temps. G. M. P.

The use of direct current in the measurement of electrolytic conductance. J. N. Brønsted and Ralph F. Nielsen. *Trans. Faraday Soc.* 31, 1478-81 (1935).—Polarization of electrodes in the d. c. method is eliminated by the use of platinumized H_2 electrodes. The cell consists of a U-tube of 6 mm. bore, 50 cm. long and provided with wide-bore electrode vessels at the ends. Potentials of 10-50 v. were used for resistances of the order of 10,000 ohms, the heating effect being minimized by the short time of current flow during setting of the bridge. An accuracy of 1 part in 10,000 was observed in measurements of the equiv. cond. of 0.001-0.1 N HCl and 0.002-0.1 N H_2SO_4 at 25° . The method is recommended for simplicity of app. and procedure, especially for solns. of low cond. L. W. Elder

Superconductivity H. Grayson Smith and J. O. Wilhelms. *Rev. Modern Physics* 7, 237-71 (1935). E. H.

New method of measuring the elastic constants of transparent isotropic solids. E. Hiedemann and K. H. Hoersch. *Naturwissenschaften* 23, 577-8 (1935).—Elastic const. of glass are detd. by observation of the interference

bands caused by ultrasonic waves in polarized light

B. J. C. van der Hoeven
Thermal studies of aluminum hydroxide—aluminum oxide by the emanation method Robert Jagtjans *Z. physik. Chem.* A174, 49-59 (1935)—Various produced samples of Al hydroxide were studied by the emanation method in their behavior on being heated from 20° to 1300° and the change in the preps was deduced from their change in power of emanation. The greatest surface development was reached in the range of stability of γ -AlOOH (200-300°). The γ -Al₂O₃, occurring at 300° showed a gradual decrease in activity corresponding to the gradual decrease in surface. At about 1100° to 1200° the emanation shows a rapidly proceeding change in structure which by means of Röntgen studies was shown to be due to change of γ -into α -Al₂O₃.

R. H. Baechler
Inhibition of hydrosols and dye solutions by porous substances I General considerations and experimental methods Augustin Bontaric. *Bull. soc. chim. bel.* 17, 1522-33 (1935)—See C. A. 28, 53104.

L. E. G.
The polarization effect in thallium fluoride Erich Hayek *Z. anorg. allgem. Chem.* 225, 47-8 (1935)—The prepn and purification are described. TlF melts at 327° to a yellow liquid. The crystals are foliated and birefringent and can be regarded as contg a polarizing anion layer of small F ions surrounded by 2 polarizing layers of large, unsymmetrical Tl ions. TlF dissolves in water with absorption of heat. The soly. at 20° is 78.8%, and the solid phase is anhyd. TlF. It is only slightly sol in EtOH. The concd aq soln is strongly alk. The b p is 653° \pm 10° and d_4^{20} is 8.36.

E. R. Rushton
New problems of theoretical crystallography. Willi Kleber. *Naturwissenschaften* 23, 608-8 (1935)—A short review of theoretical aspects of crystal structure, particularly crystal defects and inhomogeneities.

B. J. C. van der Hoeven
The possibility of a metallic modification of hydrogen E. Wigner and H. B. Huntington. *J. Chem. Physics* 3, 764-70 (1935)—Math-theoretical. Any lattice in which the H atoms would be translationally identical (Bravais lattice) would have metallic properties. The energy of a body-centered lattice of H is calcd as a function of the lattice const. This energy attains a min for a lattice const. that corresponds to a d of 0.59—much higher than that of the usual mol lattice of solid H₂. This min., though neg., is much higher than that of the mol form. Neither the body-centered nor other simple metallic lattices are attainable with pressures now available. The chances are perhaps better for intermediate, layer-like lattices.

G. M. P.
Crystallography of the copper-pyridine saccharin complex CuPy(H₂O)₂SA. J. Benjamins, P. Terpstra and J. J. de Vries. *Pharm. Weekblad* 72, 1287-94 (1935)—Optical and x ray measurements are reported on the rhombic bipyramidal crystals (8 \times 5 \times 3 mm.) obtained by slow evapn of dil solns contg CuSO₄, pyridine and Na saccharin.

A. W. Dox
Crystal structure of ammonium cupric bromide Alfred Silberstein. *Compt. rend.* 201, 970-1 (1935)—(NH₄)₂CuBr₂·2H₂O, d 2.82, is isomorphous with (NH₄)₂CuCl₂·2H₂O (cf. Hendricks, et al., C. A. 21, 3500), and has a 7.98, c 8.41, space group D_{2h}^{14} (Pr/mnm). Intensity depts show that its structure is identical with that of (NH₄)₂CuCl₂·2H₂O, i. e., the Cu atom is surrounded octahedrally by Br and (NH₄)₂.

C. A. Silberrad
X ray characteristics of various forms of dicalcium silicate E. Brandenberger. *Schweiz. mineral. petrol. Mitt.* 14, 473-7 (1935)—X-ray examn of α -, β - and γ -Ca₂SiO₄ shows them to be independent phases, but owing to the general weakness of the lines and their similarity to those of Ca₂SiO₃ the min. amt detectable in a mixt is rather high (cf. Sandus, C. A. 27, 3267).

C. A. Silberrad
Sorption of hydrogen by tungsten W. Frankenburg and A. Hodler. *Naturwissenschaften* 23, 609 (1935)—Absorption of H₂ by W surfaces shows in 2 temp. ranges (—80 to —10°, 60° to 180°) the characteristics of activated adsorption (Taylor, C. A. 25, 1422). Thorough cleaning

of both H₂ and W, however, changes the picture completely. It is evidently due to minute traces of org vapors (cock grease, etc.) in the presence of small amts of O₂. At certain temps a fractional self-cleaning occurs. Pure W and H₂ give a max. of adsorption which covers 1/4 of the surface and decreases with temp.

B. J. C. van der Hoeven
Adsorption of zinc sulfide by copper sulfide A. del Campo and A. Hoyo de Castro. *Andalus. soc. esp. fis. quim.* 33, 754-64 (1935)—Strong agitation of the soln during pptn avoids entrainment and supports the hypothesis of surface phenomena. Similar entrainment of Pb in 2 N HCl soln at 80° is appreciably reduced by agitation, although entrainment cannot here be wholly prevented.

E. M. Symmes
Adsorption theory of the electrokinetic potential. A. March. *Trans. Faraday Soc.* 31, 1468-78 (1935), cf. Rabinovich, C. A. 28, 17°—Math development of the postulate that the ψ and ϕ potentials of colloidal particles are independent quantities, the latter being related to the adsorption potential, ψ . It is shown that the principle of pos-neg equivalency does not hold for the process of exchange adsorption.

L. W. Elder
The viscosity of titanium dioxide sol in the presence of electrolytes S. M. Mehta and Olive Joseph. *J. Indian Chem. Soc.* 12, 552-9 (1935); cf. C. A. 27, 4996.—The viscosity of the sol increased with time when KCl, MgCl₂ or AlCl₃ was added as a coagulant. Periodicity was observed in the slow pptn region. The autocatalytic nature of the coagulation process disappeared on progressive dialysis.

H. E. Phipps
The acid-combining capacity of wool J. B. Speakman and E. Stott. *Trans. Faraday Soc.* 31, 1425-32 (1935), cf. C. A. 28, 6009°—The titration curves of wool with HCl, H₂SO₄, ClCH₂COOH, (COOH)₂, and H₃PO₄ were determined by the glass electrode and show that (COOH)₂ and H₃PO₄ are monobasic in reaction with wool. At high p_H H₂SO₄ is more nearly monobasic than dibasic. At low p_H ClCH₂COOH combines to a far greater extent than HCl at the same p_H and also exhibits a greater heat of reaction and greater swelling of the wool fiber. The hypothesis is advanced that concd solns of weak acids, owing to the higher swelling pressure developed, can separate the sheets of covalently linked peptide chains and liberate NH groups for combination with acid. At the surface of the fiber some NH groups are always available, hence cataphoretic detns of the isoelec. point of wool are not valid for the fiber as a whole.

L. W. Elder
The double refraction of chitin tendons J. M. Drell and G. van Iterson, Jr. *Kolloid-Z.* 73, 1425-6 (1935)—The double refraction observed by the method of Moehring (cf. C. A. 20, 3634), varied with medium bathing the chitin layer. The min. double refraction occurred at a n of 1.475 in glycerol-quinoline mixts but at n = 1.60-1.62 in aq. solns of K₂HgI₄. The difference is attributed to salt adsorption, for chitin decreased the n of K₂HgI₄ solns, but had no effect on the n of glycerol-quinoline mixts. Plant and animal chitin show the same optical behavior.

Oscar T. Quimby
X ray investigations of elastic fibers with special consideration of stretching and shrinking Heinz Köppl. *Kolloid-Z.* 73, 129-42 (1935)—Rod shaped pieces 1-1.5 mm. thick were cut from the ligamentum nuchae of fresh beef and examd both moist and dry under various tensions by means of x-ray beams (X_u and X_K lines of Cu) at various angles. With the x-ray beam inclined at right angles to the fiber axis, the moist unstretched fiber gave 2 halos, the inner of which showed 4 weak max while the dry fiber gave 2 interference rings in addition to the 2 halos. These halos were present in all of the photographs. At an extension of 75%, both moist and dry fibers gave a typical fiber diagram. Up to the max. extension (200%) the fiber diagram remained the same except that the interference rings increased in intensity. With the x-ray beam parallel to the fiber axis, the dry fiber gave 2 interference rings at low tension, the no. increasing to 5 at high tensions. No further interferences were found at other angles of inclination of the x-ray beam. In the unstretched fiber

the primary-valence complexes can be oriented in any direction with a slight preference for the fiber axis; when extended 75% or more all these complexes lie in planes parallel to the fiber axis. Shrinkage in absence of applied pressure tends to orient the primary-valence complexes in the direction of the fiber axis, but shrinkage under tension does not change the regularities along the fiber axis. The intramolecular water amounts to perhaps one-fourth of the total water in the tissue. Data from the analysis of the x-ray photographs and photometric curves are tabulated.

Oscar T. Quimby
The solubility of hydrogen in molten aluminum L. L. Bircumshaw *Trans. Faraday Soc.* 31, 1439-43 (1935).—Solubilities were determined by a method similar to that of Röntgen and Braun (C. A. 26, 5478) in an apparatus which provides for an atmosphere of H_2 outside the SiO_2 furnace tube to prevent loss of H_2 by diffusion through the latter. The results, in cc H_2 at normal temp and pressure per 100 g. Al are 0.23, 0.89, 1.87 and 3.80 at 700°, 800°, 900° and 1000°, resp. These values agree well with those of R. and B. Equilibrium is reached almost instantaneously at 1000° and after 15 to 20 min at 800°. The "saturated" heat of soln. calculated on the assumption that H_2 dissolves as atoms, is 43,400 cal/g. mol.

L. W. Elder
The solubility of lime in water G. L. Larocque and O. Maass *Can. J. Research* 13B, 276-90 (1935), cf. C. A. 27, 5231.—The solubility of lime was determined accurately over the temperature range 0° to 30° by a conductometric method. The degree of dissociation of lime over this temperature range and over the concentration range 0 to 1.64 g. of CaO per l. is calculated. J. W. S.

Interrelation between the volumes of substances in free and solvated state I. I. Zaslavskii, A. A. Astasheva and I. A. Sakov *Trans. Inst. Chem. Tech. Ivanovo (U. S. S. R.)* 1, 47-90 (1935).—The relation between the volumes of 1 N solutions of fluorides and 2 N solutions of chlorides, bromides and iodides, determined at 15-20°, and the volumes of the same compounds in the solid state is graphed and tabulated.

Chas. Blanc
Measurements of the surface tension of solutions of potassium and lithium salts of the higher fatty acids by the ring method with exclusion of carbon dioxide and with special consideration of other disturbing effects I. A. Lottermoser and E. Giese *Kolloid-Z.* 73, 155-70 (1935).—By use of an improved form of the apparatus of Lottermoser and Baumgärtel (C. A. 29, 3890), the surface tension, S , of K laurate, K myristate and Na dodecyl sulfate solutions was studied at low concentrations (0.001-0.1%). As a function of time and temperature. Exclusion of CO_2 is a necessary but not sufficient condition for reproducibility in the soap solutions. Three adsorption effects were discovered, all leading to high values of S . (1) Adsorption at the air-soln interface was sometimes so great that crystalline took place; even when surface crystalline did not take place, erroneously high results might be obtained if the soln was transferred to the measuring dish from a large flask without stirring (e. g., pipetting) because of the concentration decrease in the bulk of the soln. (2) A more important source of error was found in the wetted glass surface just above the liquid surface. This error could be avoided either by filling the measuring dish to the brim or by using a non-wetted dish (e. g., paraffin coated). (3) Because of their practice of cleaning the Pt ring by heating to redness between S measurements, L. and G. found that adsorption on the Pt ring may cause appreciable error in S . The first 2 adsorption effects were observed with the soaps as well as the alkyl sulfate, the third only with the alkyl sulfate. It was further demonstrated that the static value of S is attained very slowly at such low concentrations of Na dodecyl sulfate.

Oscar T. Quimby
The surface tensions of ternary solutions I. Aqueous solutions of (a) NaCl and KCl, (b) NaCl and HCl J. W. Belton *Trans. Faraday Soc.* 31, 1413-19 (1935).—Measurements were made at 25° by the method of maximum bubble pressure in an apparatus similar to that used by Brown (C. A. 26, 3425). For binary solutions the simple relation $(1/\gamma) - (1/\gamma_0) = km$ holds, in which γ and γ_0 are the surface tensions (dynes/cm) of soln. and of water, resp., and m is concentration in mols per 1000 g. H_2O . Values of k at 25°

are for NaCl, 1.7; KCl, 1.6; and HCl, -0.12 over the range $m = 1$ to 5. In mixtures of KCl and NaCl, where $\gamma_{12} - \gamma_0 = k_1m_1 + k_2m_2$ (II), k_1 (NaCl) = 1.6 and k_2 (KCl) = 1.5 over the range $m = 1$ to 3. For mixtures of NaCl and HCl ($m = 1$ to 5), the observed relation is $\gamma_{12} - \gamma_0 = k_1m_1 + k_2m_2 + k_3m_1m_2^{1/2}$, where k_1 and k_2 refer to HCl and $k_3 = -0.5$. Equations (I) and (II) are special forms of the general equation derived from the Gibbs equation. The negative surface adsorptions of KCl and NaCl in aqueous solutions are additive in the mixed solutions. At high concentrations the thickness of the unimolecular surface layer, calculated from surface concentrations, tends to diminish. In the NaCl-HCl mixtures the HCl is more effective than NaCl in reducing the thickness of the surface layer. (a) Ethyl alcohol-water-salt mixtures. (b) Acetic acid-water-salt mixtures. *Ibid.* 1420-51.—Solutions of LiCl, NH₄Cl, KBr, KI, KCNS, KNO₃, KCl and NaCl from 1 to 5 molar were investigated in a 0.03% EtOH soln. The data agree with the equation $(\partial\gamma/\partial m_1)m_1 = k_1(1/\gamma_1) - RTT_1(\partial \log f_1/\partial m_1)m_1$, where m_1 = bulk concn, γ_1 = surface concn, f_1 = activity coefficient of EtOH, and the subscripts 1 and 2 refer to salt and EtOH, resp., γ_1 is the surface concentration of salt in pure H_2O at the same value of m_1 . For all salts at low concentration $(\partial\gamma/\partial m_1)m_1$ is negative, approaching 0 at concentration $m_1 > 3$ except for NaCl. LiCl and NH₄Cl show definite minima in γ at high concentrations. On the assumption that $1/\gamma$ is independent of m_1 and by using values of f_1 calculated from published data, $1/\gamma_1$ can be calculated, from which it is shown that the amount of H_2O adsorbed is in some cases greater, in others less than for an aqueous solution at the same concentration $(\partial\gamma/\partial m_1)m_1$ is positive for solutions of KCl, NaCl, KBr and KNO₃ in 0.153 mol % AcOH and constant for the first three. For the AcOH solutions, $1/\gamma_1$ is less than unity and less variable with concentration of salt than in the EtOH solutions.

L. W. Elder
The viscosity of sucrose and dextrin solutions containing salts J. H. C. Merckel *Kolloid-Z.* 73, 171-4 (1935), cf. C. A. 30, 12.—Relative viscosities at 25° are given for (1) 2% sucrose solutions 0.25 and 0.5 N with respect to Na salts of univalent anions and (2) 2.5% dextrin solutions 0.25 N with respect to the same salts. The viscosity of these solutions can be expressed quantitatively as a parabolic function of the lyotropic numbers.

B. J. C. van der Hoeven
The action of alkaline solutions on ultramarine blue. Kurt Leschewski and Ernst Podschus *Z. anorg. allgem. Chem.* 225, 43-6 (1935), cf. C. A. 29, 6858*.—Ultramarine is decomposed by strong, boiling alkali solutions into colorless alkali aluminosilicates. KOH acts very slowly. LiOH and KOH give compounds containing no S, but NaOH forms a Na aluminosilicate containing S as thionate. K and Li will replace Na in the compound. The blue color disappears when the ultramarine lattice is altered or destroyed.

E. R. Rushton
Dissociation of ferrous carbonate J. Kristinsson *Z. anorg. allgem. Chem.* 225, 93-6 (1935).—FeCO₃ was prepared by heating aqueous FeCl₃ with CaCO₃ at 130-80° for 20 hours in an evacuated sealed tube, and dried at 120° for 47 min. It contained 92.07% FeCO₃ and 2.22% CaCO₃. Dissociation pressures were measured at 258.5-285.5°, in a compensating apparatus (C. A. 25, 447). The pressure is 760 mm. at 282°. The heat of dissociation, calculated from the Nerst approximation formula, is 20,900 cal. Dissociation takes place in steps, with the formation of intermediate compounds. Complete decomposition takes place at 430-450°, leaving a residue of black FeO.

E. R. Rushton
Equilibrium of the system: calcium cyanamide-sodium chloride. M. S. Maksimenko and Ya. I. Izraelovich. *Khimstroi* 7, 411-13 (1935); cf. Franck and Burg, C. A.

29, 1348²—The isothermic equilibria of the reactions. $\text{CaCN}_2 + \text{C} \rightleftharpoons \text{Ca}(\text{CN})_2$, $\text{Ca}(\text{CN})_2 + 2\text{NaCl} \rightleftharpoons \text{CaCl}_2 + 2\text{NaCN}$, were studied with com. "black cyanide" in the interval 490–1520° for various periods of time. The product was heated in a crucible in an elec furnace. The graphs and tables disclose that the cyanide is completely decomposed at 490–850°. This shows that the cooling within this temp must be reduced to a min. of time. The reaction of decomposition is $\text{Ca}(\text{CN})_2 \rightarrow \text{CaCN}_2 + \text{C}$, followed on further heating by a partial irreversible reaction $\text{CaCN}_2 + \text{C} \rightarrow \text{CaC}_2 + \text{N}_2$. The diagram of decomposition shows that the formation of cyanide begins at 900–100°, whereby the concn of NaCN equiv. rises from 0% at 850° to 13–3.5% at 950°. At 1400–1520° the reaction is energetically and completely shifted toward the cyanide formation. At 1490° the max is reached in 5 min. and at 1520° in 2 min. Thereafter the irreversible decomposition of cyanides into the elements begins, the process is accelerated by increasing temp. Chas Blanc

Pressure oxidation of ferrous sulfate in neutral and in acid solutions. G. Agde and F. Schummel. *Z. anorg. allgem. Chem.* 225, 29–32 (1935).—An autoclave with a capacity of 400 cc was used. Air or O_2 was introduced at the bottom of the tube through a lead pipe, and the exit was provided with a reflux condenser. The rate of oxidation decreased with increasing concn of FeSO_4 , increased with increasing O_2 pressure. Curves are given showing the percentage oxidation in relation to the vol of O_2 passed through at different concns and temps. In neutral solns, a basic salt, contg. only ferric iron, is pptd. When enough H_2SO_4 was added to form $\text{Fe}_2(\text{SO}_4)_3$, the reaction went more nearly to completion. When air at 105 atm was substituted for O_2 at 29 atm, more rapid oxidation took place, because a greater surface was offered to the FeSO_4 soln. E. R. Rushton

Hydrolysis of the aluminum benzenesulfonates. V. Čupr and B. Šliva. *Publ. Facult. Sci. Univ. Masaryk No. 200*, 1–11 (in English 12–13) (1935).—An investigation into hydrolysis of 0.01–0.5 N solns of aluminum benzenesulfonate and Al *p*-hydroxybenzenesulfonate is described. V. D. Karpenko

Hydrolysis of phenylalanine. Emil Baur and G. Schindler. *Biochem. Z.* 281, 238–48 (1935), cf. C. A. 29, 190¹.—Hydrolysis of phenylalanine at 110° follows the mass-action law, the velocity of the reaction being of the first order. S. Morgulis

The absolute rate of homogeneous atomic reactions. Henry Eyring, Harold Gershinowitz and Cheng E. Sun. *J. Chem. Physics* 3, 789–96 (1935).—Math-theoretical. The abs. rate of the recombination of 3 H atoms is calculated. The manner in which rotation affects the dimensions of the activated complex in cases having little or no activation energy is discussed. The calcs. agree well with the exptl. rates of Steiner (C. A. 29, 4265⁴) and of Amdur (C. A. 29, 4223³). An immediate consequence of the theory is that energy transfer occurs most effectively among particles that can react with each other, free atoms being more effective than molts. A qual. application of potential surfaces to the problem of energy transfer as met in velocity-of-sound expts. and in expts. on maintenance of high-pressure rates of unimol. reactions is made. G. M. P.

Effect of gases adsorbed by the walls of the container on the chain reaction of oxy hydrogen mixtures. Marcel Prettre. *Compt. rend. 201*, 96–24 (1935); cf. C. A. 29, 3909¹.—The change in rate of contraction with time, R , of a mixt. of 2H_2 and O_2 introduced at 600 mm. and 540° into vessels whose walls were in various states as regards adsorbed H_2O or H_2 were detd. R increases rapidly with the amt. of H_2O adsorbed, but decreases with that of H_2 , showing, however, in this case little or no induction. In all cases the reaction is a characteristically chain one. C. A. Silberrad

The speed of thermal decomposition of chloropercs. Dan Rădulescu and G. Zamfirescu. *Bul. soc. chim. Romania* 17, 87–92 (1935).—The rate of decompos. of chloropercs (I) to phosgene and nitrosyl chloride (II) was followed by heating in sealed bulbs and detg. the amt. of II produced by breaking under 0.1 N KMnO_4 at 45–50° and

1 titrating the excess KMnO_4 , not reduced by the nascent HNO_3 from the hydrolysis of II, with KI and $\text{Na}_2\text{S}_2\text{O}_3$. The reaction is unimol. with const. $K_{\text{H}_2\text{O}}$ 0.11×10^{-3} , $K_{\text{H}_2\text{O}_2}$ 0.22×10^{-3} ; $K_{\text{H}_2\text{O}_2}$ 0.97×10^{-3} , $K_{\text{H}_2\text{O}_2}$ 3.27×10^{-3} . The reaction to form the 2 poisonous gases would be almost instantaneous at the temp. of explosion of munitions. I is decomposed photochemically by violet or ultraviolet light but the reaction though rapid at first soon stops because the product II absorbs the violet light and a small concn of it protects the rest of I. This explains the relative stability of I in daylight. Janet E. Austin

The kinetics of heterogeneous organic reactions.—The reaction between benzyl chloride and solid silver nitrate. M. V. Nabar and T. S. Wheeler. *Proc. Indian Acad. Sci. A*, 265–78 (1935).—The kinetics of the reaction between benzyl chloride and solid AgNO_3 were studied in the absence of solvents and diluents. The reaction is independent of the amt. of benzyl chloride, but is proportional to the surface of AgNO_3 present. The reaction was studied with particles of 3 different sizes. All the exptl. results can be reproduced by the kinetic equation derived on the assumption that the rate of reaction depends only on the surface of AgNO_3 present. The velocity of reaction is independent of the speed of shaking. Water inhibits the reaction; the effect of 0.18% by weight of benzyl chloride taken is marked and this effect increases with the amt. of water added. Harold Gershinowitz

The transition point of hexachloroethane. E. H. Wieberga. *Z. anorg. allgem. Chem.* 225, 38–42 (1935).— C_2Cl_6 was sublimed and the middle fraction used. This had a triple point of 189.8°, in agreement with that detd. by van der Lee (C. A. 29, 6118¹) from vapor-pressure measurements. For the rhombic \rightarrow triclinic transition, 48.3–48.7° was found on the heating curve and 34–35.6° on the cooling curve. For the triclinic \rightarrow cubic transition, these temps. were 71–72.2° and 70.6°, resp. Dilatometer measurements narrowed these hysteresis ranges to 40–44.6° and to 70.83–71.15°, resp. The velocity of transition was then measured as a function of temp. by observing the rate of change in the level of the dilatometer liquid when approx. equal quantities of the 2 modifications were in contact, and the data were plotted to find the points of zero velocity. Since, in true hysteresis, all points inside of the hysteresis range can be detd., true hysteresis cannot be present in this case, within the limits of exptl. error. C. I. C. A. 28, 27¹. E. R. Rushton

Numerical relation in binary metallic systems. D. Stockdale. *Proc. Roy. Soc. (London)* A152, 81–104 (1935).—During the last 7 years the 6 systems, Cd–Zn, Cu–Ag, Pb–Sn, Cu–Al, Sb–Ag and Cd–Sn were studied exhaustively. This work was originally undertaken to obtain data to test the validity of the assumptions that (1) in all eutectic mixts. the atoms are present in a simple ratio and (2) at crit. points on the equl. diagram the solute and solvent atoms are present in a simple ratio. The results do not seem to support these assumptions. However, it is the purpose of this contribution to show that when combined with the recent work of Hume-Rothery and coworkers (C. A. 28, 5723¹) some simplifying relation may be stated as a step toward the solution of a larger problem. With 20 alloy systems of Cu and Ag the at. relations at the crit. points B (limit of solid soly. at the eutectic temp.) are discussed. In addn. with 9 alloy systems of Cu and Ag similar relations at the crit. points C (limit of solid soly. at the temp. of transformation of B) are considered. It is concluded that (a) bivalent solutes are generally most sol., tri- and quadri-valent atoms being less so, (b) where the C point is that of max. soly. for trivalent solutes the atom-electron ratio is always almost exactly 5:7, and (c) there is a simple relation between the dissolving powers of a solvent for one solute at the B and C points. The soly. at C can be calcd. from $\frac{\text{Dissolving power at B}}{\text{Dissolving power at C}} = (N - 1)/N$, where N is 4, 5, 6 or 7. Dissolving power is the increase of the no. of solvent atoms required to dissolve one solute atom. The compn. of the eutectic and of the solid solns at the

ends of the eutectic horizontal were carefully correlated graphically for the systems Ag-Cu, Cd-Sn, Cd-Zn, Pb-Sn, Ag-Sb, Al-Cu and Cu-Mg. Evidence for the following rule is put forward: (1) the solute and solvent atoms are present in a simple integral ratio in a solid solid soln at the temp. of the eutectic or peritectic horizontal, (2) in a eutectic mixt. the elements are present in a simple integral at. ratio; and (3) in a eutectic mixt. the ratio of the number of atoms irrespective of their kind in the phases is simple. These 3 roles in the strictest sense are incompatible, and it is felt that (3) is surely true because the exptl work on which it is based is best. H. A. Smith

Habits and laws of decomposition of supercooled solutions, with special regard to austenite. G. B. Lpton Penna. *State Coll. (Mineral Ind. Expt. Sta.) Bull.* No. 18, 24-58 (1935), cf. C. A. 28, 1674. H. A. Smith

Molecular clustering in binary liquid mixtures. Variation with composition and temperature. R. S. Krishnan. *Proc. Indian Acad. Sci.* 2A, 221-31 (1935), cf. C. A. 29, 7732. —A comparative study is made of the intensity and depolarization of the light scattered transversely by mixts of phenol and water in different proportions and at different temps. The lowest values for the depolarizations μ_v , ρ_v and ρ_h are obtained with the crit. compn. mixt. (in this case 34% phenol mixt.) at the crit. soln temp. The photoelectric method was employed for the comparison of intensities of scattering by these mixts at various temps. above the crit. soln temp. The intensity of scattering increases considerably for the 34% phenol mixt. as the crit. soln temp. is approached. The tendency for the formation of clusters and the size of the clusters formed depend on the temp. and compn. of the mixt. These phenomena are most pronounced for the crit. compn. mixt. at the crit. soln temp. The bearing of these results on the anomalies of viscosity, magnetic birefringence, etc., noticed in the vicinity of the crit. conditions is also pointed out. Harold Gerharowitz

Thermal analysis of the system argon-boron trifluoride. Compounds with the inert gases of the atmosphere. Harold S. Booth and Karl S. Willson. *J. Am. Chem. Soc.* 57, 2273-85 (1935). —Study of the system A-BF₃ showed that the f. p. of any mixt. of the 2 increases with increase in pressure up to a certain value and in general is little affected by any further pressure increase, indicating an equl., either A + xBF₃ = A_xBF₃ or A + xBF₃ + yBF₃ = (A + y)BF₃. A graph of the f. ps vs. compn. shows max. and min., the latter corresponding to the ratios A-BF₃, A-2BF₃, A-3BF₃, A-4BF₃, A-5BF₃, and A-6BF₃, indicating compd. formation. From the shape of the curve the ratio A-2BF₃ appears to be the most stable. The f. ps of the A-BF₃ mixts of compns. approximating those of the max. and min. were sharp, while mixts. of intermediate compn. melted over a temp. range. At pressures near 35 atm., a 2nd liquid layer appears, which is probably best explained as due to retrograde immiscibility. L. K.

Critical phenomena of the system argon-boron trifluoride. Harold S. Booth and Karl S. Willson. *J. Am. Chem. Soc.* 57, 2290-4 (1935). —The crit. phenomena of the system BF₃-A exhibited the usual retrograde condensation. A new phenomenon, best described as retrograde immiscibility, appeared at the low-temp., high-pressure range. The compds. formed by the gases at their m. ps. are practically completely dissocd. at the "crit. temp. region," which is about 100° higher, and so affect the curve of the max. temp. of liquefaction only very slightly. Louise Kelley

New composition diagrams for the systems lead thallium and lead-thallium-cadmium. Correction. Ernst Jänecke. *Z. Metallkunde* 27, 141 (1935); cf. C. A. 29, 20. —New exptl. work of A. Ölander (C. A. 28, 5743) indicates that the two-phase field between the Pb and PbTl solid solns. should extend from 49 to 55% Pb, and that the PbTl field should end at about 10 Pb on the Tl side. No changes are required for the Pb-Tl-Cd system. G. Derge

The boiling points and vapor-phase composition of the three-component mixture ethyl acetate-ethyl alcohol-water. V. A. Kureev, I. Ya. Klinov and A. N. Grigorovich

J. Chem. Ind. (Moscow) 12, 936-40 (1935). —Orienting but not exact data are presented. The solubilities of the boiling points at a given ratio of EtOAc to EtOH show a max. and then a min. as H₂O is added. The effect is most pronounced at about 20% EtOAc and 80% EtOH.

H. M. Leicester

The system calcium oxide-sulfur dioxide-water. II. Calculation of ionic concentrations. P. E. Gubler and O. Maass. *Can. J. Research* 13B, 308-22 (1935); cf. C. A. 30, 3677. —The cond. and vapor pressure data of the system CaO-SO₂-H₂O presented in an earlier paper were used to calc. ionic concns. existing in this system, in the temp. pressure range investigated. Two methods of calcn. were employed, one depending on the combination of vapor pressure and cond. data, and the other, on cond. data. For both, recourse was had to the data of Campbell and Maass (C. A. 24, 1796) on the system SO₂-H₂O. These methods gave results in good agreement with each other. The existence of a complex CaSO₃·Ca(HSO₃)₂ was deduced. H₂ ion concns. over the concn. and temp. range investigated were calcd. and extrapolations made to higher temps. These are tabulated. Apart from the theoretical interest, these results are of value in connection with studies of the delignification of wood by CaO-SO₂-H₂O solns. J. W. Shipley

Intensity parameters and stable thermodynamic equilibrium. T. Ehrenfest-Afanasyeva and G. L. de Haas-Lorentz. *Physica* 2, 743-52 (1935). B. J. C. v. d. H.

The heats of solution and specific heats of rhombic sulfur in carbon disulfide. The surface energy of solid rhombic sulfur. A. R. Williams, F. M. G. Johnson and O. Maass. *Can. J. Research* 13B, 240-8 (1935). —The heats of soln. of rhombic S in CS₂ were measured over the concn. range 6 to 17% S and at 20° and 25°, and the sp. heats of these solns. calcd. The app. designed for the measurements is described. By measuring the heat of soln. of finely divided S and its particle size, the surface energy of solid rhombic S was estd. J. W. Shipley

Energy of dissociation of carbon monoxide. Paul Goldfinger, Wladimir Lasareff and Boris Rosen. *Compt. rend.* 201, 928-69 (1935), cf. C. A. 29, 6730. —The various methods of deducing D_{CO} (the energy of dissociation of CO into normal atoms), and hence L_C (the heat of sublimation of C at 0° abs.) are discussed, and it is shown that D_{CO} = 9.10 e. v. with L_C = 123.6 kg.-cal., are the only values consistent with those deduced from them for D_{CO}* (6.1 e. v.), D_{CO} (5.9 e. v.) and the mean energy of each C-H link in CH₄ (110 kg.-cal.) (cf. C. A. 29, 6133).

C. A. Suberrad

Heats of transition of triglycerides. M. M. Ram Rao and S. K. Kulkarni. *J. Indian Chem. Soc.* 12, 574-81 (1935). —The work was based on the assumption that the triglycerides existed in only 2 forms and that the metastable solid obtained on sudden cooling was a pure phase. The heats of soln. of the 2 forms of tristearin, trilaurin and tripalmitin were detd. in different solvents by means of a double-calorimeter method. The difference in each case was 15.4 cal./g. and was the same as the difference between the latent heats. H. E. Phipps

Heat of combustion of isobutane. Frederick D. Rossini. *J. Research Natl. Bur. Standards* 15, 357-61 (1935) (Research Paper No. 833); cf. C. A. 29, 6730. —Calorimetric data on the reaction, iso-C₄H₁₀(g) + 13/2 O₂(g) = 4 CO₂(g) + 5 H₂O(l), at 25° and a const. pressure of 1 atm., yield ΔH = -2871.06 ± 0.53 international kilojoules per mol. (measured as 5 × 18.0156 g. H₂O). With the factor 1/4 1833, the value is -695.31 ± 0.13 kg.-cal. per mol. The isobutane used was estd. to be of such purity that its heat of combustion would differ from that of an absolutely pure sample by less than 0.01%. F. D. R.

Determining molecular weights of gases and vapors. Hamilton P. Cady. U. S. 2,023,164 Dec. 3. A method of detg. the d., sp. gr. or mol. wt. of a gaseous material includes the step of varying the temp. of the gaseous material being observed responsive to atm. pressure while ascertaining the d. App. and various operative details are described.

E. H.

Can quantum mechanical description of physical reality be considered complete? N Bohr *Phys Rev* 48, 696-702(1935).—The "criterion of physical reality" formulated by Einstein, Podolsky and Rosen (*C. A.* 29, 5007) contains an essential ambiguity when it is applied to quantum phenomena. This ambiguity is illustrated for several special problems, including the one considered by E. P and R. A viewpoint termed "complementarity" is explained from which quantum mechanical description of physical phenomena would seem to fulfill, within its scope, all rational demands of completeness. L S K.

The energy levels of inert gas configurations. C L. Barthelet *Phys Rev* 48, 682-3(1935).—Math

The value of the electronic charge. Raymond T. Birge *Phys Rev* 48, 918(1935), cf *C A* 29, 4664.—A recent redetermination of the viscosity of air brings the oil-drop and grating values of e [$(4.816 \pm 0.013) \times 10^{-18}$ e s u, $(4.8036 \pm 0.0005) \times 10^{-19}$ e s u, resp.] into essential agreement. Probable values of e/m , h/e and $1/e$ are discussed. G M P

Determination of h (Planck's constant). G. Schatt-berger. *Ann Physik* 24, 84-88(1935).—Disagreement between the results of Duane, Palmer and Yeh (*C A* 10, 2806) and Feder (*Ann Physik* 1, 497(1929)) occasioned a new determination of h . The so-called isochromatic method was applied. This consists in standardizing the crystal and ionization chamber in a Bragg spectrograph on a definite wave length and measuring the reflected radiation at different potentials in the region of the short-wave limit. The short-wave limit is obtained by interpolation. Apparatus and method are described. Values for h at different wave lengths are tabulated, the av was 6.553; $= 0.002 \times 10^{-17}$ erg/sec. h was also calculated from the relation $h/e = V/\nu$. These values are compared with previous ones and errors are discussed. Allen S. Smith

Symmetry considerations concerning the splitting of vibration rotation levels in polyatomic molecules. E. Bright Wilson, Jr. *J Chem Physics* 3, 18-21(1935); cf *C A* 29, 4262.—The interaction of rotation and vibration and perhaps other effects may split degenerate vibration-rotation energy levels of sym polyat mols into a no of components. The permutation symmetry of mols containing several identical atoms provides certain restrictions on this splitting. This paper discusses the maximum no of fine-structure components, their quantum numbers when nuclear spins are taken into account, and the selection rule for transitions. All arguments are based solely on symmetry considerations so that no use of the magnitude of the splitting is given. G M P

Electronic states of the carbon atom and calculation of the bond energies. Vladimir Lasareff, *Physica* 2, 737-42(1935).—By combining results of Edlen (*Z Physik* 84, 746(1933)) and of Bacher and Goudsmid (*Phys Rev* 46, 948(1934)) the energy difference ΔE between 3P and 1S for C is taken to be 4.2 ± 0.2 e v. From this is calculated for CN $CN(^3\Sigma) = C(^3S) + N(^3S) - 11.9 \pm 0.7$ e v. This is higher than the spectroscopic values of 7.0 and 9.7 e v, hence $CN(^3\Sigma)$ dissociates into $C(^3P) + N(^3S)$ with energy 7.7 ± 0.5 e v (cf Mulliken, *C A* 26, 3182). It is assumed that in diamond C is in the quadrivalent 4S form and the calculated heat sublimation of $C(^4S)$ into the bivalent vapor $C(^3P)$ is 7.20 ± 0.1 e v, formation of quadrivalent vapor $C(^4S)$ requires 11.46 ± 0.3 e v. From this is concluded that the energy of the bond C—C in diamond is 5.73 ± 0.15 e v. (132 ± 3.5 kcal), in aliphatic chains 5.56 e v (128 kcal). B J C van der Hoeven

Electric discharges in vacuum and in gases at low pressures. I Langmuir. *Gen Elec. Rev.* 38, 514-20(1935).—A detailed review. C. G. P.

Discharge processes in gases prior to breakdown. E. Hegler and H. Raether. *Naturwissenschaften* 23, 501(1935).—The ionization process in an impulse discharge (10^{-7} sec. period) was studied by cloud chamber at different pressures with point or flat electrodes. Channeling always precedes the spark. The no of channels increases with potential and duration of impulse, the channels widen for lower pressure. B J C. v. d. H.

The mechanism of unimolecular electron capture. Felix Bloch and Norris E. Bradbury *Phys Rev* 48, 689-95(1935).—The formation of negative ions by electron capture in gases in which a dissociation process does not occur is explained by a unimolecular process involving excitation of molecular vibration levels and subsequent energy loss by collision or resonance. The quantum-mechanical theory for such a process is developed. Comparison with experiment then shows that the vibrational quantum number changes by only 1 unit, this in turn sets an upper limit of 0.17 v for the electron affinity of the O molecule. The theory also gives a dependence of calculated capture cross section on average electron energy which agrees with the experimental results. L S Kassel

The role of space charge in the study of the Townsend ionization coefficients and the mechanism of static spark breakdown. R. N. Varney, H. J. White, L. B. Loeb and D. Q. Posin *Phys Rev* 48, 818-22(1935). L S K.

Photoionization in gases. R. N. Varney and L. B. Loeb *Phys Rev* 48, 822-4(1935).—No photoionization of N, A, Xe or air could be produced by radiation passing a fluorite window. In the absence of any window A and Xe are photoionized by their own radiation, but N and air are not. L S Kassel

The energy distribution of electrons in the photoelectric effect. Erik Rudberg *Phys Rev* 48, 811-17(1935).—The results of various theoretical calculations of the energy distribution of photoelectrons from metals are compared with experiment. The predicted proportion of low-energy electrons is always too high. This low-energy region, where the Fermi factor is nearly unity, is the important one for studies of the electronic structure of metals. L S Kassel

Photoelectromotive forces and currents in single crystals of selenium. R. M. Holmes *J Optical Soc. Am.* 25, 326-9(1935).—Lamellar crystals grown from Se vapor, having a surface area of about 75 sq mm and a thickness of about 0.12 mm, were used. Translucent Pt films sputtered on portions of the flat surfaces were the electrodes. When there was no source of e m f in the external circuit, light on one of the Pt films caused an electron current to flow from Se to Pt at the illuminated surface. Curves are given showing the variation of current, e m f and resistance of this photoelectric cell with illumination, also the variation of current and e m f with wave length of the light used. The photo-current and photo-e m f decrease to zero near the red end of the visible spectrum. An interpretation of the results is given. H. S. H.

Theory of some photoelectric and photomagneto-electric phenomena in semiconductors. Ya. Frenkel *Physik Z. Sowjetunion* 8, 183-203(1935), cf *C A* 28, 5326.—Equations are derived for the no of free electrons and positrons in an intrinsic semiconductor (such as Se), and applied to the theory of the Dember effect for strong and for weak illuminations, and also to the photomagneto-electric effect of Kikoin and Noskov (*C A* 28, 5326).

Helen S. Hopfield

Action of ultraviolet light on electric conductivity of quartz. Reza Radmanesh. *Compt rend* 201, 1021-2(1935), cf *C A* 29, 6810.—A current was passed through a plate of quartz $20 \times 20 \times 2$ mm enclosed in a dry atm when the quartz was and was not illuminated by light from a Hg lamp, the contacts between quartz and electrodes being protected from the light. With potentials of 180, 90 and 60 v between the electrodes the current steadily increased on illumination, attaining a maximum of

approx. 10, 8 and 3-fold after about an hr.'s exposure.

C. A. Silberad

Diffraction of electrons by metal crystals and by mica. J. A. Darbyshire and E. R. Cooper. *Proc. Roy. Soc. (London)* A152, 104-23 (1935); cf. C. A. 28, 2260³, 29, 993¹.—The object of the research was to exam the spot patterns obtained when an electron beam of 30 kv velocity is transmitted through a cryst. film. The first section of the paper is a brief review of the work relating to such patterns, the reciprocal lattice picture of electron diffraction is presented in a form suitable for discussing the results. Films of the oxides of the metals Zn, Cd, Bi and Al were prep'd by removing the surface skin from the melt by means of a Cu wire loop whose diam was 0.5 cm. The films were formed in an atm having an excess of N₂ and the temp of the metal was held just above the m p. Debye-Scherrer oxide patterns were always obtained and occasionally spot patterns due to metal crystals caught up on the oxide film. Such spot patterns from Zn, Cd and Bi seem to be due to an aggregate of crystallites varying very little in orientation and presumably arising from the distortion of single crystals. The spot patterns from Al seem to be due to aggregates. Forbidden spectra are observed whose source is most plausibly explained by successive reflections by different crystallites. Spot patterns from curved sheets of mica support the conclusion that such patterns in metals are due chiefly to distortion of the diffracting crystal.

H. A. Smith

Inhomogeneous fields for mass spectroscopy S. H. Bauer. *Phys. Rev.* 48, 917 (1935).

G. M. P.

Proton-proton forces in anomalous scattering and in nuclear binding. R. D. Present. *Phys. Rev.* 48, 919-20 (1935).—White's data (C. A. 29, 3592⁴) on the scattering of 600-750 kv protons in H are incompatible with data calcd. from the Feenberg-Knipp nuclear model. G. M. P.

The effect of primary cosmic ray energy upon burst production. W. F. G. Swann and D. B. Cowie. *Phys. Rev.* 48, 649-52 (1935).—The usual coincidence technic was used to det the direction of the cosmic-ray assoc'd with a given burst. The numbers of cosmic-ray counts obtained by the vertical and 45° counters were in the ratio of 1.5:1, the associated bursts in the ratio 10:1. This result, as well as the relatively greater burst production previously found on Pike's Peak, suggests that the efficiency of burst production increases rapidly with the energy of the primary particle.

L. S. Kassel

The showers of rays which produce bursts of cosmic-ray ionization. C. G. Montgomery and D. D. Montgomery. *Phys. Rev.* 48, 786-9 (1935).—By the application of statistical methods it is shown that there is no sharp distinction between the sprays of small nos of cosmic rays usually observed by several counters out of line and referred to as showers, and the larger groups found with ionization chambers and called bursts or Stöses.

L. S. Kassel

The corpuscular theory of the primary cosmic radiation. W. F. G. Swann. *Phys. Rev.* 48, 641-8 (1935), cf. C. A. 29, 4667².—S. proposes a theory in which the primaries are not directly observed by any ionization, but only through secondaries produced with a linear d proportional to the primary energy. A list of 11 facts concerned with cosmic-ray absorption, latitude and directional effects, burst and shower production is made; this list includes all the important facts known about cosmic rays, and it is shown that the proposed theory can account for all of them.

L. S. Kassel

The radioactivity of potassium. G. v. Hevesy. *Naturwissenschaften* 23, 583-5 (1935); cf. C. A. 29, 2439¹.—The β -radioactivity of K is reviewed in the light of artificial radioactivity. In the preterrestrial era radioactive K⁴⁰ and Rb⁸⁷ were formed, both of very long life period (order of 10⁸ to 10¹⁰ yrs). The traces remaining at present cause the above effect.

B. J. C. van der Hoeven

Scattering of slow neutrons. Allan C. G. Mitchell and Edgar J. Murphy. *Phys. Rev.* 48, 653-6 (1935); cf. C. A. 29, 5343¹.—With the radioactivity produced in Ag foil as a neutron detector, the scattering of slow neutrons by Fe, Cu, Pb, Sn and Hg is det'd. Curves of

percentage scattering against thickness of scatterer are given, and the relative scattering cross-sections calcd.

L. S. Kassel

Scattering of slow neutrons by iron and other substances. D. Budnitskii and I. Kurchatov. *Physik. Z. Sowjetunion* 8, 170-8 (1935).—The length of the free path of slow neutrons in C, Fe, Cu and Pb was measured by using their reflection and was found smaller than the free path of fast neutrons. The values found agree with those of Dunning and others except for graphite. In calog the free path, it is necessary to take into account the possible selective sensitivity of the indicator used and the absorption of neutrons in water.

Helen S. Hopfield

Disintegration of lithium by lithium ions. V. Petuhov, K. D. Sinelnikov and A. Val'ter. *Physik. Z. Sowjetunion* 8, 212-14 (1935).—A Li oxide target was bombarded with Li ions accelerated to an energy of 1.2 million e. v. A homogeneous group of particles of range 8.5 cm. was emitted by the target. However, it is thought that these are due to protons in the ionic beam, and not to Li ions.

Helen S. Hopfield

The radioactivity induced in oxygen by deuterium bombardment. Henry W. Newson. *Phys. Rev.* 48, 790-6 (1935).—Bombardment of O by 3-m e. v. deuterons gave a F isotope with positron radioactivity of half-life 1.16 min. The probable reactions are $O^{16} + D^2 = F^{17} + n^1$, $F^{17} = O^{17} + e^+$. The same active substance has previously been produced by α -particle bombardment of N. The excitation efficiency is det'd for O, it drops sharply to zero at 2 m. e. v. This is explained by assuming a heat of reaction of -1.8 m e. v. This estimate is confirmed by detg. the max angle between the paths of the deuterium beam and the radioactive recoil atom. This method was checked by application to deuterium bombardment of C, the heat of reaction of -0.1 m. e. v. for $C^{12} + D^2 = N^{13} + n^1$ agrees well with values found in other ways.

L. S. Kassel

Absorption of slow neutrons in iron. I. Kara, L. Rosenkevich, K. D. Sinelnikov and A. Val'ter. *Physik. Z. Sowjetunion* 8, 215-18 (1935).—Radon with Be powder was used as a source of neutrons, and the measurements were made with very slow neutrons scattered back from a paraffin block. The induced radioactivity of the Ag detector was measured with a Geiger-Müller counter with mech registration. The absorption of slow neutrons by Fe and Cu was found to be very small.

H. S. H.

Selective absorption of neutrons. I. Kara, L. Rosenkevich, K. D. Sinelnikov and A. Val'ter. *Physik. Z. Sowjetunion* 8, 219-22 (1935), cf. preceding abstr.—Since Fe and Cu absorb slow neutrons much less than neutrons with medium velocities, the problem of selective absorption was investigated. Ra with Be was used as a source, and slow neutrons with different velocities were obtained by dissolving boric acid in water. A table and a graph show the results. Apparently the av. values of the sensitivity for B, Ag and Cu be consecutively one above the other, B being the lowest. The optimum absorption value for B is probably very near to the zero velocity of neutrons, and the max for Ag may be near zero also. The effective cross-section for absorption decreases rapidly with increasing velocity of the neutrons, which is to be expected on theoretical grounds.

Helen S. Hopfield

After-effect of aluminum bombarded by electrons. Masamichi Tanaka. *Phys. Rev.* 48, 916 (1935).—Al was bombarded by 250-300 kv. electrons. It gave off an electron radiation, with half-value periods of 7 sec., 40 sec. and 10 min. The 40-sec group had a max. energy of 2.5 kilo-e. v.

G. M. P.

X-ray light source in single crystals. G. Bornmann. *Naturwissenschaften* 23, 591-2 (1935).—A monocryst. ball of Cu at the proper distance (several cm.) from the photographic film gives a Laue x-ray diagram by reflection of the Cu K α radiation excited by x-rays in the crystal interior on the various crystal faces.

B. J. C. v. d. H.

A two-crystal spectrometer for x-rays of wave length 0.030 < λ < 0.215 Å. T. R. Cuykendall and M. T. Jones. *Rev. Sci. Instruments* 6, 356-61 (1935). E. H.

Energy bands in copper. Harry M Krutter. *Phys. Rev.* 48, 664-71 (1935).—Math. The electronic energy levels in the Cu lattice are calcd by use of a corrected Hartree field. The model used accounts theoretically for the high cond of copper, but cannot give quant. results.

The computation of spectral intensities for hydrogen. Philip Rudnick. *Phys. Rev.* 48, 807-11 (1935).—Math.

Hyperfine structure in selenium, palladium and gold. L Sibuya. *Proc. Indian Acad. Sci. A*, 313-10 (1935).—Hyperfine structure analysis of some Se and Pd lines shows that none of the levels examd reveals any even isotope displacement. The nuclei of Se 77 and Pd 105 have very small magnetic moments and their spin moment is probably $(1/2)h/2\pi$. The doublet structure ($\Delta\epsilon = 0.224 \text{ cm}^{-1}$) observed by Ritschl in the resonance lines of Au has been confirmed by the redoubling of each component due to self-reversal in the source, this test proves that the originally observed doublet structure does not arise from self-reversal as the earlier results of Frisch would suggest. While in the isoelectronic spectrum of Hg II the $5d^9 6s^1 2D_{3/2}$ level exhibits isotope displacement, arc lines of Au involving this level point definitely to the existence of a single isotope of mass 197; the accepted chem. at wt is therefore considered to be too high. The nuclear spin moment of Au is $(1/2)h/2\pi$ and the $g(I)$ factor comes out as 0.139, agreeing with Landé's theoretical value.

The hyperfine structure of europium. H Casimir. *Physica* 2, 719-23 (1935).—The irregularities in the Lu hyperfine spectrum explained by Schuler and Schmidt (*C. A.* 29, 5346) from nonspherical symmetry of the nucleus are further worked out on this basis.

Doubly excited states of helium—a correction. Ta-You Wu and S T Ma. *Phys. Rev.* 48, 917 (1935), cf. *C. A.* 28, 6629.

Ultraviolet resonance series of sodium. A Seidel. *Physik. Z. Sowjetunion* 8, 204-5 (1935).—On excitation of Na vapor heated to 500-50° by different metal lines (Ag, Cu and Zn), resonance spectra of the mol. Na₂ are observed near the second member of the principal series of Na.

The spectrum of trebly ionized cerium. R. J. Lang. *Can. J. Research* 13A, 1-4 (1935).—The spectrum of Ce has been photographed from 3300 to 500 Å by means of a two-meter grating of 30,000 lines per in. mounted in a vacuum spectrograph, with the vacuum spark and the spark in N as sources. An analysis of the spectrum of Ce IV results in the location of the 6S-6P, 6P-6D, 6P-7S, 6D-6P, 6P-8S and possibly the 6P-7D multiplets. The ionization potential is approx. 33.3 v.

Deepest terms in ions of the isoelectronic sequence A I—Mn VIII. P Gerald Krüger and S G Weissberg. *Phys. Rev.* 48, 659-63 (1935).—A number of new terms in this sequence are detd. and correlated by means of Moseley diagrams.

The spectrum of the zinc arc in vacuum. Charles William Hetzler, Robert W Boreman and Kevin Burns. *Phys. Rev.* 48, 656-0 (1935).—Sixty lines in the spectrum of the vacuum Zn arc were observed, including all known solar lines of Zn and the stronger lines of Pb, Cu, Cd, Ag, Sn, Na, K, Rb, Cs, Sr and Be. A source for obtaining weak lines in vacuum is described.

The spectrum of doubly ionized zinc. Sudhendu Basu. *Indian J. Physics* 9, 537-44 (1935).—This spectrum was analyzed in the region 5313-2387 Å. Twenty-three new terms were obtained, mostly from the configuration $3d^4 4d$ and over 100 lines were accounted for.

Suggested new interpretation of the structure of band spectra. S. Bhagavantam. *Proc. Indian Acad. Sci. A*, 32, 92-100 (1935).—It is assumed that in the process of electronic excitation the atoms become elec. doublets whose axes can become either parallel or perpendicular to the nuclear axis. In the former case the doublets attract each other with consequent diminution of the nuclear spin and in the latter the nuclear spin is increased. By

adding the mutual potential energy of the doublets to the nuclear potential energy function it is shown that the creation of doublets may be regarded as equiv. to an increase in the vibrational frequency of the mol. if they are of the attractive type and a decrease if they are of the repellent type. An independent method of calcg the strength of the induced elec. moments is given on the assumption that the energy of electronic excitation is all spent in polarizing atoms.

Continuous spectrum of deuterium. Adolphe Tournaire and Etienne Vassy. *Compt. rend.* 201, 957-8 (1935).—The spectrum of D₂ has been examd for $\lambda\lambda$ 4861-2300 Å. For λ greater than 4000 Å it is practically identical with that of H₂. For shorter λ there is a slight difference increasing as λ diminishes, the continuous spectrum of D₂ being slightly more intense than that of H₂.

Rotational structure of the Schumann-Runge bands of oxygen in the vacuum region. Harold P. Knaus and Stanley S. Ballard. *Phys. Rev.* 48, 706-9 (1935).—Rotational analysis of these bands photographed with a 3-meter grating gives new upper state consts for the range $v' = 8$ to 15. The energy of disson. of the normal O mol. to normal atoms, D₂, is 0.05 v.

The absorption of liquid oxygen. P. Tulipano. *Nuovo cimento* 12, 418-22 (1935).—The visible absorption spectrum of liquid O₂ is as follows, where the first figure is the wave no. (in cm^{-1}) of the max. and the second is the absorption coeff. 15,858, 0.228, 17,296, 0.274, 18,813, 0.074, 20,827, 0.084, 22,425, 0.028, 26,259, 0.054, 27,685, 0.214. A Carrelli. *Ibid.* 423-5.—The data of Tulipano (cf. above) indicate the existence of mols. assocd. as a result of polarization.

The energy of formation of negative ions in oxygen. Leonard B. Loeb. *Phys. Rev.* 48, 684-9 (1935).—Electrons and neg. ions from an arc in purified O were driven by a steady d.c. potential through parallel wire grids S₁ and S₂ to a collector plate P. Transverse, high-frequency a-c potentials at the grids caused capture of most of the electrons reaching them. The currents reaching S₁ and P were detd. for various gas pressures and a-c frequencies. Increase in the current to S₂ and simultaneous decrease in that to P represents break-up of the neg. ions in the d-c. field between S₁ and S₂. The actual curves are very complex, but the break-up seems to occur when the ratio of field strength in v./cm. to gas pressure in mm. is approx. 90. This value corresponds to an ion energy of not over 0.68 v. Since not over half of this is available for electron detachment, the probable upper limit for the energy of formation of the neg. ion is 0.34 v., which might correspond to a wave length of 36,000 Å.

The electron affinity of iodine from space-charge effects. Geo. Glocker and Melvin Calvin. *J. Chem. Physics* 3, 771-7 (1935).—The electron affinity of I atoms was detd. by a direct method in which only 1 atom and electrons were involved. The value obtained, 74.6 kcal., is in good agreement with values obtained by other methods. The consens. of the several ions of different masses (I^- and E^-) were calcd. from their effects on space charge. I has no effect on the thermionic emission of W.

Potential-energy curves and structure of the alkaline earth oxides. P C Mahanti. *Indian J. Physics* 9, 517-36 (1935).—Curves for different electronic states of BeO, MgO, BaO, SrO and CaO are drawn by the method of Morse. The electronic configurations and disson. products are discussed in each case.

A new afterglow spectrum in nitrogen. Joseph Kaplan. *Phys. Rev.* 48, 800-1 (1935).—See *C. A.* 29, 6141.

Predissociation in the sulfur bands. Maurice Déchant and Jules Duchene. *Phys. Rev.* 48, 916 (1935).—Absorption spectra of sulfur vapor. Louis D. Or. *Compt. rend.* 201, 1023-8 (1935).—The spectrum of S vapor in the visible and near ultraviolet has been examd under conditions in which the concn. does, and does not vary with temp. Previous results are not confirmed. The spectrum consisting of bands without fine structure between 3600

and 4200 Å., attributed by Graham (C. A. 5, 422) to S_2 and S_3 , is definitely not due to these mols., but to some intermediate mol. probably S_4 , or perhaps S_5 (cf. Dobbie and Fox, C. A. 13, 1965). C. A. Silberrad

Rotation structure of band systems D and E of cuprous chloride. Jean Ternier. *Compt. rend.* 201, 1029-33 (1935).—The band spectrum of CuCl is conveniently obtained by passing a c. at 2000 v through CuCl vaporized in an evacuated Pyrex tube. A detailed account of systems D and E , examd. by means of a grating giving dispersion of 1 Å./mm. is given, showing clearly the isotopic effect in conformity with theory (cf. Ritschl, C. A. 21, 1931). C. A. Silberrad

Ultraviolet absorption of mixtures of NO , NO_2 and H_2O . Eugene H. Melvin and Oliver R. Wulf. *J. Chem. Phys.* 3, 755-9 (1935); cf. C. A. 26, 1514.—In NO contg. small amts. of NO_2 a continuous absorption occurs in the ultraviolet, which is due to N_2O_2 . This obscures the absorption of NO and that part of the absorption of NO_2 which lies below 2500 Å. With small amts. of H_2O , a group of bands occurs in the near ultraviolet, extending from 3850 Å. to shorter wave lengths. They are diffuse, but possess an ordered arrangement, and decrease in intensity with increasing temp. The first members are broader and more diffuse than those that follow, indicating a predissociation process in the carrier, which is probably HNO . G. M. P.

Normal vibrations of heavy acetylene and of the ethylene halides. Yonezo Morino and San-churo Murakami. *Physik. Z.* 36, 600-2 (1935).—Valence-force calcs. are given for C_2D_2 , C_2H_2 , $\text{C}_2\text{H}_3\text{Cl}$ and $\text{C}_2\text{H}_3\text{Br}$. The agreement with expt. (Raman spectra) is good in the first two cases. The calcs. in the case of the last two mols. are used as a basis of assignment of some observed Raman lines. A. B. F. Duncan

Hindered rotation and oscillation of molecules in liquids and in crystals. S. Bhagavantam. *Proc. Indian Acad. Sci.* 2A, 65-6 (1935).—Wings on either side of Rayleigh lines are interpreted as Raman radiations somewhat analogous to rotational Raman spectra. The extended portions of the rotational wings in liquids are due to small oscillatory motions of the mols. about their equil. positions. In liquids there is only an imperfect quantization on account of a quasicrystalline arrangement. J. H. H.

Vibrations of benzene and Raman spectra of benzene- d_6 and benzene- d_5 . O. Redlich and W. Stricks. *J. Chem. Phys.* 3, 834 (1935). G. M. P.

The photographic infrared spectrum of methylacetylene and the distance between centers in the C-C bond. G. Herzberg, F. Patat and H. Verleger. *Physik. Z.* 36, 625 (1935).—An absorption band at 1.03μ was analyzed, single P, Q and R branches were found. The mol. is a symmetrical top with the CC-CH group linear. The sep. of centers in the C-C bond is 1.525 ± 0.005 Å. A. B. F. Duncan

Doppler effect in light scattering in liquids. II. Polarization of the transversely scattered radiations. B. V. Raghavendra Rao. *Proc. Indian Acad. Sci.* 2A, 236-41 (1935).—A study has been made of the state of polarization of the 3 components observed in the spectrum of the scattered light when examd. with a Fabry-Perot etalon. Three typical liquids, CCl_4 , PhCH_3 and CS_2 , have been examd. The results indicate that the 2 Doppler components are completely polarized, as is to be expected, and that the central component is practically completely polarized. The significance of the latter result, which appears surprising at first sight, is discussed in some detail. Harold Gershomowitz

The Raman spectra of the isotopic molecules H_2 , HD and D_2 . Gordon K. Teal and Geo. E. MacWood. *J. Chem. Phys.* 3, 780-4 (1935).—Raman spectra are reported for H_2 , HD and D_2 at 3 atm. and 32°. The positions of the pure rotation lines for H_2 agree with Rasetti's measurements (C. A. 24, 789); the lines in the Q vibration band do not. Calcd. and observed results are in good agreement. Contrary to theoretical predictions, the 0,0 line of the Q vibrational band of HD was observed. A change in the external pressure from 505 to 745 mm. caused

Raman spectrum of carbon disulfide. A. Veerabhadra Rao *Proc. Indian Acad. Sci. 2A*, 46-53 (1935).—The intensity and polarization of Raman lines of CS_2 were detd. The Q branch of $\Delta\nu=636$ cannot be sep'd from the PP and RR branches. The depolarization is 0.15 and is increased to 0.2 by progressing from λ 4358 to λ 4946.

J. H. Hibben

The Raman spectra of dioxane and tetralin. C. S. Venkateswaran *Proc. Indian Acad. Sci. 2A*, 279-99 (1935).—The Raman spectra of dioxane and tetralin have been obtained with the filter technique. The spectrum of dioxane consists of 24 lines, of which 14 are reported for the first time, and resembles closely that of cyclohexane. Tetralin has also given 11 new lines. The results are discussed with reference to the structure of the mols.

Harold Gershinowitz

The Raman spectra of cis- and trans-decalins. S. K. Kulkarni *Jatkar Indian J. Physics* 9, 545-551 (1935).—The Raman spectra of cis- and trans-decalin mixts show that the cyclohexane ring is not in one plane. The trans form is considered more sym. because of its smaller number of frequencies. The shift 750 cm^{-1} is broad in a mixt of the two forms, showing that the characteristic frequency of the fused rings is slightly different in the two forms.

A. B. F. Duncan

Fluorescence in cyclohexane. R. Padmanabhan. *Proc. Indian Acad. Sci. 2A*, 209-12 (1935).—An app. for continuous distn. has been described which works satisfactorily and is free from the defects of the arrangement described by Pal and Sen Gupta (*C. A.* 25, 1159). With the help of this app. pure cyclohexane is shown to have no fluorescence, that reported by Haberl (*C. A.* 29, 1711*) has been proved to be due to products of photochem. decompn. The wave lengths in the region $\lambda = 2490-2600\text{ Å}$ have been found to be active in the above reaction.

Harold Gershinowitz

A blue fluorescing substance from yellow carrots. F. H. Cohen *Chem. Weekblad* 32, 441 2 (1935).—Aq. ext. from carrots, with 3% HCl, twice adsorbed on frankomire, extd. the second time with H_2O -EtOH-pyridine (4:1:3), has a strong blue fluorescence. The substance is $CHCl_3$ -sol but does not fluoresce in this solvent, it can be extd. therefrom by soda soln. After 48 hrs in daylight the fluorescence decreases to one-half the intensity; it increases by addn. of dil. alkali, NH_3 or Na_2CO_3 , and does not change with AcOH. In 0.5 N HCl the shade is dark blue and the intensity decreased. The fluorescence disappears irreversibly in 24 hrs. in the presence of 0.1 N NaOH, reversibly by Na hyposulfite treatment, is not affected by heating in neutral soln. to 60° . KH_2I_2 , lead acetate or basic lead acetate does not give a ppt. and

$FeCl_3$ gives no violet color. The substance is not a decompn. product of lactoflavin. It has not been identified as yet. B. J. C. van der Hoeven

The fluorescence of pyrimidine, purine and pyrimidine derivatives. H. v. Eijler, K. M. Brandt and G. Neumüller. *Biochem. Z.* 281, 206-14 (1935). S. M.

Ultraviolet absorption and color-center formation in alkali halide crystals. Ernst Rexer *Physik. Z.* 35, 602 (1935).—The absorption coeffs. in the main absorption band of KBr increase with pressures of 800 g./sq. mm. At the same time the intensities of the satellite bands at longer wave lengths are increased. This latter absorption is connected with the color centers formed, which are probably atoms. A. B. F. Duncan

The inversion of cane-sugar solutions in tropical sunlight. N. A. Yajnik, D. N. Goyle and M. L. Wadhwa. *Z. anorg. allgem. Chem.* 225, 24-8 (1935).—The sugar solns. were placed in a Jena-glass flask in a glass beaker contg. water inside another beaker filled with water at the same temp. Const. temp. was maintained by passing cold water through the outer beaker. The entire app. was placed in direct sunlight, and it was shown that the light alone would cause the reaction to take place but the velocity const. is small. In the control expt. the flask was blackened. The effects of HCl and H_2SO_4 on the velocity const. in the dark and in the sunlight were measured and the light was found to increase the rate slightly. Aq. solns. of inorg. salts and dyestuffs were used as light filters in the inner beaker and ranges found for the max. inversion of the soln. These varied with the catalyst used.

E. R. Rushton

The presence of metastable active oxygen molecules in sensitized photooxidations. Joseph Weiss. *Naturwissenschaften* 23, 610 (1935).—Results of Gaffner (*C. A.* 29, 7813*) and Frauck (*Z. physik. Chem.* B27, 409 (1935), cf. *C. A.* 29, 5021*) were confirmed by expts. on quenching of the fluorescence of dye solns. (eosin, uranin) by sulfite or arsenite. The dye absorbs $h\nu$, the excited dye mol. can either give off light or transfer the quantum to the sulfite substrate or liberate photochem. H atoms and form HO_2 ; this formation explains certain phases of the expts. of Kautsky (*C. A.* 27, 1023). The HO_2 radical thereby fulfills the role of "active" O. B. J. C. van der Hoeven

New investigations on the photoresistance of metals. Quirino Mayrona. *Nuovo cimento* 12, 4/9-17 (1935), cf. *C. A.* 27, 2620.—Further expts. confirm the existence of the effect and show that it is not merely a thermal action. J. B. Austin

Speed of thermal decompn. of chloropicroin (Räddleson, Zamfirescu) 2

4-ELECTROCHEMISTRY

COLIN G. FINE

The influence of molten aluminum on firebrick lining in an electric furnace. A. N. Lusenko. *Legkie Metal* 4, No 5, 8-13 (1935).—In remelting Al in an elec. resistance furnace with a firebrick lining, the Al penetrated into the porous brick, reduced the SiO_2 and Fe_2O_3 and made the brick a conductor of electricity. The slagging of the walls progressed upward from the level of the metal to the top of the furnace where it short-circuited the Ni-Cr resistor units.

H. W. Rathmann

Electrically heated industrial furnaces. R. Boye. *Eng. Progress* 16, 265-72 (1935).—A review. E. H.

Operation of fused-electrolyte cells with an increased charge of alumina. A. I. Zhelezov and B. N. Maksimenko. *Legkie Metal* 4, No 5, 4-8 (1935).—The amt. of alumina charged at one time into 2 Hall cells at the Dnepropetrovsk plant was increased to 120-140 kg. (about 50-75%) for a 4-mo. period. As a result the output increased 1% and the consumption of cryolite decreased 10%, that of anodes 15%.

H. W. Rathmann

Production of titanium-aluminum alloys in fused-electrolyte cells. A. I. Zhelezov and B. N. Maksimenko

Legkie Metal 4, No 4, 24-22 (1935).—Alloys contg. up to 1.53% Ti were made by dissolving and electrolyzing a mixt. of Al_2O_3 and TiO_2 . A total of 2800 kg. of alloy was obtained with an av. daily output of 141.3 kg. per cell and a current efficiency of 73.5%. Ti segregated somewhat because of the large difference in sp. gr. of Ti and Al, this can be prevented by frequent stirring. H. W. R.

Oxidation of foam carbon with air (aluminum). B. I. Ivanov and B. N. Maksimenko. *Legkie Metal* 4, No 5, 14-18 (1935).—The foam formed in the electrolysis of the fused Al salt bath was crushed and heated in a ruffle furnace to 700-900° to oxidize the C and recover the electrolyte. At 780° the C content was reduced from 12% to 0.84% in 1 hr. and to 0.24% in 2 hrs. The loss of electrolyte was insignificant. H. W. Rathmann

The best concentration of sodium chloride for the alkali-chlorine cell. D. V. Adamovich. *Khimiya* 7, 481-6 (1935).—A discussion with math. treatment of the advantages and disadvantages of the electrolysis of NaCl solns. of higher than the usual concn. of 300 g/l.

Chas. Blake

The electrolytic preparation of magnesium persulfate. Lin-Yü Li and Kin-Tehouan Pei. *Contrib. Inst. Chem., Natl. Acad. Peiping* 2, 1-20(1935).—An aq. soln. of about 60% $MgSO_4$ was prep'd. by electrolyzing a $MgSO_4$ soln. with Pt electrodes. Attempts to isolate the persulfate in solid condition were not successful. The best anodic current density was 70 amp./sq. dm., at a current efficiency of about 50%. It is essential to sep. the anolyte from the catholyte by an unglazed porcelain diaphragm. Production of Caro's acid is negligible. C. L. Tseng

Electrodeposition of tin alloys from alkaline stannate baths. R. G. Monk and H. J. T. Flingham. *Trans. Faraday Soc.* 31, 1460-8(1935), cf. Hothersall, Clarke and Macnaughtan, C. A. 28, 5344.—Satisfactory deposits of Sn-Ni alloys contg. up to about 25% Ni are obtainable at high current efficiencies from an alk. bath at 70-5° contg. 90-100 g. Sn as Na stannate, 2 g. Ni as K nickelocyanide, and 5 g. of KCN per l. with Ni anodes. Deposits contg. 18-25% Ni, obtained at about 0.15-0.5 amp./sq. dm., remain bright up to about 0.0005 in., then become mat. Their hardness is about 7 times that of electrodeposited Sn. Deposits of higher Ni content, obtainable only at lower current efficiencies, are much harder, but more brittle and less wear-resistant. Alloys contg. Sn and Sb in almost any proportion can be electrodeposited at practically 100% current efficiency from an alk. stannate-thioantimonate bath at 70-75° by currents from 0.1 to 10 amp./sq. dm. Only those contg. less than 50% Sb form satisfactory deposits as thick as 0.0005 in. and even these are brittle. L. W. Elder

Bright zinc. C. M. Hoff. *Metal Cleaning and Finishing* 7, 483-6, 490(1935).—In view of the present shortage of Cd and the resulting increase in its price Zn is pointed to as a logical substitute. The phys., chem. and rust-protective properties of Zn and Cd are compared and the factors pertaining to the electrodeposition of these 2 metals are discussed. D. Thuesen

Electrolytic lead plating of chemical apparatus. P. P. Belyaev and Ya. N. Birman. *Khimistrol* 17, 426-8(1935).—Various Fe objects can be directly electroplated with Pb by the use of H_2SiF_6 electrolyte on addn. of ice, $Be(OH)_2$, and some $CaCO_3$ to neutralize any H_2SO_4 . In prep. the bath H_2SiF_6 is neutralized with Pb carbonate or oxide, and the filtrate, dild. to a definite concn. and treated with carpenter's glue, is used in the electrolysis at room temp. Good results are obtained with the following: 87-291 g./l. of 0.5-1.5 N $PbSiF_6$, 18-72 g./l. of 0.25-1 N H_2SiF_6 , 5 g./l. of 0.5% $Be(OH)_2$, and 1-2 g./l. of 0.1-0.2% glue. $CaH_2(SO_4)_2$, $HOC_2H_4SO_3H$ and $MeC_2H_4(OH)SO_3H$ can be substituted for H_2SiF_6 . Many tech. and economic advantages are claimed for the electrodeposition of Pb on Fe as compared with the hot-dipping process. Among them is that the Pb-electroplated objects can be stamped, machined and formed without distortion. The method, however, requires further development and refinement. Chas. Blanc

Almost instantaneous action of some colloids on electrolytic deposits of copper. Pierre A. Jacquet. *Compt. rend.* 201, 953-5(1935); cf. C. A. 29, 2093.—The distinction between the behavior in an electrolytic bath of pectones and protein on the one hand, and of gum arabic, gum tragacanth and dextrin on the other, is confirmed by expts. with Marie and Thon's contractometer (C. A. 25, 5100) with aq. $CuSO_4$. These show that only the pectones and proteins have immediate action on the deposition of Cu, the gums acting much more slowly and less powerfully, while dextrin has scarcely any effect at all. C. A. S.

The copper voltammeter (coulometer). F. E. L. Parsons. *School. Sci. Rev.* 17, 171-80(1935).—App. for demonstration and student work. O. Reimnuth

Alkaline plating baths containing ethanalamines. I. Copper plating from triethanolamine solutions. C. J. Brockman and A. L. Brewer. *Trans. Electrochem. Soc.* 69, 6 pp. (preprint)(1935).—The production of strike plates from solns. of Cu salts contg. triethanolamine is compared with those from other solns. A new soln. was developed which will not plate Cu by replacement when brought in contact with Fe. This soln. will in 70 sec.

produce a bright adherent Cu plate at 0.4 amp./sq. dm. capable of taking a subsequent good, adherent Cu plate from the com. acid $CuSO_4$ bath. The soln. contains 15 g./l. $CuSO_4$, 51H₂O, 10 g./l. Na oxalate and 22 cc./l. triethanolamine. C. G. F.

Vacuum discharge with cold cathode as the cause of delayed ignition of certain high-tension rectifier tubes. F. M. Penning and J. G. W. Mulder. *Physica* 2, 724-30 (1935).—A time lag in the starting of anode current in certain high-voltage Hg-arc rectifiers is explained from a negative charge of the glass wall around the anode. This charge is attributed to a vacuum discharge during the negative phase with anode as cathode. These discharges were studied in a special tube; they have characteristics of auto-electronic emission. B. J. C. v. d. H.

Electrotypers' waxes. Charles F. Mason. *Chem. Industries* 37, 443-4(1935). E. H.

Electrochem. methods in varnish and pigment industry (Parnilox) 26. H_2SO_4 (Brit. pat. 433,676) 18. Coated ferrous wire, etc. (U. S. pat. 2,023,564) 9. Flue furnace for baking porcelain (Fr. pat. 757,009) 19.

Electric battery. Gustav Willmck. U. S. 2,023,717, Dec. 10. An anode of PbO_2 and a cathode of an alloy contg. Sn 96, Pb 2 and Sb 2% is used with an electrolyte of 24% B_4H_4 . H_2SO_4 to each l. of which is added Cr sulfate 3 g., Na₂Cr₂O₇ 1 g. and $SnSO_4$ 30 g.

Primary electrolytic battery. Martin L. Martus and Edmund H. Becker. U. S. 2,023,515, Dec. 10. ZrO_2 0.1-0.8% is used in the electrolyte of a primary cell of the type using a depolarizer and a caustic alkali soln. as electrolyte, and serves to improve cell operation. Some TiO_2 also may be used.

Electric battery with zinc and carbon electrodes. Charles K. Bamber (to Bamberite Battery Co., Ltd.) U. S. 2,022,998, Dec. 3. Various structural details.

Dry cell. Bruto Laurenti. Ger. 617,785, Aug. 26, 1935 (Cl. 21b 7.01). A dry or semi-dry cell has a cylindrical Zn cathode, forming also the cell container, coated on its inner side with insol. animal gelatin. This forms an insulation from the anode rod which may be made of C.

Lead storage-battery plates. Charles F. Haunz (one-third each to Alexander McGary and George R. Berger). U. S. 2,023,170, Dec. 3. Structural features.

Active material for lead storage-battery plates. Alexander Stewart (to National Lead Co.). U. S. 2,022,482, Nov. 20. Pb oxide is used with a small proportion of solid org. material pptd. from waste sulfite liquor by the action of a water-sol. Pb compd. such as Pb acetate, etc.

Filling device for storage batteries. Asa H. Mosher. U. S. 2,022,380, Nov. 26. Structural and operative details.

Electrolytic condensers. Frank W. Godsey, Jr. (to Sprague Specialties Co.). U. S. 2,023,522, Dec. 10. A viscous electrolyte is used comprising a substance such as gluconic, mannonic or gulonic acid which acts both as a weak acid and as a viscous ionizing solvent of the electrolyte which also may contain an NH_4 salt of the acid and water.

Electroplating apparatus suitable for plating various articles. Burton G. Daw. U. S. 2,023,668, Dec. 10. Structural and mech. details.

Electrolytic capacitors, etc. Frank M. Clark and John H. Koenig (to General Elec. Co.). U. S. 2,022,500, Nov. 26. For impregnating capacitor spacers, etc., a mixt. of salts is used which is noncryst. in the working range of temps. of the capacitor, such as a mixt. of NH_4 borate and acetate.

Electric current rectifier filled with a rarefied gaseous medium such as mercury vapor. Walter Dillenbach. U. S. 2,023,166, Dec. 3. Various structural and elec. details.

Electric rectifier unit for electrolysis control. Edgar A. Hartv (to General Elec. Co.). U. S. 2,023,226, Dec. 3. Structural details of an app. suitable for control of electrolysis in pipe lines, etc.

Electrolytic production of alcohols and hydrocarbons. Walter H. McAllister (to Procter & Gamble Co.). U. S. 2,022,894, Dec. 3 For making alcohols or unsatd. hydrocarbons having one less C atom per mol. than the salt used as raw material, graphitic anodes are used in electrolyzing a soln. contg. a sol salt of an aliphatic acid having at least 6 C atoms per mol. such as K coconut oil soap and also contg. about 10-30% of a water-sol. aliphatic monohydric alc. such as EtOH and about 3.0-8.5% of an alkali metal chlorate, perchlorate, bicarbonate or sulfate. Numerous examples are given

Electrolytic apparatus for making sheet metal Allgemeine Elektrizitäts-Ges. Ger. 620,209, Oct. 16, 1935 (Cl. 48a. 3)

Electrolytic manufacture of hollow metal tanks, etc. Blasius Bart U. S. 2,023,192, Dec. 3. Various operative details

Coated aluminum articles Helmer Bengtson (to Aluminum Colors Inc.) U. S. 2,022,798, Dec. 3 An article of Al to be decorated and protected from undesired change is made anode in a bath contg. H₂SO₄ until a substantial porous coating is formed (the bath having an acid concn. of 60-77%) and the coating formed is impregnated with chemicals such as FeSO₄, etc., this produces a light-fast inorg. pigment, which is pptd. in the pores of the coating, e. g., by use of a ferricyanide soln

Separating copper and zinc from their alloys Frederick Laist (to Anaconda Copper Mining Co.) U. S. 2,023,424, Dec. 10 An alloy contg. Cu and Zn is melted and blown with air to recover a portion of the Zn content as ZnO; the modified alloy is subjected to electrolytic treatment in an electrolyte contg. H₂SO₄ and sulfates of Zn and Cu to convert the Zn into ZnSO₄, which dissolves in the electrolyte, acid in the electrolyte is neutralized with material including ZnO, effecting pptn. of Cu and forming a substantially Cu-free soln. of ZnSO₄; metallic Zn is electrolytically produced from this soln., and remaining soln. is used for producing electrolyte for treating the alloy

Bessemer steel Hauts Fourneaux & Acieries de Differdange-St. Ingbert-Rume-Lange and Jules Welter Fr. 789,735, Sept. 9, 1935 The converter is provided with adjustable electrodes so that an elec. arc may be produced above the bath of steel, the converter being in the turned-down position

Treatment of cast iron or steel Vereinigte Stahlwerke A.-G. Ger. 620,210, Oct. 16, 1935 (Cl. 48a. 14). A process is described for increasing the resistance to corrosion of cast iron or steel contg. more than 0.1% Cu and small proportions of constituents which tend to form gelatinous compounds by combination with OH ions in the corrosion medium, e. g., Al, Si, Ni or Sn. The process consists in immersing the iron or steel in a corrosion medium, e. g., sea water, together with a more electropos. metal, and connecting the metals so as to produce an electrolytic circuit. A coherent Cu coating is thus produced on the iron or steel. The dimensions of the cathode should be such as to yield a current of 0.5-1.5 × 10⁻⁴ amps. Exptl. results are given of the treatment of a steel contg. C 0.33, Si 0.02, Mn 0.29, P 0.037, S 0.031, Cu 0.20 and Al 0.18%

Electrolytic cleaning of metals such as iron and steel and deposition of tin on the cleaned metal. Thomas E. Dunn (to Bullard Co.) U. S. reissue 19,773, Dec. 3. A reissue of original pat. No. 1,898,765 (C. A. 27, 2637)

Beryllium Harry C. Clafin (to Beryllium Corp.). U. S. 2,022,494, Nov. 26 In the electrolytic production of Be, NH₄ Be fluoride is added to a fusion of the fluorides of one or more metals more electropos. than Be, such as those of Na and other alkali metals and the material is electrolyzed at a temp. below the m. p. of Be.

Hydrogen peroxide Lynn H. Dawsey. U. S. 2,022,650, Dec. 3 H and O are introduced at high velocity into a silent elec. discharge using high-frequency power of 500 to 3000 cycles per sec. App. is described.

Hydrogen peroxide Ferdinand Krauss Brit. 434,488, Aug. 26, 1935. See Fr. 781,506 (C. A. 29, 6156)

Electric furnaces Siemens-Schuckertwerke A.-G.

(Carl T. Buff, inventor). Ger. 620,000, Oct. 11, 1935 (Cl. 21a. 15 03). In furnaces having heating elements made of materials which are conductors only at high temps., e. g., metal oxides, rare earths, or silicates or other salts, the heating of the materials to a temp. at which they become conductive is facilitated by mixing the materials with a material having a higher cond. at atm. temp. The latter may be a material which is vaporized when the required temp. has been attained, e. g., Pb or Sn.

Electric furnaces Siemens-Schuckertwerke A.-G. (Johann Schnepf and Rudolf Grundmann, inventors). Ger. 620,185, Oct. 19, 1935 (Cl. 21a. 15.50). Means for supporting heating units from the furnace cover is described

Coreless induction furnace for melting metals in vacuo or in an inert gas Fried Krupp A.-G. Ger. 620,458, Oct. 21, 1935 (Cl. 21a. 18 01)

Electric furnace for making sheets from quartz or like refractory material Soc. anon. des manufactures de glaces et produits chim. de St. Gobain, Chauny & Cirey. Ger. 620,191, Oct. 16, 1935 (Cl. 32a. 35). See Brit. 400,020 (C. A. 28, 1937)

Electric furnaces for annealing metal strip in a protective atmosphere Heraeus-Vacuumschmelze A.-G. Brit. 433,918, Aug. 22, 1935

Electric resistance furnace suitable for annealing metal articles Willard Roth and Frank X. Kerin (to Westinghouse Elec. & Mfg. Co.) U. S. 2,023,101, Dec. 3.

Electric resistance heater Albert H. Heyroth and Walter E. Schildhauer (to Globar Corp.) U. S. 2,022,314, Nov. 26 A nonconducting slab which may be formed of unglazed ceramic material and which has a rounded end carries a conductive layer of Si and bentonite baked on the sides and curved end of the slab (various structural details being described)

Glowing electrode Patent-Treuhand-Gesellschaft für elektrische Glühlampen m. b. H. Ger. 617,548, Aug. 21, 1935 (Cl. 21f. 82 03) The electrodes for gas filled discharge tubes, especially electric light tubes, contain alk. earth metal silicate or a mixt. of such silicates as the sole electron-emitting substances

Treating graphite electrodes The British Thomson-Houston Co. Ltd. Brit. 434,230, Aug. 29, 1935 Graphite electrodes for discharge devices are freed from dust by heating to 1000° and quenching, the quenching liquid is preferably H₂O, heated to 90°, but CCl₄, a 28% soln. of AcOH or 25% soln. of glycerol may be used. After quenching, the electrode is dried at 1200° in H₂ or in vacuo

Carbon electrodes for primary cells Siemens-Planawerke A.-G. für Kohlefabrikate (Oswald von Wartburg, inventor). Ger. 620,455, Oct. 22, 1935 (Cl. 21b. 7.01).

A core of coarse porous C prepd. by a high temp. coking process is coated with a layer of fine active C which has not been subjected to a high temp. The layer may be produced *in situ* by coating the core with a paste of a material such as peat or wood, and carbonizing the coating at a relatively low temp. Constructions of electrode are described

Electrostatic filters Siemens-Lurgi Cottrell-Elektrofilter-G. m. b. H. für Forschung und Patentverwertung Fr. 787,043, Sept. 16, 1935 Means for cleaning the electrodes.

Neon tube Allen P. Tallman U. S. 2,023,558, Dec. 10. The rear half of a Ne tube is provided with a reflecting coat contg. Ti oxide

Emissive coatings on electron tube filaments Hans J. Spanner and Ulrich Doering (to Electrons, Inc.) U. S. 2,023,707, Dec. 10 For alloying an alk. earth metal such as Ba with a core metal, the latter is heated in an atm. contg. a gaseous compd. of an alk. earth metal, such as a Ba alkyl compd., and the compd. is d-compd. at such a temp. as to effect alloying of the alk. earth metal with the core. App. is described

Electrical glow discharge for effecting reactions such as production of biphenyl from benzene. Robert V. Kleinschmidt (to Arthur D. Little, Inc.) U. S. 2,023,677,

Dec. 10. A hydrocarbon, such as C_4H_8 for the production of biphenyl, is subjected, in a dispersed state, to an electric glow discharge between electrodes in a reaction chamber; free access of current is permitted from one electrode to the other through the material, while the pressure in the chamber is maintained at a value corresponding to the max. elec. cond. of the dispersion. App. is described.

Electrical gaseous discharge vacuum pump Clarence W. Havell (to Radio Corp. of America) U. S. 2,122,465, Nov. 26. Structural and elec. details.

Discharge lamps N. V. Philips' Gloeilampenfabrieken Brit. 433,671, Aug. 19, 1935. In a lamp contg. a gas, e. g., Ne, and a metal volatilizable with comparative difficulty,

e. g., Na, Cd, Mg, Ti, K or Li, means are provided whereby the metal condensing at the coldest part of the tube either flows to another part where it is evaporated by a heating device or is evaporated by heat transmitted from the anode, the temp. of which rises because of the increase in operating voltage resulting from the decrease in vapor pressure.

Discharge lamps. The British Thomson-Houston Co. Ltd. and Wm. J. Scott. Brit. 434,633, Sept. 5, 1935. A high-pressure lamp contains a mixt. of Hg and another vaporizable material, e. g., Cd, the Hg only being entirely vaporized and the unevaporated portion of the other material acting as the cathode.

5—PHOTOGRAPHY

E. R. BULLOCK

Advances in photography. G. Heymer *Z. Ver. deut. Ing.* 79, 1295-1301 (1935). I. H.

Photographic process in variable-density sound recordings F. v. Orban *Filmtechnik* 11, 8-10 (1935).—Development of the negative up to a γ of 1.1 gave very little increase in distortion. Beyond this point, further gain in modulation is accompanied by a sharp increase in the percentage of distortion for high modulation in the recording.

O. E. Miller

Present position of the theories of the latent photographic image Hans Arens and Fritz Luft. *Veroffentlich. voss. Zentral-Lab. phot. Abt. AGFA* 4, 1-14 (1935).—The 3 most important theories of the latent image at the present time, namely, the Ag germ theory, the surface discharge theory (of G. Schwarz) and the micelle theory, are considered. According to the Ag germ theory, the developability of the grains depends on the development nuclei. The genesis of these nuclei by the deposition of "photo-Ag" on the centers produced by ripening is discussed, and the reason why only certain of the grains on which photo-Ag could be formed become developable is investigated on the basis of probability. The fundamental effects which have led to the advancing of the surface-discharge and micelle theories are described, and some consequences of these theories are discussed. Authors.

Spectro-sensitometer for the determination of a color-sensitivity curve Kurt Looge. *Atelier Phot.* 42, 170-3 (1935); cf. C. A. 29, 1375.—A new spectral sensitometer uses a step diaphragm, with steps in geometrical progression, moved in front of the exposure plane by a synchronous motor, to give a time-scale stepped exposure. The light source is a W lamp, operated at 2300° and screened with a Davis-Gilson filter, to give mean sunlight quality.

H. Parker

A new method for the determination of the resolving power of photographic emulsions A. Narath *Kino-technik* 17, 51-5, 107-10 (1935).—Resolving-power measurements on a no. of Agfa emulsions are given. Resolving power is nearly inversely proportional to grain size. Expressed in linear size of the smallest structure resolved, the resolution of most emulsions lies between 10 and 30 μ .

O. E. Miller

Light filters of cyanine dyes W. Dieterle *Veroffentlich. voss. Zentral-Lab. phot. Abt. AGFA* 4, 95-7 (1935).—Gelatin filters contg. benzothiazine, benzothiazine-pentacarbocyanine, and naphthothiazine-pentacarbocyanine, resp., have been prep'd. and tested. They all have very sharp extinction curves, and as regards stability in light are not greatly inferior to ordinary light filters. E. R. Bullock.

Bromoll prints on ordinary enlargement paper. P. L. English. *Am. Phot.* 29, 290-0 (1935).—Am. papers are not satisfactory for bromoll when used in the usual way, since the emulsion is already hardened. The following technique is suggested: Use a paper of low contrast and smooth surface. Develop with amidol 7.5 g., Na_2SO_4 30 g., H_2O to 1 l. dild. 1:3 and treat with 4 cc. of 10% KBr soln. per l. of dild. developer. Expose so that development will be completed in not less than 2

min. Fix for 15-20 min. in Eastman F-1 formula with alum omitted. Bleaching and tanning may be combined. Bleach by immersing in $CuSO_4$, 5H $_2O$ 53 g., KBr 2.8 g., H_2O 500 cc. until gray disappears, drain 15 sec., and transfer to the tanning soln., $K_2Cr_2O_7$ 2.5 g., KBr 50 g., H_2O 500 cc. for an 11 × 14-in. print, dil. 30 cc. to 150 cc. and rock in this for 2 min. Redevelop for 4-5 min. in the developer described above, from which the bromide may be omitted. Bleach and tan again in the same way as described above. Fix as above, but less time is required. Washing must be thorough after initial fixing, while between other operations, except where otherwise specified, 5 min. is sufficient, wash finally 30 min. After complete drying, swell in H_2O at various temps. depending upon the consistency of ink to be used, or in NH_4OH soln. at room temp., the concn depending upon the ink. For inking are suggested rosin ink, and professional hard, medium and soft. The first is described in detail, together with fine-grain inking technique. I. P. Wightman.

Marking, ornamenting or coloring Al and its alloys by photographic processes (Ger. pat. 620,664) 9

Photographic plates. Anton Jasmatzki. Ger. 617,714 Aug. 21, 1935 (Cl. 57b. 18 02). The strengths of negatives with differing Ag halide contents, e. g., of tripack negatives, are equalized by coloring the washed relief from the Ag negative with a dye of suitable actinic value.

Apparatus and method for drying coated plates for photolithographic and other purposes. Pictorial Machinery Ltd., Leslie Linzell and John P. L. Corkett. Brit. 433,718, Aug. 10, 1935.

Photographic paper. I. G. Farhenndustrie A.-G. Ger. 617,712, Aug. 21, 1935 (Cl. 57b. 9). Halogen-Ag-gelatin printing-out paper is made by adding org. compds. which form Ag salts the soly of which is not materially greater than that of AgCl. Thus, a soln. of nitroindazole is added to the paper. Such paper is free from gray or yellow fog on developing. Other suitable substances are benzotriazole, nitrobenzotriazole and nitrobenzimidazole.

Printing apparatus for transferring dichrome or trichrome pictures to lenticulated films Armand Rodde, Albert H. Herault, Victor Hudeley and Jean Lagrave. U. S. 2,022,432, Nov. 26. Various optical, mech. and operative details.

Pentacarbocyanine dyes. I. G. Farhenndustrie A.-G. Brit. 434,211, Aug. 28, 1935. See Fr. 774,028 (C. A. 29, 21034). Corresponding propene compds., wherein 1 or more of the H atoms of the trimethylene chain are replaced by an alkyl group or groups may be used.

Photostats Conzett & Huber. Ger. 617,614, Aug. 28, 1935 (Cl. 57d. 1.01). In copying by photography, the sensitive layer consists of a substance bleached by exposure to light. Thus, the sensitive layer consists of distd. water, $KMnO_4$, lactic acid and $AcOK$. After exposure, the print is fixed by a 5% soln. of the HCl salt of *p*-aminophenol. Other examples give MnO_2 - H_2PO_4 and tartaric acid and primuline as the light-sensitive agents.

6—INORGANIC CHEMISTRY

A. R. MIDDLETON

The direct formation of bromides and the distance of the closest approach of atoms of bromine. Bimayendra Nath Sen *Proc Acad Sci United Provinces Agra Oudh, India* 4, 316-18 (1935), cf. *C. A.* 27, 4476.—All the available data indicate that only those elements combine directly with Br whose distance of the closest approach of atoms is greater than about 2 Å. From this S. concludes that the distance of closest approach of Br atoms is about 2 Å, that is, less than that of any of the elements with which Br combines directly. This is supported by the value (1.73 Å) which S. obtains by calcg the closest at approach of Br by his formula. If this is true, then the unknown values for the closest at approach of S, Se, Te, Be, P, As, Ti and Sr must all be greater than 1.73 Å since these elements combine directly with Br. On the other hand, the distances of closest approach for Pt, Os, Ir, Ru and Pd are all over 1.73 Å yet none of these elements combines directly with Br. John E. Milbrey

Double chlorides and bromides of nickel and organic bases. Jean Amiel *Compt rend* 201, 1198-1200 (1935), cf. *C. A.* 30, 4064.—It was not possible to prep. $[NiCl_2 \cdot (C_6H_5NH_2)_2]$ by the previous method, but violet-brown crystals of approx $[NiBr_2 \cdot (C_6H_5NH_2)_2]$ were obtained by evapng mixed solns of the constituent chlorides (or bromides) under reduced pressure, crystg near 100°, redissolving in MeOH and pptg by gaseous HCl (or HBr) the following have been prepd: $NiX_2 \cdot B$ HCl and $2NiX_2 \cdot B'$ 2HCl, X = Cl or Br, B = MeNH₂, EtNH₂, PrNH₂, C₄H₉N, C₆H₅N and C₆H₅N₂, B' = C₆H₅(NH₂)₂ and C₆H₅N₃, and also $2NiCl_2 \cdot C_6H_5(NH_2)_2$, 2HCl, and, at a lower temp., $2NiX_2 \cdot C_6H_5N_2$, 2HCl 6H₂O, of which last d¹⁰ (X = Cl) is 2.04, and (X = Br) 2.58. The Cl compds are yellow and moderately deliquescent, the Br compds. are dark yellow or brown and very deliquescent. All are sol in MeOH and EtOH, but only slightly or not sol in other org solvents. On heating they decompose without melting. Duval's method (*C. A.* 29, 5373) shows no cation except Ni^{++} . C. A. Silberrad

Comparative oxidizing actions of corresponding oxychloro and oxybromo compounds on sodium thiosulfate. Emile Carnère and Lucy Faysse *Compt rend* 201, 1036-7 (1935).—The oxidizing actions of solns of HClO₂ and HIO₂ and of HClO and HIO on Na₂S₂O₃ compared under similar conditions show the action of the I compd to be greater than that of the Cl compd, contrary to the view sometimes held that the reverse should be the case on the assumption that O is less firmly attached in the Cl compds. C. A. Silberrad

The carbides of lead and of silver. E. Montagnie, *Bull soc chim* [5], 2, 1807-9 (1935).—Unsuccessful attempts were made to prep. PbC₂ by several procedures. In attempting to prep. PbC₂ by heating Pb(CN)₂, it was discovered that Pb(CN)₂ does not exist. A MeOH soln of Pb(OAc)₂ dropped on CaC₂ gave a mixt of PbC₂ with several other compds. PbC₂ is stable in air, but is readily hydrolyzed by acid or alk solns, yielding C₂H₂ (cf. Durand, *C. A.* 18, 657; Heuz and Neukirch, *C. A.* 18, 799; Gründt, *C. A.* 21, 2858). Uniformly unsuccessful attempts were made to prep. AgC₂ by calcining org. Ag salts the oxalate, benzoate, salicylate, tartrate and oleate were used, the residue in each case was Ag (cf. Sabatier, *Bull soc chim* [4], 29, 791 (1921); Durand and Banos (*C. A.* 22, 715)). G. M. P.

Action of oxidizing agents on sodium hypoferrite. Xavier Thesse *Compt rend* 201, 1135-7 (1935); cf. *C. A.* 29, 1349.—When Cl is passed into a satd soln of Na₂FeO₄ contg 35% NaOH at 120° Fe(OH)₃ is pptd, with 40% NaOH some Fe₂O₃ is formed, with 50% at 130-40° yellow-green crystals of (probably) Na₂FeO₄ · 10H₂O; and with 60-70% the metaferrite Na₂FeO₃ · 3H₂O is similarly. Solns contg up to 4 g/l of Fe(OH)₃ in 40% NaOH are obtainable by oxidizing solns of Na₂FeO₄ of suitable strength. On adding Pb(OH)₂ to a hot soln of Na₂FeO₄ (50% NaOH) there is a transitory formation

of fine black needles (Pb or Pb₂O), which quickly redissolve with evolution of gas 2Pb(OH)₂ + 2Na₂FeO₄ + 2NaOH = 2Na₂FeO₃ + Pb₂O + 3H₂O; PbO + 4NaOH = 2Na₂PbO₂ + H₂O + H₂, while some Pb(OH)₂ is merely dehydrated. On adding a soln of Na₂FeO₄ to hot aq NaOCl contg 10-15% NaOH, the soln turns purple through formation of Na₂FeO₄. C. A. Silberrad

Action of perchloric acid on iodine and iodo derivatives. Determination of iodine in organic substances. Ernest Kahane and T. Tomesco, *Compt rend* 201, 1195-8 (1935).—HClO₄ and KI interact in 2 stages, first at about 135° with liberation of I, and then at 200-10° with disappearance of the I, the final result (in a sealed tube) being 7HClO₄ + 4KI = 4HIO₄ + 3HCl + 4KClO₄, with no formation of free O₂. Other inorg iodides react similarly. Organic iodo compds are as a rule completely decompd into H₂O, CO₂ and HIO₄. There is some evidence that at about 210° HClO₄ (72%) undergoes some reversible dissoc. into 2 products both of which react with the I to form only HIO₄, HCl and H₂O. Iodine can be detd. by an adaptation of K's method (cf. *C. A.* 26, 940) by passing the product formed by heating the substance under examn. with the sulfo-nitro perchloric mixt into Br H₂O, which converts any I passing over into HIO₄, or better by adding a large excess of As₂O₃ to the original mixt. when all the I thus passes over. C. A. Silberrad

Action of heat on ortho-, pyro- and meta-arsenates of calcium and strontium. Henri Guérin, *Compt rend* 201, 1133-5 (1935).—The ortho-arsenates of Ca and Sr are stable in a vacuum up to 1200°, any excess of As₂O₃ left in prepn. passing off as As₂O₃ + O₂. The pyro- and meta-arsenates pass into the ortho salt on heating above about 800° and 500°, resp., in the latter case with intermediate formation of pyroarsenate. C. A. Silberrad

Stabilized cubic ferric oxide. André Michel and Georges Chaudron *Compt rend* 201, 1181-3 (1935).—Solid solns of varying amts of NaFeO₃ in Fe₂O₃ were prepd by adding various amts of aq NaOH to pptd Fe(OH)₃, the product being reduced to Fe₃O₄, oxidized at 300° and then heated to 650°. The Curie point decreased regularly with increasing content of Na₂O, while the side of the unit cube (a) increased with equal regularity, the figures for an oxide contg about 5% Na₂O being about 400° and 8.52 Å, and (by extrapolation) 675° and 8.32 Å. for pure Fe₃O₄. The dissociability of Fe₃O₄ (into Fe₂O₃ and O) decreases rapidly with increase in Na₂O, and with 5% thereof it is practically undissociable at 300°. Though the content of Na₂O is reduced by hydrolysis in hot H₂O or by AcOH, no change in Curie point or a occurs until after reheating to 650°. Solid solns of other ferrites behave similarly, the limit solns of those of Be, Ag and K having Curie points at 220°, 270° and 290°, resp. C. A. Silberrad

Potentiometric investigations of ammonium mercury sulfites. G. Spacu and C. Drăgulescu, *Z. anorg. allgem. Chem.* 224, 273-9 (1935), cf. *C. A.* 29, 5353.—By potentiometric titration of HgCl₂ solns with (NH₄)₂SO₃ under various conditions, 2 compds. are indicated [HgCl(SO₃)](NH₄) and [Hg(SO₃)₂](NH₄)₂. These are well-cryst. stable compds. H. Stoertz

Decomposition of cupric sulfate pentahydrate by heat. Osias Binder *Compt rend* 201, 1035-6 (1935), cf. *C. A.* 30, 3631.—On heating CuSO₄ · 5H₂O in an elec. furnace at 650° 2CuO · SO₃ is obtained as a homogeneous Indian red powder with distinctive x-ray spectrum. It is stable in air; treated with H₂O it gives 4CuO · SO₃ · 4H₂O or 3CuO · SO₃ · 2H₂O according as the H₂O is cold (20°) or boiling. C. A. Silberrad

Reactions of sulfuryl diamide (sulfamide). F. C. Wood *Nature* 136, 837 (1935).—When a soln of xanthidrol in I:OH is added to a soln of sulfamide in AcOH and H₂O, after some time, crystals of dioxanthylsulfamide, m. 182-4°, are obtained. Condensation products have also been obtained with xanthidrol and *p*-aminobenzenesulfonamide,

m. 209°; *m*-benzenedisulfonamide, m. 170°; *p*-toluenedisulfonamide, m. 198°. The reaction between sulfamides and sulfonamides in some cases may conveniently be used for their estimation. G. M. P.

The dimer of carbon chlorosulfide. The chlorosulfide $C_2S_2OCl_2$ and a new chlorosulfide $C_2S_2Cl_4$ Marcel Delépine, Louis Labro and Frederique Lange. *Bull. soc. chim.* [5], 2, 1969-80(1935) — $C_2S_2Cl_4$ was prep'd by heating 10 g. $CSCl_2$ dimer with 15 cc. of abs. $FeOH$ on the water bath; 1.6 g. of $C_2S_2Cl_4$ was obtained. It crystallizes in small yellow plates, m. 58-9°, is sol in most org. solvents, but not in H_2O , and is stable at ordinary temps. Some reactions, chiefly condensations with secondary bases, are described. $C_2S_2OCl_2$ was prep'd from 1 l. H_2O and 46 g. of $CSCl_2$ dimer, with repeated shaking. The yield was 36 g. of crude crystals, 26.50 g. remained after purification. The properties are given by Schönberg and Stephenson (*C. A.* 27, 3197). Several reactions, chiefly condensations with secondary bases, are described. Several structural formulas each are proposed for $C_2S_2OCl_2$ and for $C_2S_2Cl_4$. G. M. P.

System lithium nitrate-water Jean Bureau. *Compt. rend.* 201, 1197-5(1935) — The hydrate $LiNO_3 \cdot 1.5H_2O$ (I) is stable below -7.95° at which temp it undergoes a peritectic transformation into $LiNO_3 \cdot H_2O$, which similarly passes into $LiNO_3 \cdot 0.5H_2O$ at 50.9°, and this again peritectically without fusion into $LiNO_3$ at 94°. Iodine and H_2O form a eutectic at -38.7°. Solns. show no hydrolysis below 100°. The anhyd salt (99.5%) decomposes to a slight extent on fusion, the fused product solidifying at 210° and contg. 95.5% $LiNO_3$. C. A. Silberrad.

Alkaline oxide systems $CaO-Al_2O_3-SiO_2-CO_2$, IV. The CO_2 pressure of the silice acid-rich part of the system $Li_2O-SiO_2-CO_2$ and the action of Al_2O_3 upon Li_2CO_3 . C. Kröger and E. Fingas. *Z. anorg. allgem. Chem.* 224, 289-304(1935), cf. *C. A.* 29, 7210°. — The action of Li_2CO_3 upon $Li_2O-xSiO_2$ was studied, with $x = 3, 5$ and 7. Action of quartz upon Li_2CO_3 leads to metasilicate. The last equal which is established leads to orthosilicate formation as follows: $[Li_2SiO_3] + Li_2CO_3 = [Li_2SiO_4] + (CO_2)$. At higher temps. the orthosilicate reacts with Li_2CO_3 thus: $[Li_2CO_3] + [Li_2SiO_4] = [Li_2SiO_3] + (CO_2)$, and again $[Li_2SiO_3] + Li_2CO_3 = [Li_2SiO_4] + (CO_2)$. In the action of Al_2O_3 upon Li_2CO_3 , the following reactions occur: $[Li_2CO_3] + [Al_2O_3] = [Li_2O \cdot Al_2O_3] + (CO_2)$ and 3- $[Li_2CO_3] + [Al_2O_3] = [3Li_2O \cdot Al_2O_3] + 3CO_2$. Above 750°, the system is bivalent by the occurrence of $Li_2O-Al_2O_3$ solid melts, until with further decompn. the disoc pressure of Li_2CO_3 is reached. H. Stoertz.

Investigations of alkali aluminum silicates. IX. The silicate part of ultramarines. Erhard Gruner. *Z. anorg. allgem. Chem.* 224, 351-68(1935); cf. *C. A.* 29, 5329°, 7210°. — By repeated fusion of ultramarine with alkali cyanides the ultramarine is completely desulfured and forms a colorless silicate similar to nephelite or kaliohphile, having the compn. $Al_2Si_4R_{10}O_{38}$ or $3(R_2O \cdot Al_2O_3 \cdot 2SiO_2)$. In the desulfurization the polysulfidic S is first given up and forms thiocyanate with the cyanide melt. Gradually monosulfidic S is also given up, but this is so firmly attached to lattice alkali that it tears it apart and seps. in the form of Na_2S , leaving the ultramarine lattice resembling those ultramarines constructed on the basis Al_2Si_4 . The lattice consists of the cubic elementary cell, green, $a = 9.14$ Å.; blue, $a = 9.16$ Å.; violet, $a = 9.08$ Å.; red, $a = 9.19$ Å.; yellow, $a = 9.09$ Å. The lattice const. of S-free ultramarine residue from green is $a = 9.19$ Å.; a change in the ultramarine lattice by alkali sepn. has therefore not occurred. For the cubic crystal, ultramarine residue of the compn. of nephelite (NaCN melt) and kaliohphile (KCN melt) the names pseudonephelite and pseudokaliohphile are used. X. The system ultramarine silicate-sulfur. Erhard Gruner and Johannes Förster. *Ibid.* 367-57. — Blue and green ultramarine are subjected to isothermal S sepn. and give the same form of curve as the decompn. of substances contg. zeolitic H_2O . From the point where the basic substance corresponds to a pure monosulfidic ultramarine, the lattice constituents experience the same decompn. as occurs in the treatment of ultra-

marine with fused alk. cyanides. The ultramarine gives up alkali simultaneously with monosulfidic S. While S is present in the basic substance all the intermediate substances are blue or green. When about all of the S has been sepd., the residue sinters at about 1030° to a hard stony mass which gives the x ray spectrum of nephelite. Neither blue nor green ultramarine will take up S, nor will pseudonephelite or nephelite, but pseudonephelite will form ultramarines with alk. sulfides. Only by the presence of alkalis, S and the ultramarine lattice can stable ultramarine be formed. H. Stoertz.

The transformation of sodium nitroferrocyanide to blue ferrocyanide. Ed. Justin-Mueller. *Bull. soc. chim.* [5], 2, 1932-6(1935) — According to Overbeck (*Pogg. Ann.* 87, 110), $Na_2Fe(CN)_6 \cdot NO$ decomposes slowly in sunlight, yielding $Fe(CN)_6$ and NO. A partial yield of blue ferrocyanide was likewise observed in a study of the reaction of H_2S with $Na_2Fe(CN)_6 \cdot NO$ in NaOH soln. These and other reactions are used to suggest that the structural

formula is either $Na_2(CN)_6Fe^{III}[(CN)_6NO]$ $[(CN)_6NO] \cdot Fe^{III}(CN)_6$ or $Na_2[(CN)_6NO]^{III}-(CN)_6$ - $Fe^{III}Fe^{III}(CN)_6-[(CN)_6NO]Na_2$. The tricyanide and

nitrosobicyanide groups have cyclic structures $\begin{array}{c} \text{C} \quad \text{N} \quad \text{C} \\ \diagup \quad \diagdown \quad \diagup \\ \text{N} \quad \text{C} \quad \text{N} \end{array}$ and $\begin{array}{c} \text{C} \quad \text{N} \quad \text{O} \quad \text{N} \quad \text{C} \quad \text{N} \end{array}$. This compd. splits to form

the colorless salt $Na_2Fe_2(CN)_{10}$. $Na_2Fe_2(CN)_{10}[(CN)_6NO] + 2H_2O \rightarrow Na_2Fe_2(CN)_{10} + 4HCN + 2NaNO_2$. This is followed by a slower reaction $4Na_2Fe_2(CN)_{10} \rightarrow Na_2Fe_2[Fe_2(CN)_{10}] + 6NaCN$. This, in the presence of NaOH is transformed to Prussian blue (1) $NaOH + CO_2 \rightarrow NaHCO_3$, (2) $Na_2Fe_2[Fe_2(CN)_{10}] + 2NaHCO_3 + O_2 \rightarrow [Fe^{II}(CN)_6]^{4-}Fe^{III}(CN)_6 + Fe^{III}(OH)_3 + 2Na_2CO_3$. The NaOH is a carrier for CO_2 . The same reaction occurs in the presence of H_2SO_4 , yielding Na_2SO_4 instead of $2Na_2CO_3$. In a closed flask, the reaction is $Na_2Fe_2(CN)_{10} + 6HCN + 4NaNO_2 \rightarrow Fe_2(CN)_{10} + Fe(OH)_3 + 6NaCN + 4NO + 2H_2O$. This reaction, in the presence of $FeCl_3$ and sunlight, gives Prussian blue directly, without the formation of the colorless salt, and the NO is liberated directly, without the formation of $NaNO_2$. $3Na_2Fe_2(CN)_{10}(NO_2) + 2FeCl_3 + 9H_2O \rightarrow Fe_2(CN)_{10} + Fe(OH)_3 + 12NaCl + 9HCN + 3HCNO + 6NO$. G. M. P.

7. A new group of complex compounds. — Complex compounds whose central ion is a complex cation. II. Complex sulfato- and oxalato-compounds with complex cobalt cations as central ions. H. Brintzinger and H. Osswald. *Z. anorg. allgem. Chem.* 224, 283-8(1935), cf. *C. A.* 29, 7211°. — Certain complex Co cations when dissolved in $(NH_4)_2SO_4$ or $K_2C_2O_4$ soln. combine with sulfate and oxalate radicals to form new complex anions. The following anions were prep'd. and their ion wt. was det'd by dialysis

are given to prove that the chromate method (cf. Karasch and Sugarschew, *C. A.* 24, 5234) serves for e.g. Pb from Cu, Ag, Ni, Ca, Ba, Sr, Mn, Zn, Cd, Al and Fe. It is necessary to ppt. the Pb with $(\text{NH}_4)_2\text{CO}_3$ during 10 min. by adding the reagent slowly, with stirring, to the boiling soln. contg. free HNO_3 . The ppt. is filtered after standing a few hrs., washed with water, dried at 140° and weighed as PbCrO_4 . In the filtrate the Cu can be detd. as CuCN_2 , the Ag as AgCl , the Ni as salt of dimethylglyoxime, the Ca as CaO and Ba as BaSO_4 . The results are excellent. W. T. H.

Determination of magnesium in Duralumin. G. Stanley Smith. *Analyst* 60, 812-14 (1935).—Dissolve 2 g. of the alloy in 60 ml. of 10% NaOH soln. Filter, wash the residue with hot water and transfer it back to the original beaker. Add 5 ml. of H_2SO_4 (d. 1.2), boil 1 min., filter and wash the residual Cu with hot water. To the last filtrate contg. the Mg, add NaOH soln. until a faint permanent ppt. is formed. Clear the soln with a drop of dil. H_2SO_4 , and add 0.1 N KMnO_4 dropwise to oxidize Fe. Boil and add ZnO suspension in slight excess. Continue adding KMnO_4 until the liquid is colored pink on boiling and adding more ZnO . Filter, wash with hot water. The filtrate contains Mg, sometimes a little Cu and also Ni besides Zn. Add about 1 g. of KCN and 10 ml. of 10% NaOH to ppt. $\text{Mg}(\text{OH})_2$. Filter with the aid of paper pulp and wash with 1% NaOH . Transfer the pulp and ppt. to a beaker and add a little more than sufficient H_2SO_4 to give an acid reaction to methyl orange. Filter through the same filter and wash with hot water. Add a little NH_4Cl and make the soln. slightly alk. The absence of a ppt. shows the absence of Al and Fe. Make the soln. slightly acid and ppt. the Mg as $\text{MgNH}_4\text{PO}_4 \cdot 6\text{H}_2\text{O}$ with suitable precautions. Or, suitable results can be obtained by adding a measured vol. of standard NaOH to the neutral soln., filtering and titrating the excess NaOH with acid. The results obtained in 6 test analyses were very satisfactory. W. T. H.

Determination of small quantities of mercury with dithizone. Hellmut Fischer and Grete Leopoldi. *Z. anall. Chem.* 103, 241-57 (1935).—F. has already shown (*C. A.* 20, 5600) that small quantities of Hg can be detected by means of dithizone dissolved in CCl_4 . By colorimetry, about 0.01 mg. of Hg^{++} can be detd. The detn. can also be accomplished, and with somewhat greater accuracy, by extg. the Hg with a measured vol. of the reagent, adding an excess of standard AgNO_3 soln. and titrating the excess Ag with a very dil. soln. of dithizone. Quantities of Hg lying between 0.3 γ and 10 γ can be detd. by the color tint formed between the orange-colored Hg compd. and the green of the reagent in CCl_4 . A definite vol. of the green soln. obtained by dissolving 1-3 mg. of dithizone in 100 cc. of CCl_4 is added to the Hg soln. and the resulting color is matched by adding known quantities of Hg soln. to an equal vol. of the reagent. The detn. of Hg in this way is not prevented by the presence of Cl^- . The only metals that interfere with the procedure recommended are Ag, Au, Pd and Pt. W. T. H.

Photometric silicon determination in presence of iron and accompanying substances. Hans Pansl. *Arch. Eisenhüttenw.* 9, 225-30 (1935).—The known methods for colorimetric and photometric detns. of Si in Fe require an intermediary phosphate pptn. and filtration. A new simpler method is described by which the same end can be obtained by addn. of NaF after the Mo reaction. The procedure without compensating measurement requires 0.1 g. of the sample which is dissolved in a 100-cc. Erlenmeyer flask in 15 cc. HNO_3 and 1 cc. H_2O_2 at not more than 50° ; this takes about 5 min. To the hot soln. so much permanganate soln. is added, drop by drop, until the red color remains even under strong shaking when 2 cc. HCl is added and permitted to act about 10 sec. under heat. After cooling to 20° and filling up to the mark, the soln. is divided in 2 parts of 50 cc. each. One part is mixed with 5 cc. cobaltate soln. and, after 6 min. reaction, with 20 cc. NaI soln.; the other serves as compensating soln. and is mixed with 20 cc. NaI and 5 cc. distd. H_2O . The 2 solns. are compared photometrically with one an-

other, preferably with Hg light and a special Hg filter. The amts. of Si present can be obtained from a calibration curve. The method is applicable to alloy and nonalloy steels which dissolve without residue. For high-Cr and W steels the procedure is somewhat modified and for V steels a correction of -0.02% Si must be made. It cannot be applied to steels with more than 0.6% Ti. Eight references. M. Hartenhein.

Colorimetric method for the determination of small amounts of silver by the use of p-dimethylaminobenzalrhodanine. Irl C. Schoonover. *J. Research Natl. Bur. Standards* 15, 377-84 (1935) (Research Paper No. 636).—The procedure recommended is similar to that suggested by Feigl (*C. A.* 22, 4089) and later used by Kolthoff (*C. A.* 24, 3720) with some modification. It was found that soft glass was absolutely unsuitable, Jena glass better but fused silica best for the detn. Appreciable quantities of Ag are likely to be adsorbed by the contg. vessel. The adsorption is negligible with SiO_2 vessels. W. T. H.

Iodometric titration of tin. F. L. Okell. *Analyst* 60, 813-11 (1935).—Low results in the iodometric titration of stannous solns. with I_2 are often due to O_2 dissolved in the I_2 soln. A method for prep. air-free I_2 soln. is described. The various methods adopted by previous investigators for the improvement of the method are for the most part methods of preventing the oxidation of the Sn^{++} by dissolved O_2 . The assumption that the O interference can be allowed for by standardizing the I_2 soln. against pure Sn is not justified in the assay of Sn ores, because Ti is the main cause of the inconstancy of the O effect and it is rather troublesome to remove all Ti from the ore. W. T. H.

A colorimetric method for determining nitrate nitrogen in grass. F. L. Ashton. *J. Soc. Chem. Ind.* 54, 389-90 (1935).—Finally ground grass is boiled with MgO , and solns. of potash alum, Pb subacetate and Ag_2SO_4 are added. The mixt. is filtered and a small amt. of H_2O_2 added to the filtrate. The soln. is evapd. to dryness and the residue heated on the water bath. Phenoldisulfonic acid, H_2O and NH_4OH are added and the nitrate N is detd. colorimetrically. R. R. Rushton.

Determination of iodine in iodized salt. R. L. Andrew and J. L. Mandeno. *Analyst* 60, 801-3 (1935).—The procedure recommended is based upon that of von Fellenberg (*C. A.* 24, 1817-18, 5322), which depends upon the conversion of the iodide to iodate by Cl_2 water and titration of the I formed by the interaction of I^- and IO_3^- in the presence of acid. It was found more convenient to use Br water for the oxidation and 0.02 N $\text{Na}_2\text{S}_2\text{O}_3$ for the titration. The conversion of the iodide into iodate is complete if the soln. is nearly neutral but as HCl is added the results are progressively low. W. T. H.

Determination of the solubility of potassium fluosilicate, K_2SiF_6 , under different conditions. A. A. Vas'lev and Nina N. Mart'yanova. *Z. anall. Chem.* 103, 103-6 (1935).—Inasmuch as F is often pptd. as K_2SiF_6 , it is desirable to know how sol. the ppt. is in liquids which are likely to be present during an analysis. The following values were obtained by shaking with 150 cc. of liquid and allowing to stand overnight. In 100 cc. of soln. there was found of K_2SiF_6 0.115 g. in pure water at room temp., 4.0 mg. in 50% EtOH , 5.0 mg. in satd. KNO_3 soln., 5.0 mg. in satd. KCl soln., 2.2 mg. in 50% alc. + KCl soln. mixt., 2.0 mg. in 50% alc. contg. 2% KCl + 0.5 cc. N HCl in 100 cc. and 0.9 mg. dissolved by washing on the filter with 50% EtOH contg. 2% KCl . Determination of fluorine as potassium fluosilicate with subsequent titration of the complex salt. *ibid.* 107-13.—Dissolve a sample equiv. to 0.2 g. NaF in 15 cc. of water in a 200-cc. beaker. Add 15 cc. of water-glass soln. contg. 10 mg. dissolved SiO_2 per cc. add 2-3 drops of methyl orange indicator soln., 1 g. of KCl and sufficient 6 N HCl to make the indicator assume a red color and provide an excess of 2-3 drops of the acid. Add sufficient alc. to make the content 50% by wt. After an hr. filter through a moderately hard filter and transfer the ppt. to the filter with the aid of portions of the mother liquor. Wash out the beaker twice with the

wash liquid (50% alc. contg. 2 g KCl per 100 ml) and wash the ppt. on the filter 3 times more with the same soln. The vol. of the mother liquor and that of the wash liquor must be subsequently measured. Transfer the ppt. and filter to the same vessel in which the pptn. took place, add 100 cc of CO-free water and titrate with NaOH to a phenolphthalein end point. Toward the end of the titration heat the soln. nearly to boiling. One cc of 0.1 N NaOH = 6.3 mg NaF. To find the wt. of NaF in mg to be added in order to correct for the soly. of the ppt., take the vol. of the mother liquor in cc. and multiply by 0.023 and the vol. of the wash liquid by 0.10. To det. F in insol. fluorides, fuse 0.5 g of the sample with 1.25 g quartz sand and 6 g NaKCO₃. Introduce the hot crucible into cold water, remove the melt and heat it with 200 cc of water. Filter into a 300-cc measuring flask, add 20 g conc. (NH₄)₂CO₃, dil. to 200 cc and keep at 40° for an hr. Cool to room temp., dil. to exactly 300 cc and allow to stand overnight, filter and take 200 cc of the filtrate for the further analysis. Evap. thus on the water bath to 30-40 cc., cool, add 2 g KCl, etc., as in the analysis of a sol. fluoride. The results agree fairly well with those obtained by the much longer procedure of Starck (cf. Hawley, C. A. 29, 2471) or that recommended by Hoffman and Lundell (cf. C. A. 24, 1192). W. T. H.

Qualitative test for bromate. I. M. Korenman. *Z. anal. Chem.* 103, 269-71 (1935).—See C. A. 29, 7866.

The action of charcoal on aqueous solutions of silver nitrate. T. R. Bolam and W. A. Phillips. *Trans. Faraday Soc.* 31, 1443-52 (1935).—The action of sugar charcoal on solns. of AgNO₃ was examined by titrating the Ag ion and free acid in the filtrate, pptg. the adsorbed Ag ion as chloride, extg. the reduced Ag by HNO₃ for direct titration and estg. the adsorbed Ag ion by difference. The reaction occurs in 2 steps: (1) rapid adsorption of Ag ion and (2) slower reduction of adsorbed Ag ion to metallic Ag which aggregates to form sep. particles. The ratio of reduced Ag to (adsorbed Ag ion + adsorbed acid) is const. and less than unity at fixed concns. of AgNO₃ on charcoals subjected to a variety of pretreatments. It is concluded that only an amt. of Ag ion corresponding to a unimol. layer of adsorbed AgNO₃ undergoes reduction and that the C atoms which are oxidized by the Ag ion retain their capacity of adsorbing AgNO₃. At high concns. of AgNO₃ the adsorbed layer of salt appears to be multimol. The suppression of reduction by added acid appears to be due to selective adsorption of acid on the reducing surface. Exposure to air at room temp. decreases the reducing power of the charcoal. Variation of the amt. of reduction with degree of activation and temp. of treatment of charcoal appears to be due to variation in sp. adsorptive surface. The quantity, adsorbed Ag ion + adsorbed acid is independent of degree of aging of charcoal or time of contact with the soln. L. W. Elder.

Conductometric titration of molybdate with silver nitrate. C. Candea and I. G. Murgulescu. *Bul. soc. chim. Romania* 17, 183-5 (1935).—Solns. which are 0.005-0.05 N in Na₂MoO₄ can be titrated conductometrically with 0.05-0.5 N AgNO₃. The greatest error in 8 expts. was 0.3 cc. when 16 cc. of reagent was used. W. T. H.

Determination of small quantities of water by the method of Crismer. Lucia de Brouckere and Albert Gillet. *Bull. soc. chim. Belg.* 44, 473-503 (1935).—Instead of attempting to det. H₂O directly, it is sometimes better to take advantage of the change in the phys. properties caused by the presence of a little H₂O. Thus Crismer (*Bull. soc. chim. Belg.* 18, 4 (1904)) detd. H₂O accurately by noting the temp. at which a solvent became turbid. By means of methanol-C₂H₅I, or methanol-C₂H₅I it is possible to det. H₂O accurately by detg. the temp. at which congelation takes place. The method is described. W. T. H.

Determination of carbon monoxide in mixtures with hydrogen and methane. G. Meyer and A. Stoeff. *Rec. trav. chim.* 54, 800-3 (1935).—Scheffer (C. A. 24, 4436, 26, 1874, 27, 5051) and his students have studied methods of analyzing gases by combustion over CuO. When a mixt. of CO, CH₄, and H₂ is passed through a combustion tube

contg. CuO, the CO₂ formed is a measure of the total C content and the water formed gives the total H. By passing the original mixt. over I₂O₅ at 120-130° the CO is oxidized to CO₂, which, together with a little CH₄, can be condensed by passing through a tube chilled with liquid air. By proper fractional distn. of the condensate, the CO₂ can be volatilized and measured. The moisture formed will remain with the I₂O₅ but can be obtained by heating to 180°. W. T. H.

Dependence of the palladium salt test for carbon monoxide upon the presence of other substances. W. Daller. *Z. anal. Chem.* 103, 83-8 (1935).—The importance of the test for CO, because of its poisonous property, makes it desirable to know whether the presence of other substances may affect the delicacy of the test. PdCl₂ dissolves to form a clear soln. in dil. HCl or in solns. contg. sol. chlorides, double salts contg. the PdCl₂ anion are formed. PdCl₂ solns. did largely give a ppt. of basic salt and a little free HCl is formed. When dissolved in a little water and a little HCl, a nearly clear soln. is obtained which, when filtered, can be held without the formation of a turbidity. The test for CO depends on the reaction Pd⁺⁺ + CO + H₂O = Pd + CO₂ + 2H⁺. According to the mass law, excess of acid retards pptn. of Pd and the presence of NaOAc or other buffer salt is helpful. An excess of Cl⁻ makes pptn. of Pd more difficult because it lowers the concn. of Pd⁺⁺. The correctness of these conclusions was proved by many expts. Sometimes the first effect of the CO introduced into PdCl₂ in dil. HCl is to form a white adsorption compd. of CO and PdCl₂ which, however, is not very stable, and soon breaks down in the desired direction. Na₂PdCl₄ solns. contg. suitable quantities of Na₂SO₄ can be used to detect CO in the presence of considerable H₂. W. T. H.

Determination of arsenic acid, phosphoric acid and iron in the presence of one another. Gr. Balanescu and V. Ionescu. *Bul. soc. chim. Romania* 17, 93-102 (1935).—The results of over 100 analyses are given and the following conclusions drawn: (1) H₃AsO₄ in the presence of H₃PO₄ can be detd. iodometrically by adding KI to the soln. contg. 16% HCl and titrating the liberated I₂ with Na₂S₂O₃. (2) To det. H₃PO₄ in the presence of H₃AsO₄, good result can be obtained by the usual molybdate method after adding (NH₄)₂S to the acid soln. to ppt. As₂S₃, evapg. the filtrate to dryness and carrying out the molybdate pptn. of H₃PO₄ in the usual way, preferably measuring the vol. of NaOH soln. required to dissolve the ppt. (3) To det. As in a soln. contg. H₃PO₄, H₃AsO₄, and Fe salt, the As can be detd. directly as As₂S₃ and the Fe in the filtrate as in (4) or, as is better, the Fe and As can be detd. together iodometrically as in (1) and the Fe in a sep. portion as in (4). (4) To det. Fe in the presence of H₃AsO₄, it is best to ppt. the As as pentasulfide from a strongly acid soln., evapg. the filtrate to dryness with HNO₃, and finally det. the Fe⁺⁺⁺ iodometrically. (5) To det. H₃PO₄ in the presence of Fe and As, proceed as in (1). W. T. H.

Colorimetric determination of phosphoric acid in grass and similar materials by the Fiske and Subbarow method. A. W. Greenhill and N. Pollard. *J. Soc. Chem. Ind.* 54, 404-6T (1935), cf. C. A. 20, 1092-3.—The dried and finely ground material is mixed with a dil. soln. of Mg(NO₃)₂, evapg. to dryness and ignited. The residue is dissolved in 10 N H₂SO₄ and phosphate detd. colorimetrically in an aliquot with the (NH₄)₂MoO₄-ammoniasulphuric acid reagent. E. R. Ruchton.

Mixed perchloric and sulfuric acids. III. Determination of chromium in chromic oxide. G. Frederick Smith, L. D. McVickers and V. R. Sullivan. *J. Soc. Chem. Ind.* 54, 369-72T (1935).—Further expts. are described to show that Cr in chromite or in Cr₂O₃ can be detd. rapidly and accurately by dissolving the sample in a mixt. of 1 part 72% HClO₄ and 2 parts H₂SO₄ at 190°, cooling rapidly in ice water, dilg., boiling off Cl₂ and titrating with FeSO₄ soln. with o-phenanthroline-ferrous complex as indicator. Cf. C. A. 29, 6174, 6793, 7838.

W. T. H.
System of qualitative analysis for the anions. J. T.

Dobbins and H. A. Ljung *J. Chem. Education* 12, 580-8 (1935).—Anions such as are likely to be present in salts given to students in elementary qual. analysis are divided into 5 groups as follows: Group I, CO_3^{--} , F^- , $\text{C}_2\text{O}_4^{--}$, AsO_4^{--} , AsO_3^{--} , PO_4^{--} and $\text{C}_2\text{H}_3\text{O}_2^{--}$, pptd. by $\text{Ca}(\text{NO}_3)_2$ in slightly basic soln. Group II, SO_4^{--} and CrO_4^{--} , pptd. by $\text{Ba}(\text{NO}_3)_2$ in slightly basic soln. Group III, CN^- , BO_3^{--} , I^- , Br^- and Cl^- pptd. by AgNO_3 in dil acid soln. Group IV, ClO_4^- , NO_3^- and $\text{C}_2\text{H}_3\text{O}_2^-$ detected in the filtrate from the above group tests. Group V, NO_2^- , detected in the original substance.

New device for the rapid determination of certain gases or vapors in the atmosphere Kohn-Abrest *Ann. phys.* 28, 547-61 (1935).—This is an improvement on the previously described portable app. (*C. A.* 13, 1938, 28, 63 (1932)) which is suitable for the detn. of CO_2 and halogen derivs. in the atm. or in viscera. The air is drawn through a soln. of $\text{Ba}(\text{OH})_2$ (absorbing CO_2 which can be detd. if required), through a 25-cm. quartz tube of 5-7 mm. bore heated electrically to 850-900°, and through a 2nd $\text{Ba}(\text{OH})_2$ washer which absorbs the products of combustion. CO_2 is most conveniently detd. in each of the $\text{Ba}(\text{OH})_2$ washers by adding 2 drops of a 1 l. mixt. of 1% phenolphthalein and 1% lueanthin in alc. and titrating with 0.125 N HNO_3 , the 1st end point (red to light yellow) indicates neutralization of the excess $\text{Ba}(\text{OH})_2$, and the 2nd end point (yellow to pink) indicates decompn. of the BaCO_3 . Halogens and HCN are detd. in the usual way in the titrated soln. When relatively high boiling alkyl halides are suspected, the first washer should preferably be maintained at 60-70°.

A Papineau-Couture
The detection of respiratory poisons Gerhard Stampe *Drugs-Hefte* No. 180, 2904-6 (Sept.-Oct., 1935).—A description of the app. and methods used in detecting the presence of poisonous gases. Of special interest is the description of a new specific test for mustard gas which is based on a reaction with certain gold salts. A. L. K.

Method for making latent fingerprints visible M. Wogenarr. *Pharm. Weekblad* 72, 1265-71 (1935).—The object bearing the latent fingerprint is placed under a Petri dish cover on the inner side of which a few I crystals have been fused. The I vaporizes and is absorbed by the fingerprint. The image thus obtained is evanescent, but

a permanent copy can be made by covering with a sheet of slightly moist paper contg. a paste of rice starch and KI, and finally varnishing the paper with a 3% soln. of dammar resin in C_2H_5 . Several copies of the same fingerprint can thus be made. The color of the print is bluish brown. A. W. Dux

Colorimetric determination of salicylic acid. J. L. Heesterman. *Chem. Weekblad* 32, 403 (1935); cf. *C. A.* 29, 42914.—The violet color of FeCl_3 -salicylic acid is stable in the presence of AcOH . To 100 cc. of soln. add 2 drops FeCl_3 soln. (1% M) and 1 cc. 4 N AcOH ; less than 1 mg. salicylic acid can be detd. B. J. C. v. d. H.

The potentiometric determination of oxalate with silver nitrate P. Sprau *Z. anal. Chem.* 103, 272-4 (1935).—E. Müller (*Die elektrometrische Massanalyse, C. A.* 21, 39) states that the potentiometric titration of $\text{C}_2\text{O}_4^{--}$ with Ag^+ is impossible, but if to approx. 2.55 ml. of 0.25 N $\text{Na}_2\text{C}_2\text{O}_4$ soln. there is added 80 cc. of 60% alc. a good potentiometric end point can be obtained in titrating with AgNO_3 soln. As electrodes a wire of Ag and a calomel half cell were used. W. T. H.

Rapid identification of methyl anthranilate. Sébastien Sabatay *Ann. phys.* 28, 478-9 (1935).—Heat 4 drops of methyl anthranilate and 12 drops of a 1.2 $\text{Ac}_2\text{O}-\text{C}_2\text{H}_5\text{N}$ mixt. in a test tube for 5 min. in a boiling water bath, add a few cc. of H_2O , heat a few min. longer, cool; on rubbing with a glass rod, a cryst. mass of methyl N-acetyl anthranilate seps out which, after recrystn. from aq. alc., in 90-100°. For the detn. of methyl anthranilate in neroli, the generally used Hesse and Zeitschell method (*Ber.* 34, 296 (1901)), based on the quant. sepn. of the sulfate from an Et_2O soln. of the oil, is rather long and requires a large sample, the Zeisel method gives equally accurate results (in absence of EtOH) on a 0.5-2-g. sample. A. P.-C.

Levulose reaction with dinitrobenzenes. Ladislav v. Székényi-Nagy. *Biochem. Z.* 281, 175-7 (1935).—The color reaction with levulose ascribed to m-dinitrobenzene is due to o-dinitrobenzene present as an impurity. Samples of pure m-dinitrobenzene gave no color reaction. Only o-dinitrobenzene (m. 115.9°) is therefore a suitable color reagent for levulose. S. Morgulis

Detn. of P_2O_5 by pptn. as NH_4 phosphomolybdate (Terlet, Briaux) 15. Detn. of I in org. substances (Kahane, Tomesco) 6

8—MINERALOGICAL AND GEOLOGICAL CHEMISTRY

EDGAR T. WHERRY AND J. F. SCHLAIRER

Some properties of opal. N. L. Tahaferro. *Am. J. Sci.* 30, 450-74 (1935).—Natural opals and pure cherts are hardened, greatly hydrated silica gels. In nature they dehydrate and contract in a manner similar to the dehydration of such gels in the lab. As a gel, opal or chert dehydrates there is a steady and const. loss of vol. and a const. structural modification which causes a progressive increase in both n and sp. gr. with loss of H_2O . When n and d. are plotted vs. H_2O content the points lie scattered between the theoretical amorphous $\text{SiO}_2-\text{H}_2\text{O}$ curve and that of the theoretical system cristobalite- H_2O . The measured values are always higher than the computed theoretical values. X-ray patterns of a no. of opals, cherts and SiO_2 gels show faint, but unmistakable β -cristobalite patterns, even though the substances have never been heated above 100°. The departure of n and d. from the theoretical amorphous $\text{SiO}_2-\text{H}_2\text{O}$ curve is due to the tendency toward a denser atomic arrangement in the direction of the β -cristobalite modification. This arrangement of the atoms is not a function of the aging of the gel, opal or chert, but appears to take place at an early stage in their formation while there is yet a great deal more H_2O than SiO_2 present. Alden H. Emery

Morphological reference directions of plagioclases and their suitability for determining the anorthite content. G. Manolescu. *Schweiz. mineral. petrog. Mit.* 14, 452-63

(1935).—The chief cause of uncertainty in the compn. of a plagioclase as deduced by the Fodorov method is that the twinning plane is often a vicinal face, though there is also frequently a small residual variation not so explicable. C. A. Silberrad

Bronzite rock from Loderio (Blenio tal., Ticino). F. de Quervain. *Schweiz. mineral. petrog. Mit.* 14, 447-9 (1935).—Near Loderio (Blenio valley, Ticino) in the peridotite occur blocks of bronzite in more or less radial tufts of crystals, but showing no iridescence; d. 3.232, n_α 1.602, n_β 1.607, n_γ 1.674. A very pure crystal contained SiO_2 56.49, FeO 9.67, MgO 33.83 and MnO 0.06%. In places the bronzite has passed into bastite, and more frequently into a talc-magnetite mass. C. A. S.

The water content of clay substances. O. Koerner, K. Fuhal and H. Salmann *Z. anorg. allgem. Chem.* 225, 69-72 (1935).—At 11.5°, H_2O could be pumped off of Zeolith kaolin so that it had the compn. $\text{Al}_2\text{O}_3 \cdot 2\text{SiO}_2 \cdot 2\text{H}_2\text{O}$. No steps were found in the isothermal diagrams up to 445°; hence 0.5 mol. of H_2O is ad-sorbed by the air-dried material, and only 1.5 mol. is chemically combined. Detns. lasting 7 and 18 months, resp. were made. Decompn. takes place as follows: $\text{Al}_2\text{O}_3 \cdot 2\text{SiO}_2 \cdot 1.5\text{H}_2\text{O}$ aq. \rightarrow $\text{Al}_2\text{O}_3 \cdot 2\text{SiO}_2 \cdot 1.5\text{H}_2\text{O}$ \rightarrow $\text{Al}_2\text{O}_3 \cdot 2\text{SiO}_2 \cdot \text{H}_2\text{O}$ \rightarrow $\text{Al}_2\text{O}_3 \cdot 2\text{SiO}_2 \cdot 0.5\text{H}_2\text{O}$ \rightarrow $\text{Al}_2\text{O}_3 \cdot 2\text{SiO}_2$ aq. \rightarrow $\text{Al}_2\text{O}_3 \cdot 2\text{SiO}_2$

Petrographic and tectonic investigation of central granite of Upper Baltscheider Valley W Minder *Schweiz mineral petrog Mitt* 14, 150-75(1934) —After a brief description of the Baltscheider granites the central granite is described in detail with the connected aplite, lamprophyre and inclusions. Numerous chem analyses are given and compared with the results of measurement of thin sections. There is also a variation diagram, and the magmatic differentiation of the different varieties is discussed C A Silberrad

Percy ring-dike complex Randolph W. Chapman *Am J Sci* 30, 401-31(1935) —The ring-dikes and stocks of syenite and granite are described and their origin is discussed Alden H Emery

Basic dike rocks from neighborhood of Brissago (Ticino) Conrad Burri and F de Quervain *Schweiz mineral petrog Mitt* 14, 507-17(1935) —These dike rocks are true gabbrs with proximate compn hornblende with ilmenite 40-60, plagioclase (mostly An_{60-80}), but in one place An_{60-80} , and in another An_{80} 30-45, biotite 12-10.6, titanite 0-2.2, ore (sep ilmenite) 12-2.9%. Thus, as also does a complete analysis, shows very low alkali, the rock falling in Niggli's pyroxene-hornblende-gabbro class C A Silberrad

Kaolin and clay Their geologic origin Albert Vasel *Keram Runtschau* 43, 517-0(1935), cf C A 30, 828¹

—A review V. maintains that the formation of kaolin or of clay is independent of the weathering and is determined by the nature of the parent rock P S R

A recently discovered kaolin sandstone occurrence in the crystalline limestone of Pargass—Al Island, region of Abo—Turku, SW Finland H Hausen *Acta Acad Aboensis, Math Phys* 8, No 1, 59 pp (1934)(in German) —In the limestone quarry at Skrabblö a kaolin bed was discovered, the deeper part of which appeared to fill a cavity. This kaolin is plastic and is of a predominantly chocolate color. Over the kaolin is a stratum of light rust-colored, brittle sandstone, and over this a dark gray, argillaceous mass in which a no. of different crystal rocks are imbedded. H concludes from detailed study that there occurred (1) formation of deep, enclosed cavities in the limestone during a warm and moist climate; (2) energetic chem weathering of the adjacent crust, Al-rich silicate rocks (diopside, plagioclase, microcline, etc.) and formation of kaolin; (3) covering of the autochthonic kaolin with residual quartz sand from a distance; (4) sliding of the kaolin and sand into the cavity; (5) pre-Quaternary regional erosion; (6) commencement of the Quaternary glaciers and formation of a moraine, further forcing of the kaolin and limestone into the cavity; filling in with moraine clay, glacial removal of various pre-glacial deposits, and (7) at the end of the glacial period a deposition of a sandy moraine. The kaolin-sandstone deposit is considerably younger than the surrounding Archean rocks and older than the overlying glacial formations. Thirty-eight references D Thuesen

Dolomite in Permian limestones of West Texas William A Cunningham *Bull Am Assoc Petroleum Geol* 19, 1678-92(1935) —Analyses for CaCO_3 and MgCO_3 in approx 150 samples from 35 oil wells are tabulated. Most of the Blaine limestone in the Permian basin is 75% dolomite Alden H Emery

The travertine deposits near Port St Johns W. Kupferburger *S African Mining Eng J* 46, Pt. 1, 801-5(1935) —See C A 29, 7881¹ Alden H Emery

Chemical classification of metamorphic rocks Paul Niggli *Schweiz mineral petrog Mitt* 14, 464-72 (1935) —Classification of metamorphic rocks is specially difficult because of the difficulty of obtaining a fair average sample. That now proposed is based on chem compn. It consists of 12 groups, closely resembling those of Grubenmann I Alkali-alumino silicate; II Same, with decreasing alkali; III Lume-alkali aluminosilicate; IV Imme-aluminosilicate; V Femic-silicate; VI Femic or Ca rich alkali silicate; VII Aluminosilicate, Al rich; VIII Silica rocks, Si-rich; IX Limestones; X Carbonate; XI Femic-oxide; XII Alumino-oxide rocks. The limits of each group are expressed in N's notation, and exemplified by diagrams, with a statement of the chief rocks falling in each group. C A S

Petrography and geology of the Silretta crystallines (Lower Engadine) Ed Wenk *Schweiz mineral petrog Mitt* 14, 196-278(1934) —Apart from geological details the paper contains descriptions, with proximate constituents, of the various amphibolites, para-, ortho- and mixed gneisses of the area, with a more detailed account of the Monchalp gneiss, showing it to be probably the result of assimilation. A detailed account of mylonitization as it affects the various rocks and their constituent minerals follows, especially as regards orthoclase which is converted into a quartz-sericite via microcline, quartz and albite, and the plagioclases, which are more decomposed the more cataclastic and mylonitized the rocks are in which they occur C A Silberrad

Development of torbanite in South Africa (Duff) 22

value of various sands, (2) expansion of air, (3) effect of gaseous expansion upon the permeability no, (4) dried permeability value of various sands after correction for expansion of air, (5) dried permeability values obtained on silimanite bonded with 5% Na silicate, (6) expansion of various sands, (7) expansion of silimanite, (8) dried compression strength of various sands, (9) dried compression strength of various sands after cooling from elevated temps and (10) max temp reached by the sand in the molds for castings of various thickness Downs Schaaf

Metallurgical researches of the national physical and technical institute for 1934 A Schulze *Z. Metallkunde* 27, 139-40(1935)—A progress report of investigations on the chem and phys properties of metals and alloys, dealing especially with the prepn of high-purity materials, magnetic, thermal and elastic properties, low-temp work, and the development of special app

The elastic limit and the engineer. W. Späth. *Z. Metallkunde* 27, 132-6(1935)—Phenomena which occur when materials are stressed below the endurance limit are analyzed by means of a mech model This is a set of springs, of the material in question, whose displacement due to loading is opposed by a resistance element placed 90° to the direction of load After-effects, damping and the raising of the endurance limit due to loading are interpreted in terms of the model and related to irregular stress distributions along the "structural imperfections" of Smeal Conclusion The mech testing of material can be divided into elastic and inelastic regions, these being sep'd by the endurance limit, and the elastic limit is of little value to engineers until the effects related to it are better understood G Derge

Properties of metals at low temperatures A S Fal'kevich and B A Smurnov. *Khimstrol* 7, 436-42(1935)—Different Fe and Cu alloys, with and without elec welded seams, were treated with boiling liquid O and at from -183° to 50° either once or repeatedly for various periods of time, and then subjected to phys and mech tests The results are presented in graphs and tables and discussed Chas Blanc

Compression requirements for Avional samples K Guler *Z. Metallkunde* 27, 137-38(1935)—Stress-strain curves were obtained for a high-quality Avional contg Si 0.7, Mn 0.7, Mg 0.7 and Cu 4% The compressional elasticity modulus was calcd from these and related to the shape of the specimen The compression expts were made on an app. designed to insure uniform application of load G Derge

Developments and results of investigations of hardening phenomena G Wassermann *Arch. Eisenhüttenw* 9, 241-5(1935)—The discovery of age hardening in Duralumin and the general principles of methods based on it to make metals stronger and harder by natural or artificial means are explained More recent investigations have shown that pptn hardening is preceded by a series of other preparative conditions which are of importance for age hardening Thirty three references M H

The quenching power of liquid hardening agents K G. Speith and H. Lange *Mitt Kaiser-Wilhelm-Inst Eisenforsch., Dusseldorf* 17, 175-84(1935)—Temp. control in quenching is discussed The cooling velocity is of paramount importance, it depends, at high temps, on the thickness of the vapor film produced around the object to be hardened Lab tests indicate that the quenching power of water can be influenced by addn of "Pektinit," a trade prepn consisting essentially of pectins; an addn of 6-7% produces in water the same effect as that of the usual hardening oils Dried water quenches considerably more slowly than tap water. Cooling curves were det'd in different quenching solns M Hartenheum

New materials for permanent magnets A Kussmann *Z. Ver deut Ing* 79, 1171-3(1935)—Considerable progress in producing permanent magnet steel has resulted from the research of recent years Characteristics of alloy steels formerly used are briefly reviewed Fe-Ni-Cu alloys of the pptn hardening type show magnetic proper-

ties similar to Co steel and are quite workable. The most important group of new permanent magnet steels consists of the Ni-Fe-Al alloys contg. approx. 25% Ni, 10% Al and the remainder Fe (with addns. of Co, Mo, Cr, etc.). The relation between the structure and magnetic behavior of these alloys is briefly discussed. A permanent magnet material is prep'd by sintering ferro magnetic oxides, finely divided Co ferrite (CoFe_2O_4) and Fe_2O_3 contg. Fe_2O_3 , and pressing into the desired form An alloy of Pt-Fe with about 78% Pt surpasses all the alloys mentioned in magnetic properties but the cost is too high.

Defects in the manufacture of sheet silver III. E. Raub. *Mitt Forschungsanst. Proberamt Edelmetalle* 9, 69-75(1935)—Defects in Ag sheets may be due to impurities which entered the metal during the mfg process (cf *Ibid.* 6, 29(1932); *C. A.* 26, 4018). The present article deals with the influence of pouring temp on the technological properties of Ag alloys and is illustrated by photographs of structures and defects in casting and rolling A definite temp cannot be given as correct pouring temp as this depends on kind of mold (chill mold, sand mold, etc.), shape and capacity of the mold and on the compn of the metal. Only an empirical method will be able to take all factors into account. A few examples show the effects of wrong temps M Hartenheum

Effect of oxygen and nitrogen on the change of ferrite W. Elender and H. Cornelius *Arch. Eisenhüttenw* 9, 263-4(1935)—Investigations did not reveal a connection between the degree of change in ferrite and the N and O contents. There seems, however, to exist a relation between the α change and the stresses due to the γ - α transformation Impurities appear to have only a minor effect. The results are illustrated by photographs of the structures M. Hartenheum

Rearrangements in iron between 70° and 700° G. Naeser. *Mitt Kaiser-Wilhelm-Inst. Eisenforsch., Dusseldorf* 17, 185-90(1935)—By detg. the av. sp heat of pure Fe between 70° and 700°, the curve showed 6 distinct, reversible irregularities at 112°, 198°, 292°, 388°, 487° and 591°. These irregularities seem to point to a relation between rearrangement of the mols and the ferro-magnetism of the Fe The distances between the points of irregularity and the heat liberated at these points seem to follow a simple law. More expts are required for full elucidation Thirty-eight references M H

A study of the heats of transformation in iron H. v. Steinwehr and A. Schulze. *Z. Metallkunde* 27, 129-132(1935)—The heats of transformation at the A_1 and A_2 points of vacuum melted electrolytic Fe, contg. 0.03% Mn and a trace of Si, are det'd by a calorimetric procedure already described (*C. A.* 28, 5025). In a series of 5 expts the magnetic transformation was found to begin near 790° and end at 710° giving an av heat of transformation of 4.8 ± 0.02 cal per g. The change from γ - to α -Fe began at 894° and ended at 870°. For 6 runs the av. value for the heat evolved was 6.2 ± 0.03 cal per g. G Derge

Influence of chemical reactions upon the fatigue of iron F. Roll *Z. anorg allgem. Chem* 224, 322-4(1935)—The effect of oxidation of the metal surface upon its fatigue strength is det'd With Fe this effect varies depending upon what oxide is formed upon the surface H S

Types of cast iron for use at elevated temperatures Lemoine. *Usine* 44, No 44, 27(1935)—Results of recent investigations of heat-resistant cast Fe are summarized Growth and permanent expansion of cast Fe under repeated heating are caused by decompn of the free cementite and the cementite of the pearlite into ferrite and graphite. The outer layers begin to graphitize under heating before the heat has penetrated into the interior, so that cracks develop which also contribute to a growth in vol. Into these cracks, gases of a more or less corroding nature can enter and form Fe compds which increase the wt. and vol Remedies are a cast Fe which remains pearlitic up to 600-50°, or, for temps up to 800-900°, a cast Fe for which the pearlitic structure is not indispensable, by adding 1-2% Cr or diminishing the C content to 2.2-

2.5%. The properties of cast irons of these types are described. M. Hartenheim.

Retardation of the solution of iron in sulfuric acid. V. F. Postnikov and I. P. Kirillov. *Khimizol* 7, 431-4 (1935); cf. Brauer, *J. Chem. Ind. (Moscow)* No. 9, 64(1935).—On the addn of 0.5% $\text{CS}(\text{NH}_4)_2$ to 20.6% H_2SO_4 , the rate of soln. of Fe was reduced to $1/10$ in 6 hrs. and to $1/100$ in 72 hrs. Chas. Blane.

Recrystallization of electrolytic iron. G. Wassermann. *Mitt. Kaiser-Wilhelm-Inst. Eisenforschung, Düsseldorf* 17, 203-6(1935).—Rolled electrolytic Fe crystallizes with a fine grain, heating beyond the A_1 point produces, however, a fairly coarse grained structure. By quenching from the γ -state a finer recrystallized grain can be obtained. If electrolytic Fe is cooled from the γ -state so that the transition temp. progresses gradually along the specimen, narrow, long needle crystals are formed, the shape of which is the more perfect the slower the cooling. Adjoining α -crystals act frequently as nuclei. Armco Fe and C-poor ingot Fe behave differently from electrolytic Fe in recrystn and transformation, the recrystd. structure is always of very fine grain and does not show the narrow needle crystals. The formation of the latter is ascribed to the fact that the no. of nuclei of α -crystals in the γ - α transformation is at first very small and becomes larger only with increasing undercooling. M. Hartenheim.

X-ray investigation of stress distribution and excess stresses in steel. H. Möller and J. Barbers. *Mitt. Kaiser-Wilhelm-Inst. Eisenforschung, Düsseldorf* 17, 167-66(1935).—The x-ray reflection method is particularly suitable for the study of whether the occurrence of excessive internal stresses is connected with the existence of nonuniform stress distribution and if a relation between these 2 quantities exists. The equipment and theory of the tests are described in detail. A simple linear relation between load and stress exists only under comparatively small loads. Under higher loads, the stress distribution becomes very irregular even below the flow limit. There occur differences in tension between adjoining groups of crystallites, even under theoretically uniform load, which are equal to those produced intentionally in the bending test. This causes in some crystallites a reduction, in adjoining crystallites an increase, in stress. Nine references. M. Hartenheim.

The properties of some low-nickel steels containing manganese. R. H. Greaves. *Engineering* 140, 693-3 (1935).—See C. A. 29, 79114.

Silicon steel in communication equipment. C. H. Crawford and E. J. Thomas. *Elec. Eng.* 54, 1318-53 (1935).—The different grades of Si steel and other magnetic materials are discussed, particular emphasis being given to the selection of the most satisfactory alloy for the applications in communication equipment, which includes transformers for radio frequencies, small rotating app. and relays. W. H. Boynton.

Plasticity and practical behavior of cast light alloys with reference to the bending test. Luigi Locati. *Industria meccanica* 17, 803-7, 802-8(1935).—The plasticity of material helps the stresses of unforeseen origin to remain in limits below the danger point even if they exceed the normal value. The other mech. properties, however, as elongation, must not be overlooked in this connection. The bending test alone will not give sufficient indication of behavior under stress; it can only give a certain quality factor which must be considered together with ultimate strength, elastic limit and max. deviation in bending. Twelve references. M. Hartenheim.

The influence of foreign elements of some industrial aluminum alloys. I. T. Kolenov and B. F. Grashchenko. *Legkie Metal.* 4, No. 4, 40-55(1935).—The influence of Fe, Si, Zn and Cu on the mech. and corrosion-resistant properties of Duralumin, Aludur and Silumin was investigated. H. W. Rathmann.

The influence of alloying elements on aluminum and magnesium alloys. A. S. Lugaskov. *Legkie Metal.* 4, No. 5, 32-4(1935).—L. discusses the influence of Be, Ca, Ce, Si, Mn and Na on the properties of Al and Mg alloys. H. W. Rathmann.

An x-ray study of the alloys of aluminum with barium. K. R. Andrews and L. Alberti. *Z. Metallkunde* 27, 120-8 (1935).—Alloys contg. 0.5% increments of Ba from 0% to the eutectic at 2%, and 5% increments from this point to 50% Ba were studied by back-reflection powder photographs. A const. a_0 value for Al was found throughout this range, indicating no solid-soln. fields. Only one intermetallic phase, corresponding to Al_3Ba and 66% Ba, was observed. Photographs of cleavage sections of Al_3Ba showed that it may be considered as a body-centered tetragonal lattice of Ba atoms with $a = b = 4.53 \text{ \AA}$, $c = 11.1 \text{ \AA}$, whose interstices are filled with Al atoms in the positions of the 2 types (00 u) and (01 $u/2$), and u is detd as 0.28. G. Derge.

The influence of small excesses of magnesium or zinc on the hardening of alloys of aluminum with MgZn . R. Schmitt. *Z. Metallkunde* 27, 121-6(1935).—A series of 17 alloys contg. 2.6, 14% MgZn , with excesses of 1.15-6.4% Mg and 1.7-6.8% Zn is annealed at 475° and water quenched, then aged at room temp., 80° , 125° , 150° and 175° . The changes are followed by means of Brinell measurements. After the anneal all samples showed a softening from the as-cast condition, followed by a hardening at room temp. which did not reach a max. after 33 days. The aging data are plotted separately for each alloy. All showed an increase in hardness at all temps., which was asymptotic to the time axis below 150° , but at 175° the hardness decreased after reaching a max. Conclusion. The process is complicated but dependent upon the MgZn , primarily, the effect of MgZn , being greater from 6-9% than from 0-14%. G. Derge.

Modulus of elasticity of beryllium-copper alloys. Léon Guillet, Jr. *Compt. rend.* 201, 1049-2(1935).—The hardness, Δ (Rockwell), modulus of elasticity, E , and rate, H , of vibration of the note given out by cylindrical samples $20 \text{ cm} \times 20 \text{ mm.}$, were detd. for Be-Cu alloys contg. 2-18.5% Be (with 0.02-0.12 Fe , 0.1-0.54 Si , 0-0.21 Al , 0-0.3 Mg , 0-0.5 Mn and 0-0.05 Zn). E increases linearly (70-110) until the amt. of Be is 11%, i.e., until the constitution of the alloy changes (cf. Masys and Dahl, C. A. 24, 3174). H increases linearly (12,000-20,000) throughout the series. Δ also increases with content of Be, but at a decreasing rate. C. A. Silberrad.

Magnetic alloys of iron, nickel and cobalt. G. W. Timen. *Elec. Eng.* 54, 1202-9(1935).—A paper dealing largely with the phys. and elec. properties of the permalloys, permivar and permendur. Curves and tables and 7 references are included. W. H. Boynton.

Iron-cementite-manganese carbide-manganese. Rudolf Vogel and W. Döring. *Arch. Eisenhüttenw.* 9, 217-62(1935).—Former investigations of this system and parts of it were enlarged and completed by establishing the constitutional diagrams on the basis of heats of reaction and structure. Mn and Mn_3C do not form, as indicated previously, an uninterrupted series of solid solns with a max. temp.; a transition equl. occurs at solidification between 1.5 and 2.9% C which leads toward higher C contents, to a min. temp. A new transformation of Mn carbide was observed at 1070° . Four kinds of crystals were found in the system $\text{Fe-Fe}_3\text{C-Mn}_3\text{C-Mn}$: Ternary solid solns of $\alpha(\delta)$ - γ e with C and Mn which are restricted to a small range in the Fe corner; ternary solid solns. of γ -Fe with C and Mn with a very extended range; ternary solid solns. of γ -Mn with C and Fe (area $\alpha + \beta_{\text{Mn}}$); and solid solns. Fe_3C and Mn_3C (area $\text{C} \beta_{\text{Mn}}$). The cementite does not form solid solns. with the excess Fe, but the Mn_3C does with excess Mn. The conditions are explained in detail by the diagram. A table shows the location of the characteristic points α , β , γ , δ and ϵ for the equilibria of the Fe-Mn-C alloys in solid state. The various structures are illustrated in photomicrographs. M. Hartenheim.

Heat conductivity of pure iron and commercial steels. F. Hollenrath and W. Rungardt. *Arch. Eisenhüttenw.* 9, 233-62(1935).—Recent literature on heat cond. is reviewed for practically pure Fe, alloy and plain steels at different temps. in order to derive useful values. This was possible, however, only for plain steels at room temp.

All other information for alloy steels contains so many gaps and contradictions that the influence of the alloying material can be determined only approx. A few curves and numerical values are given for com. steels. Thirty-eight references. M. Hartenheum

The corrosion problem. Paints and anticorrosive coatings. Georges Genin. *Industrie chimique* 21, 898-902 (1934), 22, 93-7, 250-5, 402-5, 488-91, 652-4 (1935).—A general discussion of the various aspects of the problem of corrosion in industry, with a review of the means at present available for preventing or combating it, more particularly in the chem. industry. A. P.-C.

Corrosion in the production of ethylene chlorohydrin. L. V. Iskra. *J. Chem. Ind. (Moscow)* 12, 947-53 (1935).—Mixts of $C_2H_5(OH)Cl$, HCl , C_2H_5Cl , and Cl_2 such as are used in prep. $C_2H_5(OH)Cl$ corrode Pb strongly, and the degree of corrosion increases with temp. Acid resisting lacquers and many alloys are badly affected. Acid-resisting cements and Fe contg 13-17% Si are not greatly corroded. A Havg type resin alone is slightly corroded, but when deposited on an Fe surface it resists corrosion. H. M. Leicester

Substances inhibiting corrosion of iron by acids. Jacques Bancelin and Yves Cramail. *Compt. rend.* 201, 1033-4 (1935).—While the inhibitory action of rhodamine on the corrosive action of 0.1 N HCl on steel continually increases with concn of rhodamine that of thiourea at first increases, and then decreases with a max. effect for a concn of about 50 mg/l. This concn (c) gives the min. e. m. f. in the cell steel/0.1 N HCl + thiourea (c)/ Hg_2Cl_2/Hg , whereas with rhodamine the e. m. f. decreases continually as concn increases. C. A. Silberrad

Study of the influence of cold work on the intergranular corrosion of 18-8 rustless steels. A. Van den Bosch and M. Vialle. *Métaux* 10, 68-75 (1935).—The authors discuss intergranular changes which take place in reheating the annealed 18-8 Cr-rustless steels, the changes on reheating the cold worked material, the pptn. process of the carbides, the rate of heating that produces changes and the temp. range of susceptibility to alteration, the stabilization of the steel, starting with cold-worked metal and its application to welding. Regarding the use of stabilized 18-8 steel, they draw the following conclusions: (1) This steel can be arc welded without alteration. (2) Carbides may ppt. at the grain boundaries when the steel, while not completely stabilized, is used at a temp. below the temp. of stabilization. G. T. Motok

Rammed mixes for cupola furnaces (Borsch) 19 Preventing (metal) corrosion and paint (Schleife) 26 Effect of thermal agitation on ar. arrangement in alloys (Bragg, Williams) 2 Pneumatic process for refining ores (Ger. pat. 620,489) 21

Froth flotation process and apparatus. Thomas J. Taplin. *Brit.* 434,352, Aug. 30, 1935. To insure good contact between the air bubbles and the mineral particles, a vibratory movement is imparted to the pulp in addn. to the normal movement produced in the aeration by agitation or by the direct introduction of air, the vibratory movement being produced by imparting vibration to an impermeable surface in contact with the pulp on 1 side only.

Leaching ores to separate lead and other metals from zinc sulfide. Maxwell G. Platten. U. S. 2,021,896, Nov. 26. Lead zinc ores, etc., contg. ZnS are leached with a soln. of a chloride of Na, K, Ca or Mg not contg. over about 1% of acid such as HCl, etc., in excess of that neutralized by the acid neutralizing substances in the material being leached, and contg. $FeCl_3$ as active solvent, thus selectively dissolving the Pb without dissolving the ZnS.

Treatment of ores, etc., containing iron, nickel and copper. The International Nickel Co. Inc. *Ger.* 620,419, Oct. 21, 1935 (Cl. 40a 13.50). See Can. 323,286 (C. A. 26, 3993).

Ores of lead and zinc. Ernst Bierbrauer. *Fr.* 780,684, Sept. 7, 1935. Ores of Pb and Zn are sepd. by selective

flotation; ligninsulfonic acid, its salts or derivs. are used to render the blende passive.

Purifying zinc ores. National Processes Ltd. and Thomas B. Oyles. *Brit.* 433,801, Aug. 22, 1935. Pb and Cd are removed from Zn sulfide ores, concentrates, etc., by a blast-roasting operation in which the ore, etc., is mixed with a granular or nodular material in such quantity as to insure a high porosity in the charge and a Pb content below 1.5% thereof, and in which the draft through the charge bed and the fuel value of the charge are adjusted to give a temp., e. g., 1300° , above that required to eliminate S without the Pb content of the exit gases exceeding 250 mg per cu. ft.

Reducing ores of zinc. American Smelting & Refining Co. *Fr.* 780,688, Sept. 7, 1935. The ore in intimate contact with a reducing agent such as C and in a finely divided state is passed through a retort heated to and maintained at the temp. of reduction of the ore, so that the ore is reduced in a practically instantaneous manner. The vapors are removed through a coke filter maintained under conditions such that CO_2 is reduced to CO, and the Zn is condensed. App. is described.

Apparatus (with a series of bowls arranged in step formation) for separating materials such as gold and sand. Michael Schlank. U. S. 2,023,926, Dec. 3. Various structural, mech. and operative details.

Treatment of metallurgical by-products. Wilhelm Witter. *Ger.* 620,263, Oct. 17, 1935 (Cl. 40a. 15.01). Powd. mixts of metals with oxides or sulfides, obtained as by-products in refining metals and particularly in removing Cu, Zn and Sn from Pb, are subjected to a winnowing process to sep. the metallic and the nonmetallic components. The fractions are then worked up separately in known manner. As a modification, the nonmetallic components may be withdrawn by an air stream from the surface of the metal bath being refined.

Treating slag. Edward Perchard Dunn. *Ger.* 617,510, Aug. 20, 1935 (Cl. 80b. 22.01). App. for filtering, desulfurizing and mixing molten slag is described.

Granulated slag. Edgar E. Broaus. U. S. 2,023,511, Dec. 10. Molten slag is disintegrated by violent agitation and there is added to it simultaneously sufficient water to produce a granulated product but so limited as to insure substantially complete vaporization of the water.

Pot furnaces for melting metals, etc. South Metropolitan Gas Co., Dean Chaudler and Alec J. Skinner. *Brit.* 433,127, Aug. 2, 1935. In a gas-fired furnace for melting metals or heating liquids, where flames and hot gases from burners, after passing upwardly around the pot, escape through a chamber to down flues having outlets at their lower ends, the inner face of the refractory wall is lined with cast-Fe plates which are spaced from the wall by ribs and have vertical ribs on their inner faces to divide the heating space into sep. passages.

Regenerative furnace for heating metals or fusing ores. Wilhelm Doderer. *Fr.* 786,704, Sept. 9, 1935.

Pusher type furnace for heating metal articles. Ernst Neubaus. *Ger.* 620,153, Oct. 15, 1935 (Cl. 18c 10.01).

Rotating furnace for producing spongy iron. Fried. Krupp Grusonwerk A.-G. *Ger.* 614,045, May 31, 1935 (Cl. 18a 18.03). Addn. to 610,520 (C. A. 29, 58023).

Annealing furnace for iron, etc. Hans-Arthur Schweichel. *Ger.* 616,788, Aug. 5, 1935 (Cl. 18c 10.01). Details of a water-cooled conveyor are given.

Continuous furnace for annealing metal strip in which the strip hangs in a catenary between supporting rollers. Birmingham Electric Furnaces Ltd., Alfred G. Lobley and Fred Kerfoot. *Brit.* 433,899, Aug. 22, 1935.

Means for lifting sheet metal conveyed from an annealing furnace. Vereinigte Stahlwerke A.-G. *Ger.* 620,154, Oct. 10, 1935 (Cl. 18c 11.20).

Continuous pair furnace suitable for heating metal bars. Ray M. Fenton. U. S. 2,023,318, Dec. 3. Structural, mech. and operative details of a furnace with an endless conveyor extending through a horizontal heating chamber.

Heat treating furnace suitable for normalizing sheets.

of steel. Frank A. Fahrenwald. U. S. 2,023,126, Dec. 3. Various structural, mech. and operative details.

Heat-treating materials as in annealing or normalizing steel strip. Albert N. Ous (to General Elec. Co.). U. S. 2,023,283, Dec. 3. Various details of app. and operation.

Means for charging blast and shaft furnaces Pierre François-Bongarcou Fr. 787,102, Sept. 17, 1935.

Stock support for furnaces such as those for heating metal billets, slabs, etc. John W. Cornston U. S. 2,022,640, Dec. 3.

Linnings for nozzles of foundry ladles Allmanna Svenska Elektriska Aktiebolaget Brit. 434,520, Sept. 3, 1935. The linings, consisting as usual of magnesite, or the oxide of Mg, Cr, Al or other earthy metal mixed in powder form with a binder, e. g., water glass, are heated to considerably below the burning temp. of the material, which then sinters when the hot metal is poured. Substances that lower the m. p. of the lining, e. g., quartz, CaF₂, alkalis, may be added to the magnesite, etc., so that the bore of the lining increases by wear and compensates for the reduced head of molten metal during pouring.

Pot for holding and expelling molten lead or the like Luther H. Hopkins U. S. 2,022,372, Nov. 26. A construction is described by which city gas or air under pressure may be utilized for expelling molten material from the pot.

Castings of magnesium free aluminum-copper alloys Joseph A. Nock, Jr. (to Aluminum Co. of America) U. S. 2,022,686, Dec. 3. A Mg-free alloy contg. Al together with Cu-12 and Sn 0.005-0.1% is cast and, without aging, the casting is heat-treated by heating to between 400° and the temp. of incipient fusion and then rapidly cooling. The Sn improves the ductility of the product.

Powdering metals Walter Zeiss. Ger. 620,126, Oct. 14, 1935 (Cl. 49/3). See Fr. 780,698 (C. A. 29, 58014).

Fluxes Ernst J. M. Mattsson. Brit. 434,531, Sept. 4, 1935. Fe or steel articles to be coated by dipping in molten Al or an alloy contg. Al as its main constituent, e. g., 1 contg. at least 95% Al, are immersed in a molten flux bath that contains 1 or more fluorides, e. g., Na₂AlF₆, and 1 or more alkali fluorides, with or without other salts, e. g., ZnCl₂, but which does not contain any compd. of Ca. The articles are left in the flux until oxides, etc., are removed and the articles are properly heated and are then transferred to the Al or Al alloy bath. In an example, the flux contains Na₂AlF₆, 10, ZnCl₂, 20, NaCl 30 and KCl 40%.

Container for steel tempering oil Zimmerman & Co. Komm.-Ges. Ger. 617,567, Aug. 21, 1935 (Cl. 18 & 2 10).

Apparatus for forming and quenching automobile leaf springs, etc. John F. Beans (to First National Bank in Massillon, Ohio). U. S. 2,022,632, Nov. 26. Structural and mech. features.

Manufacture of seamless tubes such as those of ferrous metals by extrusion of pierced billet material Adolf Wefing (to Tubus A.-G.). U. S. 2,023,776, Dec. 10. App. and operative details are described.

Brazing together materials such as metal sheets Frank T. Cope (to Electric Furnace Co.). U. S. 2,023,354, Dec. 3. Various details of app. and operation are described, involving use of suction to reduce the pressure between parts to be brazed together.

Brazing joints of curved metal sheets such as automobile panel material. James Velko (to Murray Corp. of America). U. S. 2,022,795, Dec. 3. Various operative details are described, involving the use of a bimetallic strip formed of a layer of retaining material and of spelter material in which a flux is embedded.

Trays suitable for use in heat-treating metal or ceramic

articles. Henry H. Harris. U. S. 2,022,283, Nov. 26. Structural features.

Annealing. Thomas Bolton and Sons Ltd., Wm. E. Atkins and Walter Cartwright Brit. 133,534, Aug. 12, 1935. Current-collectors for traction purposes, e. g., trolley wheels, are made from a known Al bronze contg. a small proportion of Mn and (or) Ni and having a refined structure produced by heat treatment and (or) working. The heat treatment may comprise a normalizing at 400° for 21 hrs. after a quenching from 850°.

The collectors may be produced by casting a blank, forging at 800-900°, quenching and then heating at 400-450°. If the forging cannot be quenched, it may be heated to 850°, quenched and then reheated at 400-500°. In an example, the alloy contains Al 9-11, Mn 0.2-3.0 and, optionally, Ni 0.2-5.0%, the Mn and Ni combined being not more than 5%.

Annealing razor blades Hermann Schmidt. Ger. 617,514, Aug. 20, 1935 (Cl. 18 & 2 28).

Hard metal bodies such as tools Bruno Fethenheuer (to Deutsche Edelstahlwerke A.-G.) U. S. 2,023,413, Dec. 10. Articles such as tools are formed of a material comprising Ti carbide about 60-85%, a carbide of W, Mo or Ta about 10-20%, the remainder being an alloy of Co, Cr and W in the resp. proportions of 40-80, 20-35 and 25% or less. Cl. C. A. 29, 107⁹.

Rotary drum for cleaning and descaling castings, etc., provided with centrifugal devices to inject the cleaning material through apertures in the end walls of the drum. Walter Schemmann and Fritz Kottmann Brit. 434,712, Sept. 6, 1935.

Coated ferrous wire, etc. Frederick M. Crapo (to Indiana Steel & Wire Co.). U. S. 2,023,364, Dec. 3.

A ferrous metal core carries a hot-galvanized Zn coating with an overlying coating of electrodeposited Cd. Cf. C. A. 29, 722⁹.

Coating iron with aluminum. Franz Nilsson, Fr. 780,645, Sept. 6, 1935. Fe or steel to be coated with Al is dipped into a salt bath contg. one or more fluorides, e. g., a double fluoride of Al and Na, and one or more alkali chlorides, with or without other salts except salts of Ca, and then into a fused bath of Al. The salt bath may contain NaAlF₆, 10, ZnCl₂, 20, NaCl 30 and KCl 40%.

Iron Mathias Fränkl. Ger. 617,943, Aug. 29, 1935 (Cl. 18 & 16 01). A method is described of refining crude Fe in the molten state by treatment with a blast of air charged with O, and of after-refining by adding solid Fe₂O₃, in which the heat developed by the oxidation of the P present is used.

Sponge iron Wm. D. Brown. U. S. reissue 19,770, Dec. 3. A reissue of original pat. No. 1,979,729 (C. A. 29, 108⁹).

Iron sponge. Mathias Fränkl. Ger. 617,942, Aug. 29, 1935 (Cl. 18 & 18 02). A shaft furnace is described for producing Fe sponge by the acid of reducing gases.

Deoxidation of iron. Soc. d'électrochimie, d'électrometallurgie & des aciéries électriques d'Ugine Fr. 786,872, Sept. 11, 1935. Fe and steel are deoxidized with the cyclic utilization of slags and regeneration thereof, slags are used in which the ratio of MnO content to FeO content is above 4 and preferably above 5. The periodic regeneration is carried out so as to maintain this ratio above 4.

Rustless iron and steel. Wm. B. Arness (to Rustless Iron Corp. of America). U. S. 2,021,979, Nov. 26. For the production of a N-contg. rustless iron or steel of fine-grain structure, a bath of molten iron is prepd. with an overlying slag contg. oxides of Cr. The Cr oxides are reduced, thus enriching the bath, and N is added to the slag during the reducing operation so that N is absorbed by the nascent Cr and thus carried into the bath.

Steel. Herbert Grubitsch. Ger. 617,765, Aug. 26, 1935 (Cl. 18 & 2 40). See Austrian 142,230 (C. A. 29, 6200⁹).

Alloy steels. Child H. Wills. Fr. 786,597, Sept. 5, 1935. See U. S. 1,992,905 (C. A. 29, 2500⁹).

Forged steel rolls suitable for rolling mills Clifford B. Ferrec. U. S. 2,022,192, Nov. 26. Rolls are formed from

a steel the C content of which approximates and does not substantially exceed the eutectic value and is 0.75-0.95% and contg Cr 1.3-1.8%, by casting, forging and heat-treating in a single elevation of temp to a peak of about 810°, followed by slow reduction of temp, machining, hardening and tempering.

Composite steel bars. Max R. Trembour (to Jessop Steel Co.) U. S. 2,023,908, Dec. 10. Various details are given for the manuf. of a welded composite ingot suitable for the manuf. of edged tools or dies and which comprises a body of soft steel with a welded corner piece of harder steel.

Medium- or high-carbon steel wire rods. Henry D. L. Lloyd (to Whitecross Co. Ltd.) U. S. 2,023,786, Dec. 10. For producing coiled medium- or high-C steel rods of sorbite structure, the rods are rolled at a temp substantially above that of a molten quenching medium such as molten salt maintained at 450-500° and are immersed in this medium while substantially at rolling temp and are cooled in the medium while the latter is maintained substantially at the quenching temp. App. is described.

Preparing sheets of metal such as low-carbon steel for deep drawing. Louis Schulte (to Schulte Grinding and Polishing Machine Co.) U. S. 2,023,904, Dec. 10. The sheet is pickled, cold rolled, fished to provide a concave surface and the latter is engaged with a cushioned rotating grinding surface and ground only sufficiently to remove surface defects and strain-hardened film imparted to the sheet from preceding steps of manuf. App. is described.

Marking, ornamenting or coloring aluminum and its alloys by photographic processes. Siemens & Halske A.-G. Ger. 629,664, Oct. 24, 1935 (Cl. 576, 501). Addn. to 607,012 (C. A. 29, 1768⁹), 615,092 (C. A. 30, 75⁹) and 619,450 (C. A. 30, 427⁹). The oxide coating produced on Al and its alloys in the processes of Ger. 607,012, 615,092 and 619,450 is replaced wholly or in part by a coating of different compn, e. g., by a phosphate or fluoride coating.

Composite metal articles of aluminum metals. Robert H. Brown (to Aluminum Co. of America.) U. S. 2,023,512, Dec. 10. For producing articles resistant to corrosion, a base of metal such as Al alloyed with Mn 1.25% is provided with a coating of a plurality of aluminum metal layers, each of which (suitably because of alloying with Sn and Bi, etc.) has an electrode potential greater than that of the base metal, and with the layers arranged in the order of increasing electrode potential from the base metal to the surface of the article.

Separating nickel and cobalt. Raoul Bévérini and Élie Raymond. Fr. 780,810, Sept. 10, 1935. Ni and Co are sep'd by utilizing the fact that they form complex compds. with ethanolanimes in alk. medium, those of Co being very stable whereas those of Ni are unstable even in the cold, hydrolyzing to form the hydroxide. Under the same conditions Mn does not give a complex and ppts immediately as hydroxide. Fr. 780,808, Sept. 11. Glycylamines are used instead of ethanolanimes to sep. Ni, Co and Mn, the Ni forming an unstable and the Co a stable complex, while the Mn is ppt'd immediately as hydroxide.

Metallic magnesium. Fritz Hansgurt (to American Magnesium Metals Corp.) U. S. 2,022,282, Nov. 26. For producing substantially pure Mg, materials such as a crude Mg is heated to liberate Mg vapor, the vapor is removed from the heating zone by a nonoxidizing gas and dust is sep'd from the vapor by effecting suitable variations in its flow to promote gravity sep'n of suspended solids, and the vapor and nonoxidizing gas are passed to a condensing zone. App. is described. Cf. C. A. 29, 4728⁹.

Refining magnesium and its alloys. Oesterreichisch-Amerikanische Magnesium A.-G. Brit. 433,859, Aug. 16, 1935. Mg and high percentage Mg alloys are refined by melting with a halide or sulfide of a heavy metal from groups I, II, V, VI, VII and VIII of the periodic system, such metal, base metals excepted, having a sp. gr. above 6 and below 11. Mg halides may be used in addn. The

salts or mixts. of salts must have m. ps. below that of Mg and a sp. gr. above that of molten Mg. In examples, (1) Mg, refined by distn., is melted with a mixt. of equal parts of ZnCl₂, FeCl₃ and MgCl₂, and (2) a Mg alloy contg Al 4, Zn 1 and Sb 0.3% is melted with a mixt. of Sb₂S₃ 40, FeCl₃ 20, ZnCl₂ 10 and MgCl₂ 30%. Cf. C. A. 29, 443¹.

Rolled products from magnesium and its alloys. John E. Hoy (to Dow Chemical Co.) U. S. 2,023,366, Dec. 3. Mg or a high-percentage Mg alloy is cast to a plastic deformation by extruding and the deformed metal is then rolled. App. is described and a product is obtained which does not tend to crack.

Recovering copper and silver compounds from alloys. I. G. Karbennd A.-G. (Hermann Weber, Ernst Hempelmann and Robert Griesbach, inventors). Ger. 620,350, Oct. 19, 1935 (Cl. 40a, 23). Alloys contg 30-70% of Cu, the remainder being wholly or mainly Ag, are treated with Cl without applying heat. A mixt. of AgCl and CuCl is obtained, and is fused by the heat of the reaction. The fused chloride mixt. is run into a solvent for CuCl, e. g., dil. HCl or NaCl soln., and the undissolved AgCl is withdrawn. A neutral substance which increases the soly. of CuCl in the solvent used, e. g., NaCl or CaCl₂, may be added before, during or after the chlorination.

Alloys. Thomas W. Iles. Brit. 434,291, Aug. 29, 1935. A draft-excluding strip for the meeting edges of doors, windows, etc., consists of a flat elastic metal strip such as an alloy contg Cu 88.32, Zn 10.30 and Sn 1.16% rolled to 0.18-0.22 mm thickness.

Alloys. Pierre G. Adeline. Fr. 786,793, Sept. 9, 1935. Thermo-reaction is used for incorporating metals such as Cr, Si, Ti, W, Mo, Mn, V, Zr, Sr and Th in metals such as Fe, Cu, Zn, Sn, Bi, Sb, Pb, Ni, Na, Al and Mg. An example is given of the prep'n of an alloy contg Al 90, Cr 2 and Ti 2% by using Cr₂O₃ 3.7, TiO₂ 4, fluor spar 0.5 and Al 3.2 kg. An alloy contg Al 80, Cr 10 and Ti 10% may be made first, and molten Al added to this to get an alloy contg a greater amt. of Al.

Alloys by diffusion. Fritz Bergmann. Fr. 786,715, Sept. 9, 1935. The diffusion of a metal such as Cr, Ni, W, Mn or Si into the surface of another metal such as Fe takes place in a neutral fused mass of salt. The diffusing metal may be mixed as a powder with the fused salt.

Light alloy. Vereinigte Leichtmetallwerke G. m. b. H. Fr. 786,592, Sept. 5, 1935. Alloys of good resistance to traction and of improved elastic limit contain Cu 3-5, Mg 1.3-1.4, Si 0.4-0.7, Mn 1.25-1.25% and Al the rest.

Hard alloys. The British Thomson-Houston Co. Ltd. Brit. 434,468, Sept. 2, 1935. In making alloys of the type contg 2 or more hard constituents, e. g., refractory metal carbides, and 1 or more auxiliary metals of lower m. p., each of the hard constituents is separately assoc'd. with 1 or more of the auxiliary metals, e. g., by grinding, and the fractions so formed are afterward mixed and sintered under pressure at high temp. Thus W₂C 75-97 may be ground with Co 3-25, and Ti carbide 75-92 with Ni 8-25 parts and a final sintered product obtained from the W₂C mixt. 90-95 and the Ti carbide mixt. 5-10%.

Hard alloys. Fagersta Bruks Aktiebolag. Fr. 787,010, Sept. 10, 1935. A mixt. contg Ti carbide 6-25 and inorg. compds. such as oxide or carbonate of one or more auxiliary more fusible metals such as Fe, Co and Ni, the rest being principally W carbide, is used. Pieces are made from this mixt. by pressing, after or not previous decomp'n of the comp'd of the auxiliary metal. The pieces are machined to the desired shape and fritted.

Alloys suitable for cast dentures. Baker & Co., Inc. Brit. 434,583, Sept. 2, 1935. See U. S. 1,930,119 (C. A. 28, 919⁹).

Aluminum alloys. Horace C. Hall and Reils Royce Ltd. Brit. 434,022, Aug. 29, 1935. The Cu content of those alloys described in Brit. 350,110 (C. A. 26, 1230⁹) that have a Mg content of 0.7-1.75% is increased to 2.6-6.0%. Mn and other elements may also be added as described in Brit. 425,102 (C. A. 29, 5408⁹). The alloys may be subjected to artificial aging at 100-100° for 12-2

hrs., to soln. treatment followed by natural aging in air for 7 days or more, or to soln. treatment and artificial aging.

Columbium alloys. Frederick M. Becket (to Electro Metallurgical Co.). Brit 434,400, Aug. 30, 1935. Materials contg. Cb oxides are reduced with Si or Si alloys, e. g., Fe-Si, Cr-Si, Fe-Cr-Si, Cb-Si or alloys with other metals unobjectionable in the final product. The Si in the charge is preferably adjusted to yield an alloy with a Cb-Si ratio of 6-12-1, whereby upward of 75% of the metal may be recovered and the Cb oxide is selectively reduced in preference to the oxides of Ta and Ti present. Fe, Ni, Cr or other metals may be added to the product either by reducing in the presence of a metal bath or making the addn. during or after the reduction. Slags obtained contg. substantial amts of Cb, Ta and Ti may be smelted with enough Si to yield a Cb-Si alloy of a less ratio than 6-1, this being used as reducing agent for Cb oxide-contg. material to form the lower Si alloy. Cf C. A. 30, 425².

Iron alloys. Strömsjö Jernverks Aktiebolag Brit. 434,760, Sept. 9, 1935. An alloy for the production of Mn 0.3-0.5, C 2.7-3.2, P 0.55-1.0, Cr 0.3-1.0, Mn 0.3-0.6, Si 0.9-1.6 and S 0.07-0.15%, the remainder being Fe.

Lead alloys. S. & T. Metal Co. Brit. 433,653, Aug. 19, 1935. See Fr. 772,826 (C. A. 29, 1381¹).

Composite rolled forms of magnesium alloys. Arthur W. Winston (to Dow Chemical Co.) U. S. 2,023,498, Dec. 10. In forming articles such as airplane propeller blades, etc., of integrally joined layers, properly shaped ingots of the metal are arranged in the container of an extrusion press and are extruded through a common die opening at a temp. of about 230-450° so as to form a composite billet, the latter is then heated to about 215-450° and rolled or forged.

Zinc alloys. Wm. W. Broughton and Geo. L. Werlev (to The New Jersey Zinc Co.). Brit. 434,047, Aug. 20, 1935. Addn. to 376,988 (C. A. 27, 3191). See U. S. 1,989,368 (C. A. 29, 1769²).

Zinc base alloy dies suitable for casting low-melting metals. Wm. G. Newton and Howard E. Christie (to

Wm. G. Newton). U. S. 2,023,645, Dec. 10. The face of a die formed of Zn 90-92, Al 4-5, Cu 3-4 and Mg 0.02-0.1% or the like is treated with HNO₃ and then with a soln. of NaOH and Sb oxide, producing a blackish coating which has good hardness.

Welding rod. John B. Austin (to Una Welding, Inc.). U. S. 2,022,307, Nov. 26. A low-C steel welding rod contains an effective proportion of Ti, but not more than about 0.2%, an effective proportion of V, but not more than about 0.25% (the total of Ti and V being 0.16-0.29%). A rod of this compn. is suitable for welding rusted steel.

Welding rod. Wm. W. Sieg. U. S. 2,022,439, Nov. 26. A welding rod is formed to the extent of over 99% of an alloy of Cu with a lesser quantity of Zn, and with small proportions of Si, Mn, Fe, B and Sn, and with the Si, Mn and Fe in about the proportions of 2:2:1.

Metallurgical blanks such as welding rods and hollow drill steel. Burt H. Payne (to Stultz-Sickles Co.). U. S. 2,021,945, Nov. 26. An opening is formed through a drill billet at its center and from end to end, and there is inserted into the opening a Mn-Ni welding steel alloy contg. Mn 11-13.5 and Ni 2.5-3.5%, substantially filling the opening and having a coeff. of expansion greater than that of the billet, the materials are heated to about 925°, the billet is rolled until the diam. of the opening and the core has reached a desired size, and the billet is cooled until the core can be readily removed from it.

Electrode for arc welding. Fritz Müller (to N.-V. Machine-en Apparat Fabriek "Meaf"). U. S. 2,023,818, Dec. 10. A steel core is coated with a mixt. of "technically pure" Mg silicate 70, water glass 30 and deoxidizing and alloying constituents such as ferro-Mn contg. C about 10%, free from mixed elements adapted to transmit impurities "of the oxygen type" to the iron.

Apparatus and method for coating welding electrodes with flux by extrusion machines. James G. Jackson. Brit. 433,718, Aug. 20, 1935.

Apparatus for making metal pipe such as that of ferrous metal by electric welding. Wm. M. Neckerman (to Republic Steel Corp.). U. S. 2,023,897, Dec. 10. Various structural, mech. and operative details.

10—ORGANIC CHEMISTRY

CHAS. A. ROULLIER AND CLARENCE J. WEST

Productivity of a synthetic methanol installation in relation to various factors. L. M. Chavnick *Khi-miel* 7, 416-18 (1935).—A math. discussion. Chas. Blare. **Fluorination of halomethyl ethers.** I. Fluorination of trichloromethyl ether. Harold Simmons Booth and Paul E. Burchfield *J. Am. Chem. Soc.* 57, 2070 (1935).—Fluorination of CCl₃OMe by anhyd. sublimed SbF₅ without a catalyst yielded a mixt. of CFC₂OMe, b. 55.3°, m. -105.1°, and CFC₂OMe, b. 30.1°, m. -96.2°. These compds. are only slowly hydrolyzed in H₂O.

Geometrical isomers of heptenenitrile. Charles Hoffmann. *Bull. soc. chim. Belg.* 44, 435-7 (1935); cf. C. A. 27, 266, 5717.—C₆H₁₁Br, prepd. from the alc., was converted into C₆H₁₁CN (I). Bromination of I in the presence of S gave α-bromohexanenitrile, which on debromination with quinoline gave 2 heptenenitriles. These were sep'd. by fractional distn. and converted by treatment with concd. H₂SO₄ into the corresponding amides, m. 122.8° and 61-1.4°. Dehydration of the amides with P₂O₅ gave the cis- and trans-α-heptenenitriles (II and III). II b₁, 60.2-0.4°, has d₄²⁰ 0.8260, n_D²⁰ 1.43543, n_D²⁵ 1.43849, 1.44596, n_D³⁰ 1.45228, d₄²⁰ 0.81754, n_D²⁰ 1.42912, n_D²⁵ 1.43205, n_D³⁰ 1.43945, n_D³⁵ 1.44555. III b₁, 67.5°, has d₄²⁰ 0.83088, n_D²⁰ 1.43978, n_D²⁵ 1.44292, n_D³⁰ 1.45067, n_D³⁵ 1.45719, d₄²⁰ 0.81875, n_D²⁰ 1.43369, n_D²⁵ 1.43688, n_D³⁰ 1.44377, n_D³⁵ 1.45082.

Geometrical isomers of undecenitrile. R. van Cailie. *Bull. soc. chim. Belg.* 44, 438-40 (1935).—α-Bromoundecenitrile (cf. C. A. 27, 5716) was heated with an

equimol. quantity of C₆H₅N for 40 hrs., first at 110° and then at 140°, giving 45-50% of the undecenitriles, which were converted into the corresponding amides (m. 114-15° and 76-7°) by means of cold concd. H₂SO₄. Dehydration of these amides with P₂O₅ gave the 2 pure nitriles (I and II). I b₁, 119.7-19.9°, has d₄²⁰ 0.83255, n_D²⁰ 1.44536, n_D²⁵ 1.44816, n_D³⁰ 1.45515, n_D³⁵ 1.46000; II b₁, 127.9-8.1°, has d₄²⁰ 0.83359, n_D²⁰ 1.44858, n_D²⁵ 1.45146, n_D³⁰ 1.45873, n_D³⁵ 1.46484.

Aldehyde acetals. R. Forné. *Seifen-Ind.-Ztg.* 62, 847-8, 857-8 (1935).—Synthetic methods are briefly reviewed and the properties of a no. of acetals tabulated.

Thirty references. J. W. Ferry. The solvent effect in the addition of hydrogen bromide to allylactic acid. M. S. Kharasch and M. C. McNab. *Chemistry & Industry* 1935, 989-90.—By use of the technic described (C. A. 27, 3444), allylactic acid in C₆H₆ with small amts. of NHPH₃ or thioacetal gave γ-bromovaleric acid, m. 22°, but with a small amt. of ascaridole it gave β-bromovaleric acid, m. 40°. Peroxides, not the solvents, control the direction of addn. and it could not be reversed by the use of peroxides or antioxidants in unsatd. compds. in which the double bond is either adjacent to a carboxyl group (crotonic acid) or does not involve a terminal C atom (2-pentene).

E. R. Rushton. Addition of hydrogen bromide to olefinic acids. R. P. Linstead and H. N. Rydon. *Chemistry & Industry* 1935, 1009.—The authors obtained β-bromovaleric acid, m. 40°, from allylactic acid in C₆H₆ in the presence of

NHPh, using a current of HBr, whereas Kharasch and McNab (preceding abstr.) used an excess of HBr in a sealed tube and obtained the γ -acid. The facts cannot be explained by any simple peroxide theory which neglects the polar effect of the carbonyl group when near the double bond.

E. R. Rushton
Fractional distillation in vacuo as a method of purification of fatty substances. I. Application to alkyl oleates. L. Kellier *Bull. soc. chim. Belg.* 44, 425-34 (1935).
Contrary to the statements in the literature, a single fractional distn of the esters of oleic acid is inadequate if the ester is to be used for precise work, often several successive fractionations are necessary. The heats of combustion of 3 carefully purified alkyl oleates were found to be as follows: Me oleate 9576, Et oleate 9037, and Pr oleate 9702 cal./mole per g. in vacuo and at const. vol. The value for Et oleate is not exact, since the ester was evidently not quite pure. Calen gave the following values for the heats of combustion of oleic and linoleic acids 9170 and 9390 cal. per g., resp.

Louise Kelley
Preparation of ϵ -trimethylcaprobutene. Francisco Gural *Anal. soc. esp. quim.* 33, 752-3 (1935); cf. *Coll. Czechoslov. Chem. Communications* 2, 712 (1930).
Heat cyclohexane isooxime (ϵ -leucine lactam (Ann 312, 171 (1900)) with 50% aq. HCl, decolorize with C, conc., recrystallize from H₂O; yield 84% of ϵ -leucine-HCl (I), m. 131-2° (cor.). Dissolve 15 g. of I in a little H₂O, neutralize by solid KOH, add in small increments 25 g. KOH in a little H₂O, and 51 g. of Me₂SO, while cooling, then heat under reflux, cool, neutralize with H₂SO₄, conc., evap. to dryness on a water bath, ext. several times with cold alc. to remove K₂SO₄ and KCl, heat 6-8 hrs. under reflux with concd. HCl to hydrolyze Me esters, ppt. by BaCl₂, filter, evap. to dryness and take up by hot alc. to remove excess BaCl₂, filter, evap. to dryness, forming the methochloride of ϵ -dimethylaminoacetic acid (II), (yield quant.), m. 180° (cor.). Mix 10 g. of II with freshly prep. Ag₂O, filter, evap. to dryness, evap. repeatedly with abs. alc., recrystallize from abs. alc.; yield, 83% of ϵ -trimethylcaprobutene, m. 249-50° (cor.) with decompn. E. M. Symmes

The transformation of arginine into citrulline. K. Durr and H. Späth *Z. physiol. Chem.* 237, 121-30 (1935).
—Arginine was converted into citrulline by amidation, benzoylation and subsequent hydrolysis. Arginineamide HCl salt (I) was obtained in hygroscopic needles, which sintered at 110°, decompd. at 155° with evolution of gas and showed further decompn. at 270°, by satg. the MeOH soln of arginine Me ester HCl salt with dry NH₃, pptg. with Et₂O and recrystg. from H₂O-EtOH-Et₂O. It has $[\alpha]_D^{25}$ 13°, gives a strong birefract. reaction, is not attacked by arginase at pH 7, and forms a picrate, decompg. 220°. α -Benzoylarginineamide HCl salt + H₂O (II), sinters 115° and decomposes 260°, was obtained by esterification of benzoylarginine and treatment with NH₃. Esterification of dibenzoylarginine gave the Me ester HCl salt, sinters 167° and m. 171°. Benzoylation of either I or II yielded dibenzoylargininebenzoylamide (III), sinters 236°, m. 245° becoming brown, and evolves gas at 255°. Hydrolysis of III by concd. HCl at room temp., evapn. in vacuo and extn. with EtOH gave dibenzoylcitrullinebenzoylamide, sinters 185° and m. 220°. This on further hydrolysis gave ornithine and proline, identified as picrates. The structure and identity of III were established by prepn. of the same substance from ornithine. α -Benzoylornithine was condensed with urethan to form α -benzoylcitrulline, from which the Me ester, decompg. 120°, was obtained by treatment with CH₃N₃. NH₃ converted the ester into a benzoylcitrullineamide, decompg. 140°. This was then benzoylated to III. The dihydroxyperazine of arginine, decompg. 316°, was obtained as a by-product in the prepn. of arginineamide. A. W. Dox

2,3,6-Trimethylglucose anhydride. Karl Freudenberg and Emil Braun *Ber.* 68B, 1938 (1935).
—In reply to the statement of Hess and Neumann (C. A. 29, 6882) that the authors' synthesis of 2,3,6-trimethylglucose anhydride is not reproducible, F and B call attention to their reply (C. A. 27, 3701) to a similar criticism made

before by Hess and Lüttmann (C. A. 27, 3701).

C. A. R.
Dehydration and hydrate formation of lactose. W. Mohr and J. Wellm. *Milchw. Forsch.* 17, 109-17 (1935).
Lactose (D. A. B. 6) lost water of crystn. at 87° at abs. humidity from about 3 g./cu. m. downward. At 100° evapn. occurred between 8 and 14 g./cu. m. The anhydride, H₂O free lactose, obtained by dehydration at 100° in vacuo was highly hygroscopic at room temp. and was converted back immediately to the hydrate. Evapn. of lactose solns. at 70° and 90° yielded in thin layers a H₂O-free lactose which at 20° and 7 g./cu. m. atm. humidity was not hygroscopic and took up H₂O over and above the amt. necessary for hydrate formation only in air almost satd. with humidity (17 g./cu. m.), and from that originally in storage in ordinary room atm. (5.2 g./cu. m. humidity) the H₂O was given up almost completely. Still longer storage in very moist air led to hydrate formation. The H₂O contained in lactose glass was only absorbed since it was given up under conditions where the H₂O of hydration does not escape. The α -lactose hydrate and α -lactose anhydride 10 min. after dissolving showed $[\alpha]_D^{25}$ 82.2° and 79.6°, while the lactose glass obtained in thin layer from solns. at 70° and 90° showed $[\alpha]_D^{25}$ 60.3°, 58.1° and 56.6°. The Debye-Scherrer x-ray diagrams of the lactose preps. varied as did those of the α -hydrate and the lactose obtained in thin layers from soln. The α -lactose anhydride gave a characteristic diagram. The lactose glass showed only a broad, indistinct interference ring and was also solidified amorphously.

H. Macy
Mechanism of addition to double bonds. II. Stereocourse of 2 diene syntheses. Albert Wassermann. *J. Chem. Soc.* 1935, 1511-14, cf. C. A. 29, 5730°.—The 2 possible stereoisomeric forms of cyclopentadiene benzoquinone, the endo- and the exo- forms, are shown in photographs of space models. The ultraviolet absorption was detd. by the method of Smakula and Wassermann (C. A. 26, 2974) in C₆H₆ and in EtOH. When isolated from C₆H₆, EtOH, CCl₄, C₆H₆, and C₆H₆ at 20°, 40° and 50° and purified by recrystn. from C₆H₆, all specimens of this substance have the same m. p., crystal shape and color, and there is a sharp absorption max. at 2220 Å. It is therefore certain that one of the isomerides predominates, and there is no subsequent interconversion. The induction energies corresponding to the different intermediate configurations in the reaction were calcd. and found to be greater for the endo-isomeride. The activation energy of the endo-addn. product is therefore smaller, and since only one is formed, it must be the endo-product. Induction energies corresponding to the different intermediate configurations in the cyclopentadiene maleic anhydride reaction were calcd. and the activation energy was found to be less for the endo addn., indicating that this product is formed more rapidly, which is confirmed by expt. Rate consts. were calcd. The m. p. of cyclopentadienebenzoquinone is 75-76°. At 0°, the soln. in C₆H₆ is 0.9%.

E. R. Rushton
Fluorinated chlorobenzenes. Harold S. Booth, Howard M. Elsey and Paul E. Burchfield. *J. Am. Chem. Soc.* 57, 2004-5 (1935).
—m-C₆H₄ClF (I), prepd. in 60% yield from m-C₆H₄ClNH₂, bp₁₀ 127.6° (cor.), m. less than -78°, has d₄²⁵ 1.221 and n_D²⁵ 1.4911. The vapor pressure and temp. of I are related by the equation: $\log P$ (mm.) = (-2342.4/T) - 2.4165 $\log T$ + 15.017. 2,4,6-C₆H₂Cl₃F (II), prepd. from 2,4,6-C₆H₂Cl₃NH₂, bp₁₀ 208.4° (cor.), m. 11.2°, with d₄²⁵ 1.530, n_D²⁵ 1.5429. The vapor pressure and temp. of II are related by the equation: $\log P$ (mm.) = -2452/T - 0.7316 $\log T$ + 9.9389. II is thermally unstable. An improved precision technique for the detn. of the vapor pressure of liquids was used in these measurements. Louise Kelley

Benzoisofluoride and its halogenated derivatives. Harold S. Booth, Howard M. Elsey and Paul E. Burchfield. *J. Am. Chem. Soc.* 57, 2060-6 (1935).
—In the prepn. of PhCF₃ (I), the use of an excess of SbF₅ improves the yield; 1 b. 102.3° and m. -29.03°. The following derivs. of I were prepd. m-F (II), prepd. by nitration of I, re-

duction to *m*-NH-C₆H₄CF₃ (III), and replacement of NH₂ by F, b. 100.9°, m. -51.5°, *n*_D²⁰ 1.3982 (II was not analyzed); *p*-F, prep'd. by chlorination of *p*-Cl-C₆H₄Me in the presence of PCl₅ and fluorination of the *p*-FC₆H₄CCl₃ by means of SbF₅, b. 102.8°, m. -41.7°, *n*_D²⁰ 1.3990, -*o*-Cl, prep'd. from *o*-MeC₆H₄NH₂ by replacing the NH₂ by Cl, and chlorinating and then fluorinating the side chain, b. 152.8°, m. -7.4-7.6°, *n*_D²⁰ 1.4541, -*m*-Cl, prep'd. by replacing the NH₂ group of III by Cl, using the Sandmeyer method, b. 138.4°, m. -55.4°, *n*_D²⁰ 1.4466, -*p*-Cl, prep'd. by chlorinating *p*-ClC₆H₄Me, *n*_D²⁰ 1.4466, *p*-Cl, prep'd. by chlorinating *p*-ClC₆H₄Me, b. 139.3°, m. -54.0°, *n*_D²⁰ 1.4469, 3,4-*di*-Cl, prep'd. by successively converting *p*-MeC₆H₄NH₂ into 3,4-Cl₂C₆H₃Me, 3,4-Cl₂C₆H₃CCl₃, and 3,4-Cl₂C₆H₃CF₃, b. 173.5°, m. -12.3.2°, *n*_D²⁰ 1.4736. Exhaustive chlorination of I apparently converted it into a mixt. of the isomeric tri- and tetra-Cl derivs. L. K.

Evaluation of new methods of production of aniline hydrochloride B. P. Fedorov *Trans. Inst. Chem. Tech. Inst.* (U. S. S. R.) 1, 162-5 (1935).—Patents are critically reviewed. A procedure is described (pat. application No. 112,685 (1932)) for the production of PhNH₂·HCl with 99.6% yield by the interaction of atomized PhNH₂ and dry HCl. Chas. Blanc.

Preparing diphenylthiourea V. I. Kuznetsov and P. M. Aranovich *J. Chem. Ind. (Moscow)* 12, 953-4 (1935).—The yield of (PhNH)₂CS, prep'd. according to the patent of Flemming (C. A. 20, 1631) depends chiefly on the temp. reached during the reaction. Therefore, when only the heat of reaction is used, excess of inert reagents must be avoided, and the app. must be well insulated. Yields of 98% are obtained if the mixt. is heated on the water bath for 1 hr. after it has reached the max. temp. (80°) which it can reach alone. H. M. L.

Synthesis of *p*-benzylmercaptobenzenesulfonic acid. Torizo Takahashi *J. Pharm. Soc. Japan* 55, 875-9 (in German 164-5 (1935)).—*p*-ClC₆H₄NO₂ (8 g.) after standing with alc. KOH (200 cc. alc. and 8.5 g. KOH) sat'd. with H₂S, gave *o*-nitrophenylmercaptan (I), m. 77°. I (4 g.) in alc. KOH and PhCH₃Cl (3.26 g.) on heating on the water bath for 2 hrs. gave 4-aminophenyl benzyl sulfide (II), PhCH₂SC₆H₄NO₂, m. 123°. II (2 g.) in alc. (90 cc.), HCl (5 cc., ca. 30%), and 15% MeCl (48 g.) on boiling for 0.5 hr. on the water bath gave 4-aminophenyl benzyl sulfide-HCl (III), m. 256°. III (1 g.) and AcOH (3 g.) on boiling for 2 hrs. on the sand bath gave 4-acetamidophenyl benzyl sulfide, m. 133° and 105°. III (0.5 g.) on boiling gently with BrCl (3 cc.) for 3 hrs. gave 4-benzamidophenyl benzyl sulfide, m. 182°. The diazonium comp'd. of III and Na₂AsO₄ gave *p*-benzylmercaptobenzenesulfonic acid, C₆H₄CH₂SC₆H₄AsO₄H₂, decomp. about 250°, light yellow needles. F. I. N.

Action of dicyanogen on phenols. Georg Hahn and Walter Leopold. *Ber.* 68B, 1974-80 (1935), cf. Machek, C. A. 27, 3922.—In his report of the study of the action of (CN)₂ on phenols (the 3 C₆H₄(OH)₂ and C₆H₃(OH)₃, and the 2 C₆H₃(OH)₂ M. makes the surprising statement that pyrocatechol (I) undergoes nucleus substitution to give the hitherto unknown 3-cyanopyrocatechol (II), all the other phenols and naphthols forming very labile addn. products. On repeating his work, it was found that when purified (CN)₂ is passed into aq. I there soon seps an oil, clear at first, which gradually becomes redder and redder. On long standing it decomposes and deposits a small amt. of the crystals of M.'s supposed II, which, after decanting from the water and rubbing repeatedly with ether, he obtained as a reddish powder, m. 198°, in 52% yield. H. and L. find that the conversion of the oil into the cryst. powder can be effected almost instantaneously, with a slight evolution of heat, by means of dil. HCl, giving 70% of a colorless cryst. substance (III), m. 220°. It does not melt without decompn., however. If the resolidified melt is sublimed *in vacuo*, somewhat more than 50% is recovered as carbonyldibenzene (IV) (Einhorn and Lindenberg, *Ann.* 300, 141). Because of its instability, III was not recrystd. from PhNO₂. Neither is M.'s proposed purification method (soln. in dil. NaOH and reprecip. with HCl) suitable; III undergoes cleavage almost instantly

in alkali and darkens because of atm. oxidation, and only when a large amt. is used can a small part be recovered. By pptn. from acetone-ligron, without heating, however, it was obtained in clear prisms which, after repetition of the process, were analytically pure. Their compn. corresponds to C₁₂H₈O₂·xCN, instead of C₁₂H₈O₂·xCN, as given by M., and mol-wt. detns. point to the formula C₁₂H₈O₂·xCN₂. While III can be crystd. unchanged from dil. HCl, boiling alc. HCl decomposes it into I and (CONH)₂. The formation of (CONH)₂ shows that the C atoms of the (CN)₂ are still attached to each other in III. The further facts that III is sol. in alkalis (i. e., still contains free OH groups), yields IV, forms a diacetate, a dibenzoate and a di-*o*-Me ether, exclude all other possible structures for III than that of a *dipyrrocatechol dimidooxalate*, [C(NH)OC₆H₃(OH)]₂ (V). This structure explains, furthermore, why M. obtained I instead of 2,3-(HO)₂C₆H₃CO₂H on alk. sapon. and veratrole with Me₂SO, and only poor yields on benzylation by the Schotten-Baumann method. With CH₃N₃ in ether, on the other hand, III in acetone almost quantitatively yields the *di-Me ether (diguacyl dimidooxalate)* (VI), which in 104° without decompn. and can therefore be used for mol-wt. detns. by the Rast method, sapon. with 4 N NaOH gives guaiacol and (CONH)₂. The 1st product of the reaction between aq. I and (CN)₂ is assumed to be a comp'd. HOC₆H₃OC(NH)CN (VII) which remains in soln. and reacts with another mol. of I to form the oil, (HOC₆H₃O)₂C(NH)₂CN (VIII). When this oil is converted into III with dil. HCl, the soln. always contains considerable I and NH₄Cl. There must therefore be a partial splitting off of I from the oil and hence the latter must be an addn. product (VIII) of I and VII. H ions (H₂BO₃) can be used instead of HCl) produce a disproportionation of VIII to V, in the course of which a part of the I remains free and the regenerated VII is hydrolyzed to I and (CONH)₂. Definite proof of a further possible change of VII in acid soln. was obtained. If the clear reaction soln. (contg. VII) above the oil VIII is treated with dil. HCl, crystals of IV sep. after a few moments. It is believed they are formed by splitting off of HCN from VII with formation of C₆H₄·O·C(NH)₂·O (IX), which is

then hydrolyzed to IV. This smooth conversion afforded a means for detecting the presence of VII in the reaction mixt. It was found that as long as there was still much I, all the VII combined with it to form VIII, and only toward the end of the reaction was there any considerable amt. of VII. Previous addn. of acid should therefore completely prevent the sepn. of the oil, and, as a matter of fact, by addn. of 10% H₂BO₃ (based on the amt. of I used) the reaction VII → IX can be effected without any sepn. of VIII; at the same time the reaction VII → IX → IV is favored and the yield of III is decreased to 40-50%. The ratio of the products IV:III depends also on the velocity with which the (CN)₂ is passed in, if it is passed in very rapidly the yield of III is increased, while with a very slow rate up to 40% of IV may be formed. This does not yet exhaust the reaction possibilities between (CN)₂ and I. If NaH₂PO₄ is used to allow the formation of VIII there is formed, often exclusively but generally along with III, a new comp'd. After passing in the (CN)₂ for about 2 hrs., there sep. crystals (X) (8.2 g. from 10 g. I), m. 144° (decompn.). At a const. rate of flow of the (CN)₂ and a *pH* of 3.2-4.0, III is obtained directly without sepn. of oil and with only an insignificant amt. of IV; at *pH* 4.9 X is formed along with a little III; at *pH* 4.9-5.3 the ppts. become more and more oily, and at *pH* 5.3, as also in pure water, VIII is deposited. X has the compn. (C₇H₄O₂N)₂; it dissolves in dil. NaOH and even in Na₂CO₃ without color at first but after a time the soln. is turned brown by the air. Contrary to III, which can be crystd. from dil. HCl, X is decomposed by hot water and by cold dil. HCl into I, NH₄Cl and (CO₂H)₂. It is believed that at the acidity of the NaH₂PO₄ soln. (*pH* 4.9) water adds at the double bond of the NH group to form [C(NH₂)(OH)OC₆H₃(OH)]₂ (X). Such addn. does not occur with preformed III, and hence the addn. of H₂O is assumed to be similar to

that of I, viz., VII (+H₂O) → HOC₂H₄C(OH)(NH₂)CN (+I) → HOC₂H₄C(OH)(OH)C(NH₂)OC₂H₄OH (+H₂O) → X. X contains 2 HO groups which can be methylated with CH₃I, and 4 acetylatable HO groups. In non-aq medium (MeOH was used) I treated a short time with (CN)₂, gave crystals (XI) of the compn (C₇H₁₀O₂N₂), sol in dil NaOH, with brown color, only after some length of time, and not methylated by CH₃I. If, here again, VII is formed primarily, the simplest assumption is that the free HO group in VII plays the same role as the 2nd mol. of I in the formation of VII or the H₂O at p_H 4.9 in the formation of X: VII → O C₂H₄ O C(NH₂)CN → [O C₂H₄ O C(NH₂)₂], (XI). The NH₂ groups are apparently not

acetylatable, for heating with AcCl resumes XI. Hydrolysis with cold dil HCl gives a whole series of cleavage products, depending on the length of action. I, (CO₂H)₂, (CONH₂)₂, or the so-called quadroxalate, m 130°, in 1 case the o-HOC₂H₄ ester of (CO₂H)₂, was also obtained in small yield. The action of (CN)₂ on phenols therefore always consists in addn of the phenolic HO at the C N unions, in no case is there CN substitution on the nucleus. An improved form of app for the prepn of (CN)₂ from KCN and CuSO₄ is described. Dibenzate of III, m 129-30°. Di-Me ether of X, m 129-30°, tetraacetate, m 105°. XI, decomposes 139°. C. A. R.

Preparation of pure benzyl acetate E Shapiro *Masloboino Zhivore Dolo* 11, 321 2(1935) — PhCH₂OAc, b_p 93-4°, was obtained from a mixt of PhCH₂OH, Ac₂O, and 3% of the catalytic mixt (10 parts of Ac₂O and 1 part of H₂PO₄, (d 1.7) prep'd 48 hrs before using) by stirring 24 hrs at 35°. The reaction mixt was dild with H₂O, AcOH was removed and the product after neutralization with 10% Na₂CO₃ was dried with anhyd Na₂SO₄ and redistd. Chas Blanc

Properties and uses of some homologs of α-amylinamaldehyde R Fornet *Seifensieder-Ztg* 62, 697-8 (1935) — Example compns illustrate the use in perfumery of α-phenylcinnamaldehyde and various α-alkylcinnamaldehydes, alkyl representing, resp., Me, Et, Pr, Bu, Am, hexyl, heptyl, octyl, nonyl and decyl. J. W. Perry

New experiments in the camphene series Determination of the structure of camphenelaunonic acid Ossian Aschan *Soc Sci Fennica Commentationes Phys-Math* 8, No 1, 13 pp (1935), d C A 4, 3200, 5, 3577, 3579, 3580, 6, 1141 — Attempts to prep the anhydride of camphenic acid (I) by dry distn at normal pressure resulted in decompn into CO and a viscous product which distd over. This could be sep'd by steam distn into 2 monobasic acids, viz., camphenonic acid (II), the constitution of which is known, and camphenelaunonic acid (III), which was volatile with water vapor. When redistd *in vacuo* III b_p 129°, d₄ 1.0187, [α]_D 25.1° (1 dm tube), ketone test neg. The acidity, det'd by titration with NaOH, corresponded to that calcd for III. No salt, non-crystg, soapy. Ba salt, readily sol in water; Ca salt, needles, which ppt on addn of CaCl₂ to an aq soln. of the Na salt, but redissolve in excess of water. Amide, recrystd twice from alc, m 139°, sol in AcOH and alc, slightly sol in benzene and water, insol in cold ligroin. Prepn: Add 0.8 g PCl₅ to 2 g III in a small flask, mix, and let stand for 48 hrs to sep H₂PO₄. Cool, decant the acid chloride, drop by drop, into properly cooled 25% NH₄OH and dry the pptd amide by suction. In view of the formula for I CO can be cleaved in 2 different ways, giving 2 possible formulas for III, viz:

The double bond is evident from the instantaneous discoloration of KMnO₄ and Br solns, resp., when an aq, alk (Na₂CO₃) soln of III is added. The cryst., acid oxidation products thereby obtained were in all cases identical with II. The Thiele test, characterizing the group

, as represented by IV, was neg. HCO₂H

at high temp. and pressure, which in the presence of the same arrangement of 6 C atoms should lead to a hydrolytic decompn of III into COMe₂ and 1-pentanone-3-carboxylic acid (VI), also gave a neg test. A great no of expts on the oxidation of III with KMnO₄ in neutral, acid or alk solns did not yield VI in a single case. In accordance with these observations it is concluded that the structure of III corresponds to that of V. D. T.

8-Methylhydriindane derivatives, and the cis- and trans-2-methyl-1-carboxycyclopentane-2-acetic acids. Chang-Kong Chuang, Chi-Ming Ma and Yu-Lan Tien *Ber* 68B, 1946-52(1935). — Some 8-methylhydriindane derivs, and similar compds, have been synthesized for the ultimate purpose of synthesizing the parent hydrocarbon (I) of the bile acid and sterol groups. It was assumed that by condensation of 2,4-diketo-8-methylhydriindane (II) with 1-methyl-2-acetylcyclohexene (III) according to Michael, and subsequent ring closure, there might be obtained a compd. (IV) which, on Clemmensen reduction of the CO groups, followed by catalytic hydrogenation of the double bond, would give I. The synthesis of II is described in the present paper; the expts now being carried out on the condensation of II with III are reserved for a later communication. III condenses smoothly with CH₃(CO₂Et), in the presence of NaOEt to Et 2,4-diketo-8-methylhydriindane-1-carboxylate (V), which yields II on hydrolysis. II behaves in all respects like dihydrosorcinol, it is a strong acid, easily sol in alkalis and Na₂CO₃, and gives a brown color with FeCl₃. The diketone structure is confirmed by the formation of a dioxime and a characteristic condensation product (VI) with HCHO. Clemmensen reduction gives 8-methylhydriindane (VII). Attempts were made to dehydrogenate VII with Se at 300° to C₁₀H₈, to obtain direct proof of the possibility of expanding a 5- to a 6-membered ring by entrance of the angular Me group into the ring, as is believed to occur in the formation of chrysene from cholesterol. These attempts were unsuccessful, probably because of the relatively low b p of VII, so that a sufficiently high temp could not be attained in the dehydrogenation. II is smoothly oxidized by alk hypobromites to CHBr₂ and cis-2-methyl-1-carboxycyclopentane-2-acetic acid (VIII). Oxidation with hot concd HNO₃ or with alk KMnO₄ gives an oil from which also a small amt. of VIII can be isolated. The cis-configuration is assigned to VIII, by analogy with other acids contg a CO₂H group united directly to the ring, on the basis of the instability of VIII toward HCl, with which at 180° it gives the trans-isomer (IX). VIII smoothly forms a cis-anhydride (X) which regenerates VIII on hydrolysis. IX on similar treatment with Ac₂O likewise forms X instead of a trans-anhydride. X is very stable; long heating at 240° does

not alter its configuration. The configuration of II has not yet been definitely established, but since it gives VIII by 3 different methods of oxidation it is very probable

1 phenolic OH, two MeO and one NMe groups. Its formula can therefore be written as $C_{18}H_{14}(CO)(OH)(NMe)(OMe)$. Possible alternative structural formulae are discussed.

C. L. Tseng
 Quinic acid and derivatives VI Degradation of shikimic acid to ascorbic acid Hermann O. L. Fischer and Gerda Dangschat *Helv. Chim. Acta* 18, 1204-6 (1935); cf. C. A. 29, 1002¹.—The necessarily careful oxidation of Me shikimate (I) was carried out by the slow addn of a 10% HIO₄ soln contg 0.02 mol O₂ to a soln of 1.88 g of I (0.01 mol) in 10 cc H₂O at room temp. After 30 mins the HI formed was removed by shaking with 7 g AcOAg, the soln was neutralized with HCl and filtered through animal black. The filtrate was chilled with ice and treated with a cooled soln. of 50% perpropionic acid (cf. Ans and Frey, C. A. 6, 2737) corresponding to 2.5-3 mols of active O. After standing overnight, the reaction mixt was heated on the steam bath and, on cessation of gas evolution, was evapd *in vacuo*. The partially cryst residue was taken up in 20 cc. of 2 N NaOH, heated for 1 hr. at 50°, and, after precise acidification with H₂SO₄, was taken down to dryness *in vacuo*. Repeated extrn of the residue with AcOEt gave 0.6 g (35%) of ascorbic acid (II), $C_6H_8O_6$, m 184-91° (C. A. 23, 1878), transformed, in 75% yields, to tricarballic acid, m 157-8°, by catalytic hydrogenation in the presence of Pd II, but with a lower m. p., was prepd in almost the same yields by a corresponding procedure starting with free shikimic acid. Quinic acid similarly yields 30% of citric acid. The dialdehyde resulting from the HIO₄ oxidation of I was pptd from the HI- and Ag-free soln by the addn of 2,4-dinitrophenylhydrazine, as the bis-2,4-dinitrophenylhydrazone, $C_{18}H_{14}N_4O_8$, m 169°, in 75% yields. VII Configuration of shikimic acid *Ibid* 1206-13.—Dihydroshikimic acid (I) (C. A. 24, 464), m 180°, [α]_D²⁰ -13.45 (in H₂O) (tri-Ac deriv, b_p 200° (anhydride, m 171-3°), anilide, m 145-7°), was heated to 190°, and, after the total evolution of gas, was distd at 0.2 mm from a bath at 220°. The distillate was taken up in MeOH and, on the addn of AcOEt to the concd soln, yielded dihydroshikimic acid lactone (II), $C_{11}H_{10}O_5$, m 146-7°, [α]_D²⁰ -145.2°, which was completely inert to (AcO)₂Pb AcOH (C. A. 29, 1003¹). Treatment of I with Ac₂O gave the di-Ac deriv of II, $C_{17}H_{14}O_8$, m 145-6°, [α]_D²⁰ -128.3° (in ordinary CHCl₃). The working up of a soln. of 1 g of shikimic acid (III) in 20 cc of dry Me₂CO contg 1% HCl yielded 1.1 g (90%) of acetoneshikimic acid (C. A. 24, 464), m 184° (decompn). III also gave a tri-Ac deriv, $C_{18}H_{14}O_8$, b_p 200-10°, decompn on heating at 240-60°, particularly in the presence of a trace of HCl, to m AcOCH₂CO₂H, m 130°. The working up of a soln. of 10 g of Me shikimate (IV) in 100 cc of Me₂CO contg 1% HCl gave Me isopropylideneshikimate (V), $C_{18}H_{20}O_6$, b_p 150°, volenesulfonate deriv, $C_{18}H_{20}O_6S$, m 66-67°, cleaved with AcOH to the monobenzenesulfonate of IV, $C_{18}H_{18}O_6S$, m 137-8°; Et₂ deriv b_p 180°, catalytically reduced to the benzoate, m 121°, prepd by the acetonization and benzoylation of reduced IV (C. A. 29, 1003¹) and cleaved to the mono-Et deriv of IV, $C_{18}H_{20}O_6$, m 136°. Treatment of V with MeOH-NH₃ gave good yields of isopropylideneshikimide (VI), $C_{18}H_{20}O_5N$, m 150°, which could not be further acetonated with Me₂CO contg HCl. The hydrogenation product of VI could not be isolated but with a mixt of pyridine and Ac₂O was converted into cryst monooctylisopropylideneshikimide, $C_{28}H_{44}O_5N$, m 125°, and on treatment with BrCl and pyridine gave the monobenzoate of isopropylideneshikimic acid nitrate, $C_{18}H_{18}O_6N$, m 168-69°. From the formation of II, its rotation and that of its di-Ac compd, and the prepn of V a configuration of I is proposed in which the following groups in the 1-, 2-, 3-, 4-, 5- and 6-positions are on I side of the plane contg the C atoms CO₂H, H, H, OH, OH and H and the remaining substituents H, H, OH, H, H and H are on the opposite side. In III the configuration around the OH-carrying C atoms is the same but the CO₂H group, controlled by the double linkage, will be directly in the plane of the ring in the naturally occurring acid. The posi-

tion of the double bond in I is between C₁ and either C₂ or C₆ but has not been definitely located in the present investigation. The genetic relationship existing between quinic, shikimic and gallic acids is pointed out and the probability of the formation of the latter by loss of H₂O and dehydrogenation is suggested. C. R. Addinall.

Lignin and related compounds XII Methanol lignin. Fritz Brauns and Harold Hibbert *Can. J. Research* 13B, 28-34 (1935).—Methanol lignin was prepd. by extg spruce wood meal with abs. MeOH, using HCl as catalyst. In 5 small, bomb tube expts, methanol lignin preps having the same MeO content (about 21.6%) were obtained, the product in each case being apparently homogeneous. The methanol lignin was acetylated, partially methylated by treatment with CH₃N₃ and fully methylated with Me₂SO₄ and NaOH. From the elementary analyses and the ratio of MeO in the original methanol lignin to that in the diazomethane methylated compd a formula for the smallest building unit of the methanol lignin and for the native lignin can be derived. The latter is represented by the empirical formula $C_{11}H_8O_4$, or, expanded, $C_{11}H_8O_4(OMe)_2(OH)_2$. XIII The structure and properties of glycol lignin. K. R. Gray, E. G. King, Fritz Brauns and Harold Hibbert, *Ibid* 35-47.—Lignin was extd from spruce wood meal with (CH₃OH), contg (a) 0.05% and (b) 0.2% HCl. On purification the two glycol lignins were found to contain 10.9% OMe and 62.8% C, and 16.5% OMe and 64.7% C, resp. The aq glycol mother liquor was found to contain a sol lignin-carbohydrate compd. The glycol lignin could be sep'd into a CHCl₃-insol and a CHCl₃-sol fraction, each having the same chem compn and yielding the same methylated products. From the glycol lignin, purified by means of dioxane-ether, acetylated and methylated derivs were prep'd, as were also trityl derivs of glycol lignin and pre-methylated glycol lignin. The introduction of 3 trityl groups indicates the presence of 3 primary alc groups in the original lignin. Glycol lignin can be both partially and completely demethylated by use of HI. The effect of the glycol radical on the MeO value in the Zeisel detn was studied and an equation derived for the correction of the MeO value. The bearing of the results on the formula proposed previously for methanol lignin is discussed. XIV. The action of lead tetraacetate and of mercuric acetate on glycol lignin derivatives. K. R. Gray, Fritz Brauns and Harold Hibbert *Ibid* 48-60.—Fully methylated glycol lignin (OMe, 30.4%) was treated with Pb(OAc)₂ and with Hg(OAc)₂. In the first case the AcO group was introduced to the extent of 11.5%. With Hg(OAc)₂, in alc, the sole reaction was the substitution of H by the HgOAc group, there being no addn of EtO or loss of MeO groups. After repeated mercurization the final product contained 42.7% of Hg, i. e., a ratio of introduced Hg atoms to original MeO groups of 1.1. XV. Phenol glycol lignin. Fritz Brauns and Harold Hibbert *Ibid* 55-60.—Phenol condensation products of glycol lignin, of a pre-methylated and a fully methylated glycol lignin have been prep'd. In each case it has been found that, on the basis of the 5 MeO groups present in the original glycol lignin, 3 mols of phenol react with one lignin unit by nuclear condensation, and when the product is worked up immediately no loss of MeO groups occurs. With the fully methylated glycol lignin in 1 expt, some of the MeO groups were removed but the OH groups thus formed could not be remethylated with CH₃N₃, thus indicating their probable aliphatic character. Quercetin does not give a phenol condensation product under the same conditions. J. W. Shipley.

Oxidation of 3-epidihydrocholesterol acetate with chromic oxide 3-Epidihydrocholesterolic acid S. Kuwata and T. Toyama *J. Pharm. Soc. Japan* 55, 978-84 (1935) (in German) 153-4.—Oxidation of epidihydrocholesterol acetate (I), m 96-7°, with CrO₃, according to Ruzicka, (C. A. 29, 810¹) gave 3-acetoxysteroic alcoholic acid, $C_{27}H_{46}O_4$, 199.5° (cor). Lieberman's phytylosterol reaction is pos. The Na salt of I (3 g) on heating with 4% alc KOH (150 cc) on the water bath for 2 hrs gave, after addn of HCl, 3-epidihydroxyal-

cholic acid (III), $C_{24}H_{40}O_6$, m. 244° (cor.). Methylation of II gave 3-epihydroxyallocholic methyl ester of II, $C_{25}H_{42}O_6$, m. 164.5° (cor.). Methylation of epiachoxyallocholic acid gave 3-epiacetoxyallocholic methyl ester, $C_{27}H_{44}O_7$, m. 148° (cor.). Oxidation of II with CrO_3 gave 3-ketoallocholic acid, $C_{24}H_{38}O_6$, m. 187° (cor.).

F. I. Nakamura
Nor- and bisnorlithocholic acids F. Reindel and K. Niederländer. *Ber.* 68B, 1969-73 (1935).—For the degradation of the side chain of lithocholic acid (I) by 1 and 2 C atoms, essentially the Wieland, Schlichting and Jacoby method (*C. A.* 21, 590) was used. In prep. the Me ester of I it was observed that CH_3N_2 gives the known Me ester, m. 125-7°, which seeps with 1.5 mols MeOH, but HCl gas in abs MeOH gives an alc.-free labile ester, m. 90-3°, which, on long standing and recrystn from MeOH or on heating about 0.5 hr above its m. p., rearranges into the higher-melting stable isomer. Both esters give 1, on even mild hydrolysis. *Et* ester, from I with HCl-EtOH, m. 92-3°. *Benzyl* ester, needles with 1 H_2O , m. 145-8°. *3-Ac* deriv. of I, from I boiled with Ac_2O , m. 189°. *Et* ester, from the *Et* ester of I with Ac_2O , m. 90-1°, splits off the *Ac* group on attempted sapon to the free acid. The Me ester (3 g) of I in 30 cc. ether dropped in the course of 1.5-2 hrs into a boiling soln. prep. from 8.5 g MeI and 1.5 g Mg in 15 cc ether gives, after removal of unchanged I with boiling alc. NaOH, about 3 g of *nor*-epicoprostanic-3,24-diol (II), needles from MeOH, m. 141-2°, addn of water to the mother liquors gives 0.3 g. of leaflets of the same m. p. and mixed m. p. but contg. 1 mol H_2O of crystn. *Di*-acetate, m. 79-80°, gives with CrO_3 (6 atoms O) in $AcOH$ 50% of 3-acetyl*nor*lithocholic acid, m. 175-6°, hydrolyzed to *nor*lithocholic (α -3-hydroxy*nor*lithocholic acid) (III), which m. 170-1°, resolidifies and m. again 181-2°. *Me* ester of III, m. 90-100°, *Et* ester, m. 83-5°. With cold CrO_3 - $AcOH$ III gives *dehydranor*lithocholic (3-ketono*nor*lithocholic acid), m. 179-80°. *Me* ester, m. 90°, *semicarbazone*, m. 208-10° (decompn.). *Bis*nor*epicoprostanic*-3,23-diol (IV), prep. like II from the *Me* ester of III, crystals with 0.5 H_2O , m. 196-7°, *di*-acetate, m. 105-6°. *Acetyl**bis*nor*lithocholic* acid, from IV treated with Ac_2O (it is not necessary to isolate the diacetate) and oxidized with CrO_3 , rosets with 1.5 H_2O , m. 210-12°. *Me* ester, m. 148-50°. C. A. R.

The bile acids XLVII Martin Schenck. *Z. physiol. Chem.* 237, 105-12 (1935), cf. *C. A.* 29, 68938°. The ketolactamcarboxylic acid $C_{26}H_{44}NO_6$, of the bilanic acid series, by treatment with 57% HNO_3 for 6 days was converted into the *aminonitrile* $C_{26}H_{42}N_2O_6$ (I), decomp. 205-7°. The product was identical with a previous prep. obtained from the oxime lactam of bilanic acid. The yield was increased to 84.8% by shortening the reaction time to 5 days. Refluxing of I with 10% HCl added H_2O with formation of an *aminoamide* $C_{26}H_{44}N_2O_6$, decomp. 226°, identical with a previous prep. The identity of I was further established by a Beckmann rearrangement to the β -acid, m. 203°. A. W. Dox

Synthetic experiments on the constitution of the bile pigment. XIV. Synthesis of glaucobilin, and on urobilin and mesobiliviolin. Walter Siedel. *Z. physiol. Chem.* 237, 8-34 (1935), cf. *C. A.* 29, 4019°. Glaucobilin IX a, so designated because of its derivation from hemin IX by cleavage at the α -methine bridge of the porphyrin nucleus, has now been synthesized and its structure established in every detail. It is the first bilirubinoide of the unsymmetrical natural series to be prep. artificially by a clear-cut procedure. Moreover, a new proof is advanced for the derivation of bile pigments from the blood pigment. Neoxanthobiluribic acid and isoneoxanthobiluribic acid were esterified with CH_3N_2 and the *Me* esters converted by treatment with dry HCN and HCl into the *formyl* deriv., m. 205.5° and 218-20°, resp. The corresponding free acids obtained by sapon. m. 257° and 273°, resp. Condensation of formylneoxanthobiluribic acid with isoneoxanthobiluribic acid by refluxing the suspension in MeOH with 48% HBr gave the *di*-*Me* ester of glaucobilin IX a, m. 232°, identical with the analytical prep. The

free acid, glaucobilin IX a, m. 316°, was similarly obtained by condensation in the presence of 2 N HCl and treatment of the products with dil. NH_4OH and $AcOH$ and extrn. with $CHCl_3$, finally recrystg. from MeOH. Condensation in the presence of FeCl₃ yielded ferrobilin IX a, m. 265°, from which the *di*-*Me* ester, m. 263-4°, was obtained by esterification with MeOH-HCl. Two glaucobilins isomeric with the above IX a were prep. for purposes of comparison. Glaucobilin XIII a was obtained as the *di*-*Me* ester, m. 246-7°, by condensation of formylneoxanthobiluribic acid with neoxanthobiluribic acid in MeOH by means of 48% HBr. The corresponding ferrobilin XIII a, m. 275°, was obtained by treatment of mesobilurubin XIII in $AcOH$ with FeCl₃ and HCl, and esterified to the *di*-*Me* ester, m. 282.5°. The 2nd isomer, glaucobilin III a, was obtained as the *di*-*Me* ester, m. 237.5-8.5°, by condensation of isoneoxanthobiluribic acid with CH_3O_2 and Ac_2O and esterification with MeOH-HCl. Condensation of formylneoxanthobiluribic acid with isoneoxanthobiluribic acid in MeOH by 48% HBr gave mesobilurubin, while formylneoxanthobiluribic acid with isoneoxanthobiluribic acid yielded mesobilurubin A. W. Dox

Chemistry of plant sterols Jaromír Haňáček and František Fink. *Časopis Českoslov. Lékařnictva* 15, 206-12 (1935).—Of the 0.5% unsaponifiable substances found in *Oleum pruni armeniacae* phytosterol formed 90%. In sample 1 there was found 0.31% of phytosterol, 0.17% of which was free and 0.04% bound as the ester. Recrystd. from ether, sterol forms needle or ruler-like crystals. The I no. of sterol isolated from the above was 61.29. The formula of sterol crystd. from alc was found to be $C_{27}H_{46}O$ H_2O and that of the sterol crystd. from ether $C_{27}H_{46}O$. The Br deriv. of acetylated sterol forms a powder-like substance, m. 86°, with the probable formulas $C_{27}H_{46}O(OAc)Br$. V. D. Karpenko

Corrosion in the production of ethylene chlorohydrin (Iskra) 9. Dehydroandrosterone (Butenandt, et al.) 11F. Testosterone—transformation of dehydroandrosterone into androstenediol and testosterone (Butenandt, Harnisch) 11F. Reactions of sulfonyl diamide (Wood) 6.

Hydrocarbons I. G. Farbenind. A.-G. (Carl Krauch and Martin Müller-Cunradi, inventors). *Ger.* 617,595, Aug. 26, 1935 (Cl. 12a, 19.01). Unsatd. aliphatic hydrocarbons are obtained by dehydrogenating satd. hydrocarbons at high temps. in the presence of a contact agent free from noble metal. Thus, an active C obtained by heating semi-coke to 800-900° in steam, is heated to 450-500° and C_4H_{10} vapor led over the mass. The liquid product obtained by cooling is C_4H_8 rich in C_4H_6 . Other examples are given.

Oxidation of hydrocarbons. Frank J. De Rewal (to Atmospheric Nitrogen Corp.). U. S. 2,022,845, Dec. 3. In the vapor-phase oxidation of a hydrocarbon of the naphthalene or anthracene series, with an O-contg. gas, as in the production of anthraquinone from anthracene, the reaction is catalyzed by the presence of N oxides.

Chlorinating ethylene hydrocarbons Meyer Berhner (to Texas Co.). U. S. 2,022,610, Nov. 26. Dichloro derivs. such as those of C_2H_4 , C_2H_2 or C_2H_6 are produced by the reaction of ethylene hydrocarbons with Cl in the presence of a mixt. of trichloro- and tetrachloro-propanes and -butanes. App. is described.

Olefins and aromatic hydrocarbons from methane and its higher homologs Paul Feiler (to I. G. Farbenind. A.-G.). U. S. 2,022,279, Nov. 26. A gas essentially comprising CH_4 and its higher homologs is brought into contact with heated refractory material contg. 60-95% of SiC with a binder derived from feldspars, cryolites or feldspars, preheated to 700-900° and unsatd. hydrocarbons formed are removed, the refractory material being alternately heated to 900-1300° and brought into contact with the residual gas. App. is described. Cf. *C. A.* 29, 1430°.

Hydrated olefins. N. V. de Bataafsche Petroleum Maatschappij. Fr. 786,687, Sept. 7, 1935. The catalytic hydration of olefins is effected at above 100° under pres-

sure in a vessel the interior surface of which is composed for the greater part of a metal, the normal electrochem. potential of which is between +0.2 and -0.4 on the scale, the zero of which is the normal electrochem. potential of H. In an example Cu or a Cu alloy is used and the catalyst is an aq. soln. of H_2SO_4 contg. a sulfate of Be, Mg, Zn, Cd, Al, Mn, Cr, Co or Ni.

Alcohols Bohme Fettechemie-G m b H. (Wilhelm Normann and Hermann Frickner, inventors) Ger. 617,542, Aug. 26, 1935 (Cl. 12a 5 02) Aliphatic alcs. with more than 8 C atoms in the chain are prep'd by treating the corresponding acids, free from aging products, with H at high temp. and pressure in the presence of a catalyst. Thus, $(AcO)_2Cu$ is dissolved in water and added to kieselguhr. Excess of soda soln. is added to ppt. the Cu as carbonate. This is reduced in a stream of H at 190-200°. The product is a catalyst suitable for hydrogenating freshly prep'd acid from coconut oil to give the corresponding alc.

Alcohols N. V. de Bataafsche Petroleum Maatschappij Bnt. 433,868, Aug. 20, 1935 Alcs. are produced by the hydration of olefins contg. at least 3 C atoms by treatment with an aq. mixt. of a Zn salt and an inorg. acid. Among examples, a mixt. of C_4H_8 and C_4H_{10} , free from iso- C_4H_8 and contg. 30% C_4H_8 , is treated with an aq. soln. contg. $ZnSO_4$, 8 and H_2SO_4 , 4.7% at 225° and 3000 lb. pressure.

Aliphatic alcohols I. G. Farbenindustrie A.-G. Bnt. 433,869, Aug. 21, 1935 Alcs. of high mol. wt. are produced by condensing aldehydes contg. at least 2 C atoms by means of org. N-contg. catalysts and simultaneously or subsequently hydrogenating the products in presence of a hydrogenating catalyst. In examples, (1) crotonaldehyde is condensed by means of hydrogenated β -naphthoquinoline and $Ca(OH)_2$ and the product is hydrogenated with a Co catalyst at 150° and 200 atm.; the product contains BuOH and octyl alc. and about 55% of monohydric and polyhydric alcs. of high mol. wt., without the $Ca(OH)_2$, only 39% of such alcs. is produced, and (2) a mixt. of AcH, decalhydroquinoline and a Ni catalyst or silica gel is hydrogenated to yield a product contg. EtOH 49, BuOH 21 and higher alcs. 30 parts Cf. C. A. 29, 3355⁴

High molecular alcohols Walther Schrauth and Theodor Böttler (to "Umchem" Chemikalien Handels A.-G.) U. S. 2,023,333, Dec. 3 A natural fat such as coconut fat has been added to a hydrogenation catalyst comprising a Cu, Zn, Pb, Mn, Co or Hg salt of palmitic, stearic, linoleic oil, colophonic or naphthenic acid or chromous salt of cocoric acid and is subjected to the action of H under about 100-200 atm. pressure at a temp. of about 280-300° until the esters are sepd. into alcs. and acids and the acids are reduced to alc.

Higher alcohols from waxes Wilfred A. Sexton and Denis Ward (to Imperial Chemical Industries, Ltd.) U. S. 2,021,926, Nov. 26 For the production of a higher alc., a wax such as spermaceti or beeswax, etc., is heated with a dry mixt. of KOH and NaOH in proportions such as to give a eutectic mixt. of the corresponding soaps, and this mixt. is treated with superheated steam.

Drying alcohols and esters Benjamin T. Brooks (to Standard Alcohol Co.) U. S. 2,022,274, Nov. 26 For drying isopropyl alc. and esters or other alcs. and carboxylic acid esters contg. 3 or more C atoms, the material is treated with a concd. aq. soln. of caustic alkali, and the dried compd. is sepd. (suitably by gravity). App. is described.

Amines Knoll A.-G. Chemische Fabriken and Wilfried Klavehn. Ger. 617,536, Aug. 26, 1935 (Cl. 12a 19 03). Unsaid. amines are obtained by condensing 2-methyl-2-hepten-6-one with a primary amine and subjecting the product to the action of a reducing agent. The condensation and reduction may be carried out together. In an example 2-methyl-2-hepten-6-one is dissolved in alc. and treated with aq. CH_3NH_2 soln. Activated Al and alc. are added. The product is 6-methylamino-2-methyl-2-heptene, b. 175-6° (picrate m. 70°). The yield is 90-95%. Other examples describe the prepn.

of the ethylamino and benzylamino compds., b. 66-8° and b. 161-3°, resp.

Amines Knoll A.-G. Chemische Fabriken and Wilfried Klavehn. Ger. 617,579, Aug. 30, 1935 (Cl. 12a 19 03). Addn. to 617,536 (preceding abstr.). Unsaid. amines are obtained by the method of 617,536 by using methylheptenone (2-methyl-1- and -2-hepten-6-one) or mixts. contg. this such as obtained by the hydrolysis of citral or lemon-grass oil. Thus, methylheptenone, b. 168-176°, obtained from citral by hydrolysis with dil. alkali, is dissolved in alc. and treated with aq. CH_3NH_2 soln. and activated Al. The reaction mixt. is then treated with dil. mineral acid and the alc. distd. off. The residue is treated with steam to remove the nonbasic constituents. On adding alkali, a colorless oil seps. and can be driven off by steam. On distn., 6-methylamino-2-methyl-2-heptene, b. 175-6° is obtained.

Amines Karl Rosenmund. Ger. 617,647, Aug. 23, 1935 (Cl. 12g 32 10). Secondary and tertiary amines, aralkylamines contg. at least two $PhCH_2CH_2$, or their derivs. with one or more OH or alkory groups in the Ph residue, linked to the N atom, are obtained from $PhCH_2CH_2NH_2$ or its derivs. Thus, p -MeOC₆H₄CH₂CH₂NH₂ is dissolved in alc. and treated with $PhCH_2CH_2Cl$. An 80% yield of p -methoxyphenethylphenethylamine, m. 188°, is obtained. p -Methoxyphenylacetaldehyde in alc. or AcOH soln. is treated with H in the presence of Pd to give bis(p -methoxyphenethyl)amine, m. 264°. The prepn. of bis(dimethoxyphenethyl)amine, m. 201°, o -methoxyphenylisopropylphenethylamine, m. 145°, (β -methoxyphenylphenethyl)phenethylamine, m. 191-193° and bis(dimethoxyphenethyl)methylamine, m. 230°, is described.

Amines Röhm & Haas Co. Ger. 617,900, Aug. 30, 1935 (Cl. 12g 5). Vaporized MeOH is treated with NH_3 or primary or secondary amines in the presence of a substance contg. chemically bound P as the catalyst. The reaction preferably takes place at 250-500° with $(NH_4)_2P_2O_5$ as the catalyst. Examples are given.

Amines I. G. Farben A.-G. (Walter Speer, inventor) Ger. 620,510, Oct. 23, 1935 (Cl. 12g 5). Addn. to 618,032 (C. A. 30, 107). Nonaromatic primary or secondary amines are converted into secondary or tertiary amines, resp., by reaction with aldehydes (or ketones) and esters of HCOOH. The reaction may be effected at 230-250° under pressure. Examples are given in which (1) $C_6H_5NH_2$, cyclohexanone (I), and HCOOMe (II) yield $C_6H_5NHC_6H_5$, b. 171-4°; (2) piperidine, I and II yield N -cyclohexylpiperidine, b. 123-3°; (3) cyclohexylamine (III), I and II yield $(C_6H_{11})_2NH$, b. 130-2°; (4) piperidine, benzaldehyde and II yield N -benzylpiperidine, b. 133-4°; (5) III, acetone and II yield N -isopropyl-III, b. 93-4°.

Esters of dicarboxylic acids and polyhydroxy compounds. Carl J. Malm and Charles R. Fordyce (to Eastman Kodak Co.). U. S. 2,023,455, Dec. 10 A nonsaccharide polyhydroxy compd. such as ethylene glycol is caused to react with a dicarboxylic acid anhydride such as phthalic anhydride and at least an equiv. amt. of a tertiary base such as pyridine and the resulting product is pptd. with a dil. inorg. acid such as 5% HCl soln. and purified.

Esters of cyanohydrins of unsaturated aliphatic aldehydes I. G. Farben A.-G. (Kurt Meisenburg, inventor) Ger. 617,764, Aug. 24, 1935 (Cl. 12a 22) The above esters are prep'd by the action of an aq. soln. of alkali cyanide on a mixt. of an unsaid. aliphatic aldehyde and an aroyl halide, or substitution products. Thus a mixt. of crotonaldehyde, C_4H_8 and $BaCl_2$ is cooled to -10° and treated drop by drop with an aq. soln. of NaCN to give the BrOH ester of crotonaldehyde cyanohydrin, b. 128-9°. Other examples describe the prepn. of the 2,5-dichlorobenzoyl acid ester of crotonaldehyde cyanohydrin, b. 159-9°, the BrOH ester of sorbaldehyde cyanohydrin, m. 47°, the BrOH ester of acrolein cyanohydrin, b. 158-8°, and the naphthoic acid ester of crotonaldehyde cyanohydrin, b. 180-182°.

Tri-alkyl esters of phosphoric acid. Concorium für elektrochemische Industrie G m b H. Bnt. 433,927,

Aug. 22, 1935. These esters are obtained from POCl_3 and the corresponding alc. by causing the alc. to react with the POCl_3 and treating the reaction product with dry NH_3 , the temp. being kept down to minimize production of alkyl chloride. Examples describe the production of Et and Bu esters.

Polyglycerol esters of aliphatic acids of relatively high molecular weight Benjamin R Harris U. S. 2,023,348, Dec. 3. Numerous examples are given of the production of esters having wetting, emulsifying or antispattering properties, etc., the general mode of manuf. of which is to polymerize glycerol to a desired mol. magnitude, whether it be diglycerol, triglycerol, tetraglycerol or higher polymerized glycerols or mixts thereof, by heating glycerol by itself or in the presence of a catalyst, then freeing the polyglycerol or polyglycerol mixt of unpolymerized glycerol, if any be present, and finally esterifying the polyglycerol material, free of glycerol, with a fatty acid or a fatty acid mixt by causing the two to react with or without the presence of an esterification catalyst, or alternatively with acyl halides or acid anhydrides in or without the presence of a catalyst or condensing agent. As being new compds., general claim is made to esters of a polyglycerol and a relatively high mol. "monobasic" aliphatic acid, the ester contg. at least one free hydroxy group.

Vinyl thio ethers and ethylene dithio diethers I G Farbenind A-G (Walter Reppe and Fritz Nicolai, inventors) Ger 617,543, Aug. 26, 1935 (Cl. 12a 23 03). Mercaptans are treated with C_2H_4 at high temps. in the presence of a catalyst. The C_2H_4 may be added by inert gases. In an example, a mixt. of PhSH , BuOH and KOH is heated to 160° at 15 atm. with a mixt. of C_2H_4 and N_2 in an autoclave. The product is $\text{PhSCH}_2\text{CH}_2\text{SCH}_2\text{Ph}$. The prepn. is described of p - $\text{MeC}_6\text{H}_4\text{SCH}_2\text{CH}_2\text{SCH}_2\text{C}_6\text{H}_4\text{Me}$, b_1 , 125–30°, 2-mercaptobenzothiazole vinyl ether, b_1 , 135–40°, ($\text{PhSCH}_2\text{CH}_2\text{SCH}_2\text{CH}_2\text{SCH}_2\text{Ph}$), m , 70°, (p - $\text{MeC}_6\text{H}_4\text{SCH}_2\text{CH}_2\text{SCH}_2\text{C}_6\text{H}_4\text{Me}$), b_1 , 81°, ($\text{EtSCH}_2\text{CH}_2\text{SCH}_2\text{CH}_2\text{SCH}_2\text{Et}$), b_1 , 91°, ($\text{EtSCH}_2\text{CH}_2\text{SCH}_2\text{CH}_2\text{SCH}_2\text{Et}$), b_1 , 90–5°, and 1,8-chlorothioanaphthol vinyl ether, b_1 , 154–5°.

Ether derivatives of morpholine alcohols Henry L. Cox and Thomas I Carruthers (to Carbide and Carbon Chemicals Corp.) U. S. 2,023,872, Dec. 10. Compds. such as N -(β -ethoxyethyl)morpholine and 2,6-dimethyl- N -(2-methoxypropyl)morpholine are formed by heating a 4-morpholine salt lower alkyl alc. such as N -(β -ethanol)morpholine or 2,6-dimethyl- N -(2-propanol)morpholine with a dialkyl sulfate such as diethyl or dimethyl sulfate in the presence of an inorg. base such as NaOH .

Anthrone derivatives I G Farbenind A-G (Karl Köberle and Otto Schlichting, inventors) Ger 620,345, Oct. 19, 1935 (Cl. 22b 3 14). Leuco compds. of anthrone derivs., the 1- and 9-positions of which form part of a heterocyclic ring, are treated in an alk. medium with an aliphatic, aromatic or heterocyclic aldehyde, e. g., CH_3O , BzH , or furfural. Suitable starting materials are leuco compds. of 1,9-anthrapyrimidine and its substitution products or of 1,9-anthrapyrimidone or 1,9-pyridinoanthrone. Preferably, the aldehyde is added to an alk. vat of the anthrone deriv. at atm. or raised temp., and the pptd. product is filtered. Treatment of the mixt. with air or another oxidizing agent may be necessary to complete the pptn. The products are believed to be in part substitution products of the starting materials, thus, CH_3O yields Me derivs. and BzH yields PhCH_2 derivs. some of the products are useful as dyes, and others as intermediates for dyes. Examples are given.

Salicylic acid derivatives Gddecke & Co, Chemische Fabrik A-G, Fr. 786,887, Sept. 11, 1935. See Brit 430,130 (C. A. 29, 7587°).

Nitrogenous products of oxazoles and imidazoles. I. G. Farbenind. A-G. (Ernst Herdeckerhoff, Werner Zerweck and Heinrich Salkowski, inventors). Ger. 617,544, Aug. 21, 1935 (Cl. 12p. 3). Addn. to 615,526 (C. A. 29, 8003°).

Compds. of the general formula $\text{X}-\text{arylene}-\text{N}=\text{C}(\text{SO}_2\text{H})_2$, in which X represents O or NR (R being H, alkyl, aralkyl or aryl) are treated with NH_3 or agents

yielding NH_3 , or with amines of the aliphatic, aromatic, hydroaromatic or heterocyclic series, which have at least one H atom bound to the N atom. Thus, Na 2-(β -naphthoxazolesulfonate is heated with NH_3 for 2 hrs. at 120° under pressure to give 2-amino- β -naphthoxazole, m , 199–200°. The prepn. of 2-aminobenzimidazole, m , 235°, and 2-aminobenzoxazole, m , 173–4°, is also described.

Acetyl compounds Holzhydrolyse A-G. (Eduard Farber, inventor) Ger 617,989, Aug. 30, 1935 (Cl. 12a 6). Finely powd. carbohydrates are treated with a small excess of Ac_2O in the presence of an acid-condensing agent and the acetyl product, which is insol. in water, is washed or pptd. Thus, wood sugar or dextrin is powdered and treated with Ac_2O in the presence of concd. H_2SO_4 or ZnCl_2 . The products are used as starting materials for artificial masses, paints, etc.

Undecyl compounds Carbide & Chemicals Corp. Fr. 786,734, Sept. 9, 1935. Ethylhexaldehyde is condensed with acetone in the presence of an alk. catalyst to form undecyl ketol of the formula $\text{C}_{11}\text{H}_{21}\text{CH}(\text{C}_2\text{H}_5)\text{CHOH}-\text{CH}_2\text{COCH}_3$, which on losing the atoms of water is transformed to an unsatd. undecylene ketone of the formula $\text{C}_{11}\text{H}_{20}\text{CH}(\text{C}_2\text{H}_5)\text{CH}=\text{CHCOCH}_3$, b , 229°. This is partially hydrogenated to form a satd. undecyl ketone, b , 93°, and hydrogenated to a secondary undecyl alc. of the formula $\text{C}_{11}\text{H}_{22}\text{CH}(\text{C}_2\text{H}_5)\text{CH}_2\text{CH}_2\text{CH}(\text{OH})\text{CH}_3$, b , 225°, which can be sulfonated to give a product which has wetting and cleansing properties.

Desulfonating diaminodiphenylamine-2-sulfonic acid compounds Luther M. Lauer (to National Aniline & Chemical Co.) U. S. 2,022,889, Dec. 3. Desulfonation of compds. such as 4,4'-diaminodiphenylamine-2-sulfonic acid, etc., is effected by hydrolysis in the presence of a nonoxidizing inorg. acid, as by heating with aq. H_2SO_4 .

Reaction of sodium with aromatic hydrocarbons Norman D. Scott (to E. I. du Pont de Nemours & Co.) U. S. 2,023,703, Dec. 10. An alkali metal such as Na is caused to react with naphthalene or a homolog, as in the production of 1,4-disodium naphthalene in a vehicle comprising dimethyl ethylene glycol ether or other polyether derived from an aliphatic polyhydric alc. having all the hydroxyl H atoms replaced by alkyl groups and which promotes the reaction but is inert to the reagents and products. Cf. C. A. 30, 490°.

Hydroxybetyl chloride. Clyde O. Henke and Milton A. Frahl (to I. I. du Pont de Nemours & Co.) U. S. 2,023,473, Dec. 10. Di- or tetra-hydroxybetyl chloride is obtained by reaction of PCl_5 or thionyl chloride upon a hydrogenated rosin. Cf. C. A. 29, 8000°.

Metal carbamates Ernst Kuss and Emil Germann (to I. G. Farbenind A-G.) U. S. 2,023,890, Dec. 10. Carbamate is formed by reaction of NH_3 , carbamate on CaCl_2 in EtOH substantially in the absence of water. Other carbamates such as those of Na, K, Ba or Zn may be similarly formed from the chloride, nitrate or oxide of the metals. Several examples are given. Cf. C. A. 29, 2549°.

Dithiocarbamates. Wilhelm Rittmeister (to Deutsche Hydrierwerke A-G.) U. S. 2,022,979, Dec. 3. Dithiocarbamates are produced from CS_2 and a primary or secondary amine such as piperidine, cyclohexylamine, dibutylamine or the like by reaction in finely divided state and while dried by an inert carrier gas such as water gas or H_2 . Several examples with details of procedure are given.

Aldehydes J. D. Riedel-E. de Haën A-G. (Friedrich Boedecker and Hans Volk, inventors). Ger. 617,763, Aug. 24, 1935 (Cl. 12a. 9). Aromatic hydroxy aldehydes are obtained by treating salts of glyoxylic acid with mono-alkyl ethers of pyrocatechol in a neutral or alk. medium, and subjecting the resulting condensation product to the action of a moderate oxidizing agent. Thus, a soln. of glyoxylic acid obtained by the electrolytic reduction of $(\text{CO}_2\text{H})_2$ is neutralized with NaOH and added to a concd. soln. of guaiacol in NaOH . The product is oxidized by CuSO_4 and NaOH to give vanillin.

Citrates Giuseppe Bosurgi and Paul Stukart. Ger. 620,152, Oct 16, 1935 (Cl 12o 11). A water-insoluble citrate of Pb or Zn is pptd. from suitable fruit juices or from fermentation mash in which citric acid is formed. The ppt. is then treated with a soln. of a salt derived from an alkali metal, NiH, or Fe and an acid which forms a water-insoluble Pb or Zn salt. Carbonates, phosphates, sulfides or sulfates are suitable salts. The soln. of alkali metal, NiH, or Fe citrate so produced is crystallized.

Xanthates Ernest D. Wilson (to W-B Chemical Co.). U. S. 2,021,930, Nov. 26. Vapors of CS₂ are brought into contact with a liquid monohydric alc. and a caustic alkali to form a xanthate. App. is described.

Cyclic cyano ketimides and ketones from alkylene dinitriles Schering-Kahlbaum A.-G. (Karl Ziegler, inventor). Ger. 620,904, Oct. 30, 1935 (Cl. 12o 25). Addn to 591,209 (C. A. 28, 2364). The process of Ger. 591,209 is modified by using as the condensing agents compds. of the formula RR'NM, where R is an aryl radical, R' is a nonaryl radical, and M is an alkali metal, preferably Na. The reaction is effected in a concd. or satd. soln. of the condensing agent in an org. solvent and under such conditions that the concn. of dinitrile in the reaction mixt. is always very low. In the examples, (1) CN-(CH₂)₆CN and PhMeNNA in etheral soln. yield 1-cyanocyclohexadecanone-2-imide, m. 147-8°, from which cyclohexadecanone, m. 53°, is obtained by boiling with 70% H₂SO₄; (2) CN-(CH₂)₈CN and PhC₆H₅NNA yield a cyano ketimide from which cyclohexadecanone is obtained as in (1).

Refining crude alkyl phenols Reuben Schuler (to Stanco Inc.). U. S. 2,022,256, Nov. 26. For removing alkyl phenyl ethers from crude alkyl phenols, the alkyl group of which contains 4 or more C atoms, such as *sec*-hexyl cresols, the crude material is dissolved in liquid NH₃, the soln. is sepd. from the undissolved residue of the alkyl phenyl ethers, and the dissolved product is recovered from the liquid NH₃.

Alkylated phenols Röhm & Haas Co. Ger. 616,786, Aug. 5, 1935 (Cl. 12g 16). Alkylated phenols of the general formula RR'OH, in which R' is a mono- or polycyclic aromatic or substituted aromatic nucleus and R is an alkyl group derived from disubutylene are obtained by treating PhOH or its homologs or substitution products with the equiv. amt. of di- or triisobutylene in the presence of a small amt. of concd. H₂SO₄ at 25-35°. H₂SO₄ of 96% strength is used, 0.075 to 0.30 mol. being used to each mol. of PhOH. Examples describe the prepn. of disubutylphenol, and disubutyl-*p*-cresol, m. 46-47°. The substances are used as intermediates for the prepn. of dyes, drugs, tanning and wetting agents.

Asymmetrical ureas Josef Hilger and Carl Taube (to General Aniline Works). U. S. 2,022,935, Dec. 3. Compds. of the general formula RNHCONXY, where R stands for the radical of an aminoazo compd. free from a free carboxylic acid or a free sulfonic acid group, but in which the nuclei may be otherwise substituted, for example by alkyl, hydroxyalkyl, halogen, the hydroxy group, an alkoxy group, the nitro group or an esterified carboxylic acid group, and X stands for H or alkyl and Y stands for radicals of the benzene or naphthalene series, are obtainable by causing an isocyanate of an aminoazo-compd. free from a free carboxylic acid or a free sulfonic acid group and ammonia or a primary or secondary amine of the aliphatic, aromatic or aliphatic-aromatic series, to act upon each other in a solvent. The process is favorably carried out by working with about mol. quantities of the two reacting components, and as a general rule can be performed at temps. of 30-100°, and due to the evolution of heat produced in the exothermic reaction, in some cases the process can be performed without heating. The products are suitable for use as dye intermediates and various examples are given.

Nitriles of resin acids Otto Nicodemus and Otto Wulff (to I. G. Farbenindustrie A.-G.). U. S. 2,023,337, Dec. 3. Gaseous NiH₂ is caused to react upon a resin acid or a resin acid ester such as colophony (suitably at a temp.

of about 350°) in the presence of a catalyst promoting dehydrations, such as silica gel. Nitriles are formed which form highly viscous balsams.

Synthesis of aliphatic acids Alfred T. Larson (to E. I. du Pont de Nemours & Co.). U. S. 2,022,344, Nov. 26. Acids such as propionic, butyric and valeric acids are produced by the reaction in the liquid phase, of an olefinic hydrocarbon such as C₃H₄, C₄H₄ or C₅H₄ with CO and water (suitably under a pressure of 25-900 atm. and at temps. of 150-385°). Various examples with details of procedure are given. The reaction may be catalyzed by the use of CuSO₄ and H₂SO₄, cupric phosphate and H₂PO₄, CuCl₂ and HCl, an ammoniacal Cu soln., MgCl₂ and HCl and activated charcoal, CaCl₂, Cd phosphate, silicotungstic acid, ZnCl₂, CaI₂, NaBr, KCl, etc. Cl. C. A. 30, 491.

Formic acid Gilbert B. Carpenter (to E. I. du Pont de Nemours & Co.). U. S. 2,023,003, Dec. 3. A gaseous mixt. of CO and steam (suitably at a temp. of about 325°) is passed over a catalyst contg. primary Ca phosphate or other suitable acid salt of the acidic oxides of P, As, W, Mo, U, Cr, V, B, Si or Zr. Pressures of 25-900 atm. may be used. Cl. C. A. 29, 4379.

Polyhydroxy monocarboxylic acids Oskar Spengler and Adolf Pfannenstiel. Ger. 620,248, Oct. 17, 1935 (Cl. 12o 11). Monosaccharoses, or higher sugars having reducing properties, are treated in aq. alk. soln. with air at about 45-90°, the air being fed to the soln. in such a state of subdivision that the soln. becomes turbid. Polyhydroxy carboxylic acids contg. a lower no. of C atoms in the mol. than the starting materials are obtained. An example is given of the prepn. of *d*-arabonic acid from glucose. Cl. C. A. 30, 111.

Aromatic arsonic acids Karl Streitwoll, Alfred Fehrlé and Hubert Oesterlin (to Winthrop Chemical Co.). U. S. 2,023,751, Dec. 10. See Ger. 543,114 (C. A. 26, 3263).

Aminopyrenesulfonic acids I. G. Farbenindustrie A. G. Brit. 434,123, Aug. 26, 1935. The acids are obtained by (1) treating 3-aminopyrene (I) with a sulfonating agent at 20-50°, (2) converting I into its acid sulfate and heating the product, preferably *in vacuo*, to a high temp. and (3) nitrating 8-pyrenesulfonic acid (II) and reducing the product. In examples, (1) I is sulfonated with H₂SO₄, H₂O to give a mixt. of 3-amino-8- and -10-sulfonic acids, (2) I is converted to the sulfate, which, on heating *in vacuo*, gives the 3-amino-4-sulfonic acid and (3) II, obtained by treating pyrene in CCl₄ with CH₃SO₃H, is nitrated and then reduced with a Ni catalyst and H₂ under pressure. In 434,160, Aug. 27, 1935, divided on and addn. to 434,123, a 3-aminopyrenesulfonic acid is obtained by treating I with CH₃SO₃H, whereby it is converted into the chlorosulfonate, and heating in a solvent, e. g., *o*-dichlorobenzene, which causes the evolution of HCl. Cl. C. A. 29, 6164.

Replacing the sulfonic acid group by hydrogen. Chemische Fabrik von Heyden A.-G. (Bayer-Körner and Karl Willy Rittler, inventors). Ger. 617,720, Aug. 24, 1935 (Cl. 12g 14 02). The HSO₃ group in salts of aromatic, hydroxy sulfonic acids is replaced by H by heating the salts with water under pressure in the presence of an equiv. amt. of a water-sol. alk.-earth salt. Thus, Na phenolsulfonate is heated to 200° with CaCl₂ in water and a small amt. of HCl in an autoclave at 14-15 atm. On removal of the resulting CaSO₄, a 90% yield of PhOH can be steam-distd. off. Other examples are given.

Acetaldehyde. Chemische Forschungen G. m. b. H. (Hans Deutsch and Willy O. Herrmann, inventors). Ger. 617,762, Aug. 30, 1935 (Cl. 12o 7 02). Acetaldehyde is made distn.-stable in mono- or trimeric form by treatment with acid-binding substances with the exception of org. salts, in such quantity that a negligible amt. of alkol is formed. Preferably agents which bind only the inorg. or inorg.-substituted org. acids are used. In an example, C₆H₅I is led over AcOH and H₂SO₄ to give ethylidene diacetate. This is split into AcOH and AcH by water and C₆H₅SO₃H. The AcH is an unstable mixt. of AcH and

paraldehyde. If shaken with AcONa , the AcH is rendered sufficiently stable for sepn. from the paraldehyde by fractional distn. Other examples are given.

Acetaldehyde from acetylene I. G. Farbenind A-G (Walter Rosinsky, inventor) Ger. 620,402, Oct. 21, 1935 (Cl. 120 7 02) This corresponds to Brit 313,864 (C. A. 24, 1125), but gives addnl examples.

Dichloroethylene Compagnie de produits chimiques et électrometallurgiques Alus, Iroges et Camargue Fr 786,803, Sept. 10, 1935 CCl_2CH_2 is made by heating metals such as Fe, Zn and Cd with $\text{CCl}_2\text{CH}_2\text{Cl}$ in the presence of water.

Ethylene oxide Edgar C. Britton, Gerald H. Coleman and Iverson Mate (to Dow Chemical Co.) U. S. 2,022,182, Nov. 26 In the prepn of $\text{C}_2\text{H}_4\text{O}$, a base such as NaOH is gradually added to β -chloroethyl acetate while agitating the reaction mixt and maintaining it at a temp. of between about 40° and about 150° .

Ethylene oxide N. A. de Bitaafche Petroleum Mart-schappij Brit 434,011, Aug. 23, 1935 C_2H_4 is oxidized with the use of a catalyst prepd by the thermal decomposn of an org. Ag compd., particularly the oxalate. One or more heavy metals, e. g., Cu, Au, I, Fe, Mn, Co, Ni, Ce, Th or Zn may be present as activators. The reaction may be effected at $350\text{--}400^\circ$. The gas mixt. should contain 8–9% C_2H_4 , diluents, e. g., steam or N, may be present.

Mono- and dimethylamine I. G. Farbenind A-G (Paul Herold and Karl Schmalz, inventors) Ger. 620,298, Oct. 17, 1935 (Cl. 124 4) Mixts. contg. MeNH_2 , Me_2NH and water are subjected to fractional distn. so as to sep. a mixt. of the amines from the water. The amines are then sepd. from one another by further fractionation. The

process may be applied to mixts. obtained by the reaction of MeOH or Me_2O with NH_3 . An example is given.

3,3-Dimethyl-1-bromobutane. Frank C. Whitmore and Walter R. Trent (to Mallinckrodt Chemical Works). U. S. 2,022,485, Nov. 26 This compd., a colorless oily liquid $b_{\text{m.p.}}$ $134\text{--}7^\circ$ and of pleasant odor, is produced by reaction of PBr_3 on 3,3-dimethyl-1-butanol.

Musk xylene Walter V. Wirth (to E. I. du Pont de Nemours & Co.) U. S. 2,023,865, Dec. 10. Nitration of *tert*-butyl-*m*-xylene, in prep. musk xylene, is effected in one step by the use of a com. grade of mixed acid.

tert-Butyl-*m*-xylene Walter V. Wirth (to E. I. du Pont de Nemours & Co.) U. S. 2,023,566, Dec. 10. *tert*-Bu chloride is caused to react with *m*-xylene in the presence of AlCl_3 in less than 2% of the amt. of the *tert*-Bu chloride, while keeping the temp. below 50° during the entire reaction.

Pentaerythritol Lonza I. kktirizitätswerke und Chemische Fabriken A-G Fr 786,000, Sept. 14, 1935 See Swiss 176,018 (C. A. 30, 1129)

Hydrogenated benzoisotriazoles Chuno Gygyszer és Vegyszeri Termék Gyára R. T. (Kereszty & Wolf). Ir 786,884, Sept. 11, 1935 See Ger. 613,123 (C. A. 29, 50019)

Acenaphthylene I. G. Farbenind A-G (Carl Wulff, Otto Nicodemus and Max Truppenhauer, inventors). Ger. 617,004, Aug. 26, 1935 (Cl. 120 19 01). Acenaphthene vapor is heated to high temps. in the presence of a dehydrogenating catalyst consisting of difficultly reducible oxides of metals of the 2nd to 7th groups of the periodic table. Examples of such catalysts are ZnMoO_4 and MgO , ZnO and Al_2O_3 , MgO and C. Cf. C. A. 29, 5129⁴.

PAUL E. HOWE

A—GENERAL

ARTHUR W. DOX

Biochemistry of zinc Oswaldo de Almeida Costa *Rev. quim. e farmacia* 1, 3–11 (1935) —A review with 4 references. E. S. G. B.

Cozymase. H. v. Euler, H. Albers and F. Schlenk *Z. physiol. Chem.* 237, 1–11 (1935), cf. C. A. 29, 5863⁴ —The purification procedure has now been perfected to the point where a uniform product with cozymase activity of 400,000 can be obtained in 25% yield. Analyses correspond to the formula $\text{C}_{14}\text{H}_{20}\text{O}_4\text{N}_4\text{P}_2$. The substance is believed to be pure cozymase. It contains 19.5% adenine. On the assumption that the substance is a dinucleotide, 5 of the 8 N atoms are in adenine, 2 belong to a basic component which yields nicotinic amide on hydrolysis and the 8th may account for the NH_3 evolved. The picric acid salt has N content and cozymase activity in close agreement with the calcd. values. A. W. Dox

Enzymic histochemistry. XVI. The digestion of keratin by the larvae of the clothes moth (*Tineola bisellifera* Humm). K. Landerstrom-Lang and F. Duspiva *Z. physiol. Chem.* 237, 131–58 (1935); cf. C. A. 29, 4701⁴ —In the intestinal cells as well as in the succus entericus, a very active proteinase is present which shows optimal cleavage of casein at pH 9.3. The proteinase does not attack native wool either at its optimum pH or at the pH of the intestinal juice (9.6–10.2). The alk. reaction alone is not sufficient for hydrolysis of keratin. The intestinal juice of larvae which have eaten wool gives an intense nitroprusside reaction, which, however, does not occur if they have not eaten or have been fed a nutrient poor in S (cotton-casein), but reappears when cystine is added to the feed. The nitroprusside reaction is neg. if the intestinal juice of wool-fed larvae is exposed to air a few min; hence the SH-substance is autooxidizable. In cleavage exps. with wool at pH 10 and addn. of reducing agents (Li-H and $\text{HSCl}_2\text{CO}_2\text{H}$) the wool dissolves with liberation of NH_3 and CO_2H groups in equal proportions, indicating the cleavage of peptide linkages. In the mid-

intestinal lumen of living larvae there is a reduction which can be demonstrated by feeding oxidation-reduction indicators. The reduction state is independent of the presence of major quantities of SH-compds. and persists in larvae which have been fed cotton-casein. The existence of a reducing agent is thus demonstrated. The proteinase of *Tineola* is somewhat sensitive to SH in the hydrolysis of casein. Trypsin-kinase is inert in the reducing medium required for the breakdown of keratin. Larvae of *Tineola* thus possess a keratinase, in the sense of a system which consists of a proteinase active in a reducing medium at alk. optimum and a reducing agent which breaks down the molecular structure of keratin and so renders the protein accessible to enzyme action. A. W. Dox

The free diffusion of nucleic acids and mononucleotides as a means of determining their molecular magnitude. With especial consideration of the molecular magnitude of the pentosepolynucleotide from pancreas and a comment on the molecular magnitude of cozymase. K. Myrback and E. Jorpes *Z. physiol. Chem.* 237, 159–64 (1935). —Two important factors must be considered in detg. the mol. wt. of nucleic acids by the diffusion method. The elec. charge of the substance affects the apparent mol. wt., so that adenylic and guanylic acids give about half, and yeast nucleic acid gives about one-third, of the true value, while nonelectrolytes such as sucrose show the correct value. Salts exert an inhibitory influence on the diffusion of the electrolytes, increasing with increase in mol. wt. Pancreatic nucleic acid diffuses more slowly than yeast nucleic acid, because of the greater size of the mol. For a polynucleotide structure, as the analysis indicates, the mol. wt. is calcd. to be 1649. In 1% NaCl soln., they give values near the theoretical for guanylic, adenylic and yeast nucleic acids, the value for pancreas nucleic acid is about 3000. Whether this is because of a union of 2 pentanucleotide complexes or the result of an increased salt effect on the larger mol. is difficult to decide. At any rate the pentosenucleic acid in the pancreas cannot be a mixt. of yeast nucleic acid with guanylic acid, but must be considered a particular type among the polynucleotides.

Expts with mononucleotides, especially those with yeast adenylic acid, have a certain bearing on the question of the mol magnitude of cozymase. The value of approx. 500 was not materially altered by diffusion in 5% NaCl. Possibly this is because cozymase is a monobasic and less strongly dissociated acid than adenylic acid. The expts. indicate a mol wt of cozymase not far from 500.

A. W. Dox

Glycerophosphatase activity in the tissues of animals deprived of vitamin A. Luc Emerique *Bull. soc. chim. biol.* 17, 1372-7 (1935), cf. C. A. 29, 4795.—Lack of vitamin A caused a slight decrease in the glycerophosphatase content of the kidneys (rats) and a considerable increase in that of the lungs. There was no change with the kidneys. Individual variations were large. L. E. G.

Energy of growth. XIV Action of toxic concentrations of zinc and manganese salts on energy yields of germinating seeds. Germaine Boy *Bull. soc. chim. biol.* 17, 1414-26 (1935).—When $ZnSO_4$ or $MnSO_4$ was added to water cultures of rice in such concn that germination and growth were retarded the "growth energy" yield, as detd by the heat of combustion of the seedlings, was considerably decreased. L. E. Gilson

Dehydrogenase of the S and R forms of Aertycke's bacillus. Eugène Soru *Compt. rend. soc. biol.* 120, 232-5 (1935).—Methylene blue was used as the H acceptor. With glucose, asparagine, Na lactate and Na succinate as H donors the dehydrogenase of the S form was much more active. With glycerol the difference was slight and with glycine there was no apparent difference in the activity of the 2 forms. L. E. Gilson

Compounds of proteins with o-nitrophenols. Adolph Bolliger *Australian J. Exptl. Biol. Med. Sci.* 13, 189-91 (1935).—Edeston, casein and globin form compds. which are approx. const. in compn by "saturating" with picric acid, picrolonic acid or 2,4-dinitronaphthol. C. G. K.

Photochemical oxidation of hemoglobin. F. G. Lennox *Australian J. Exptl. Biol. Med. Sci.* 13, 193-6 (1935).—The presence of KI accelerated the conversion of hemoglobin to methemoglobin when irradiated with ultraviolet light. C. G. King

Studies on invertase. I A new modified method for the isolation and purification of invertase. Takekazu Kōzaki *Japan J. Gastroenterol.* 7, 125-34 (1935).—Brewers' yeast with a high invertase value was autolyzed 3 months in the presence of $(NH_4)_2HPO_4$. After decantation it was filtered with "Glashter". Alc. pptn. was employed twice to remove N compds. The yeast gum was next removed by adsorption on raw kaolin at a pH of 3.2 followed by elution with dil. NH_4OH after 30 min. The gum remains fixed to the kaolin and the detail of importance is the prompt removal of the enzyme from the untreated kaolin. Only 20% of the enzyme is lost after this prepn is dialyzed through a fish bladder. The time value of this prepn was nearly equal to that of Willstätter. The prepn is the "abnormal" type of β -D-fructosidase. II Thermal analysis of the invertase action. I General treatise and the determination of the reaction heat. *Ibid.* 135-47.—The inversion heat of sucrose was detd. in a special calorimeter and found to be 4.1 cal per g mol. The inversion of sucrose follows the equation of $dx/dt = k\sqrt{a_1 + x}$ in the earlier stage and $b_1(a - x)/(a_1 - cx)$ afterward. III Thermal analysis of the invertase action. 2 The enzyme amount and the reaction velocity. *Ibid.* 148-53.—In these equations k_1 and b_1 bear a direct relation to the amt. of enzyme, but the time of the first reaction is not influenced by the concn of invertase. IV. Thermal analysis of the invertase action. 3 The sucrose concentration and the reaction velocity. *Ibid.* 154-61.— k_1 and b_1 are little influenced by the sucrose concn, while a_1 is inversely proportional except in concns of 2-7.5%. The time of the first reaction shortens with decrease in initial sucrose concn. V. Thermal analysis of the invertase action. 4 The hydrogen ion concentration and the reaction velocity. *Ibid.* 162-6.— k_1 and b_1 are const. at pH 2.9-3.1 and then decrease at 6.2-7. The first reaction is longer at pH 6.2-7.0. VI

Thermal analysis of the invertase action. 5 The temperature and the reaction velocity. *Ibid.* 167-72.— k_1 and b_1 have an optimum at 37° and heat inactivation starts at 35°. VII. A theoretical consideration of the invertase action. *Ibid.* 173-8. C. M. McCay

Are serum proteins affected by the time the blood stands before removing the serum from the coagulate? Jens Bing *Acta Med. Scand.* 86, 367-9 (1935).—In the detn of serum proteins by the Henriques-Klausen method (C. A. 27, 329) the results are not affected by the time blood is allowed to stand before removing the serum. S. M.

Proteolytic activity of saliva. I Autoproteolysis of saliva. Paul Fantl and Josef Weissmann *Biochem. Z.* 281, 37-41 (1935).—Human saliva contains proteinases, derived apparently almost entirely from the cellular elements and not from the oral flora, which for the same individual show a more or less definite activity. The protein of saliva undergoes hydrolysis under the influence of these salivary proteinases without any marked alteration in the pH. II. Reaction of human saliva with proteins. *Ibid.* 42-8.—Human saliva cannot hydrolyze fibrin or egg albumin which has been denatured by boiling or pepsin, at room temp. Even the hydrolysis of fibrin, prepd. according to Fuchs (C. A. 20, 3465, 21, 427, 2001; 25, 5182), obtained with mixed saliva is shown not to be due to the salivary proteinases but to the presence in the fibrin of a fibrinolytic enzyme. S. Morgulis

Pectin enzymes. III Complete direct hydrolysis of pectic acid to d-galacturonic acid by pectolase. Felix Ehrlich, Renate Guttman and Ruth Haensel *Biochem. Z.* 281, 93-102 (1935), cf. C. A. 26, 5588.—Pectic acid is hydrolyzed almost quantitatively to d-galacturonic acid with pectolactonic acid as an intermediate product of the reaction. S. Morgulis

Optical studies on the hair pigment. H. Zwicky and F. Almsay *Biochem. Z.* 281, 103-10 (1935).—The light extinction of alk. exts. (in 5% KOH) from white, red and black hair as well as from melanomas of the horse was investigated. The black pigment, the pigment from red hair and the melanin from melanomas, could not be distinguished from each other spectroscopically. The alk. solns. of the pigments obeyed the Lambert-Beer law quite consistently and did not alter in their optical properties on long standing. S. Morgulis

Effect of cholesterol and insulin on yeast fermentation. Siegwart Hermann and Richard Neiger *Biochem. Z.* 281, 121-7 (1935).—Cholesterol sol. inhibits the fermentative activity of living yeast, but increases that of yeast autolyzates. This is probably not simply a colloidal phenomenon, since it is not reproducible either by paraffin or matrix sol. The stimulation of yeast fermentation by some insulin preps. can be much inhibited by cholesterol sol. The insulin has no effect on the fermentation by yeast autolyzates. The identity of the stimulating factor of the insulin preps. with cozymase is questioned. S. M.

Coupling of the chemical reactions in alcoholic fermentation. I. Synthesis and cleavage of adenosinetriphosphoric acid and its relation to the processes of cleavage of sugar. C. Lutwak-Mann and T. Mann *Biochem. Z.* 281, 140-56 (1935).—In muscle, through the transfer of P from adenosinetriphosphoric acid (ATP) to glycogen, the glycogenolytic process is set in motion, and the resulting adenylic acid is again phosphorylated by the intermediate products of glycogenolysis (phosphopyruvic acid) and by the phosphocreatine, thus being prevented from deamination. Subsequently, phosphocreatine is rephosphorylated from ATP and creatine. An investigation of the role of adenylic acid and of adenosinetriphosphoric acid in alc. fermentation leads to the extension of this idea of their part in the process of sugar fermentation by yeast. Analyses of Lebedev's yeast juice show that this contains only very little adenylic acid and ATP, just as autolyzed or dialyzed muscle juice. The Lebedev juice as well as fresh yeast can accumulate ATP from added adenylic acid, when glucose ferments in the presence of phosphate. The P for the phosphorylation of the adenylic acid arises from 2 sources of fermentation intermediate products. Hexosediphosphoric acid causes a phosphorylation of 80%

of added adenylic acid and this reaction is practically insensitive to F poisoning. Phosphoglyceric and phosphopyruvic acids likewise act as P donors for adenylic acid, with the formation of ATP and of pyruvic acid, and this reaction is completely inhibited by F. The ATP added to Lebedev's juice in the presence of glucose leads to its phosphorylation, thus $\text{ATP} + \text{glucose} \rightarrow \text{hexosediphosphoric acid} + \text{adenylic acid}$, whereas in the presence of hexosediphosphoric acid there is no dephosphorylation of the ATP, which is thus responsible for the synthesis of the first fermentation product, the fructose diphosphate. Furthermore the ATP is the essential agency for the transformation of phosphoglyceric or phosphopyruvic acid to pyruvic acid. Phosphoglyceric acid inhibits the cleavage of ATP in the Lebedev juice while free adenylic acid stimulates the transformation of the phosphoglyceric acid.

II. Formulation of a theory J. K. Parnas, C. Lutwak-Mann and T. Mann *Ibid* 168-74—(1) The induced reaction of fermentation $\text{Glucose} + \text{H}_2\text{PO}_4 \rightarrow \text{hexose ester}$ is dependent upon the ATP and adenylic acid present in the maceration yeast juice $\text{ATP} + \text{glucose} \rightarrow \text{hexosediphosphoric acid}$, and $\text{hexosediphosphoric acid} + \text{adenylic acid} \rightarrow \text{ATP}$, which is unaffected by F. But, as with muscle, phosphoglyceric acid + adenylic acid $\rightarrow \text{ATP} + \text{pyruvic acid}$, or aldehyde + CO_2 , which reaction can be inhibited by F. In yeast fermentation, as in muscle, 2 enzyme systems are found which promote the splitting of P from hexosediphosphoric acid and phosphoglyceric acid by an acceptor or the phosphorylation of sugar by a donor. (2) The fermentation induction is supposed to involve 3 distinct reactions the summation of which is expressed by $\text{ATP} + 2 \text{ glucose} + \text{H}_2\text{PO}_4 \rightarrow 2 \text{ phosphoglyceric acids} + 2 \text{ glycerophosphoric acid} + \text{adenylic acid}$. Two subsidiary reactions are assumed to take place. (a) $2 \text{ phosphoglyceric acid} + \text{adenylic acid} \rightarrow 2 \text{ pyruvic acid} + \text{ATP} + 2 \text{H}_2\text{O}$; (b) $\text{pyruvic acid} \rightarrow 2 \text{AcH} + 2 \text{CO}_2$. The entire induction is, therefore, a summation of these various reactions: $2 \text{ glucose} + 2 \text{H}_2\text{PO}_4 = 2 \text{ glycerophosphoric acid} + \text{ATP} + 2 \text{AcH} + 2 \text{CO}_2 + 2 \text{H}_2\text{O}$, in other words, the P-transferring agent ATP is again resynthesized. The reaction is also identical with Neuberg's second form of fermentation, since the yeast phosphatase hydrolyzes the glycerophosphoric acid to glycerol. (3) The fermentation of glucose in the presence of F and of an excess H_2PO_4 , since there is no splitting of P from phosphoglyceric acid, is summed up in the reaction: $n \text{ glucose} + 2n \text{H}_2\text{PO}_4 = n \text{ phosphoglyceric acid} + n \text{ glycerophosphoric acid} + 2n \text{H}_2\text{O}$, with the retention of the original ATP and no accumulation of hexosediphosphoric acid. (4) The fermentation in the presence of an excess of hexosediphosphoric acid is attributed to the increased velocity of the ATP \rightarrow adenylic acid reaction. (5) In the stationary condition of fermentation a reaction between hexosediphosphoric acid and AcH takes place. The hexose ester is formed by phosphorylation of glucose by ATP, which in turn is resynthesized by the phosphopyruvic intermediate product with the formation of AcH. In this way the summation of the reactions becomes $\text{glucose} \rightarrow 2 \text{ alcohols} + 2 \text{CO}_2$, while the 2 catalysts (ATP and AcH) are again reconstituted. (6) In the presence of an excess of H_2PO_4 , it is shown that the summation of the reactions involved becomes: $2 \text{ glucose} + 2 \text{H}_2\text{PO}_4 = 2 \text{EtOH} + 2 \text{CO}_2 + 2 \text{H}_2\text{O} + \text{hexosediphosphoric acid}$; in other words, the fermentation proceeds according to Harden-Young (cf. C. A. 4, 1870; 5, 110, 2822) with an accumulation of the hexose ester. (7) In the alc. fermentation, as in muscle glycolysis, the coenzyme of the internal P transfer system is ATP \rightleftharpoons adenylic acid. This in conjunction with coenzyme, the coenzyme of oxidation-reductions, and Mg^{++} constitutes the coenzyme of fermentation. S. M.

Further studies on the optical activity of hemoglobin and some hemoglobin derivatives with special reference to the sulfur content. István Simonovits and Georg Balassa. *Biochem. Z.* 281, 186-97 (1935); cf. C. A. 25, 3369—Horse hemoglobin is found in 2 types with 0.43 and 0.49% S; beef hemoglobin contains 0.51% S. One % horse CO-hemoglobin with 0.43% S has $[\alpha]_{589}^{20} = +11.6^\circ$ and with 0.49% S, $+12.3^\circ$. The values for 1% horse oxy-

hemoglobin are about $+14.4^\circ$ and $+12.4^\circ$, resp. With repeated crystals the specific rotation decreases. Once crystd. 1% beef CO-hemoglobin has a sp. rotation of $+7.9^\circ$. Horse hemoglobin in 0.5% aq. soln reduced with $\text{Na}_2\text{S}_2\text{O}_4$ has an av. sp. rotation of about $+28.30$. The sp. rotation of horse CO-hemoglobin in 0.1% NaHCO_3 is independent of the concn of the pigment. S. M.

Polysaccharide proteins. VI The state of glycogen in muscle. 2. Edmund M. Mystkowski, Arnold Stiller and Aleksandra Zysman *Biochem. Z.* 281, 231-7 (1935); cf. C. A. 29, 8020^a—The press juice of mammalian muscle contains in addition to the characteristic protein fractions also small amts of glycogen. In frog muscles as much as 17% of the total glycogen can be found in the press juice. It is argued that this indicates the presence of a glycogen-myosin and possibly also of a glycogen-globulin complex in the muscle tissue. These complexes are difficult to split, and 4-10% of the glycogen seems to be irreversibly bound, since it cannot be washed out with H_2O . They are not easily attacked by salivary amylase even at the opt. pH, although the glycogen hydrolyzed from the protein by KOH is easily so digested. S. Morgulis

Dilatometric studies in the enzymic hydrolysis of polysaccharides. III Hydrolysis of starch, amylose and amylopectin by takadiastase. H. B. Sreerangachar. *Proc. Indian Acad. Sci.* 2B, 333-41 (1935), cf. C. A. 29, 2980^a—Lutner's sol starch, potato starch and amylopectin were used with a two-bulb dilatometer. The amylopectin was prepd from potato starch by the methods of Nanji and Ling and of Eckert and Marzin (C. A. 26, 3135). The depression in the dilatometer in cu mm, was linearly proportional to the release of maltose and to the fall in rotation. The same depression per millimol of maltose was found for all the starch and amylopectin preps, with an av. value of 4.8. J. J. Willaman

Bile acids (Schenck) 10 Synthetic expts on the constitution of the bile pigment (Siedel) 10

Soluble lactalbumin. Geo. E. Flanigan and Geo. C. Supplee (to Borden Co.) U. S. 2,023,014, Dec. 3. In the prepn. of sol lactalbumin, whey is brought to a pH of about 4.35-4.85, heated to above 70° , pptd lactalbumin is sep'd, and agitated with a soln. such as one of an alkali metal or NH_4 bicarbonate, carbonate or hydroxide, the pH of the resulting fluid is adjusted to about 6.4-6.99 and it is evap'd to dryness substantially instantaneously.

B—METHODS AND APPARATUS

STANLEY R. BENEDICT

Determination of nitrogen and carbon in small amounts of plankton (in sea water). Theodor v. Brand. *Biol. Bull.* 69, 221-32 (1935)—Fifty cc of sea water is treated with 1 cc. 2% KOH in a centrifuge tube and centrifuged at 3400 r. p. m. for 10 min. The liquid is decanted, the ppt. dissolved in 3% H_2SO_4 and transferred to a 25-cc. centrifuge tube, treated dropwise with 2% KOH until just turbid. The mixt. is again centrifuged 10 min. The supernatant liquid is transferred to another tube, more KOH added until the mixt. is again just turbid and again centrifuged. The first of the latter tubes contains the plankton with inorg. hydroxides; the second is used as a blank for adsorbed C or N. N analyses are made by the method of Krogh and Keys (C. A. 28, 6656). In the range 0.5-5%, the accuracy is about 10%. A modification of the method of Krogh and Rehberg (C. A. 24, 5667) is used for C. Amts. of the order of 10 to 100 γ C can be det'd. with an accuracy of $\pm 3\gamma$. L. W. Elder

The estimation of minute quantities of atabrin in the blood. R. N. Chopra and A. C. Roy. *Indian Med. Gaz.* 70, 504-5 (1935)—Oxalated blood contn. atabrin is soaked into strips of filter paper, dried 1 hr. at 50° , ext'd. with Et_2O for 2 hrs. and the ext. evap'd. The residue is dissolved in 4 cc. 0.1 N HCl by heating and shaking, the mixt. cooled and filtered and a 3-cc. aliquot taken for colorimetric comparison with standards prep'd. from a 0.01 mg./cc. soln. of atabrin hydrochloride. The unknown and standards are treated with 0.1 cc. 20% NaOH and 1

cc. amyl alc. and thoroughly mixed. The yellow color of the amyl alc. layer is matched with that of the standards to det. the atherin content. Data are presented showing recoveries of 0.005-0.025 mg. to within 0.003 mg.

L. W. Elder

Emblen's cholesterol assay method Sadaharu Miyamori *Nagoya J. Med. Sci.* 8, 135-7 (1935) (in German).—A modification of the method of Emblen and Lawaczek (*C. A.* 17, 2448). Two g. of tissue or 2 cc. of blood is saponified in 20 cc. of 25% KOH for 2 hrs. under reflux on a water bath. The mixt. is extd. 6 times by shaking 5 min. with 50-cc. portions of Et_2O . Each fraction is washed with 10 cc. H_2O by brief shaking. The Et_2O is distd. from the combined fractions, the residue dried at 60-80°, taken up in CHCl_3 and distd. to 10 cc. A 5-cc. aliquot is treated with 2 cc. Ac_2O and 0.1 cc. concd. H_2SO_4 and after 15 min. in the dark is compared colorimetrically with a standard made up from 10 cc. of 0.1% cholesterol soln. 4 cc. Ac_2O and 0.2 cc. H_2SO_4 under similar conditions. Results are slightly higher than by the digitonin method.

L. W. Elder

Anticoagulant properties of pyrogenation products of citric acid. Auguste Lumière and Suzanne Sonneroy *Compt. rend. soc. biol.* 120, 213-14 (1935).—The min. quantities required to prevent coagulation of 100 g. rabbit blood were, in g., tri-Na citrate 0.3-0.4, di-Na citrate 0.4-0.5, mono-Na citrate 1.0, di-Na itaconate 1.0, tri-Na aconitate 1.0, di-Na citraconate 2.25, di-Na mesaconate 2.5, K or Li citrate 0.3, Pb citrate 0.5-1.0 and Co or Mg citrate 1.25.

L. E. Gilson

Histochemical determination of potassium during the development of the oocytes of the hen. V. D. Marza and L. T. Chocua *Compt. rend. soc. biol.* 120, 345-7 (1935), cf. *C. A.* 29, 1117.—The K contents of different parts of the cells were detd. by the method previously described.

L. E. Gilson

Chemistry of the panoptic staining reaction applied to the detection of adrenaline in tissues. T. Pawlikowski and T. Siebodziński *Compt. rend. soc. biol.* 120, 465-6 (1935).—Adrenaline is detected by staining first by the Heule CrO_3 method and then by the Pappenheim "panoptic" method.

L. E. Gilson

Color reaction exhibited by adrenaline in mammalian erythrocytes. Thadée Pawlikowski *Compt. rend. soc. biol.* 120, 467-9 (1935).—Adrenaline was detected in red corpuscles by a modification of the Heule staining method. Presumably it is adsorbed from the plasma. Dog erythrocytes contained more than those of man, cat, guinea pig, sheep or rat.

L. E. Gilson

Investigation of the reliability of the blood alcohol determination of Widmark. Herbert Elbel *Dent. Z. ges. gericht. Med.* 25, 124-9 (1935); cf. *Kanitz, C. A.* 29, 6263.—Vein puncture is the best method of drawing blood for alc. detn. The factor 1.2 can be used to calc. whole blood values from serum values.

Frances Krasnow

Respiration apparatus for small animals. Sándor Belak and Andor Ilényi. *Biochem. Z.* 281, 27-9, *Magyar Orvosi Arch.* 36, 207-9 (1935).—The app. consists of a closed glass jar suspended in a thermostat. The animal is placed in a small wire cage about 8 cm. above the bottom where there is a layer of Ba(OH)_2 soln. As the O_2 is being used up new Ba(OH)_2 is admitted from a buret until the manometer registers normal pressure. The vol. of O_2 used up at standard pressure and temp. is calcd. from these data. The CO_2 is detd. by analysis of an aliquot of the total Ba(OH)_2 soln. To facilitate the absorption of CO_2 the entire app. is agitated by a constant back and forth horizontal motion.

S. Morgulis

The determination of the sum of glycine and serine. S. Rapoport. *Biochem. Z.* 281, 30-6 (1935).—Glycine is decarboxylated with NaNO_2 to glycolic acid, which is then oxidized with KMnO_4 to $\text{H}_2\text{C}_2\text{O}_4$ and detd. as such. Only the dicarboxylic acids and serine interfere in this detn. but the former can be quantitatively removed. Attempts have been made to det. the serine separately but the final results of this will be published later. The sum of glycine and serine (calcd. as glycine) for fibron is 40.23, for elastin 31.82, gelatin 26.45, casein 8.18, sericin 7.91 and edestin

4.42%. Preliminary detns. on sericin, with the colorimetric procedure, shows a serine content of 8.71% and of glycine of 1.69%.

S. Morgulis

Fermentation of carbohydrates, a means for the observation of cellular physiological processes. Günther Malyoth and Eckart Sommerfeld *Biochem. Z.* 281, 49-79 (1935).—A modified Krogh microrespirometer that detn. CO_2 with an accuracy of $\pm 2\%$ is used. Fermentation expts. with similar quantities of glucose and yeast give likewise consistent results with a max. error of 4%, of which 2% is due to the instrument. The CO_2 tension developing during fermentation depends primarily upon the vol. of H_2O and the amt. of sugar used. Addn. of buffers contg. KH_2PO_4 or of $\text{K}_2\text{H}_2\text{P}_2\text{O}_7$ alone stimulates the fermentation, especially with small amts. of yeast (<40 mg.) or with washed yeast. The "fermentation deficit" is due to the utilization of sugar in synthetic processes of the yeast as well as in by-reactions of the fermentative process itself; also to the respiration of the cells, whereby the O consumed tends to mask the CO_2 developed. These factors disappear when the fermentation is carried out with cell free yeast juice and the glucose is fermented 100%, i. e., without any deficit. The stimulation of the fermentation by KH_2PO_4 is greater with the cell-free yeast juice than with the living yeast.

S. Morgulis

Benzene determination with the Pulfrich step-photometer. Ladislav v. Szécsényi-Nagy. *Biochem. Z.* 281, 178-80 (1935).—Acidify the material (blood, urine, org. matter) with H_2SO_4 , dil. with 200 cc. H_2O and distil in a special app. at 90° for 20 min. Increase the flame and distil at boiling temp. Then add another 50 cc. H_2O and distil at boiling temp. for 10 min. to drive off traces of benzene, and wash the cooler with 5 cc. saturating mixt. The distillate is collected in a cooled mixt. of 20 cc. fuming HNO_3 and 10 cc. H_2SO_4 . Dil. with about an equal vol. H_2O and make alk. with NaOH . Ext. the dinitro compd. with ether, evap. and dissolve the residue in 20 cc. acetone. To 10 cc. of the acetone soln. add 2 cc. 33% NaOH , stir vigorously 5 min. and after 30 min. exam. the violet-colored soln. in the step-photometer. The max. absorption of this soln. is obtained with filter S 57. Up to a concn. of 3.2 mg. % the color obeys the Lambert-Beer law. The chief loss in this detn. is during the distn. and the app. should be carefully tested.

S. Morgulis

Recent methods of clinical value in biochemical analysis. G. A. Harrison *Pharm. J.* 135, 183-5 (1935).—Recent tests in urinary exarans. and blood analyses are reviewed, 26 references (cf. Godfried, *C. A.* 29, 2565⁹, 6266⁹, 6293⁹; Bloem, *C. A.* 27, 391²; Harris and Ray, *C. A.* 29, 3005⁹; Kay, *C. A.* 23, 1054, 24, 182; Roberts, *C. A.* 24, 3299).

S. Waldbott

Device for the rapid detn. of certain gases or vapors in the atm. (or in viscera) (Kohn-Abrest) 7. App. for drying and grinding materials such as blood (*U. S. Pat.* 2,023,247) 1.

C-BACTERIOLOGY

LAWRENCE N. JAMES

An unnoted hemolytic streptococcus associated with milk products. James M. Sherman and Helen Upton Wing. *J. Dairy Sci.* 18, 657-60 (1935).—*Streptococcus hemiothermophilus* (n. sp.) is suggested as the name for an organism believed to represent a new species. It differs from pathogenic streptococci in its higher max. temp. of growth, lower min. temp. of growth, higher thermal death point, a more acid limiting pH of growth, its ability to hydrolyze Na hippurate and its inability to ferment sucrose.

Philip D. Adams

The action of water and physicochemical factors on the tubercle bacillus. I. Veissfeller and K. M. Dvolaitzskaya-Barucheva. *Beitr. Klin. Tuberk.* 80, 151-9 (1935).—Tubercle bacilli die rapidly in water, the no. of living bacilli being reduced 1 to 100 after 10 to 20 days. Various strains differ in their resistance in this respect so that old lab. strains may even reveal multiplication in water. This "water treatment" may result in variation forms, actinomycetes forms, diphtheroides or micrococci like

forms. These forms occur with slow growth and in dissoen. expts. Const. results in dissoen. forms can be obtained in water. A pH of 8.0 and trivalent metals give the best results. Tubercle bacilli suspended in $N/204$ $FeCl_3$ are rapidly ($1/2$ to 3 hrs.) transformed into non-acid-fast forms which are stable and cannot be transformed back to tubercle bacilli.

H. J. Corper

Some methods of investigation of indole in bacteria cultures. Fgidio Tosatti *Biochim. terap. sper.* 22, 286-97(1935), cf *C A* 29, 6621¹—The method of Jolles (*C A* 28, 4445¹) in which *o*-nitrobenzaldehyde is used is more sp. and sensitive than the methods of Salkowski (cf *C A* 14, 1550), Legal, Eleig and Siere, but is less sp. and sensitive than Ehrlich's method (cf. *C A* 5, 2254). Jolles' method is preferable because color of the products of condensation is most stable. A E Meyer

Sulfur bacteria from a warm sulfur spring in Santa Rosalia, Mexico Oskar Baudisch *Svensk Kem. Tids.* 47, 191-204(1935)(in German)—A microorganism from a sulfur spring is cultured and the compn of its natural and artificial medium studied. A R Rose

A study of the flora of human, gaseous gangrene. A new anaerobic organism A Sordelli and S Soriano *Folia biol.* 1934, 197, *Annales assoc. quim Argentina* 23, 10B¹—The organism described differs from *Clostridium sporogenes*, *Cl. centrosporogenes*, *Cl. tyrosinogenes* and *Cl. oedemaloides*. It has not been positively identified as *Cl. parapsorogenes*. For comparative study of the various species, and for literature study, it should be considered as a new species. E. M. Symmes

THOMAS G. PHILLIPS

The reaction of the culture medium and the activity of ordinary and preformed mycelia of an *aspergillus* Virgilio Boleato *Ind. sacchar. ital* 28, 454-9(1935).—Citric acid is formed in a medium with a reaction of pH 3.4 or less, and gluconic acid is produced when the pH is above 3.4, while the mycelia are under development. The sp. acid forming activity of a transplanted mycelium is influenced by the reaction of the original medium, and more markedly in the case of citric acid production. This is explained by a stabilizing influence on the enzymes involved. Great variations in the pH of the media result in weakening the mold. L. Cusachs

Does the radon content in the air in soil influence seed development? Walter Kosmath and Volkmar Hartmar. *Protoplasma* 24, 8-13(1935).—These expts. show that the germination of *Vicia faba equina* in quartz sand was not influenced by a radon content in the soil air of 1000 $\times 10^{-12}$ curies/cc. F. L. Dunlap

Growth substances of microorganisms in embryonic tissues and in exudation sap. Jonas Dagys *Protoplasma* 24, 14-91(1935).—Resting seeds of *Zea mays* and *Triticum vulgare* contain in the embryo and scutellum a large amt. of a growth substance which aids the cell increase of yeast and the increase in dry substance of *Aspergillus niger*. In the wheat endosperm this growth substance is present in considerable amts. but only in traces in maize endosperm. In the swelling of seeds, there is first of all a transport of the growth substance toward the embryo, resulting in the case of wheat seeds of an emptying of the endosperm of growth substance. During germination there is an active new formation of growth substance in the embryo and scutellum. In wheat seeds which were 21 years old and which were no longer capable of germination, no decrease in growth substance could be noted. In the buds of *Betula verrucosa* the growth substances were found in greatest amts. in late summer; but in going over into the winter resting period the amt. of growth substance in the buds gradually decreased. The growth substance minimum was reached in February. In forced buds there is again a manifold increase of this growth substance. The greatest content in growth substance was found in young and rapidly growing birch leaves. In the summer leaves this sinks to about a half. In the falling autumn leaves there is a considerable increase in growth substance. The

active birch cambium contains the growth substance in rich amts., the secondary cortex very little. The leaves are to be looked on as the place of origin of this growth hormone. The growth hormone is sol. in 57% alc. and in 90% CH_3OH , insol in Et_2O , decomposed by long boiling with H_2O_2 , adsorbed by animal charcoal but not by fuller's earth, heat-stable at 135° , and stable to acids and alkalis. It is thus closely related to bios. The spring exudation sap from the birch contains no growth hormone (bios) which acts on yeast, but it does act on *Aspergillus* and is closely related to the chemically produced growth substance of Group B of Nielsen and Hartelius (*C A* 27, 1019). In a similar fashion an active and probably identical growth substance can be made by autoclaving a fructose-malic acid soln., when the soln. is of the same concn as birch sap. The ash of birch sap contains large amts. of a co-growth substance. Birch sap growth substance (growth substance B) differs from bios in its complete resistance to oxidation by H_2O_2 and small adsorption by animal charcoal. On account of its destructibility by heating with H_2O_2 , bios does not belong to the growth substance group B. Exudation sap from *Cucurbita pepo* contains neither bios nor growth substance B. The ash from the exudation sap of *Cucurbita* contains no co-growth substance. One hundred and forty-seven references. F. L. Dunlap

The sensitivity loss of Nitella in alkaline solution. Karl Umrat. *Protoplasma* 24, 101-7(1935). F. L. D

Tissue physiology of roots. Analysis and methods of vital staining of plant cells with neutral red. Siegfried Strüger. *Protoplasma* 24, 108-27(1935).—Neutral red in acidified distd. H_2O colors first of all only the cell membrane of root hairs of *Trifolium bogotensis*. Neutral red in weakly alk. cond. H_2O stains immediately the cell juice in the well-known fashion. If the soln. is more acid than pH 6.4, there is a pure membrane coloring of the root hairs. At pH 6.4 only certain membrane portions of root hairs are stained. Above 6.4 and toward the neutral point and beyond this, there follows a storage of the color in the vacuoles. Membrane staining does not occur. The H-ion concn of the color soln. and that of the medium in which the hair is washed and investigated are of equal significance in the color distribution in vital staining of root hairs. If the staining is carried on in acid soln. the cell membrane is first stained and if the roots are then placed in a colorless soln. which is weakly alk., there is a rapid transference of the color adsorbed by the membrane to the vacuoles. This transference from the hair ends and base is more rapid than from the middle portions. Young hairs show a more rapid carrying out of this process than the older ones. This action is reversible. Hairs colored in alk. soln. show at first only a diffuse and drop-like storage in the cell juice. If the root is then placed in acid soln. (uncolored buffered soln. or distd. H_2O) the color begins to leave the cell juice and go to the membrane. The colored drops in the cell juice disappear in a short time almost completely. These expts. on the reversibility of the color distribution can be repeated a number of times with the same root without affecting its vitality. Also the epidermal cells show in their dependence on the H-ion concn a strongly regular distribution of the dyestuff. The epidermal cells of the meristem zone store the dyestuff only in the plasma and cell juice when in an approx. neutral medium. In the extension zone the color is stored in the radial and inner membranes. In the permanent zone there is a pure membrane coloring of the outer walls, the plasma and cell juice are not affected. The membranes of the hair base which border immediately on the root tissue show a fundamentally different action. If color is stored in the vacuoles of the root hairs, it begins to wander from them into the basal membranes. From there it can be further taken up by the adjacent root cells. With the aid of vital staining in accurately defined media it is possible to show the inhomogeneity of various cell regions. Bethe's reaction theory is not applicable to the whole cell. It can be applied only to certain cell parts. F. L. Dunlap

Absolute viscosity measurements by means of the Brownian molecular movement. VIII. Cell juice viscosity and its dependability on temperature and light. J. Pekarek,

Protoplasma 24, 128-73(1935); cf. C. A. 28, 2971¹—The expts. were conducted on the cell juices of *Vaucheria sessilis*, *Forma repens*, *Leptobryum pariforme* and *Rheum palmatum*. The viscosities all decreased in light with increasing temps up to 33°. Beyond this critical temp the viscosities all increased to a max., in the case of *L. pariforme* at 48° and for *V. sessilis* and *R. palmatum* at 39°. By further increase in temp these viscosities decrease again. With all the cell juices at 33°, the viscosity is approx. 1.9 times that of H₂O at the same temp. Above 33° the ratio of the viscosity of water to cell juice increases to a max., either at 39° (*Vaucheria*, *Rheum*) or at 48° (*Leptobryum*). The viscosity of the cell juice is in the case of *Vaucheria* approximately 2.5 times, with *Rheum* 2.7 times and with *Leptobryum* 3.3 times greater than the viscosity of H₂O at the same temp. The relative viscosity of the cell juices, referred to H₂O of the same temp., does not change up to 33°, increases between 33° and 39°, respectively 48° and at still higher temps it has a const. value. The viscosity of the cell juice of the chlorophyll-free petiole epidermal cells of *R. palmatum* within the temp. range of 18-48° is unaffected by either light or darkness, its viscosity is independent of any light factor. The viscosities of the chlorophyll-contg. cell juices of *V. sessilis* and *L. pariforme* differ in a characteristic fashion when subjected to light and darkness, at different temps. In the dark, the cell juice viscosity of protonema cells of *L. pariforme* up to 24°, and the thallus threads of *V. sessilis* up to 27°, show a decrease of approx. 20%. After these critical temps it increases and in the case of *Vaucheria* at 33° it is 5%, and in the case of *Leptobryum* between 33° and 39° it is 7-10% greater than the value which characterizes the cells in the light. Above 33° (*Vaucheria*) and 39° (*Leptobryum*) the cell juice viscosity decreases with increase in temp., the relative viscosity is furthermore const., in the case of *Vaucheria* approx. twice and with *Leptobryum* approx. 2.2-2.7 greater than that of H₂O at the same temp. Above 39° (*Vaucheria*) and 48° (*Leptobryum*) the viscosities of the cells in the dark are about 20% less than in the light. In all cases, both in the light and in the dark, changes in viscosity brought about by temp. changes are reversible. Likewise changes in viscosity in cell juices by light and darkness are reversible. The cause of these changes in viscosity induced by temp. is to be sought in the degree of dispersion of the cell-juce colloids. The changes in viscosity in the chlorophyll-contg. cells of *V. sessilis* and *L. pariforme* through light and darkness are in all probability related to CO₂ assimilation.

The problem of bios. Haehn. *Wochschr. Brau.* 52, 95-6(1935)—General discussion. S. Józsa
Initiation of roots by growth substance paste. F. Laubach and O. Fischrich. *Ber. deut. botan. Ges.* 53, 528-39(1935)—Expts. are described in connection with root initiation in *Coleus*, *Vicia faba* var. *equina* and *Solanum lycopersicum* by β -indolylacetic acid.

Lawrence P. Miller
Measuring the oxygen consumption of yeast by a new principle. Georg Neumann. *Biochem. Z.* 281, 181-5 (1935).—A suspension of yeast in an oxyhemoglobin soln. of definite vol. is studied spectrophotometrically. The amt. of the oxyhemoglobin being known, the O consumption in a given time is easily calcd., since each g. corresponds to 1.34 cc. O. The physically absorbed O is detd. from the available data (pressure, temp. and absorption coeff.). Hemoglobin solns. of 0.005-2.0% concn. were employed and the cu. mm. O used up by 1 mg. yeast per hr. was detd.

S. Morghulis
The metabolism of the colorless alga, *Prototheca zopfii* Krüger. H. Albert Barker. *J. Cellular Comp. Physiol.* 7, 73-93(1935)—*Prototheca zopfii* develops only in the presence of complex organic materials (as in yeast autolyzate). It utilizes NH₃ as well as more complex nitrogenous substances. It utilizes fatty acids, monosaccharides and alcohol but apparently no keto, hydroxy or dibasic acids. Glucose aerobically yields cell material and CO₂; anaerobically it is quantitatively fermented to L-lactic acid.

T. H. Rider

The chemistry of grass crops. Artturi I. Virtanen. *Chemistry & Industry* 1935, 1015-20—A review of V's work on N fixation in legumes, changes in carotene and vitamin C content in plants during growth, the use of acids to preserve ensilage and the effect of feed on the vitamin content of milk. A method for diagnosing pregnancy is described. L. R. Rushton

Effect of frost on wheat at progressive stages of maturity. I. Physical characteristics of the kernels. R. Newton and A. G. McCalla. *Can. J. Research* 10, 414-29(1934)—Susceptibility of wheat to superficial injury by frost continued generally over nearly the whole maturation period. Marquis wheat is apparently more susceptible than Garnet, Reward and Red Bobs, to degradation by frost during the maturation period. Grade is more sensitive to frost than are chemical compn. and baking quality. Classification of the kernels of Marquis, in 1930, into vitreous, starchy, immature, green, bran frosted and heavily frosted, confirmed the earlier conclusion (cf. C. A. 26, 2219) that only the sound class (vitreous and starchy) has enough relation to grade to be useful as a grading factor. The germination of Garnet was improved by moderate freezing.

J. W. Shipley
The course of stone cell formation in pear fruits. Wm. W. Smith. *Plant Physiol.* 10, 587-611(1935); cf. Crist and Batjer, C. A. 26, 1980—No decrease occurred in the abs. amts. of lignocellulose of either Kieffer or Bartlett pears sampled periodically throughout the growing season. But, owing to the large increase in materials sol. in EtOH, the amts. of lignocellulose calcd. on a percentage basis decreased rapidly. The alleged conversion with advancing maturity of part of the lignocellulose into reducing substances is consequently questioned. The Shaffer-Hartmann method (C. A. 15, 1327) gave, with the exts. examd., values greater than the amts. of Cu reduced (cf. Phillips, C. A. 26, 5123). Storage studies at 33°F. with Kieffer fruits were also made. These showed that the percentage of hemicelluloses decreased more than that of reducing sugars, lignins or pectins. Thirty-seven references. Walter Thomas

Osmotic pressure and water content of prairie plants. Lawrence A. Stoddard. *Plant Physiol.* 10, 661-80(1935)—Colloidal imbibition is capable of exerting much greater force than is osmotic pressure and is probably the more important factor acting to secure water from a dry soil (cf. Shull, *Bot. Gaz.* 62, 1, 1916). Soil moisture and humidity were found to be the major factors affecting the osmotic pressure of plant tissues. Walter Thomas

Boron-deficiency disease of beets. J. E. Koutla and G. H. Coons. *Facts about Sugar* 30, 373-6(1935)—The symptoms of heart and dry rot, previously reported only in Europe, have been found in beets grown in certain areas in Michigan and Ohio, and are described and illustrated. The symptoms disappear upon the addn. to sand cultures, of small quantities of boric acid or borax. P. W. Z.

E—NUTRITION

PHILIP B. HAWK

Studies of the vitamin B complex. I. Effect of fats and of the individual esters upon the vitamin B requirement of rats. W. D. Salmon and J. G. Goodman. *Ala. Agr. Expt. Sta., 45th Annual Rept.* 21-2(1934); cf. C. A. 28, 7309¹—When the rat's diet contained glycerol or Et esters equiv. to 23% of the fatty acid, the acids ranked in the order of decreasing effectiveness in their vitamin B-sparing action as follows: caprylic, caproic, heptylic, lauric, myristic, nonylic, undecylic and oleic. Valeric, propionic and acetic acids had very low efficiencies; palmitic and stearic acids had no demonstrable sparing effect; this was probably due in part to their high m. ps. and poor absorption. Butyric glyceride was toxic to rats even when the diet contained adequate vitamin B. Spastic cases of vitamin B deficiency were cured by the administration of caprylic, caproic, heptylic or lauric acids without

any vitamin B. Bakers' yeast after autoclaving at 17-20 lb. pressure for 8 hrs. still contained traces of vitamin B. Such a product should not be given *ad libitum* to rats. The onset of vitamin B deficiency is not hastened by the substitution of 23% of lactic acid as the glyceride for sucrose in the diet. II Quantity of glycogen in the vitamin B-deficient rat and its ability to deplete this glycogen during starvation G A Schrader. *Ibid.* 21-2, cf. C A 28, 7306.—There is no large accumulation of glycogen in vitamin B-deficient rats as compared with rats receiving adequate amounts. The rate of depletion of glycogen in both sets of rats was approx. the same. III Ability of the vitamin B-deficient rat to utilize D-lactic acid *Ibid.* 22.—A much poorer utilization of lactic acid occurred than for D-glucose. There was no indication of a breakdown in the lactic acid metabolism of the vitamin B-deficient rats. The use of 0.3-0.5 g. daily of lactic acid in the diet did not hasten the onset of vitamin B symptoms. IV Apparent ability of the vitamin B-deficient rat to transform carbohydrate into fat *Ibid.* 22-3.—Respiratory quotients averaging 1.26 were found for all vitamin B-deficient rats on the high-carbohydrate diet, irrespective of whether they received no vitamin B, or vitamin B with either a limited or an unlimited energy intake. At no time was a R Q of 1.00 secured from the rats on the high-fat diets, in fact, after the 1st week the R Q averaged only 0.8, indicating that the energy was mainly secured from fat. Conclusion.—Rats on a high-carbohydrate diet can convert carbohydrate into fat. C R Fellers

Cane molasses as a feed for dairy cows L A Henke. *Hawaii Agr. Expt. Sta., Bull.* 73, 1-18(1934).—A ration containing 25% cane molasses was compared with a similar ration without molasses. The percentages of crude protein and digestible nutrients in both rations were the same. The wt. gains, milk and butter-fat production as well as the fat content of the milk were almost identical in the 2 rations. C R Fellers

Sunflower silage for milk production. F W Atkeson. *Idaho Agr. Expt. Sta., Bull.* 215, 2-8(1935).—Sunflower silage contains approx. 75.4% water, 2.3% ash, 2.4% crude protein, 7.6% crude fiber, 11% N-free, and 1.2% fat. The sunflower silage was equal to corn silage in wt. gain, milk and butter-fat production when fed to dairy cows. C R Fellers

Utilization of energy-producing nutrient and protein as affected by individual nutrient deficiencies III. Effects of the plane of protein intake. E B Forbes, R. W. Swift, Alex Black and O J Kahlenberg. *J. Nutrition* 10, 461-79(1935); cf. C A 28, 7383.—The effects of 4 planes of protein intake, 10, 15, 20 and 25%, were studied by means of 2, ten-weeks' growth, metabolism and body analysis expts. on 48 rats each. The effects of the increasing protein content of the eucaloric diets were: increase in gain in body wt. at decreased cost in terms of dry matter of food; increase in efficiency of digestion and retention of protein and of energy-producing nutrient; increase in urinary N at an increasing rate, and increase in protein of the body at a decreasing rate; increase in energy of the urine coincident with decrease in the energy of the feces; the metabolizable energy therefore remaining practically constant; diminished efficiency in the utilization of food N; no regular change in amt. of fat gained, but usually a decrease in fat gained in proportion to protein gained. Increases in the protein of eucaloric diets made no change in the basal heat production per unit of computed surface area, but diminished the total heat production of the animals. C R Fellers

Pathological skin changes in the tail of the albino rat on a diet deficient in vitamin G (B₂). Susan Gower Smith and Douglas H. Sprunt. *J. Nutrition* 10, 481-92(1935).—Rats fed the Bourquin and Sherman vitamin G-deficient diet for 90 days or longer showed varying degrees of atrophy of the sebaceous glands and thinning of the epithelium in cross sections of the tail. The fat normally present around the sebaceous glands was replaced by connective tissue. There was no cellular infiltration. The above diet supplemented with autoclaved yeast produced rats with normal sebaceous glands and epithelium. These

pathol. changes were corrected by the addn. of autoclaved yeast to the diet. C R Fellers

Human iodine balance. Versa V. Cole and Geo. M. Curtiss. *J. Nutrition* 10, 493-506(1935).—Iodine balance was studied in 3-day periods for 15 days on 3 subjects, 9 on a fourth and 6 on a fifth. The combined urine and stool I may account for less than 50% of the I intake. There was a fairly uniform output of I for an individual on a monotonous diet. There is an indication of increased loss in fecal I in hyperthyroidism. The fecal I was higher than usually reported by previous investigators. C R Fellers

Utilization of inulin for growth by the young white rat. Adelaide Bendaña and Howard B Lewis. *J. Nutrition* 10, 507-15(1935).—When young white rats were maintained on a limited caloric diet, the addn. to the diet of inulin (from chicory), sucrose or fructose as a supplement produced a definite growth response. The response from inulin was inferior to that obtained from sucrose or fructose. As a sole source of energy in the white rat inulin was not effectively utilized. There was marked fermentation of the polysaccharide in the intestine with distention which resulted in death in a few days. C R F.

Effects of cereal diets on the composition of the body fat of the rat. Harold S Olcott, Wm E Anderson and Lafayette B. Mendel. *J. Nutrition* 10, 517-23(1935).—Where corn, barley, wheat or oats furnished 82% of the total energy value of individual rations, and corn and oat oil supplied 8 and 10%, resp., of the total cal., the body fat produced by the corn- and oats-fed rats differed slightly in degree of unsatn. as measured by I no., e g, 83 and 79, resp. The oil of wheat and barley constituting 1.7 and 2.0% of the resp. grains supplied only 3 and 4% of the total energy value of the resp. wheat and barley diets. Body fat yielded by animals fed wheat and barley rations was less unsatd., e g, 70 and 71, than fat produced on either corn or oats diets and was similar in character to the fat from rats fed fat-free diets. The unsatd. acid content of the body fats from cereal-fed rats ranged from 68.5% for fat from those fed the barley diet to 75% for fat of rats fed on the corn ration. C R Fellers

Influence of diet on the glucose tolerance of the dog. Esther M. Greisheimer and F. W. Hoffbauer. *J. Nutrition* 10, 525-34(1935); cf. C A 29, 2114.—The effects of different dietary regimes on the carbohydrate tolerance of each of 8 dogs were studied. Dogs require approx. 3 g. of glucose per kg. of body wt., though 1 g. per kg. is sufficient for man. High-protein diet gives a decreased glucose tolerance. This decrease is even more marked after a high-fat diet. The higher the protein level, the more marked the decreased tolerance became. However, beyond 24.1% no further effect was noticeable. With both 55 and 80.1% of fat in the diet, definite decreases in tolerance were noted. Great variation among the animals was found. The differences in glucose tolerance are not due to differences in the rate of absorption. C R Fellers

Adequacy of simplified rations for the complete life cycle of the chick. Albert G. Hogan, Robert V. Boucher and Harry L. Kempster. *J. Nutrition* 10, 535-47(1935); cf. C A 28, 8097.—Four successive generations of chicks were reared on simplified rations. While growth was rapid, the fertility of the males was low. The females were normal until they attained maturity, and their egg records compared favorably with those of normally fed birds. After periods of extensive egg production, fowl mortality was high. Since earlier investigations indicate low fertility is common to all lab.-raised birds, it seems entirely possible that the present synthetic diet is complete. One of the promising rations was No. 2159 and consisted of casein 35, cornstarch 30.5, Cellophane 3, lard 11, Osborne and Mendel salt mixt. 4, wheat germ oil 4, acid hydrolyzed yeast 4, liver ext. 6, tikiiki 2 and CaCO₃ 0.5. In addn. to the above each chick received daily 0.2 mg. carotene and 240 International units of irradiated ergosterol. C R Fellers

Effect of one % cod-liver oil on the rat, with particular reference to the thyroid gland. Clay B. Freudenberg and Fred W. Clausen. *J. Nutrition* 10, 549-55(1935).—

The addn. to a good stock diet of 1% cod liver oil produced no differences in body growth, wt., nose-ans length, tail length, incidence of infections, wt. of head, suprarenal glands, hypophysis, thymus or ovaries. The thyroid gland was significantly smaller in the rats fed cod-liver oil. C. R. Fellers

Relation of rate of growth to diet. III. Comparison of stock rats used in the breeding colony at the Connecticut Agricultural Experiment Station. Lafayette B. Mendel and Rebecca B. Hubbell. *J. Nutrition* 10, 557-63 (1935), cf. C. A. 26, 4086—A gradual increase in growth and reproductive ability has followed each improvement in the stock ration of the albino rat colony. C. R. Fellers

Comparative rachitogenic property of oats and corn. Lawrence L. Lachat and Leroy S. Palmer. *J. Nutrition* 10, 565-77 (1935)—HCl exts. of oats, when purified and freed from excessive amts. of NaCl, may exhibit rachitogenic properties when fed to rats in a mildly rachitogenic ration, but not when the ration is severely rachitogenic. Rolled oats and yellow corn are rachitogenic to both rats and chicks, especially to the latter, and rolled oats appears to be more rachitogenic when the rations are otherwise only mildly rickets-producing or the susceptibility of the animals is low. Divergent results obtained by others in the study of the relative rachitogenic properties of oats and other cereals probably may be explained by lack of control of the severity of the rickets produced by the ration with which the cereal rations have been compared. C. R. Fellers

The cereal grains and their use in poultry nutrition. I. Hatchability studies. J. B. Smith. *Sci. Agr.* 16, 73-6 (1935)—In hatchability studies pens of hens were raised from the time of hatching on a single source of vegetable protein such as wheat, oats, barley and corn, but supplemented by animal sources of protein. Whereas both wheat and barley gave good hatchability records, better results were obtained when the cereals were mixed. There was usually a heavy mortality in the very young chicks from the cereal-fed hens. A crushed grain mix of wheat, oats and barley with milk gave excellent results in both hatchability and egg production over a 2-yr. period. Buckwheat was used satisfactorily in combination with oats and barley, when milk was used as an animal protein supplement. II. Influence on live weight gains and distribution of fat in fattening stock. W. A. Maw. *Ibid.* 77-8—The different cereals cause deposition of fats in the fattening cockerel in entirely different manners, e. g., cornmeal causes a high percentage of body fat to be deposited in the flesh and much less fat in the abdominal cavity and in the skin of the bird, whereas the cereals, barley, oats and wheat, show the reverse in varying degrees. The flesh from the corn-fed birds was judged to have the highest flavor and as being moist, whereas the wheat flesh decidedly lacked flavor and was dry. The barley and oat flesh was intermediate to the corn and wheat flesh. C. R. F.

Relation between the vitamin C contents of various plant tissues and the presence or absence of chlorophyll. Lucie Randoit, A. Giroud and C. P. Leblond. *Compt. rend. soc. biol.* 120, 297-300 (1935), cf. C. A. 29, 3702¹.—Feeding expts. with guinea pigs showed that the green parts of leeks, beets, carrots, leafy turnips and lettuce were satisfactory sources of vitamin C while the nongreen parts contained very little. L. E. Gilson

Hemostatic action of ascorbic acid. P. Lambin and W. van Hecke. *Compt. rend. soc. biol.* 120, 536-8 (1935)—In rabbits weighing 1900-2400 g. the intravenous injection of 12-20 mg. ascorbic acid produced a 17-22% decrease in bleeding time (detd. less than 1 hr. after the injection). L. E. Gilson

Vitamins in dermatology. Werner Jadassohn. *Z. Vitaminforsch.* 4, 324-8 (1935)—A review. J. S. H.

The distribution of vitamin C in lower organisms. G. Bourne and R. Allen. *Australian J. Exptl. Biol. Med. Sci.* 13, 165-74 (1935), cf. C. A. 29, 7413¹—The AcO₂-AgNO₃ staining technique was used to demonstrate the presence of vitamin C in *Chlamydomonas* (Protista), *Oscillatoria* (Cyanophyceae), *Scenedesmus* and *Spirogyra*

(Chlorophyceae), diatoms, lichens, yeasts, mold mycelia, *Es. coli*, and the fungi *Fusarium*, *Ophiobolus*, *Coleotrichum*, *Trichoderma*, *Hellinotriporum*, and *Rhizoctonia*. The connective tissue, liver and epithelial cells of the tadpole also showed typical granules. The uniformity in types and distribution of granules in the cells of the higher and lower plants and animals led B. and A. to conclude that the reducing granules are probably composed of the same substance, reduced vitamin C, in all of the tissues studied. C. G. King

Occurrence of ascorbic acid in the lens and vitreous humor. V. Demole and H. K. Muller. *Biochem. Z.* 281, 80-5 (1935)—Three cc. of vitreous humor produces in feeding expts. an antiscorbutic effect equal to that of 0.5 mg. ascorbic acid, which corresponds more or less to the estn. by the indophenol titration of the humor. The lens likewise produces an antiscorbutic effect which is equiv. to about 50% of the indophenol titration value and is attributable to ascorbic acid. In animals with scurvy the ascorbic acid content of the vitreous humor is decreased, but in young less than in adult animals. S. Morgulis

Growth in length of young rats on sufficient and insufficient vitamin A administration. Maj. Malmberg. *Biochem. Z.* 281, 215-18 (1935)—On a vitamin A free diet the growth of the tail practically ceases when the increase in body wt. stops. On the addn. of 20 γ carotene to this diet the tails become elongated. Carotene also antagonizes the effect of tyrosine, which causes a loss in body wt. and checks the growth of the tail, in that the wt. loss is moderated and the tail increases in length. S. Morgulis

Vitamins. M. van Laer. *Ann. zymologie* (2), 2, 101-7 (1935)—An address discussing very briefly the importance of vitamins in the foodstuffs industry, problems in relation thereto and progress accomplished in 20 yrs. in the study of vitamins. A. Papineau-Couture

Fractionation studies on provitamin D. Elizabeth M. Koch and F. C. Koch. *Science* 82, 394-5 (1935).—Com. cholesterol and purified cholesterol which has been heated at 185-95° for 1 hr. in the presence of traces of O₂ were much superior to vosterol or purified unheated cholesterol in preventing leg weakness in Leghorn chicks. Ten rat units of either prepn. per 100 g. diet were equiv. to 0.25% or 10 rat units of cod liver oil. The provitamin D of heated cholesterol evidently seps readily in the crystal. from alc., since the filtrate residue has no potency when given in comparable doses to rats or chicks. The chicks receiving 100 rat units of vosterol per 100 g. of diet were in no better condition than those receiving the basal ration only. Felix Saunders

The antineuritic vitamin (Windaus, et al.) 10.

Γ—PHYSIOLOGY

HOMER W. SMITH

The effect of endocrine glands on the composition of the skeletal muscle. IV. The effect of the tests on the composition of the skeletal muscle. S. Osada. *Folia Endocrinol. Japon.* 11, 21-2 (1935); cf. C. A. 29, 7417².—The creatinine content of the skeletal muscle of male rabbits remained unchanged after oral administration of testis powder (I) or after castration (II). Residual N, NH₄, urea, creatine and amino acid concn. increased after I but remained unchanged after II. Glycogen and lactadogen decreased and lactic acid increased after I. II produced the opposite effect. V. The effect of the ovary on the composition of the skeletal muscle. *Ibid.* 22-3.—The creatinine content of the skeletal muscle of female rabbits remained unchanged after oral administration of interstitial tissue powder (I) or of corpus luteum powder (II) or after oophorectomy (III). Creatine and lactic acid increased and glycogen and lactadogen decreased after I, II and III produced the opposite effect. Amino acid and NH₄ increased after I, but remained unchanged after II or III. Residual N and urea increased after I, decreased after II and remained unchanged after III. Ruth Berggren

Dehydroandrosterone. Adolf Butenandt, Hans Dannenbaum, Günter Hamisch and Helmut Kudsus. *Z. physiol. Chem.* 237, 57-74(1935); cf. *C. A.* 29, 4997.—Dehydroandrosterone, m. 148°, $[\alpha]_D^{25}$ 10.9°, occurs in male urine in practically the same amt. as androsterone. It is the source of the chloro ketone previously isolated from urine by a procedure involving the use of HCl. In addition, to the benzoate previously described, the following new derivs. have since been prepd.: acetate m. 168.9°, $[\alpha]_D^{25}$ 3.9°, oxime m. 191°, semicarbazone decomp. 202-4°. Its activity is about 1/3 that of androsterone in both the comb test and in the vesicular gland test. Although without activity in the Allen-Dowsy test on castrated female mice, it brings on estrus in the infantile females. The acetate has about the same activity as the mother substance, but the benzoate is only slightly active, probably because of its extreme insol. Isolation of dehydroandrosterone from urine is best performed by digitonin pptn and purification through the semicarbazone and acetate, from 100 l. of urine some 20 mg was thus obtained in pure form, probably less than a 50% recovery. Treatment with HCl, or with SOCl₂, gave the chloro ketone but only in small yield along with other products not identified. Dehydroandrosterone differs from androsterone only in the presence of a 5-6 double bond and in the spatial arrangement of the OH at C₃. Catalytic hydrogenation converts it into isandrosterone (3-hydroxy- Δ^4 -cholestanone-17). In steric configuration it corresponds to cholesterol from which it is obtained by replacement of the side chain by O. The transformation is effected by converting cholesterol into the acetate-dibromide, oxidizing off the side chain with CrO₃, removal of the 2 Br atoms and sapon. of the Ac group. The product is therefore 3-hydroxy- Δ^4 -cholestanone-17. The yield was 885 mg from 21 g. of cholesteryl acetate, or 2.5%. Sitosterol or stigmasterol may be used in place of cholesterol. As intermediate products cholesterol yielded the Δ^3 -3-hydroxycholestanic acid, while stigmasterol gave the interesting Δ^3 -3-hydroxyvinosthenic acid, a substance from which the corpus luteum hormone progesterone has already been prepd. Neither acid in 4-mg dosage showed physiol activity in the comb test. The conversion of dehydroandrosterone into androsterone consists in satg the double bond and epimerizing the OH. The reaction is performed by treatment with SOCl₂, hydrolyzing the chloro ketone, and treatment of the dihydrochloro ketone with KOAc, whereby androsterone acetate is obtained. It is probable that the Walden inversion occurs in the last step of the process. A. W. Dux.

Androstenedione, a highly active male hormone. The genesis of gonad hormones. Adolf Butenandt and Helmut Kudsus. *Z. physiol. Chem.* 237, 75-88(1935).—Cholesterol is probably the mother substance from which all the known sex hormones are derived. A simple replacement of the side chain by O yields dehydroandrosterone which is intermediate between the male hormones of the androsterone type and the female hormones of the estrone type. As the probable precursor of both types dehydroandrosterone is of especial interest, and particularly its dehydrogenation product, androstenedione. The dehydrogenation of dehydroandrosterone was effected by adding 2 Br at the double bond, oxidizing the product with CrO₃ to the dibromo diketone, and removal of the Br by means of Zn dust. The intermediate products were not isolated. The end product was androstenedione, with the keto groups at C₃ and C- and double bond at C₄. It m. 169°, has $[\alpha]_D^{25}$ 185°, absorption max. at 235 m μ (characteristic of α , β -unsatd. ketones), and forms a oxime m. 143°. Androstenedione is structurally related to all 3 types of known sex hormones, and was therefore tested for all 3 types of activity. In the capon comb test it showed approx. the same activity as androsterone, but in the vesicular gland test on rats the activity was considerably greater than that of androsterone. The corpus luteum test was entirely neg. The Allen-Dowsy test for estrus was neg. in castrated females, but the Curtis-Dowsy test on infantile females was pos. in 200-400 μ dosage. It is not improbable that the pos. result with infantile females

is due to a biol. splitting off of the angular Me at C₁₀, thereby forming estrone itself. A. W. Dux.

Testosterone. Transformation of dehydroandrosterone into androstenediol and testosterone, a way to the preparation of testosterone from cholesterol. Adolf Butenandt and Günter Hamisch. *Z. physiol. Chem.* 237, 89-97. *Ber.* 68B, 1859-62(1935). cf. *C. A.* 29, 5004.—Reduction of dehydroandrosterone in EtOH with Na and sublimation of the product in a high vacuum gave the corresponding alc, Δ^4 -androstene-3,17-diol, m. 177-8°, $[\alpha]_D^{25}$ -55.5° (diacetate m. 159.5°, $[\alpha]_D^{25}$ -56.6°). This showed unexpectedly low activity in the comb test, a 300 μ dose giving no definite response. The diacetate was partially sapon. by treatment of the dil soln in MeOH with KOH in the cold, yielding the 17-monooacetate, m. 148°, it has $[\alpha]_D^{25}$ -62.4°. Addn of Br to protect the double bond, followed by oxidation with CrO₃ in AcOH and removal of the Br by Zn dust and AcOH, gave Δ^4 -androstene-17-diol-3-one acetate, m. 138°, it has $[\alpha]_D^{25}$ 87.5°. Sapon. of this acetate then yielded the corresponding androstosterone, m. 151°, it has $[\alpha]_D^{25}$ 104°, identical in all respects with the testosterone obtained by David, et al. (*C. A.* 29, 5163¹) from bull testes. The oxime m. 215°. Testosterone exceeds all known male sex hormones in physiol. activity, both in the comb test and in seminal vesicle test. It has 6 times the activity of androsterone and twice that of androstenediol in the comb test. In the vesicle test it is 5 times as active as androstenedione and 10 times as active as androsterone. This synthesis establishes the structure of the testicular hormone in every detail. A. W. Dux.

Glycogen formation from lower fatty acids with even carbon number. III. The fate of acetoacetic acid in the animal organism. Richard Stöhr. *Z. physiol. Chem.* 237, 165-70(1935), cf. *C. A.* 27, 5343.—The influence of AcCH₃CO₂H on the respiration of surviving organ sections (liver, kidney, diaphragm of the rat) was detd. in the Warburg app. In concns. of 1, 2 and 4 mg. per cc of Ringer phosphate AcCH₃CO₂H inhibits the respiration of liver and kidney tissue and increases that of the diaphragm. Feeding expts. with 0.2 g AcCH₃CO₂Na and with 0.2-0.3 g AcCH₃CO₂Et in the presence of glucose did not show an increase in glycogen content in the liver of fasting rats. A. W. Dux.

Influence of thyroid hormone on vitamin C metabolism. Janos Mosonyi. *Z. physiol. Chem.* 237, 173-7(1935).—Subcutaneous administration of thyroid hormone (thyroid and thyroid ext.) to guinea pigs resulted in a decrease in the ascorbic acid content of the liver and especially of the suprarenals. This decrease did not occur in rats. In guinea pigs it was prevented by simultaneous administration of vitamin A. Exstirpation of the thyroid in rats increased the ascorbic acid content, apparently by increased synthesis in the suprarenals. A. W. Dux.

The occurrence of L-glyceroisophingosin in beef lung. Caspar Tropp. *Z. physiol. Chem.* 237, 178-80(1935).—One g. of L-glyceroisophingosin was isolated from 5 kg. of beef lungs, a yield of 0.06% on the dry basis. Similar quantities of heart, kidneys, lymph glands, testes and white and red bone marrow, worked up by the same procedure, yielded none of this substance. A. W. Dux.

Constant value of the ratio of the skeletal dimension to the active mass in the rat. Andree Roche and Isabelle Garcia. *Compt. rend. soc. biol.* 120, 160-2(1935).—As young rats weighing 5 g. at the start grew in wt. to 194 g. the P content of the total fresh carcass, 0.37% in the 5-g. rats, increased regularly to 0.75%, the N content, 1.54% at the start, increased to 2.89%. The P/N ratio remained within the range 0.19-0.25 throughout.

Change in the glycerol content of blood during glycolysis in vitro. Michel Polonovski, H. Warenbourg and P. Lamour. *Compt. rend. soc. biol.* 120, 191-2(1935).—Fresh hog blood and also a suspension of washed dog erythrocytes were incubated at 37° after addn of glucose. After several hrs. there was a small increase in glycerol (detd. by the method of Zeisel and Fanto). The residual chromic index increased proportionately. L. E. G.

Changes in blood composition during short-wave treat.

ment A Compère *Compt. rend. soc. biol.* 120, 237-40 (1935).—Dogs were treated with a 6-mm wave length. The max rectal temp. reached was 41.9°. The most important effect was a large decrease in the alkali reserve and p_{H} (decreased 0.07-0.33 unit) of the blood. Non-protein N increased 20-44% and total blood protein increased slightly. Total fixed bases did not change. P and Cl showed irregular fluctuations. L E Gilson

Disappearance of [injected] prolactin from the blood of nephrectomized female rabbits A Lipschütz, A. Fehreman and T. Vivaldi *Compt. rend. soc. biol.* 120, 333-6 (1935), cf C A 29, 3012.—In the normal female 80% of the injected prolactin disappears from the blood in 10 hrs., part being excreted in the urine. In the nephrectomized female about 30% disappears in 10 hrs. L E Gilson

Effect of pregnancy on the survival period of adrenalectomized animals A Gradinesco, N. Santa and F. J. Lucan Jonesco *Compt. rend. soc. biol.* 120, 356-8 (1935).—The survival period was the same or slightly shorter than that of nonpregnant cats and dogs. Apparently the fetal adrenals offer no protection to the mother. Twenty references. L E Gilson

[Absence of] influence of the thyroid on the receptivity of rabbits toward herpes virus P. Haber *Compt. rend. soc. biol.* 120, 420-1 (1935). L E Gilson

Effects of hypophysectomy on pregnancy and lactation in dogs B A Houssay *Rev. soc. argentina biol.* 11, 196-201; *Compt. rend. soc. biol.* 120, 496-7 (1935).—Total hypophysectomy produces abortion without any lactic secretion. If performed a few days after normal parturition it causes a rapid decrease in milk flow. The anterior lobe is necessary for the production of lactic secretion after parturition or abortion, and for its maintenance after it has begun. Extirpation of the posterior lobe does not affect pregnancy, parturition or lactation. Injury to the tuber cinereum does not suppress lactation. L E Gilson

Respiratory quotients of normal and neoplastic tissues cultivated in vitro A. H. Roffo and Luis M. Correa. *Rev. soc. argentina biol.* 11, 202-9 (1935).—The app and method are described. The R Q of growing chick heart was 0.80-0.97, av. of 10 expts 0.86. That of growing rat sarcoma and carcinoma was 1.01-2.02, av. for 15 cultures 1.31. L E Gilson

Production of milk secretion in female and male dogs by anterior hypophysis extract B A Houssay. *Rev. soc. argentina biol.* 11, 240-9; *Compt. rend. soc. biol.* 120, 502-3 (1935).—Repeated injections of the ext. (made by the method of Evans and Simpson, C. A. 26, 3020) produced lactation in adult females which had never been pregnant but not in very young females. It also produced lactation in females which had been castrated, thyroidectomized, hypophysectomized and thyroidectomized, or had the splanchnic nerves cut and the lumbar sympathetic chains resected. The activity of the ext. was destroyed by boiling 15 min. The ext. did not produce lactation in male dogs directly, but if the mammae were first hypertrophied by prolonged administration of folliculin and repeated injections of the ext. then made, lactation was produced in whole, castrated and castrated hypophysectomized males. L E Gilson

Production of lactation in male guinea pigs by anterior hypophysis extract J. L. Sardi. *Rev. soc. argentina biol.* 11, 250-7; *Compt. rend. soc. biol.* 120, 503-4 (1935).—The ext., or the ext. and folliculin together, did not cause lactation, but treatment for 10-17 days with folliculin to produce hyperplasia of the mammae followed by repeated injections of the ext. produced abundant lactation. L E Gilson

Morphine and ether hyperglucemia in hypophysectomized dogs Mme Elena Di Benedetto de Sabelli and Enrique J. Di Benedetto. *Rev. soc. argentina biol.* 11, 405-9 (1935); *Compt. rend. soc. biol.* 120, 738-9 (1935).—The hyperglucemia produced by ether anesthesia is much greater in normal than in hypophysectomized dogs. Morphine produced a slightly greater hyperglucemia in the latter group. L E Gilson

The corpus luteum hormone. Enrico Fels. *Rev. soc. argentina biol.* 11, 417-27; *Compt. rend. soc. biol.* 120, 730-1 (1935).—The hormone, recently renamed progesterone, is a mixt of luteosterones C and D. Previous conclusions concerning the activity of these (cf C. A. 28, 7238) were confirmed. Progesterone differs from estrone in that it has no effect on the male genital tract and does not modify the changes in the anterior hypophysis which follow castration in the female rat. L E Gilson

The influence of tyrosine on the thyroid function I. Abelin. *Naturwissenschaften* 23, 528-9 (1935).—The hormones of thyroid and adrenals are both derived from tyrosine. Duodotyrosine is active in disturbances of either of these glands. Tyrosine itself proved to have therapeutic effects in the severe secondary effects of exptl hyperthyreosis. Evidently tyrosine as well as I participates in the regulation of the thyroid action. B J C van der Hoeven

Distribution of C vitamin in cerebral basal ganglia particularly in the globus pallidus and the substantia nigra. F. Plaut and K. Stern. *Naturwissenschaften* 23, 557-8 (1935).—Vitamin C (ascorbic acid) was detd. in different parts of the brain. Typical values obtained (av) were 11.7 mg. % for globus pallidus, 15 mg. % for substantia nigra, max. 10 in front cerebrum, 17.7 in cornu ammonis. These results are significant in connection with the high Fe content of the globus which is taken as an explanation for the CO and HCN sensitivity of these regions. Ascorbic acid is likewise a reactive substance probably involved in the cell respiration but present in relatively lower concn. in the globus. B J C van der Hoeven

Influences of amino acids and choline upon the pigment-excreting function of the liver. Tatsuo Matsumura and Akio Kashimura. *Japan J. Gastroenterol.* 7, 115-19 (1935).—A series of amino acids and amines failed to stimulate the excretion of azofuchsin-G from the livers of rabbits. C M. McCay

Uric acid elimination in man. Hilding Berglund and A. Rune Frisk. *Acta Med. Scand.* 86, 232-68 (1935).—The ratio urinary uric acid/blood uric acid, or elimination index (E. I.) bears a high correlation to the Rehberg test. A linear relation exists in the E. I. in both normal persons and in those with severe kidney damage following intravenous injection of moderate amts. of Li urate, which is, however, broken over variable periods because of periodic alterations in glomerular circulation and function. The elimination can be greatly increased and the periodic "breaks" in the linear relationship avoided by the administration of salyrgan, neocinephren or ephylline. But under all circumstances the elimination of uric acid is inferior to that of creatinine, the mechanism unaltered by drugs being only 1/5 to 1/4 as efficient. No correlation apparently exists between diuresis and uric acid elimination. S Morgulis

Relationship between hydrochloric acid and total chlorides in gastric juice and the possibility of standards for gastric secretion. Hilding Berglund, Richard Johnson and H. Chien Chang. *Acta Med. Scand.* 86, 269-91 (1935).—The fundamental phenomenon in gastric secretion is the secretion of chlorides and, when the mechanism for HCl production may be lost, chloride secretion persists. The gastric acidity is very variable and no standards can be established without stimulation (with histamine) producing max response. S Morgulis

Influence of some external factors on the insensible perspiration A van Harreveld, B. W. Grutternik and A. K. M. Noyons. *Biochem. Z.* 281, 1-26 (1935).—Expts show that even as large a change as +35% in relative humidity does not affect the insensible perspiration, provided that the person has attained equilibrium with his environment. Sweating during an expt may give results which would indicate that more water is given off in a moist than in a dry atm. or when the relative humidity is changed suddenly. Within a temp range of 20° to 28.5° the insensible perspiration of a person wearing a swimming suit varies but insignificantly. Neither does the wt. of the

clothing have any effect so long as the subject is in equilibrium with his environment. The insensible perspiration even of the same subject shows considerable variability, and the relation between this and the metabolism may deviate by as much as 20%, so that the latter cannot be deduced from the insensible perspiration. S. Morgulis

The carbohydrate metabolism of guinea pigs. Friedrich Gottschalk. *Biochem. Z.* 281, 128-39 (1935).—In late fall the blood sugar of guinea pigs after a brief fast (16-26 hrs.) rises 250% or more, and this hyperglycemia is not affected by eating. During the winter this hyperglycemia is not found in the same animals. Feeding 2 g. glucose per kg. by mouth produces an alimentary hyperglycemia which attains a max. in 30-60 min. The glycemia curve then falls, occasionally even below the original level, but by the end of 7 hrs. shows invariably a renewed large rise, even beyond the previous max. values. Administration of 0.2 cc. adrenaline (1:1000) per kg. causes a marked hyperglycemia, up to 300% above the initial level. Injection of 2 units per kg. of insulin causes in the great majority of the animals severe hypoglycemic convulsions without materially lowering the glucemic level. In fact, in some guinea pigs there was no lowering of the blood sugar and others have shown considerable hyperglycemia at the height of the insulin shock. The high reducing values of the blood were not due to nonsugar reducing substances as was detected by the fermentation with yeast. S. Morgulis

Coupling of chemical processes in the muscle. X. Ostern and T. Baranowska. *Biochem. Z.* 281, 157-67 (1935), cf. *C. A.* 29, 8091.—The heart muscle of the rabbit differs definitely from the skeletal muscle by the presence of free adenylic acid and of very little phosphocreatine; the total P and the adenosinetriphosphoric acid are only about 50% of that of skeletal muscle. In heart muscle the adenylic acid is stable, its hydrolysis proceeding very slowly even in exts., and apparently it does not need to be phosphorylated at once, as in the skeletal muscle, to prevent its deamination. The stability of the adenylic acid in the heart makes it unnecessary to have a high phosphocreatine content which acts as a P donor in the rephosphorylation of the adenylic acid. In exts. from heart muscle the formation of adenosinetriphosphoric acid from adenylic acid proceeds the same as in muscle exts., the phosphoglyceric or phosphopyruvic acid being the P donor. In inactive exts. there is also a synthesis of phosphocreatine besides the synthesis of adenosinetriphosphoric acid, while in dialyzed exts. there is no synthesis of phosphocreatine and a much smaller synthesis of adenosinetriphosphoric acid. The splitting of the phosphoglyceric acid occurs only in the presence of adenylic acid and the adenosine does not function as coenzyme. In the absence of the adenylic acid the phosphoglyceric acid only changes to phosphopyruvic acid. It was also found that the Mg ions play an important role in the synthesis of adenosinetriphosphoric acid, and function therefore in the muscle as activators of the P transfer. The Mg ions seem also to play an important part in the synthesis of phosphocreatine from creatine and adenosinetriphosphoric acid. S. Morgulis

Some biochemical aspects of fats. H. Wm. E. Anderson and Harold H. Williams. *Oil and Soap* 12, 232-4 (1935); cf. *C. A.* 29, 8088.—Recent studies in animal fat metabolism are discussed. E. Scherubel

Artificial and natural regulation of body function. Ivan de Burgh Daly. *Pharm. J.* 135, 593-4; *Chemist and Druggist* 123, 674-5 (1935).—An address on the interrelation of endocrine functions in the body. S. W.

The relation between bacterial agglutinins and precipitins. Guglielmo Ascione *Arch sci biol.* (Italy) 21, 90-5(1935)—Precipitins and agglutinins are antibodies of different nature since with antityphoid, anticholeric and antimelittic serums one can demonstrate agglutination after the pptg power has been exhausted with the corresponding precipitin

P. F. Metildi

The lipolytic power of the liver of normal and tuberculous rabbits on the glycerides of lower and higher fatty acids and on the acetone soluble fraction of the lipides of tubercle bacilli. Roberto Rordorf. *Arch sci biol* (Italy) 21, 97-101(1935)—During the course of the disease in rabbit livers there is a diminution of lipase and tributryase activity. Neither the normal liver nor one from a diseased animal shows a hydrolytic action on acetone sol. lipides of tubercle bacilli

P. F. Metildi

Urinary urobilinogen value of routine estimation. P. H. Levinson. *J. Tenn. State Med. Assoc.* 28, No. 1, 17-19(1935)—Routine testing for urobilinogen is valuable in liver dysfunction, biliary obstruction, cholangitis, pyelophlebitis and excessive hemolysis

J. C. M.

Lack of mineral salts, esp. phosphoric acid in soils [causing osteomalacia] (Rubino) 15

H—PHARMACOLOGY

A. N. RICHARDS

Caffeic acid in prunes and its behavior as a laxative principle. E. Mraz, J. Fessler and C. Smith. *Science* 82, 304(1935)—Caffeic (I) and chlorogenic (II) acids cause an increase in tonus and amplitude of contraction of isolated rabbit jejunum or duodenum (C. A. 28, 1403) similar to that effected by various prune exts. Attempts to isolate these acids from the alk. hydrolyzed aq. ext. of prunes by the method of Plucker and Keilholz (C. A. 28, 5898) gave no indication of the presence of II but yielded 0.03% of cryst. I. The source of I in prunes is uncertain but I and quinic acid may be combined in complex caffeannins. Feeding tests with live rabbits, dogs and human beings failed to show any significant laxative effect but I caused a slight change in tonus and amplitude in tests with isolated rabbit duodenum. I is not the substance responsible for the laxative action caused by the ingestion of prunes

C. R. Addinall

The effects of certain acid treatments for coccidiosis on the hydrogen ion content of the fowl intestine. W. R. Kerr and R. H. Common. *Vet. J.* 91, 309-11(1935)—The reaction of various organs of birds treated with buttermilk or HCl varied very little from the values secured with the controls. The pH of the first portion of the small intestine was somewhat increased by buttermilk treatment

K. C. Beeson

The effect of pituitrin on the composition of the skeletal muscle. S. Osada. *Folia Endocrinol. Japon.* 11, 23(1935)—After one injection of pituitrin (amt. not stated) the lactic content of the skeletal muscle increased, glycogen and lactacidogen decreased, and residual N, NH_4 , urea, creatinine, creatine and amino acid remained unchanged

Ruth Berggren

Therapeutic uses of colloidal sulfur. Goff P. Lilly and Benjamin S. Gershwin. *Am. Med.* 41, 546-9(1935)

Rachel Brown

Acute potassium permanganate poisoning. Report of a case. Edmund W. Klinefelter. *Am. Med.* 41, 570-2(1935)

Rachel Brown

Better general anesthesia in animals. I. Oxygen-ether controlled anesthesia by the closed method in the dog with morphine as preanesthesia hypnosis. N. C. Covington. *J. Am. Vet. Med. Assoc.* 40, 662-72(1935)

Rachel Brown

Treatment of staphylococcus infections with staphylococcus toxoid. M. A. Gohar. *J. Trop. Med. Hyg.* 38, 249-60(1935)—Formalinized anaerobic broth culture filtrates of staphylococcus were found effective in subcutaneous injections for the treatment of staphylococcus skin infections

Rachel Brown

1 Treatment of amebic colitis with iodoform. Aldo Castellani. *J. Trop. Med. Hyg.* 38, 208-9(1935).—Satisfactory results were obtained in the treatment with iodoform of a series of 9 cases of amebic colitis

Rachel Brown

Effect of atropine on the augmented salivary secretion in the cat. F. C. MacIntosh and H. E. Rawlinson. *Quart. J. Exptl. Physiol.* 25, 199-205(1935)—After small doses of atropine the secretory response of the cat's submaxillary gland to sympathetic stimulation is increased by previous stimulation of the chorda tympani, although the latter nerve is itself unable to cause any secretion. Stimulation of the chorda tympani must therefore cause a true increase in the irritability of the secretory cells to sympathetic stimulation

Rachel Brown

The effect of sympathetic stimulation and of autonomic drugs on the paralytic submaxillary gland of the cat. A. J. Fleming and F. C. MacIntosh. *Quart. J. Exptl. Physiol.* 25, 207-12(1935)—In cats after section and degeneration of the chorda tympani, the submaxillary gland shows a greatly increased secretory response to sympathetic stimulation and to adrenaline. This increased response is due to a true heightened irritability of the secretory cells for sympathetic stimulation. Pilocarpine and acetylcholine act more strongly on the normal than on the paralytic gland

Rachel Brown

4 The effect of adrenaline and of increased work on the carbohydrate metabolism of the mammalian heart. J. Yule Bogue, C. Lovatt Evans, F. Grande and F. Y. Hsu. *Quart. J. Exptl. Physiol.* 25, 213-28(1935)—Increase in the energy expenditure of the dog's heart by the addn. of adrenaline to the circulating blood or by raising the mech. work done increases the utilization of both sugar and lactate. Cardiac muscle uses up lactate more readily than skeletal muscle. It is suggested that the lactate is burned by the tissue to yield energy, whereas the sugar is used to replace glycogen usage. When the blood sugar and lactate have fallen to a low level the heart glycogen is drawn upon, especially if the energy expenditure has been high

Rachel Brown

The selective action of histamine and the effect of prolonged vagal stimulation on the cells of gastric glands in the dog. D. J. Bowie and Arthur M. Vinegar. *Quart. J. Exptl. Physiol.* 25, 247-57(1935)—After repeated subcutaneous administrations of histamine during several hrs., there was no diminution in the amt. of pepsinogen granules in the peptic cells. The gastric juice produced by histamine was copious and of high acidity but low in peptic power. A few hrs. after the administrations of histamine were begun pepsin became practically absent from the secretion. A max. discharge of pepsinogen granules from the peptic cells occurred after prolonged rhythmic stimulation of the vagi in the neck by means of a strong induction current. The increase of pepsin in the gastric juice following vagal stimulation coincided with the discharging of the pepsinogen granules from the peptic cells. Vagal stimulation applied immediately after a period of administration of histamine soon activated the previously inactivated peptic cells. Histamine does not stimulate the peptic cells to discharge their pepsinogen granules

Rachel Brown

8 Novarsenobenzene poisoning. Wilhelm Keri. *Wien klin. Wochschr.* 48, 647-9(1935)—In 2 of 47 patients the use of novarsenobenzene was harmful. Clinical descriptions are given.

D. B. Dill

The influence of diuretics on the alkali reserve of the blood. Georg Gottsegen. *Wien klin. Wochschr.* 48, 1116-18(1935)—Hg diuretics, ephylline and Na dehydrocholate increase the alk. reserve from 1 to 12 vols. %

D. B. Dill

9 Extract of viper skin. L. Piton. *Bull. med. Jan.* 27, (1935); *J. pharm. Belg.* 14, 263, *Anal. farm. belguim.*, Suppl. 6, 77.—In cancer the ext. has all the effects previously described in C. A. 29, 7493.

L. E. Gilson

Retarding action of formaldehyde, acetaldehyde and acetone on the enzymic hydrolysis of sucrose. A. Chaudin. *Bull. soc. chim. bel.* 17, 1340-50(1935), cf. C. A. 29, 4789.—In concns. of 2-15% the compd.

retard the hydrolysis although the rate curves show an apparent increase in the enzyme concn., owing to the compds. acting as nonsolvent diluents, as in the case of glycerol and the lower alcs. L. E. Gilson

Physiological and pharmacodynamical experiments on the [isolated] human uterine tube. C. Daniel, I. I. Nitescu, A. Somaru and I. D. Georgescu. *Compt. rend. soc. biol.* 120, 54-6 (1935).—At pH about 7.4 adrenaline produced a transient increase in tone, Doryl or very small doses of nicotine a prolonged increase in tone and no. of contractions, and eupaverine, papaverine or large doses of nicotine, paralysis. Folliculin in small doses had no effect, very large doses caused a decrease in tone and cessation of contractions. Ext. of corpus luteum caused a decrease in tone. Prolan alone had no apparent action on tone or contractions but sensitized the organ to the action of estrin or folliculin. Increasing the pH of the bath to 7.6 or higher produced an increase in tone and amplitude of contractions, compared to the values for pH 7.4, while decreasing the pH to 7.1 had the opposite effect. L. F. Gilson

Some effects of piperidinomethylbenzodioxan (F933) on the circulatory system. C. Heymans and J. J. Bouckaert. *Compt. rend. soc. biol.* 120, 79-82 (1935). L. F. Gilson

Effects of adrenaline and of excitation of the cervical sympathetic nerve on the intracranial circulation of the isolated [dog] head. J. J. Bouckaert and F. Jourdan. *Compt. rend. soc. biol.* 120, 81-7 (1935). Existence of cerebral vasoconstrictor nerves and the action of adrenaline on the blood vessels of the brain. *Ibid.* 88-90. Cerebral vascular effect of adrenaline. *Ibid.* 255-7.—In the isolated dog head adrenaline causes a constriction of the blood vessels of the brain, but in anesthetized dogs with the vagus cut and the carotid sinus denervated it causes a slight dilation of the cerebral vessels. Apparently there are 2 simultaneous and antagonistic effects. L. E. G.

Action of organic peroxides in the treatment of experimental cancer in mice. W. Koch and J. Maass. *Compt. rend. soc. biol.* 120, 106-8 (1935).—Injections of a 1 in 20,000 aq. soln. of diformaldehyde diperoxide had an ameliorating effect in benzopyrene cancer in mice. L. E. Gilson

Action of commercial preparations of histidine. A. Schwartz, I. Israel and A. Jacob. *Compt. rend. soc. biol.* 120, 121-6 (1935).—Com. histidine and histidine-HCl contain traces of histamine and so produce a wheal when applied to scarified skin. Five γ of histamine is sufficient to produce a noticeable effect. Highly purified histidine has no effect on the skin. L. E. Gilson

Hemolysis by saponin and solanine and cholesterologenesis in vivo. V. de Laverge and P. Kivell. *Compt. rend. soc. biol.* 120, 149-50 (1935); cf. C. A. 29, 4829.—In guinea pigs and rabbits injections of acid solns of solanine and saponin produced hemolysis, hypercholesterolemia and death. Neutral or alk. solns of saponin produced hemolysis and hypercholesterolemia. L. E. G.

Effects of injections of spleen extract on carbohydrate metabolism. Michel Polonovski, H. Warenbourg and J. Driessens. *Compt. rend. soc. biol.* 120, 181-2 (1935).—In normal persons the injection of ext. equiv. to 100 g. fresh spleen had practically no effect on the residual chromic index of the blood. In diabetic and cancer patients where the residual chromic index was above normal the injections caused a drop to nearly the normal level. In no case was there any significant change in glycemia. L. F. Gilson

Effect of radium on the glucolytic activity of neoplastic tissues. C. Grandclaude, M. Polonovski, H. Warenbourg and J. Driessens. *Compt. rend. soc. biol.* 120, 183-4 (1935).—In 16 out of 25 cancer cases treated several days with Ra the residual chromic index decreased, and in 6 it increased slightly. The decrease is ascribed to a slowing of glycolysis in the irradiated tissues. L. F. Gilson

Lesions of the liver and kidneys in experimental intoxication [of rabbits] with apiole. A. Patour, G. Patour,

Bedrines and Payen. *Compt. rend. soc. biol.* 120, 192-4 (1935). L. E. Gilson

Effects of intravenous injections of compounds of iron and ascorbic acid on human and experimental animal cancers. F. Arlong, A. Morel and A. Joverand. *Compt. rend. soc. biol.* 120, 201-4 (1935).—See C. A. 29, 7471¹. Accelerating action on experimental cancer of intravenous injections of ascorbic acid without iron and associated with copper. *Ibid.* 205-6.—In rabbits with grafted cancer

of the testicle repeated daily injections of 0.1 g. ascorbic acid alone or 0.01 g. of the cupric salt of dehydroascorbic acid accelerated the growth of the cancer and increased the no. of visceral metastases formed. L. E. Gilson

Action of adrenaline and pelletierine on the heart of the oyster. A. Julien. *Compt. rend. soc. biol.* 120, 211-13 (1935), cf. C. A. 29, 3923¹. L. E. Gilson

Ascorbic acid of the adrenals in experimental diphtheria toxin poisoning. G. Mouriquand, P. Sédallian and A. Coeur. *Compt. rend. soc. biol.* 120, 216-17 (1935); cf. Cardoso, C. A. 29, 6044¹.—In acute intoxication of guinea pigs by diphtheria toxin the ascorbic acid of the adrenals (as detd. by the Giroud-Leblonde reaction) does not begin to decrease rapidly until 18 hrs. after injection of the toxin. L. E. Gilson

Respiration of brain tissue. L. Crasnanu and N. Gavrilescu. *Compt. rend. soc. biol.* 120, 226-8 (1935).—

Novarthenbenzene decreased the O consumption of brain tissue *in vitro* but increased the O consumption of muscle, blood, liver and yeast. L. E. Gilson

Action of diacetylmorphine on the liver. G. Baltacanu and C. Vasiliu. *Compt. rend. soc. biol.* 120, 229-32 (1935), cf. C. A. 28, 6843¹.—In dogs heroine greatly decreases the flow of bile. The compn. of the bile is not affected. L. E. Gilson

Effect of cortin on adrenaline secretion. Edgard Zunz and Jean La Barre. *Compt. rend. soc. biol.* 120, 218-50 (1935).—The hyperglycemia produced by ext. of adrenal cortex is partly, but not entirely, due to adrenaline discharge. L. E. Gilson

Action of caffeine, papaverine and barium chloride on the cerebral blood vessels. J. J. Bouckaert and F. Jourdan. *Compt. rend. soc. biol.* 120, 257-9 (1935).—In the perfused isolated dog head caffeine benzoate and papaverine salts caused dilation of the blood vessels of the brain and BaCl₂ caused constriction. L. E. Gilson

Effect of cobra venom on the pain threshold of man and guinea pig. D. I. Machit. *Compt. rend. soc. biol.* 120, 280-3 (1935).—The sensitivity to pain produced by elec. stimulation of the skin is decreased. L. E. Gilson

Action of conessine on certain protozoa *in vitro*. R. K. Goyal. *Compt. rend. soc. biol.* 120, 206-7 (1935).—A 0.01% soln. of conessine quickly kills parameria. A 0.1% soln. kills *Spirochaeta duttoni*, *Trypanosoma evansi* and *Leishmania histolytica* in 2 hrs. or less. L. E. Gilson

Influence of experimental hypertrophy of the adrenal cortex and of adrenal cortex extract on the resistance to certain intoxications. G. Benetato, I. Gains and C. Oprisu. *Compt. rend. soc. biol.* 120, 353-5 (1935).—One lot of rats was given daily injections of a suspension of total hypophysis until the adrenals were about 60% above normal wt. Another lot was given several injections of cortical ext. No increase in resistance to morphine or antityphoparatyphoid vaccine was found in either case. L. E. Gilson

Absence of the "all or none" effect in the frog heart poisoned with potassium chloride. A. Chaybany. *Compt. rend. soc. biol.* 120, 407-9 (1935). L. E. Gilson

Treatment of acute mercurial poisoning with sodium formaldehydesulfoxylate. Juan M. Muñoz. *Re. soc. argentina biol.* 11, 224-9, *Compt. rend. soc. biol.* 120, 300-1 (1935).—Na formaldehydesulfoxylate (I) reduces Hg salts to Hg metal *in vitro*. Rats and guinea pigs given HgCl₂ by mouth and then I, also by mouth, in less than 15 min. usually survived. Intravenous injections were of little or no value in rats but were effective in guinea pigs. The lethal dose of I for rats and guinea pigs, when given alone by mouth, is between 5 and 10 g./kg. L. E. G.

Magnesium in experimental uremia. I. Austo Amantea,

Arch. farmacol. sper. 60, 353-64 (1935).—MgCl₂ introduced into rabbits with exptl. uremia produces an immediate azotemia which diminishes to its original value after several hrs. and a lowering of body temp. The physiol. mechanism is discussed. Helen Lee Gruel

Drugs which affect cellular oxidation. Bruno De Biaso. *Arch. farmacol. sper.* 60, 389-94 (1935).—In rabbit and guinea-pig expts. alkaloids (papaverine and perparine) with peripheral depressive effect did not inhibit or attenuate the excit-metabolic action of dinitrophenol. Helen Lee Gruel

Japanese camphor and its synergic association with boric acid in the treatment of skin diseases. Giuseppe Ganino. *Boll. chim. farm.* 74, 671-4 (1935).

Helen Lee Gruel
Glycocoll treatment in myopathic progressive muscular atrophy and creatine exchange. Luigi Perria. *Boll. soc. ital. biol. sper.* 10, 751-2 (1935).—In 6 persons glycocoll treatment produced no beneficial results and no change of creatine bodies toward normal values. H. L. G.

Glucemic, chloremic and proteinemic curves after insulin injection. G. Dell'Acqua. *Boll. soc. ital. biol. sper.* 10, 761-5 (1935).—The subcutaneous injection of 20 units of insulin into normal persons caused a lowering of the glucemic and chloremic curves in the first hr. followed by a rise in the second hr. with subsequent inversion of the glucemic-chloremic ratio in the third hr. When similar injections of insulin were made into diabetics the inversion of the glucemic-chloremic ratio occurred earlier and was more marked. Intravenous injections of 12 units caused still greater differences. Insulin injections into normal persons usually produced an initial diminution in proteinemia followed by a rise and subsequent fall. The curve after insulin injection into diabetics was similar but much more irregular. Helen Lee Gruel

Action of compressed air on animals. XVII. Combustion of ethyl alcohol injected into rats. Alberto Agazzotti. *Boll. soc. ital. biol. sper.* 10, 782-4 (1935).—Combustion of EtOH in rats was slightly higher at atm. pressure than at 6 atm. XVIII. Combustion of ethyl alcohol injected in increasing doses. *Ibid.* 784-6.—The amt. of alc. consumed per 100 g. body wt. increased progressively at normal and at 6 atm. pressure. XV. Oxygen and carbon dioxide in expired air of rabbits subjected to compressed air. G. Buccardi, M. Leonardi and E. Ferrarini. *Ibid.* 787-8.—Increase of pressure increased the no. of respirations but the R. Q. remained practically unchanged. Helen Lee Gruel

Action of thyroxine on the catheptic and amylase power of the liver in guinea pigs. G. Scoz and L. De Caro. *Boll. soc. ital. biol. sper.* 10, 829-8 (1935).—Guinea pigs given 3 injections of 0.3-0.4 mg. thyroxine and killed 2-42 days after the last injection showed an increase of catheptic and amylase in the liver during the period of diminution in body wt. (4-6 days after injection). Subsequently the enzyme titer fell within normal limits. H. L. G.

Effect of thyroxine on protein sulfur of the liver in guinea pigs. G. Scoz, P. L. Micheli and T. Gualtierotti. *Boll. soc. ital. biol. sper.* 10, 829-30 (1935).—In general there was a decrease in protein S during the first 4-6 days after the last of 3 injections of 0.3-0.4 mg. thyroxine. This was followed by a const. increase. Helen Lee Gruel

Effect of thyroxine on extractable sulfur and vitamin C content of guinea pig liver. G. Scoz and T. Gualtierotti. *Boll. soc. ital. biol. sper.* 10, 830-2 (1935).—The period of diminution in wt. is accompanied by an increase of extractable S and a diminution in vitamin C. During the second stage after thyroxine injection the vitamin C titer increases and the extractable S values return to normal. Helen Lee Gruel

Effect of thyroxine on the phosphatase power of the liver in guinea pigs. G. Scoz and G. Cantoni. *Boll. soc. ital. biol. sper.* 10, 833-4 (1935).—The period of wt. diminution after thyroxine injection is accompanied by a 10% reduction in liver phosphatase. Subsequently this gives way to a marked increase in phosphatase. Helen Lee Gruel

Hematologic-biochemical changes in the blood from neoparsphenamine. I. R. Bakhroneev and L. N. Pavlova. *Arch. Dermatol. Syphilis* 170, 543-9 (1934).—Changes in blood leucocyte count, Ca and K are given for 3 healthy cows injected with neoparsphenamine. O. Hartley

The influence of pharmaceuticals on experimental urso sensitization in animals. F. Marquardt. *Arch. Dermatol. Syphilis* 171, 430-9 (1935).—In guinea pigs, the development of hypersensitivity of the skin to urso (II) can be prevented only by large doses of adrenaline (II) injected simultaneously. II has no effect when given prior to I, after reactions from I have set in, its use, or that of pilocarpine, in small doses, causes exacerbation of symptoms. Atropine, morphine-scopolamine, phenobarbital and thyroglanol were without effect. O. Hartley

Experimental investigations of arspenamine sensitization of the skin. H. Haxthausen. *Arch. Dermatol. Syphilis* 171, 553-9 (1935).—Diazotized arspenamine alone or coupled with horse serum produced hypersensitivity to As in all persons tested (4 in each instance). When human serum was substituted for horse serum, sensitization occurred in only 1 person out of 8 tested. O. Hartley

Psoriasis and the suprarenal cortex. II. The influence of cortical extracts and vitamin C on psoriatic conditions. Theodor Grünberg. *Arch. Dermatol. Syphilis* 173, 1-28 (1935), cf. C. A. 28, 1769.—Fifty-eight cases of psoriasis were injected with cortical ext. (Cortidyn, Promonta-Hamburg). Of these, the 12 severest cases showed striking improvement. Two badly crippled arthritic psoriatics left the clinic on foot. No patients reacted unfavorably; the most highly pigmented skins healed fastest. The theory is advanced that there is hypofunctioning of the suprarenal cortex in psoriasis. Expts. with vitamin C failed to give conclusive results. O. Hartley

Disturbances in liver metabolism in arsenobenzene poisoning. Albert Wiedmann. *Arch. Dermatol. Syphilis* 173, 173-80 (1935).—Arsenobenzene causes disturbances in both carbohydrate and protein economy of the liver. A glycogen impoverishment of the latter can be avoided by administration of sugar, according to animal investigations. Seventeen references. O. Hartley

Oral administration of potassium bismuth tartrate in treatment of syphilis. John A. Kolmer. *Arch. Dermatol. Syphilis* 31, 9-14 (1935).—Adults tolerate doses of 0.19-0.4 g. K Bi tartrate 3 times a day, orally, much better than HgCl₂, Hgl, or Hgl, and it is distinctly curative. Its toxicity for rats and rabbits is extremely low, and its curative value for syphilis in these animals much higher than that of Hg compounds. O. Hartley

Excretion of mercury after oral administration of mercury with chalk, yellow mercurous iodide and corrosive mercuric chloride. Torald Sollmann, Nora E. Schreiber, Harold N. Cole, Henry DeWoll and John V. Amlder. *Arch. Dermatol. Syphilis* 31, 15-25 (1935).—Urinary excretion of Hg when taken orally in doses of 0.2 g. Hg with chalk daily or of 0.016 g. Hgl 4 times daily was found to be essentially the same as that obtained with 4 g. 50% Hg ointment daily by inunction. O. Hartley

Use of maize oil (unsaturated acids) in the treatment of eczema. Preliminary report. Theodore Cornbleet and Earle R. Pace. *Arch. Dermatol. Syphilis* 31, 224-6 (1935).—Eighty-seven patients with chronic eczema were cured or much improved by oral administration of maize oil in 4 1/2 yrs' experience. The theory that eczema is related to the unsatd. fat acid level of the blood is being investigated. O. Hartley

Colloidal sulfur in dermatology. Hiram E. Muller. *Arch. Dermatol. Syphilis* 31, 516-25 (1935).—A review with 24 references. O. Hartley

Fatality from exacerbation of latent tuberculosis due to thioisomol in a case of yaws. C. M. Hasselmann. *Arch. Dermatol. Syphilis* 31, 695-91 (1935). O. Hartley

Reactions due to phenolphthalein. A study of their pathogenesis. E. Wm. Abramowitz. *Arch. Dermatol. Syphilis* 31, 771-92 (1935).—A review covering 43

references. Eruptions are probably due to allergy rather than to cumulative toxic effects or overdose. O. H.

Acne and furunculosis. Preliminary report of treatment with physiologic solution of sodium chloride locally or by intravenous injection. Herman Goodman. *Arch. Dermatol. Syphilol.* 31, 829-30(1935).—Several hundred patients have been treated successfully. Dosage varies from 100 to 200 cc. per injection. Therapeutic action may be due to lowering of the blood sugar. Growth of streptococci and staphylococci is inhibited in 2-3% NaCl solution. O. Hartley

Treatment of vitiligo with gold sodium thiosulfate given intravenously and subcutaneously. Jacob L. Grund. *Arch. Dermatol. Syphilol.* 31, 867-9(1935).—A case of patch depigmentation in a negro was repigmented by Au Na thiosulfate. The normal tissues remained unchanged. O. Hartley

Excretion of mercury after clinical intramuscular and intravenous injections. Torald Sollmann, Nora E. Schreiber and H. N. Cole. *Arch. Dermatol. Syphilol.* 32, 1-48(1935).—Detailed exptl. data are given on Hg excretion after injection of 12 different mercurials. Urinary excretion is an index of diffusible Hg; fecal excretion is negligible except with flumerin. Antisyphilitic efficiency is conditioned on concn of ionized Hg, that fixed in the tissues plays no therapeutic role. In all effective treatment excretion is progressively cumulative. From 31 to 77% of the Hg of diffusible org. mercurials is fixed indefinitely in the tissues, from 9% to 99% of the Hg of colloidal solns. The retained Hg has no therapeutic value and may be harmful. O. Hartley

Mercury injections. Torald Sollmann, H. N. Cole and N. E. Schreiber. *Arch. Dermatol. Syphilol.* 32, 242-57(1935).—Metallic Hg in 50% ointments was found the most effective. Hg oleate was absorbed as well, but colloidal Hg was not. Absorption was measured by detn. of urinary excretion. It was found to be distinctly greater in whites than in negroes. O. Hartley

Modified composition of iodobismutol. Results on local irritation. P. J. Hamzik, C. W. Barnett and A. P. Richardson. *Arch. Dermatol. Syphilol.* 32, 284-7(1935).—Observations on 1174 patients indicate a better tolerance for iodobismutol injections when saligenin is added as a local anesthetic. Propylene glycol is substituted for ethylene glycol as solvent to avoid the cumulative toxicity attributed to the latter. O. Hartley

Role of iodine in the therapy of syphilis. A discussion of its relationship to lipoids. E. T. Burke. *Arch. Dermatol. Syphilol.* 32, 404-12(1935).—Although I has no spirocheticidal value, it should always accompany As or Bi therapy in order to iodinate the unsatd. lipoids which prevent lymphocytic enzymes from having spirocheticidal effect. O. Hartley

Treatment of arsenical hepatitis with sodium dehydrocholate. Experimental and clinical studies in cases of arsenamine poisoning. Bernard Appel and I. R. Jankelson. *Arch. Dermatol. Syphilol.* 32, 422-45(1935).—Toxic hepatitis during syphilis treatment is largely due to liver damage by As. The latter appears in the feces after intravenous injection of arsenamine (I) as a result of excretion from the liver via the gall bladder. Addn. of Na thiosulfate (II) increases the proportion of As excreted by the liver, Na dehydrocholate (III) is still more effective. In expts. on rabbits III increased the ratio of the wt. of the liver to the percentage of I retained more than II. Clinically III promoted recovery from hepatitis and gave increased tolerance for I. O. Hartley

Dimorphophenol in treatment of ichthyosis. Matthew Molitch and Richard F. Cousins. *Arch. Dermatol. Syphilol.* 32, 486-7(1935).—Oral administration for 4 weeks of doses increased progressively to the max. recommended for obese adults failed to produce sweating or loss of wt. in a 108-lb. 16-yr. old boy with ichthyosis. Basal metabolism increased 18% but no effects were produced on temp., blood count, blood sugar, blood urea or urine vol. O. Hartley

Pre-iodine and post-iodine days. A review of 37,228 cases of goiter at the Mayo Clinic. Charles H. Mayo and

1 Charles W. Mayo. *West. J. Surgery Obstet. Gynecol.* 43, 477-82(1935).—In the 15,973 cases of exophthalmic goiter treated since 1892 the mortality in pre-iodine days was nearly 4 times the rate averaged since I therapy was begun. Much of this improvement is due to increased operability induced by preoperative I therapy. O. Hartley

Chemotherapy of bacterial infections. Gerhard Domagk. *Angew. Chem.* 48, 657-67(1935); cf. C. A. 29, 4831¹.—A very comprehensive treatise including the following subjects: streptococci, staphylococci, pneumococci, tuberculous bacilli, leprosy, coli, typhus, paratyphus, anthrax, erysipelas, Malta fever, Bang's disease, gas gangrene and tropical bacterial infections. Fifty-two references. Karl Kammermeyer

The therapeutic value of inhalation for patients suffering from inflammation of the upper air passages due to inhalation of vapors of dichloroethyl sulfide (mustard gas).

3 H. Osswald. *Gesellschaft u. Luftschutz* 5, 235-7(1935).—Expts. were made with rabbits. The treatment consisted in exposing the poisoned animals to smokes composed of salts of Ce, Ca and Na. Although the treatment did not affect the percentage of recoveries it is claimed that the severity of the effects was considerably mitigated.

A. L. Kibler. Experimental investigation of indelible-pencil poisoning. J. Guerlich. *Deut. Z. ges. gericht. Med.* 25, 156-63(1935).—Methyl violet, the poison of the indelible pencil, created a local necrotic center from which it passed into the circulation. It is a strong protoplasmic poison, destroys erythrocytes, causes methemoglobin formation and results in anemia. The growing organism appeared able to decolorize and detoxify comparatively large amounts without fatal poisoning. Histological examn. presented great similarity to aniline or nitrobenzene poisoning.

4 Frances Krasnow. Atebrin and plasmochin in the treatment and control of malaria. D. L. Seckinger. *Am. J. Trop. Med.* 15, 631-49(1935).—A review. G. H. W. Lucas

5 Allergic shock from local and general anesthetics. G. L. Waldbott. *Anesthesia and Analgesia* 14, 199-204(1935).—Sensitization to local and general anesthetics may produce allergic shock and death when given as an overdose to an extremely sensitive patient. Autopsy findings in sudden death from anesthesia are identical with those of allergic shock from pollen and serum injections. G. H. W. Lucas

Cyclopropane anesthesia. Harold R. Griffith. *Anesthesia and Analgesia* 14, 253-6(1935).—A review of 1108 cases in which cyclopropane has been used successfully. G. H. W. Lucas

Clinical use of vinethene. Frank W. Marvin. *Anesthesia and Analgesia* 14, 257-62(1935).—A review. G. H. W. Lucas

7 Cyclopropane anesthesia in thoracic surgery. E. A. Rovenstone. *Anesthesia and Analgesia* 14, 270-5(1935).—Statistical data recorded in 160 thoracic operations show that certain characteristics of cyclopropane endow it with many advantages in thoracic surgery. Its main disadvantages are its explosibility, which necessitates a special closed technic for its administration, and its high cost. G. H. W. Lucas

8 Leucocytosis following inhalation anesthesia. Ivan B. Taylor and Ralph M. Waters. *Anesthesia and Analgesia* 14, 276-81(1935).—A leucocytosis, reaching a max. in 4 to 8 hrs. after operations and continuing for 2 to 3 days, occurs after the use of such inhalation anesthesia as ether, N₂O, ethylene and cyclopropane. The return to normal requires from 3 to 5 days. G. H. W. Lucas

9 Experimental convulsions induced by administration of thujone. A pharmacologic study of the influence of the autonomic nervous system on these convulsions. H. M. Keith and G. W. Stavsky. *Arch. Neurol. Psychiatry* 34, 1022-40(1935).—A study of the effects of other drugs on the convulsions produced by thujone showed that sympathetic stimulants such as adrenaline, pitresin and nicotine, as well as histamine, when added to the thujone markedly increased the severity of the convulsions and lowered the min. convulsant dose of the drug.

tolerance to As is increased, permitting the use of larger doses
A. E. Meyer

The therapeutic action of arsenobenzene associated with sodium dehydrocholate L. Jacchia and G. Truffi *Arch. Dermatol. Syphilis* 170, 550-71(1934)—Add clinical evidence is presented to show the favorable influence of Na dehydrocholate in As therapy O. H.

The enterochromaffin cells of the guinea pig and the rabbit after treatment with histamine, pilocarpine and acetylcholine Vittorio Lrpamer *Biochim terap sper* 22, 390-4(1935)—The enterochromaffin cells are not stimulated by either of the drugs tested Conclusion The chromaffin tissue examd does not secrete a substance taking active part in the digestion, since the drugs used stimulate the secretion of digestive juices A. F. M.

Criminal poisoning with seeds of *Datura* and *Mandragora* J. Bouquet *Bull sci pharmacol* 42, 450-9(1935)—Description of two cases A. F. M.

Physiological investigation of the optical isomers of diethylaminomethylbenzodioxan D. Bovet and A. Simon *Bull sci pharmacol* 42, 466-73(1935)—The l-compd is twice as toxic to fishes as the d-compd The hypertensive action of adrenaline in cats is inverted by the l-compd at 1/5, to 1/10 of the quantity necessary for the d-compd The myotic action on the mouse iris is 4 to 8 times stronger in the former compd than in the latter A. E. M.

Intravenous use of mercury oxyacynide against tenias F. Prado Moreira *Publicações med (Brazil)* 6, No. 9 (1935), *Rev sud-americana endocrinol imunol quimioterap* 18, 634—Two cc of a 1% soln was given with good result A. E. Meyer

The action of indole and skatole on the isolated intestine A. M. Michelazzi and G. Bellucci *Rass terap patol clin* No. 9 (1934), *Rev sud-americana endocrinol imunol quimioterap* 18, 637—Both substances applied on the smooth muscle of the intestine cause an inhibition of the tonus and the contractions A. E. Meyer

Treatment of psoriasis with organ extracts Th. Grüneberg. *Rev méd Germano-Ibero-Americana* 7, Nos. 5 and 6(1934), *Rev sud-americana endocrinol imunol quimioterap* 18, 650-1—Adrenal cortex and liver exts. give favorable results A. E. Meyer

Ephedrine in treatment of shock affecting the hepatobiliary system. J. Lauer *Rev med chir des mal du foie* (July, 1934); *Rev sud-americana endocrinol imunol quimioterap* 18, 653-4—Ephedrine combines the action of adrenaline and caffeine It is recommended as a cardiotonic and for treatment of symptoms caused by liver dysfunction as asthma, urticaria, etc A. E. Meyer

Treatment of diabetes with testicle extract G. Odio de Granada *Rev med cir Habana* 40, No. 3(1935), *Rev sud-americana endocrinol imunol quimioterap* 18, 655—The ext. was prepd from testes taken from animals after previous ligation of the vas deferens Treatment by injections caused cure in cases of mild diabetes A. F. Meyer

Alkali therapy in leprosy and other diseases Nicolas V. Greco *Semana med.* (Buenos Aires) 1935, II, 597-604 *Rev asoc med Argentina* 49, 1381-94 A. F. Meyer

Treatment of arterial hypertension with octyl alcohol Carlos Rossi Belgrano *Semana med* (Buenos Aires) 1935, II, 1073-80—Intravenous injections of 10-20 cc of a soln. 1:10,000 of octyl alc. were given The effect is a slight hydemia with decrease of urea and Cl in the blood The influence on the blood pressure was not very significant; subjective symptoms were relieved, but occasionally fever was observed A. E. Meyer

Hematological changes caused by intoxication with barbiturates R. Carratalá. *Soc. med. legal toxicol* July 11(1934); *Rev sud-americana endocrinol imunol quimioterap* 18, 675-6—The red cell count is reduced An increased white count with relative mononucleosis gives unfavorable prognosis. Leucocytosis with accentuated polynucleosis is a favorable sign Eosinophilia appears a few days after the onset of symptoms. A. F. M.

Absorption and oxidation of alcohol in alcoholics. Carl G. Bernhard and Leonard Goldberg *Acta Med. Scand.* 86, 152 215(1935)—The blood alc. curve has been studied

in several chronic alcoholics and in nondrinking persons. The alc. was administered by mouth in doses of 0.41-0.79 g per kg. The detns were made by Widmark's micromethod In the post-absorptive phase the blood alc. curve in both alcoholics and in temperate subjects follow a straight line The av. velocity of oxidation of the alc. in the male alcoholics was $0.0028 \pm 0.00017\%$ per min and in the female 0.0028 ± 0.0001 . In the abstemious male and female subjects this value was 0.0024 ± 0.0001 and 0.0026 ± 0.0001 , resp. The distribution coeff r was 0.72 ± 0.02 , 0.64 ± 0.10 , and 0.70 ± 0.01 , 0.59 ± 0.01 , resp. The alc. oxidation per kg and hr. was 115 ± 4.4 mg., 109 ± 13 mg., and 93 ± 3.1 mg., 80 ± 4.1 mg., resp. The max. absorption occurs in 32 ± 4.5 min, 30 min, and 46 ± 23 min, 44 ± 6.8 min, resp. There is, therefore, no difference from these standpoints between the chronic alcoholic and the abstemious persons The max. absorption, however, seems to come somewhat earlier in the former group. It is pointed out that single blood alc. curves give no basis for diagnosing chronic alcoholism S. Morgulis

Results from sanocrysin therapy in nonsurgical joint diseases. Knud Secher and E. Gudiksen. *Acta Med. Scand* 86, 370-95(1935)—Sanocrysin is regarded as an efficient remedy against a series of joint diseases S. Morgulis

Amidopyrine and agranulocytosis Knud Brochner-Mortensen *Acta Med Scand* 86, 396-406(1935)—Leucocytosis followed by pronounced leucopenia was observed in a polyarthritus patient treated with amidopyrine S. Morgulis

Effect of adrenaline on liver cell suspensions. E. Geiger. *Biochem Z* 281, 86-92(1935)—Sedimentation of the proteins pptd by CCl_4CO_2H in liver cell suspensions is increased through the addn of adrenaline, which apparently so alters its phys. state as to diminish the colloid protective action. S. Morgulis

The effect on gaseous metabolism of poisons paralyzing the vegetative nervous system F. Peter *Biochem Z* 281, 111-20(1935)—Ergotamine causes a rise, up to 42%, of the metabolism of the adult rat at the crit. temp. 28°. This effect may last 5-6 hrs. Atropine causes a lowering of the metabolism and Na phenylethylbarbiturate has no effect The effect of various combinations was also studied S. Morgulis

Composition of the residual nitrogen in experimental uranium poisoning Martin Jacoby *Biochem. Z* 281, 198-9(1935)—In normal rabbits the urea N constitutes 35.7 to 51.9% of the total residual N of the blood In animals poisoned with $UO_2(NO_3)_2$, this fraction is always and very markedly increased (69 to 96%). S. Morgulis

Effect of salyrgan, theophylline and caffeine on diuresis, glomerular filtration and proteinuria. Hilding Berglund and Bjorn Sundh *Acta Med Scand* 86, 216-32(1935)—Salyrgan may be used in primary renal disease, and no harmful results were noted even in extremely contracted kidneys Its diuretic action is due to diminished tubular reabsorption Administration of NaCl accelerates the action of salyrgan, and this may account for the poor results obtained in patients who have been on a salt-free diet a long time With a given damage to the glomerular structure, the glomerular blood flow is the chief factor detg. the protein loss Theophylline causes a certain degree of kidney irritation, but there is no evidence that salyrgan has a deleterious effect S. Morgulis

Behavior of ethynal in the animal and human organism. Shigeru Tsunoo *J. Biochem (Japan)* 21, 409-16 (1935)—Ethynal (furylacrylyl- β -1-hydroxyphenylurea) administered to dogs undergoes hydrolysis to furanacrylic acid and β -hydroxyphenylurea The former is conjugated with glycine, the latter with glucuronic acid, and both are excreted as these conjugated products In the rabbit the glucuronic compd was found but neither the furanacrylic acid nor any of its derivs was found in the urine. In the human organism ethynal is likewise hydrolyzed but no conjugation with glucuronic acid occurs while the furanacrylic acid is changed to pyromucic acid which is eliminated conjugated with glycine S. Morgulis

Vinyl ether (vinesthene) anesthesia in dogs Wesley Bourne and Bernard B. Raginsky. *Brit. J. Anesthesia* 12, No. 2, 62-9(1935), cf following abstr.—Liver function was not altered in normal or partially starved dogs. Death in dogs following exposure to vinyl ether resulted from respiratory failure. In general, vinyl ether is a poor anesthetic for dogs. James C. Munch

Vinyl ether obstetrical anesthesia for general practice. Wesley Bourne. *Can Med Assoc J* 33, 629-32(1935), cf C A 29, 34014 and preceding abstr.—Vinyl ether in concn suitable to maintain anesthesia for obstetrical procedures does not cause liver damage. Pharmacol. studies show that the musculature of uterus and intestines remains unaffected. It appears safe for both mother and child. As it is extremely volatile it should be given in a closed system with O_2 . Also in *J Am Med Assoc* 105, 2047-51(1935). G H W. Lucas

Poisoning from phenobarbital (luminal) E P Scarlett and D S Macnab. *Can Med. Assoc. J.* 33, 635-41(1935)—Rept. of a case of phenobarbital poisoning when the drug was administered under hospital control, together with a review of phenobarbital poisoning. G H W. Lucas

Biological testing of trypanamide L. Launo and M. Friess. *Bull. Soc. Path. Expt* [5], 28, 289-98(1935); *Trop. Diseases Bull.* 32, 696-7(1935)—Intravenously injected into 5 male rabbits, 3 survived 750 mg/kg in 10% soln for 10 days. Many brands were tolerated in doses of 1250 mg/kg, the LD₅₀ being 2500 mg/kg. More regular results were obtained by using a 20-day limit instead of a 10-day limit. In tests upon 20 g mice, 80% survived 60 mg/mouse for 10 days, 50% survived 90 mg, and 38% survived 100 mg. Somewhat smaller percentages survived a period of 30 days. James C. Munch

Further observations on the vessels and nerves of the rabbit ear, with special reference to the effects of denervation R. T. Grant, P. D. Camp, Ashton Graybiel and Paul Rothschild. *Clin. Sci.* 2, No. 1, 1-33(1935).—The recovery of vascular tone was due to an increased responsiveness of the denervated vessels to stimuli, including an adrenaline-like substance circulating in the blood stream. The source of this stimulus is unknown, but is not the adrenal gland nor the pituitary gland. The concn of this adrenaline-like substance is increased by nervous or muscular activity, and is reduced by rest. It may play a part in the maintenance of normal tone and temp. increase may produce pallor and hyperthermia. James C. Munch

The manner in which necrosis arises in the fowl's comb under ergot poisoning Sir Thomas Lewis. *Clin. Sci.* 2, No. 1, 43-56(1935)—Intramuscular injections of 10 mg of ergotamine as ethane sulfonate were made daily to white leghorn hens. After a single dose recovery was complete in 2 to 3 days. After daily injections the effects range from cyanosis to stasis to necrosis. Ergot vasoconstriction does not lead directly to tissue necrosis but to damage of the vessel walls, which is followed by dilatation, stasis or thrombosis, thus producing dry necrosis. Maintained arterial constriction produces serious nutritional changes in the endothelium, loss of plasma, capillary stasis, vascular clotting and necrosis. Mech. occlusion or clamping produces all of these changes. James C. Munch

Dinitrophenol poisoning N. L. Beebe. *Colorado Med. J.* 32, No. 1, 30-31(1935)—A woman, aged 32, showed high fever and rash after taking one 1/16 grain capsule daily for 3 days, then 2 capsules daily for 3 days more. James C. Munch

A case of quinine hemoglobinuria R. N. Chopra, B. Sen and S. N. Bhattacharya. *Indian Med. Gaz.* 70, 453-4(1935)—A Hindu girl, aged 11, excreted black urine within 4 hrs after the administration of quinine for the treatment of malaria. The administration of 6 grains of quinine orally produced black urine for 3 days. The administration of 0.1 g of atabrin 3 times and also of 0.0099 g of plasmochin did not produce black urine, but 3 daily administrations of 3 g. of quinine subsequently

produced black urine once more. Blood examn showed increased fragility of corpuscles, decrease of serum albumin, with increase in Ca, cholesterol, euglobulin and pseudoglobulin. Hemoglobinuria depends upon factors other than quinine. J. C. Munch

Sodium thiocyanate as a prophylaxis and in the treatment of bacillary dysentery with special emphasis upon the shiga type L. D. Massey. *J. Ark. Med. Soc.* 31, No. 12, 216(1935).—In the treatment of 73 cases, 1 to 3 intravenous injections of 20 mg of NaSCN per kg were given, with a mortality of 13.7%. Oral administration of 20 mg/kg daily for 3 days was effective in prophylaxis. James C. Munch

Recent cardiovascular therapy. J. Curtis Lyter. *J. Missouri State Med. Assoc.* 32, No. 4, 138-41(1935)—Lacornel or padutin, combined with supervised exercise, was useful in the treatment of 21 cases of angina pectoris. James C. Munch

What may we expect of dinitrophenol? O. S. Jones. *J. Missouri State Med. Assoc.* 32, No. 5, 106-7(1935).—Clinical studies have shown that 10% of patients receiving dinitrophenol show urticaria or some untoward effect. A period of 4 weeks is necessary to establish a lack of sensitivity. Ice packs and inhalation of O_2 decreased toxicity of dinitrophenol for animals. James C. Munch

The use of dilaudid in general practice Clifford M. Bassett. *J. Oklahoma State Med. Assoc.* 28, No. 5, 178-81(1935).—Dilaudid was 5 times as potent as morphine in relieving coughs, but did not produce nausea, constipation, vertigo or anuria. James C. Munch

Agranulocytosis with report of a case B. H. Teasdale. *Tri-State Med. J.* 7, No. 12, 1514-16(1935).—Agranulocytosis has been observed after treatment with atabrin and plasmochin for Vincent's angina. For antidotes, liver ext. and thiosulfonate were employed. J. C. M.

Chemical injury of cornea in the newborn with report of experiments Sidney Trattner. *Virginia Med. Monthly* 62, No. 3, 163-5(1935).—Topical application of 10% $AgNO_3$ produced negligible corneal irritation, but phenol produced definite injury. Recovery was complete after 2 months. James C. Munch

Chronic lead poisoning in early childhood H. H. Donnelly, C. A. Schutz and A. Nimetz. *Virginia Med. Monthly* 62, No. 2, 83-9(1935).—Chronic lead poisoning increases the density of the ends of rapidly growing bones. Three cases of chronic lead poisoning in children under 5 yrs of age were diagnosed by x-ray studies of this factor. James C. Munch

The acute narcotic action of aliphatic and aromatic hydrocarbons I. The action of a single inspiration of different concentrations of benzene, benzene, toluene and xylene on rabbits and cats Wilhelm L. Englehardt and Wilhelm Estler. *Arch. Hyg. Bakt.* 114, 249-60(1935).—Cats are more sensitive to hydrocarbons than rabbits except that the rabbits are almost as sensitive toward xylene. In low concn. the homologs of C_6H_6 bring about light narcosis earlier than C_6H_6 and are also more toxic in higher concns. (100 mg/l) C_6H_6 seems to be more toxic than xylene. Benzene in concn of 200 mg/l is only slightly active. II. The action of repeated inspiration of different concentrations of benzene, benzene, toluene and xylene on the white mouse W. Estler. *Ibid.* 261-71.—No characteristic action of benzene could be shown within the limits of the concns. used. In general the homologs of C_6H_6 were more toxic than the C_6H_6 . Results are summarized in tables. Felix Saunders

Strychnine poisoning or tetanus? Hans Bludau. *Arch. Hyg. Bakt.* 114, 287-303(1935).—A report of an unusual case of tetanus which simulated strychnine poisoning. Felix Saunders

Goutier prophylaxis with iodized salt Roy D. McClure. *Science* 82, 370-1(1935).—The general use of iodized salt in Michigan began in 1924. The first effect was an increase in the no. of thyroid operations and the death rate from gout which reached its peak in the 2nd year. The increase was in the nodular gout or adenoma group and except for this group there was no increase in hyperthyroid-

ism. The no. of operations for toxic diffuse and toxic nodular goiter rapidly and steadily decreased after the apex of the 2nd year increase had been reached. The incidence of endemic goiter or enlarged thyroid has been reduced to almost nil since iodized salt has been widely used and cases showing ill effects from the use of iodized salt are no longer seen.

Felix Saunders
The nature of the barbiturate-picrotoxin antagonism Charles R. Linegar, James M. Dille and Theodore Koppanyi. *Science* 82, 376-7 (1935).—The findings of Maloney and Tatum (*C* 26, 3301) have been confirmed. The antidotal effect of different doses of picrotoxin was manifested in 4 different ways. (a) Occasional rise in blood pressure, (b) prevention of the steep fall in blood pressure and hastening the recovery from the fall produced by intravenous barbiturate injection, (c) stimulation of respiration when stoppage was produced by barbiturates, (d) maintenance of respiration after barbiturate injection even after cardiac stoppage. The action of small doses of adrenaline and ephedrine was especially marked after picrotoxin in the barbiturized animals.

Felix Saunders
The toxicity of local anesthetics György Gömöry *Magyar Orvosi Arch* 36, 223-36 (1935).—Procaine, tucocaine and nupercaine in small doses do not produce fatal collapse in guinea pigs, excessive doses do

Henry Tauber
The sensitivity of animals to histamine István Karády *Magyar Orvosi Arch* 36, 244-50 (1935).—Three \times 1 mg of histamine, injected subcutaneously daily for 1 or 2 weeks, caused the animals to become more resistant to histamine. This may be due to an increased histaminase production.

Henry Tauber
The action of narcotics on the brain of white rats György Mayer *Magyar Orvosi Arch* 36, 251-6 (1935).—Ether, chloroform and EtCl diminished the respiration of the cortex cells (Warburg method). Evipan (barbiturate), however, had no effect on these cells but it affected the white substance, especially the thalamus. When fatal narcosis was produced the respiration of cells of the medulla oblongata was diminished by ether and chloroform more than by evipan.

Henry Tauber
The chemistry of the blood in ammonia poisoning Gyula I. Fazekas *Magyar Orvosi Arch* 36, 285-95 (1935).—In rabbit blood in exptl. NH_3 poisoning Ca, alkali reserve and p_{H} are decreased; inorg. P and glucose are increased.

Henry Tauber
The effect of small doses of copper upon erythropoiesis János Somogyi *Magyar Orvosi Arch* 36, 317-26 (1935).—A single intravenous injection of CuSO_4 (0.3-0.6 mg of Cu per kg.) into rabbits increases erythropoiesis. The number of red cells rises 16-39.2% and the hemoglobin 6.3-24.4% above the normal. The increase is maintained for 18 days. In hemorrhagic anemia copper hastens regeneration of blood. Numerous references are given.

Henry Tauber
Pharmacological study of an alkaloid isolated from Chinese fengchiangchi. Li-Pin King and Yuan-Kao Shih. *Bull. Natl. Acad. Peiping* 6, No. 3, 13-50 (1935); cf. *C* A. 30, 726¹, 727¹.—From Chinese fengchiangchi, of the family Menispermaceae, bought from the Shanghai market, an alkaloid (*fengchiangchin*) is isolated by leaching with slightly acidified 70% alc., then concg. under vacuum, treating with strong alkali and extg. with ether. The yield of this alkaloid, after several purifications through the hydrochloride, is 6 g. from 1 kg. of raw material. Pure fengchiangchin forms colorless radiating crystals, is bitter and turns yellowish in contact with air. It is insol. in water, but sol. in abs. alc. and easily sol. in ether and acetone; it m. 218-218.5° and has $[\alpha]_D^{25} +268.7^\circ$. Fengchiangchin-HCl is similar to other alkaloids of Menispermaceae in physiol. action, and the strongest of all of them. The minimum lethal dose of this compd. for rats is 0.5 mg. per g. body wt. when injected under the skin; that for rabbits, 18 mg. per g. body wt. when injected intravenously. A large intravenous dose causes an immediate lowering of blood pressure. Small doses excite respiration centers and increase rate and depth of respiration. Medium doses cause excitation and deepening of respiration at first,

and then paralysis and weakening of respiration. Lethal doses cause at first a momentary weakening of respiration, then a deepening, and finally cessation of respiration. Small doses have little effect on the heart, but large doses are decidedly harmful. Fever caused by typhoid germs can be relieved by fengchiangchin-HCl.

C. L. Tseng
Cosmetics and skin irritation. I. Effect of synthetics on the skin Frank Atkins *Pharm J* 134, 669 (1935).—Aside from the factor of idiosyncrasies, Albeck's irritation index (*Aromatics*, Sept., 1931) is a useful general guide. This index (the degree of diln. producing an effect of definite, tolerable intensity) varies from 4 for esters to 24 for aliphatic and 37 for aromatic aldehydes. The index should not be above 6 (alcs = 5) and should never exceed 10 (terpenes). With benzylidene acetone (not examd by Albeck) an index of about 12 (ketones) is expected; but it is one of the strongest irritants, as a perfume of the sweet-pea type it can be used only on fabrics. The mellowness of the rose and similar perfumes is connected with a low index on the basis of their chem. compn. Possibly the aldehyde problem for creams can be solved by conversion into acetals.

S. Waldbott
II Influence of the medium and other factors *Ibid* 135, 346.—Alky. and rancidity in creams may cause irritation of the skin. To avoid alky. it is recommended to det. p_{H} after manu. and again after storage. To avoid rancidity, hydrocarbons, hydrogenated oils and nonoxidizable waxes should form the basic materials. Colors are also factors in skin irritation.

E. D. Walter
Survival and increase of adrenaline in tissue cultures of adrenal glands from chick embryos Margaret R. Lewis and E. M. K. Geiling *Am J Physiol.* 113, 529-33 (1935). cf. *C* A. 23, 869.—The presence of adrenaline was demonstrated by blood-pressure changes following injection of exts. into cats under phenobarbital anesthesia, by dilatation of the pupil in frogs, and by the FeCl₃ reaction. Exts. of adrenals of chick embryos under 7 days old had little effect on blood pressure. Exts. of adrenals of chick embryos grown 3 days in tissue cultures showed a definite increase in the amt. of adrenaline. In embryos at different stages (5-14 days) progressive increases of adrenaline occurred.

E. D. Walter
Reversible loss of the all or none response in cold-blooded hearts treated with excess potassium. Geo. H. Zwister and T. E. Boyd. *Am. J. Physiol.* 113, 560-7 (1935).—The ventricle of the turtle or bullfrog heart, soaked in modified Ringer soln. contg. 0.2-0.4% KCl, shows perfectly graded mech. responses to graded stimuli. The ventricles take up K from the soln. Normal response to stimulation is restored when the preps. are soaked for a time in normal Ringer soln.

E. D. Walter
The influence of peptones and certain extracts of the small intestine upon the secretion of succus entericus. E. S. Nasset and H. B. Pierce. *Am. J. Physiol.* 113, 568-77 (1935); cf. *C* A. 29, 6297¹.—A potent secretagog was extd., free of vasodepressor substances, from Witte's peptone with 70% EtOH. It is digested by erepsin or trypsin, and is thermostable. When given intravenously to dogs with denervated jejunal transplants, it may cause a 3-5 fold increase in the vol. of juice secreted and a 2-8 fold increase in enzyme production. Five other peptones showed little or no secretagog activity. Small intestines from dogs and swine, extd. with 70% EtOH acidulated with HCl, yield an ext. which stimulates intestinal secretion when given by vein. It is thermostable and resists ereptic and tryptic digestion. The vasodepressor and the secretion-promoting substances of these exts. are not identical because the latter is destroyed by boiling in alkali, while the former are scarcely affected.

E. D. Walter
The effect of ergotamine upon glucosuria and hyperglucemia produced by stimulation of the superior cervical sympathetic ganglion David A. Cleveland *Am. J. Physiol.* 113, 592-4 (1935).—Ergotamine inhibits the action of the sympathetic nervous system. Smaller doses usually prevent and larger doses are more certain to prevent glucosuria and hyperglucemia following stimulation of the superior cervical ganglion in cats which have a sufficiently high glycogen reserve.

The clearance, extraction percentage and estimated filtration of sodium ferrocyanide in the mammalian kidney. Companson with inulin, creatinine and urea. Donald D. Van Slyke, Alma Miller and B. T. Miller. *Am. J. Physiol.* 113, 611-28(1935), cf *C. A.* 29, 4810¹.—In the dog $\text{Na}_2\text{Fe}(\text{CN})_6$, inulin and creatinine show the same excretory behavior in the following respects: Their plasma clearances are approx equal. Their percentage extn from the plasma are approx equal, averaging approx 20. Their clearances and extn percentages are independent of plasma concn. The av urea clearance is 0.57 of the clearances of the above 3 substances, and is independent of plasma concn. These observations appear to support the filtration reabsorption theory of renal excretion. The distribution of ferrocyanide, inulin, creatinine and urea in the blood and its effect on the significance of their extraction percentages. *Ibid.* 629-41.— $\text{Na}_2\text{Fe}(\text{CN})_6$ and inulin injected intravenously into a dog circulate in the plasma without entering the erythrocytes in measurable amts. Creatinine absorbed or injected into the circulation gradually enters the blood cells. Urea diffuses so quickly that when added to blood it reaches equil between cells and plasma before they can be sep'd for analysis. The effects of these diffusibility differences on the relative concn. decreases of these substances in plasma and whole blood during perfusion of the kidneys have been calcd. E. D. Walter

I—ZOOLOGY

R. A. CORTNER

Adrenaline in the venom of *Bufo arenarum*. Venancio Deulofeu. *Z. physiol. Chem.* 237, 171-2(1935).—Adrenaline was isolated in cryst. form from the venom of the Argentine toad, *Bufo arenarum*, and identified by m. p., optical rotation and the usual color reactions. A. W. Dorr

Chloride and total osmotic pressure in the blood of marine teleosts. Allan L. Grafflin. *Biol. Bull.* 69, 245-58(1935).—Plasma chloride in pollack, cod, sculpin, flounder, mackerel and conger ranges from 150 to 172.6 millimols. per l. There is no correlation between chloride

concn. and f.-p. depression for the whole blood (Δ). Both chloride and Δ are higher in fish bled after delay in landing or rough handling. L. W. Elder

Osmotic pressure and molecular weight of hemerythrin of *Sipunculus nudus*. Andr  e Roche and Jean Roche. *Bull. soc. chim. biol.* 17, 1494-1508(1935).—See *C. A.* 29, 2006¹. L. E. Gilson

Acetylcholine in invertebrate tissues. Z. M. Bacq. *Compt. rend. soc. biol.* 120, 243-5(1935).—No acetylcholine was found in ascidians, coelenterates or porifera (entire animals) or in the blood of any other marine invertebrate. Certain crustacean tissues contained traces, and tissues of various mollusks, marine worms and echinoderms contained 0.4-1.4 γ per g. The cerebral ganglions of *Octopus vulgaris* contained 77 γ per g. The nerves of mollusks, worms and echinoderms are probably cholinergic. Identification of acetylcholine extracted from the ganglions of *Octopus vulgaris*. *Ibid.* 246-7.—Crystals of the chloroaurate were obtained. L. E. Gilson

Choline esterase in invertebrates. Z. M. Bacq. *Compt. rend. soc. biol.* 120, 247-8(1935), cf *C. A.* 29, 6017¹.—Choline esterase is present in the blood and tissues of marine mollusks, worms, holothurids and ascidians. It is not present in crustaceans, insects, coelenterates and sponges exclud. so far. Its absence in crabs explains their insensitivity to acetylcholine and also indicates that their motor nerves cannot be cholinergic. L. E. Gilson

Attempted treatment of amebiasis in snakes. J. Rodhain and M. T. van Hoof. *Compt. rend. soc. biol.* 120, 523-5(1935).—Rivanol and emetine-HCl were ineffective in snakes (*Tropidonotus natrix*) infected with *Entamoeba invadens*. L. E. Gilson

Presence of vitamin A and carotenoids in the frog. Charles Rand. *Biochem. Z.* 281, 200-5(1935).—Considerable quantities of carotenoids are present in various organs (liver, skin, kidney, lung, ovary, ova, oviducts, testes and fat bodies) of summer or winter frogs. The carotene is almost always accompanied by variable amts. of xanthophyll. The highest percentage of carotene was found in the liver and fat bodies. Vitamin A was found regularly in the liver of both summer and winter frogs. S. M.

12—FOODS

F. C. BLANCK AND H. A. LEPPER

Problems of chemistry in the new Germany. XII. Biology in food conservation. W. Schwartz. *Angew. Chem.* 48, 629-32(1935), cf *C. A.* 29, 4896¹.—A general discussion with tables on the methods of food conservation, the application of the most important processes of conservation and the ripening processes and decomposition by microorganisms in refrigeration. Nine references. Karl Kammermeyer

Sifting and mixing machinery for foodstuffs. H. Thomas. *Food S.* 93-7(1935). A. Papineau Couture

Presence and identification of silicic acid in various foodstuffs. R. Strohecker, R. Vauhel and K. Breitwieser. *Z. Unters. Lebensm.* 70, 345-53(1935).—The most important details of the step-photometric method for the detn. of SiO_2 are given. Thirteen samples of milk were exam'd. and the SiO_2 content was found in every one to be less than 1 mg. per l. Milk concentrates contained relatively more SiO_2 , which must have had its source in the method of prep'n. Under certain conditions it is possible from a SiO_2 detn. to adduce that milk has been watered. The SiO_2 has been det'd. in different types of meat, in internal organs and in the most important kinds of sausages, and these results have been compared with data found in the literature. The detn. of SiO_2 can be used for the detn. of added H_2O to minced meat, but not for sausages, for species bring about a significant increase in the SiO_2 . A whole series of different types of cacao beans has been studied for their SiO_2 content. The cacao shell contains 2-10 times the SiO_2 found in the kernel. The SiO_2 found in the fat free bean (dry basis) averages somewhere in the neighborhood of 1 mg. per g. The preservation of eggs

in water glass does not cause an increased SiO_2 of the inner portions of the egg, but only of shell. As compared with this, hmed eggs produced an increased alkali of the egg white. Twenty-three references. F. L. Dunlap

The nature of food poisoning. S. Lancelfield. *Food S.* 125-6(1935). A. Papineau Couture

Changes in stored corn meal. Charles O. Willets and Frank J. Kosokis. *Ind. Eng. Chem.* 27, 1491-6(1935).—Corn meal can be stored for a long period of time without change in the crude fat content. (a) When the moisture content is 14% or higher, the storage temp. must be maintained at 18° or lower; (b) with a moisture content less than 8%, the storage temp. may be as high as 37°. The "degrees of acidity" of corn meal do not indicate changes in crude fat and therefore cannot be used as an index to crude fat losses. F. L. Dunlap

Vanetal differences of wheats with reference to the ash content in grain and flour. M. I. Knyaginichev. *Bull. Applied Botany, Genetics, Plant Breeding* (U. S. S. R.) Ser. III, No. 5, 169-201(1935).—A max. ash content is found in grain grown under conditions of sufficient moisture and strong insolation. The ash content decreases with a shift toward the more arid regions. The winter varieties of wheat contain 13-14% less ash than the soft and hard spring wheat varieties. The flour of winter wheat contains 25% less ash than that of soft spring wheat. The ash content of flour does not necessarily correlate with its cellulose content. In general, however, a variety with a high cellulose content has a high ash content. The index for the milling qualities may be judged from the cellulose content. J. S. Joffe

Fermentable carbohydrates of wheat flour and the fermentation of dough. R. Genffroy. *Bull. soc. chim. bulg.* 17, 1351-71 (1935).—The flours examd. contained 0.5% or less of sucrose. This is less than reported by other workers. Less than 1% *l*-xylan, and 0.1-0.15% glucose were also present. Maltose and probably more glucose were formed in the dough by the enzymes present in the flour. The amylase content is greater in the latter grade flours. Flour contains a fermentation factor "7" or something very similar. Fourteen references. L. E. G.

The microbial content of soft wheat flour. D. Frank Holtman. *J. Bact.* 30, 379-61 (1935).—Overbleaching of flour may permit microbial or atm. oxidation causing it to darken in color. John T. Myers.

Biochemistry of bread making. The carbohydrate sequence. C. H. Bailey and R. C. Sherwood. *Ind. Eng. Chem.* 27, 1426-30 (1935).—Bread making is a dynamic process in which various organisms and tissues, and numerous enzymes are involved. Flour from normal wheat contributes starch, sucrose, a trace of glucose, and the saccharifying enzyme β -amylase. Flour milled from germinated wheat, or active malt expts., contributes α -amylase, the starch-hydrolyzing enzyme. In dough or flour suspensions to which small amts. of wheat or barley malt have been added, the rate of saccharification is greatly increased. The effect on sugar production is substantial and prompt. A small proportion of wheat malt flour (1%) approx. doubled the rate of sugar (maltose) production, when added to either a low or high diastatic flour. The optimum condition in a dough is approached when fermentation rate and saccharogenesis are so adjusted as to maintain a const. level of sugar in the dough from the time it is mixed until it goes to the oven for baking. This condition tends to impart stability and fermentation tolerance which in turn implies that, at the close of the fermentation period, the fermentation shall be vigorous and that there shall be an adequate residue of sugar to result in a brown crust and a suitable sweetness of flavor in the baked loaf. F. L. Dunlap.

Bakers' yeast. Englebert Rosenbaum. *Z. Untersuch. Lebensm.* 70, 366-78 (1935).—A general discussion. Some tabular data are given as to moisture losses at ordinary temps. and in cold storage, difference in fermentation time with the same yeast but with varying amts.; difference in fermentation time with the same yeast but the yeast contg. varying amts. of moisture, influence of cold on the stability and the fermentation time of bakers' yeast; difference in the fermentation time with the same yeast but with different good flours. F. L. Dunlap.

Foreign bakers' yeast. Englebert Rosenbaum. *Z. Untersuch. Lebensm.* 70, 378-83 (1935).—An examn. of 26 samples of yeast from 13 European countries. Analytical data are given for moisture, N, protein and P_2O_5 (in the dry substance), acidity and stability at 35°. A table is also presented of the properties of these yeasts, such as color, odor, consistency and fermentation time. F. L. Dunlap.

The determination of chlorides in milk. A. Masvot and H. Lestra. *Bull. soc. pharmacol.* 42, 523-6 (1935).—(1) The method of Deméché becomes more accurate when the HPO_4 is transformed into H_2PO_4 by boiling with $AgNO_3$ and HNO_3 before titration. (2) Laudat's method is modified as follows: Mix 10 cc. milk first with 5 cc. 0.1 N $AgNO_3$ soln. and then add 20 cc. satd. $KMnO_4$ soln. Heat to boiling; add 40 cc. HNO_3 and heat until a clear liquid is obtained. (3) To 60 cc. of a mixt. of 3 parts $FeOH$ and 1 part Me_2CO add, drop by drop, 10 cc. of milk and fill to 100 cc. with the same mixt. Filter, mix 75 cc. with 5 cc. HNO_3 and titrate with $AgNO_3$ in the usual way. The last method is the quickest and most accurate. A. E. Meyer.

The substitution of methylene blue thiocyanate for methylene blue chloride in the reduction test of milk. H. R. Thornton, R. B. Sandin and C. S. Miller. *Can. J. Research* 13B, 258-63 (1935); cf. *C. A.* 29, 8159.—Methylene blue thiocyanate has been found to be superior to methylene blue chloride in the reduction test for bacteriol. quality of milk, because the thiocyanate is

1 easily prepd. in a state of purity approaching 100%. It reduces over the same oxidation-reduction potential as the chloride and has approx. the same reduction time and the same poisoning and lethal effects. J. W. S.

Production of artificial cream and sour cream. V. Bochkov and V. D'yachenko. *Maslobolno Zhirovo Delo* 11, 359-70 (1935). **Production of artificial milk products at margarine works.** V. Bochkov. *Ibid.* 451.—Cream with 25-30% fat content was obtained by centrifugal emulsification of a mixt. of 75 parts of skim milk and 25 parts of mixed compd. fat and sunflower oil and then converted to sour cream and cheese. Chas. Blanc.

Differentiation of butter from pasteurized and non-pasteurized cream by aid of the peroxidase reaction. L. Waters and A. Zürn. *Z. Untersuch. Lebensm.* 70, 353-6 (1935).—Place a piece of butter the size of a hazel nut in a test tube, add 2 cc. of a satd. soln. of $MgSO_4$ and 10 drops of a 4% alc. benzidine soln. Shake to make a homogeneous mixt. Add 5 drops of 3% H_2O_2 and, after shaking, add 5 cc. of I_2O and again shake until the butter fat has completely dissolved in the I_2O . Let stand and observe the color of the aq. layer. If a blue color develops at once or within a half hr., the butter has been made from cream which has been subjected to a temp. not over 80°. Occasionally this color may be greenish instead of blue, but this is not significant for butter made from pasteurized cream always gives a pure white color in the aq. layer. A neg. color result in a test cannot unconditionally be due to butter from pasteurized cream, for it has been found that older country butters fail to respond. Fresh country butters, however, respond to this test. Very rancid and strong tallowy butters fail to respond to the test. A neg. color reaction, therefore, cannot be taken as abs. assurance of pasteurization, for the peroxidase can be destroyed not only by heat but also by storage. F. L. Dunlap.

The flavor of butter. H. M. Langton. *Food* 5, 95-100 (1935).—A brief review of present knowledge of Ac, its presence in butter and methods of detg. it, of defects in flavor of butter and of the chemistry of rancidity in butter. A. Papineau-Couture.

Control of production of margarine works. A. Siyazhkina. *Maslobolno Zhirovo Delo* 11, 431 (1935); cf. Sandomirskii, *C. A.* 29, 81617.—Methods of control of various operation steps of processing are discussed. Chas. Blanc.

Moisture contents in margarine in relation to the churning temperature. V. Bulin-Sokolov and A. Kopteva. *Maslobolno Zhirovo Delo* 11, 378-9 (1935).—To obtain margarine from cottonseed-oil fat mixt. and cottonseed oil with a standard moisture content, the churning should be carried out at 2° below the m. p. of the fat base. Chas. Blanc.

Effect of the degree of aging of cheeses on their fat content. Ch. Brioues and Ldg. Jour. *Ann. Jais.* 28, 535-7 (1935).—Analyses of a lot of Camembert cheese immediately after manu., and after 3 weeks and 2 months, gave the following results: total solids by drying in vacuum at atm. temp. 43.43, 40.88, 65.87; total solids by drying in air at 100° 43.11, 19.40, 64.61; total solids by drying at 105° 43.10, 49.20, 64.31; fat 20.31, 22.80, 32.55; fat on dry basis 47.19, 47.20, 50.61; total N 2.90, 3.38, 4.21; insol N (Trillat method) 2.65, 2.26, 2.63; sol. N 0.25, 1.11, 1.65; ammonia N —, 0.55, 0.85; sol. N as percentage of total N 8.64, 32.92, 33.90%. The loss of N during drying at 105° of the fresh cheese and also at the end of 3 weeks and 2 months was 0.05, 0.13 and 0.22%, resp., though the amt. of nitrogenous matter lost on drying cannot be calcd. owing to the complexity of the products formed, the results clearly indicate that they are not the sole factor that accounts for the increase in fat on a dry basis, but that there are very probably other losses caused by the volatilization of volatile acids or other nonnitrogenous compds. A. Papineau-Couture.

Changes in meat proteins, determined by their digestibility with pancreatin. I. A. Smorodintzev and I. N. Laskovskaya. *Z. Untersuch. Lebensm.* 70, 355-65 (1935).—1 or the complete activation of 10 mg. pancreatin,

a mixt. of 1 cc enterokinase soln with an equal vol of glycerol is necessary. A neutral enterokinase soln. with glycerol 1:1 can be preserved in the cold without change for some time ($1\frac{1}{2}$ month). Various animals furnish activator preps of the same strength. Dry pancreatin preps made according to the methods of Willstätter and Waldschmidt-Leitz (C. A. 18, 91) retain their activity for a long period ($1\frac{1}{2}$ year). The optimal conditions for meat digestion by means of pancreatin were obtained with 1 g meat, heated to 37° for 1 hr. The degree of digestibility of meat one hr after slaughter by pancreatin is of const magnitude, corresponding to an increase in acidity of 1.3 cc 0.2 N KOH. The max. digestibility of meat is found in the sixth hr after slaughter and is independent of the temp at which the meat has been held. The meat digestibility after the sixth hr following slaughter is less than it was during the first hr. The mean increase in digestibility is const. for different animals. An increase in the storage temp. of meat from $1-3^\circ$ up to 37° accelerates protein changes, but in no way alters the character of the curve.

F. L. Dunlap

Carbon dioxide in handling fresh fish. Maurice E. Stansby and Francis P. Griffiths. *Ind. Eng. Chem.* 27, 1452-8 (1935); cf. C. A. 30, 1761. Whole haddock, stored in CO_2 from the time they were caught until they are unfit for food, keep approx. twice as long as those stored in air. Haddock which are just passing out of rigor mortis are benefited if stored in the presence of CO_2 , a pronounced difference existing after 4-day storage in ice in favor of the gas-stored fish over those stored in air. Haddock which are in rigor mortis are not greatly benefited by CO_2 storage, as long as rigor exists. Fillets maintained in a CO_2 atm will be of better quality than those kept in air, especially after prolonged storage. If the best sanitary conditions are used during filleting, the use of CO_2 will be of the greatest benefit. The use of hypochlorite solns will not offset careless handling of the fillets.

F. L. Dunlap

Some chemical changes exhibited in sterile and in contaminated haddock muscle stored at different temperatures. J. T. R. Nickerson and B. E. Proctor. *J. Biol. Chem.* 30, 383-94 (1935), cf. C. A. 29, 1171. The pH of sterile samples decreased while that of contaminated muscle increased. There was an increase in amino acid followed by a decrease in sterile muscle, while contaminated muscle showed an increase particularly toward the latter part of the storage period, probably because of bacterial action. This will eventually cause spoilage; hence low-temp. storage is essential.

John T. Myers

Chemical composition of pig stomach. I. A. Smorodintzev and V. V. Palmin. *Z. Untersuch. Lebensmittel* 70, 385-6 (1935). Pig stomach is a N-free foodstuff. Its fat content is small, but shows great variation. The ash content of the stomach is less than that of other organs. A tabular result is given of the analysis of 15 samples of pig stomachs, the data being the av. value, max and min, and variations from the av. values for the following detns: moisture, total N, protein N, residual N, fat, extractives and ash. Another table gives the moisture, N substance, fat, ash and calorie value of the pig stomach as compared with other organs of the pig, such as heart, lungs, liver, kidneys and spleen.

F. L. Dunlap

Quantitative estimation of vitamins A and D in food substances, cooked and fresh. Katharine H. Coward and Barbara Morgan. *Brit. Med. J.* 1935, II, 1041-4. Inconsistencies in the methods of detg the vitamin content of foods are discussed. The use of the international standard is recommended. The vitamin A content of several foods has been detd in comparison with a cod-liver oil which in turn was compared in 9 different labs, with standard carotene. This standard oil was likewise employed in detg the vitamin D content of certain foods. Boiling vegetables did not decrease their vitamin A content. Boiled carrots, cabbage and runner beans were shown to be valuable sources of A, their potencies being $1\frac{1}{2}$, $1\frac{1}{2}$, and $1\frac{1}{2}$, resp. of an av. sample of summer butter which contains 60 units/g. The following vitamin D contents of several foods in international units were re-

ported: calf liver 0, milk 0-0.1/cc.; butter 0.4-4.0/g.; egg yolk 1.5-5.0/g.; cod-liver oil 60-300/g.; halibut-liver oil 2000-4000/g.; olive oil 0. J. B. B.

The vitamin C content of Indian paprika. J. P. Spruyt and W. F. Donath. *Geneeskund. Tydschr. Nederland. Indis* 75, 1944-50 (1935).—The 2,6-dichlorophenolindophenol titration method was used for the detn of ascorbic acid in some native fruits. Pending the definite proof by animal tests, the results given are preliminary values. The results are tabulated.

J. C. Jurejans

Vitamin C (ascorbic acid) content of the paprika preparation "Vitapric." Eugene Becker. *Z. Vitaminforsch.* 4, 255-9 (1935).—Vitapric, a bright-red, marmalade-like product manufd from the tomato paprika, contains 29-27% total solids and 0.45-0.46% ascorbic acid (approx. 20 times the concn of that acid in lemons). In feeding expts with guinea pigs for periods in excess of 60 days, a daily dose of Vitapric contg 1 mg ascorbic acid produced normal growth and freedom from scurvy. Animals receiving twice this daily dose had a greater resistance to other diseases.

Joseph S. Hepburn

[Effect of boiling on the ascorbic acid content of cabbage.] B. Ahmad. *Nature* 135, 797 (1935).—By boiling cabbage before extg with 20% $\text{CCl}_3\text{CO}_2\text{H}$, the ascorbic acid content is increased from 13 mg to 40 mg per 100 g of vegetable. This is perhaps due to hydrolysis of an ester of ascorbic acid.

W. T. H.

Relation of maturity and handling of Bartlett pears in the Pacific Northwest to quality of the canned product. B. D. Ezell and H. C. Diehl. U. S. Dept. Agr., *Tech. Bull.* 450, 1-24 (1934); cf. C. A. 29, 7388. Results of 3 years' investigation are detailed. As the season advances there is a decrease in the alc-insol solids and in the acids and reducing sugars and an increase in alc-sol. materials, sucrose and total sugars. There is also a similar increase in the alc-sol materials in ripened fruit, though variations in total solids obscure this relation. In the early-picked fruit the insol solids make up 23-30% of the total solids, dropping in storage and ripening to 22-23%. In the later-picked fruit insol solids amount to only 18-20% of the total solids, dropping to 15-18% on ripening. Sucrose increases both in total amt. and in percentage of total sugars. Acid changes are but little affected by ripening changes. A progressive decrease in astringency takes place during ripening. Time of picking has little influence on the color of the sirup. Ripening temps. of 21-1-23 $^\circ$ at relative humidities of 78-85% give best results. Soil types have no appreciable effect upon the quality of the canned product.

C. R. F.

Extraction of pectin from apple thinnings. H. W. Gerritz. *Ind. Eng. Chem.* 27, 1458-9 (1935).—Apple thinnings were found to be rich in pectin-yielding material. Best results were obtained by slicing turgid apple thinnings into 0.5% HCl and allowing them to stand for 2-3 days at room temp. before pressing. Similar results were obtained from the pomace after freezing the apples, thawing and pressing to remove the juice. A quantity of acid soln. equiv to $1\frac{1}{2}$ times the wt of the unpressed apples gave a convenient vol of rich pectin soln. A second extn with hot H_2O gave an addl yield of pectin. The pectin obtained either as the original soln., as a concd. soln., or as dried powd. pectin produced an excellent gel. Solns of 0.5% H_2SO_4 or tartaric acid were about 75% as efficient as HCl in extg the pectin. The nature of HCl, which makes it an efficient agent for sugar hydrolysis, is probably responsible for its efficiency in hydrolyzing the insol. pectin. The HCl pectin soln. obtained at room temp. did not need decolorizing with charcoal.

F. L. Dunlap

Consistency changes in starch pastes. Tapioca, corn, wheat, potato and sweet potato. G. V. Cascar and E. E. Moore. *Ind. Eng. Chem.* 27, 1447-51 (1935).—A new and improved consistometer and technic for the study of the pasting phenomena of starches are described. Charts give the consistency record of pastes of tapioca flour, heavy- and thin-boiling corn, potato and wheat starches. The usual concn. is 20%. For tapioca, concns of 10, 20 and 30% are given. The temp. range extends from the

zone where starch and H_2O constitute a milk, to boiling and back to room temp. The record covers, therefore, the whole paste history of a starch from cooking to cooling. The degree of degeneration of a starch is sensitively revealed in the form of curves, where paste temp is plotted against the net power in w required to maintain a const. speed of agitation. Each starch thus assumes a characteristic form, and a classification into types exhibiting similar characteristics may readily be made. The scientific and practical interest of the method is described.

F. L. Dunlap

Effect of soybeans, soybean-oil meal and tankage on the quality of pork. C. M. Vestal and C. L. Shrewsbury Ind. (Purdue) Agr. Expt. Sta., *Bull.* 400, 47 pp. (1935). — When supplementing a full feed of corn, minerals added to the corn-soybean rations reduced the feed requirement and increased the rate of gain in growing pigs. Roasted soybeans and cooked soybeans had high nutritive values, and surpassed tankage, soybean-oil meal and raw soybeans in wt. gain production and reduction in feed requirements. Soft, low-melting fats were produced only when soybean products were fed in amounts exceeding 14% of the ration. Soybeans should be fed as a supplement and not as a substitute for corn.

C. R. Fellers

Following the removal of bitter substances of the soybean with the aid of the hemolytic reaction. M. Krayčnović. Z. *Untersuch. Lebensm.* 70, 391-4 (1935), cf. C. A. 29, 1172. — This method depends on following the disappearance of saponin, present in the bean, by means of the hemolytic reaction. The lower the temp., the longer the time needed for the complete deodorizing of unhulled beans. On the other hand, the coeff. of digestion of the protein of the deodorized bean is more favorable on treatment at lower temps. The last trace of saponin disappears in unhulled beans after heating them with water at 100° for 25 min.; the previously dried and hulled beans under the same conditions of treatment show a neg. hemolytic reaction after 21 min. In deodorizing the crude soybean meal in boiling water, the pos. hemolytic reaction disappears after 3 min. because of greater contact area. Bread made from crude soybean meal shows only a partial destruction of the saponin during the baking process. For a complete quant. removal of the residual saponin, it was necessary to heat the bread with boiling H_2O for 15 min. The addn. of 0.05% HCl to the unhulled beans heated to 100° with H_2O hastened the hydrolytic decompos. of the saponin, reducing the time for the disappearance of the hemolytic reaction to 21 min. Through the action of moist water vapor at 100° on unhulled beans, the saponin is destroyed only after 40 min. This increase in time, as compared with other results, is due to the minimal absorption of H_2O , but it has the advantage that subsequent drying of the beans is more rapid and more easily carried out. When the bean is heated with said. H_2O vapor at 115° under pressure, a neg. hemolytic reaction is obtained in 2 min. The deodorizing of the bean at higher temps. under pressure has the advantage of a minimal time for the disappearance of the saponin. While the coeff. of digestibility of the protein of the raw bean is the highest (94-92%), the lower the temp. at which deodorization takes place, the more favorable is this coeff. The digestion of the bean with weakly acidulated H_2O protects the vitamins from destruction. Deodorizing with boiling H_2O produces a lighter-colored product than when the vapor is used. In the latter case the color of the bean becomes still darker, particularly when dried at higher temp. so it is necessary to dry beans deodorized with steam at lower temp. (80-85°). The dark color of the bean is, for the most part, caused by pectin substances. A method is described for the identification of saponin in the soybean.

F. L. Dunlap

Action of dilute acids on aluminum. Charles F. Poe, R. M. Warnock and A. P. Wyss. *Ind. Eng. Chem.* 27, 1505-7 (1935). — Data are returned in mg. loss per 100 sq. cm. of sheet Al. The strengths of acids used were N, 0.1 N and 0.01 N. Expts. were carried out at 25° and at boiling temps. Of the inorg. acids, the halogen acids seemed most active. Of the org. acids, acetic and its Cl

deriv., formic and lactic are rather active. A no. of acids showed a rather great activity for the first few weeks, but thereafter decreased. Among these are glycolic, *Hil*, malonic, oxalic, H_2SO_4 , etc. The metal may have become coated with a fine film of the Al salt and further soln. thus made difficult. Most of the acids found in fruits and vegetables are more or less active. It cannot be said at present how much of the soly. of Al would be altered by the other food constituents. Nothing stated in the paper should be construed as claiming that Al is not a proper material for use in the manuf. of cooking utensils. The physiol. actions of Al salts were not considered. Nineteen references.

F. L. Dunlap

The mineral content and feeding value of natural pastures in the Union of South Africa. III. P. J. Du Toit, A. I. Malan, J. G. Louw, C. R. Holzappel and G. Roets. *Onderstepoort J. Vet. Sci.* 5, 201-14 (1935); cf. C. A. 28, 5593. — Data are given on the P, Ca, Mg, K, Na, Cl, crude protein and crude fiber contents of numerous samples of natural pastures. Practically all samples were low in P for the greater part of the year. Crude protein varied more or less directly as the P content of the pasture and was extraordinarily low during certain seasons of the year, particularly in herbage of advanced stage of growth. In general, the Na content of the samples was so low that it suggested an insufficiency of Na for producing animals on pasturage. IV. The influence of season and frequency of cutting on the yield, persistency and chemical composition of grass species. P. J. Du Toit, J. G. Louw and A. I. Malan. *Ibid.* 215-70. — Grasses cut at monthly intervals were highest in percentage P and crude protein and lowest in crude fiber. With decreased frequency of cutting the crude fiber content increased to a max. at maturity, while the P and crude protein dropped markedly to minima in the old mature herbage cut prior to the commencement of new growth in the following season. The percentages of Ca and Mg were not appreciably affected by the frequency of cutting. Pure species grown on the same soil and exposed to the same climatic conditions showed appreciable differences in mineral and protein content when harvested after definite intervals, e. g., 1 month. Fluctuation in the chem. compn. of species cut at monthly intervals during the growing season is attributed mainly to the stage of growth attained by the species and to the rainfall insofar as it influences the stage of growth. During dry seasons the P content of herbage cut at monthly intervals tended to be low; at the same time the percentage of Ca was high. The crude protein content did not seem to be adversely affected by drought. The percentages of mineral constituents and crude protein were low and that of crude fiber was high during seasons of plentiful rains. The highest yields of dry matter, crude protein and P were obtained from pasture species by cutting at bi-monthly intervals during the growing season. The difference in nutritive value between herbage cut at monthly and bi-monthly intervals was insignificant during seasons of dry weather conditions. Numerous analytical data are tabulated.

Colorimetric method for detg. nitrate N in grass (Ashton) 7. Thermal properties of fats (Ravich) 27. Colorimetric detn. of phosphoric acid in grass (Greenhill, Pollard) 7. Chemistry of grass crops (Virtanen) 11D. Effect of frost on wheat at progressive stages of maturity (Newton, McCalla) 11D. App. for drying and grinding materials such as fruit pulps (U. S. pat. 2,023,247) 1. Grease- and moisture-proof paper for wrapping foods (U. S. pat. 2,021,947) 13. Moistureproof material such as regenerated cellulose for wrapping foods (U. S. pat. 2,022,490) 13.

Food product. Soc. des crédits internationaux S. A. Fr. 787,018, Sept. 16, 1935. Flakes of oats, barley, rice or maize are mixed with milk powder and salt, sugar, fruit juice or other flavoring, and the mixt. is compressed. Lecithin, vitamins, fatty material or other food may also be added.

Food preservation Per D. Peterson and Göran A. Möller. Fr. 786,962, Sept. 14, 1935. Meat, fish, eggs and vegetables are disinfected by means of H_2O_2 , formalin or other disinfectant and then preserved by an atm. of CO_2 .

Vitamin concentrates Lloyd A. Hall (one-half to Carroll L. Griffith) U. S. 2,022,464, Nov. 26. A vitamin D emulsified concentrate suitable for addition to various foods is prepared by mixing with an oil base vitamin D prep (such as one from irradiated ergosterol or a strong cod liver oil extract) an emulsifying agent such as gum acacia and gum tragacanth or the like and adjusting the pH to 5.5-6.0 by adding water containing a mild alkali such as $NaHCO_3$ or a weak acid such as citric acid or $HOAc$.

Bread, etc. Standard Brands, Inc. Brit. 433,413, Aug. 14, 1935. The crust color of baked goods is improved by bringing the surface of the dough into contact with NH_3 or an NH_3 compound that rapidly decomposes under heat treatment, e.g., NH_4OH , NH_4 tartrate, NH_4 carbonates, NH_4 malonate. The process is used preferably when a sugar, other than cane sugar, is incorporated in the batch.

Stable dry leavening material Hans Wögerbauer. U. S. 2,023,500, Dec. 10. A culture of acid-producing bacteria such as lactic acid bacteria, with which yeast may be associated if desired, is mixed with a food flour in the presence of only such an amt. of water that the flour is moistened without becoming sticky, and the mixt. is allowed to undergo a long period dough fermentation (sufficiently until it becomes sufficiently dry to permit milling without artificial drying). Various details and modifications are described.

Use of hydrogen peroxide and other per compounds such as sodium percarbonate or perborate as dough leavening agents. E. I. du Pont de Nemours & Co., Joseph S. Reichert and Wm. J. Sparks. Brit. 433,471, Aug. 15, 1935. See U. S. 1,953,567 (C. A. 28, 3897).

Process and apparatus for the continuous or intermittent concentration of milk to obtain evaporated or condensed milk Alfred R. Jahn. Brit. 433,678, Aug. 19, 1935.

Removing milk or beer scale. Henkel & Cie. G. m. b. H. (Helmuth Figgau, inventor) Ger. 617,583, Aug. 22, 1935 (Cl. 53e 2). Scale and other deposits occurring in food-making app. are removed by treating the app. with enzymes, such as pancreatin soln., which have no corrosive action on metals.

Rotary-drum apparatus with internal scraper, etc., for desiccating materials such as milk, casein, etc. Julius F. Dietrich U. S. 2,023,468, Dec. 10. Various structural, mech. and operative details.

Whey. Josef Sirek U. S. 2,023,350, Dec. 3. A whey prep. suitable for use with various dietetic compns. such as those containing vitamins and enzymes is obtained by freeing whey from milk proteins and their products of decomposition and from all milk ferments and adding a colloidal soln. of edestin-calcium derived from hemp seed and about 0.05% of $MgSO_4$. Various details of prep. are described.

Whey Kraft-Phenix Cheese Corp. Brit. 434,058, Aug. 26, 1935. Whey is condensed, to give a product having a high vitamin G content by evap. at a pH not higher than 6 and not below about 5.5. In an example, H_2PO_4 is added to give the desired pH prior to or subsequent to the introduction of the whey into a vacuum pan, where it is evap. until it will set on cooling. While still hot, the free H_2PO_4 is preferably neutralized by adding CaO . After setting, the product is subdivided and dried in a drying tunnel at a temp. sufficiently low to prevent caramelization of the sugar.

Margarine Marvin C. Reynolds U. S. reissue 19,767, Nov. 26. A reissue of original pat. No. 1,917,273 (C. A. 27, 4600).

Margarine Marvin C. Reynolds. U. S. 2,022,924, Dec. 3. A normally liquid vegetable oil such as cottonseed oil is hydrogenated to a point at which it is solid at

room temp., the oil is melted at a temp. above its clearing point, crystd., heated to a temp. below its clearing point to melt the relatively lower-melting constituents, and the oil is churned with an aq. liquid such as cultured milk to form a relatively liquid emulsion, the emulsion is crystd. to solidify it and the solid emulsion is processed to form a final plastic margarine product.

Jacketed tubular processing apparatus suitable for congealing ice cream or lard, etc. Bruce DeH. Miller (to Vogt Processes, Inc.) U. S. 2,023,607, Dec. 10. Structural details.

Cheese Pomosin Werke G. m. b. H. Ger. 617,858, Aug. 27, 1935 (Cl. 53e 6 01). See Brit. 420,563 (C. A. 29, 3418).

Cheese treatment Ernest Schneider (to Kraft-Phenix Cheese Corp.). U. S. 2,021,899, Nov. 26. An emulsifier such as Na phosphate or whole-milk powder is added to cheese and the material is worked to a smooth consistency at a temp. not substantially above about 93° and is subjected to heat and to the action of a vacuum without heating to swell the casein, the operations being so conducted and timed as not to impair the flavor. App. is described.

Preserving eggs Göran A. Möller. Fr. 786,963, Sept. 14, 1935. The whites and yolks of eggs are preserved, after removing the shells, in hermetically closed containers in an atm. of CO_2 .

Preserving fruit. Wilhelm J. H. Hinrichs. Brit. 434,137, Aug. 27, 1935. See Fr. 779,631 (C. A. 29, 6324).

Drying fruits. Charles C. Moore (to Vacuodri Fruit Corp.) U. S. 2,023,536, Dec. 10. A "dehydrated" fruit having a considerable fructose sugar content is brought to a substantially dry condition by subjecting it for a predet. time to a pressure-heating medium such as steam at a temp. considerably in excess of that at which fructose sugar inverts, to heat the fruit to a temp. approx. the point of inversion, withdrawing the heating medium before the fruit has absorbed sufficient heat to cause inversion, and immediately reducing the pressure of the surrounding medium to vaporize suddenly a portion of the moisture in the fruit, and maintaining a reduced pressure until the moisture is substantially removed.

Pectin Suzanne G. Rabaté (nee Grillon), Adrien Macé and Jean Clément. Brit. 434,037, Aug. 26, 1935. See Fr. 769,210 (C. A. 29, 5187).

Pectous preparation suitable for use in jelly making Herbert T. Leo, Frederick A. Beck and Clarence C. Taylor U. S. 2,022,470, Nov. 26. A dry powd. mixt. is prepd. with particles of greater than colloidal size comprising fibrous crushed fruit or vegetable cellulose tissue containing substantially the original content of water-insol. pectose substantially free from water-sol. substances and bitter components of the original fruit or vegetable, together with a filler and such as diatomaceous earth to standardize the material to a desired jelly strength. Numerous details of prep. are given. U. S. 2,022,471 relates to a similarly standardized prep. of water-sol. pectin.

Flavoring material Albert K. Epstein and Benjamin R. Harris U. S. 2,023,877, Dec. 10. A flavoring suitable for use with margarine, etc., in very small proportion to impart a butter-like flavor comprises butyryl and another diketone such as 2,3-pentadione or 2,3-hexadione.

Soluble coffee Wilbert A. Heyman U. S. 2,022,467, Nov. 26. A closed porous container such as a cheese-cloth bag is filled with a partly sol. coffee in the form of granular particles of coffee ext. and granular particles of roasted coffee, from both of which powd. material has been sepd. Numerous details of prep. are given.

Decaffeinating coffee Jean MacLang (to Coffex A. G.) U. S. 2,023,333, Dec. 3. Selective extraction of caffeine is effected with a dichloroethane. Various details of operation are described.

13—CHEMICAL INDUSTRY AND MISCELLANEOUS INDUSTRIAL PRODUCTS

(PLASTICS, RESINOIDS, INSULATORS, ADHESIVES, ETC.)

HARLAN S. MINER

Systematizing chemical technology. H. Hoppmann. *Chem. Fabrik* 1935, 468-77.—Chem. technology is discussed from the material or consumptive, the operating or process, and the app. or construction sides, and various methods and equipment employed are classified. Ten tables.

Systematizing chemical technic. H. Hoppmann. *Chem. Fabrik* 1935, 467.

Industrial gas masks. F. Rutledge Davis. *India Rubber World* 93, No. 3, 27-9 (1935).—An illustrated description of present developments, with special reference to the part played by rubber.

Plastics in chemical industry. Lester W. Tarr. *Ind. Eng. Chem.* 27, 1281-6 (1935).—A description of Ilavog, a PhOH-CH₂O resin reinforced by asbestos fiber and available in large molded shapes (0 × 10 ft.). Some advantages are chem. resistance, lightness combined with strength and toughness, resistance to thermal shock and to temps. up to 150°, machinability and elimination of electrolytic corrosion.

The significance of plastic masses, ceramic materials and glass for the development of domestic raw materials. W. Spielvogel. *Glastech. Ber.* 13, 381-90 (1935).

A new method for determining phthalic acid in alkyl resins and other phthalic acid esters. C. P. A. Kappelmeier. *Farben-Zig.* 40, 1141-2 (1935).—This new simple method isolates and weighs the phthalic acid (I) as a previously unknown K phthalate contg. one mol. of alc. of crystn., viz., CaH₂O₄, EtOH (II). The sample is weighed out into a 150-cc. Erlenmeyer flask, dissolved in a few cc. of benzene and treated with 2-3 times as much 0.5 N alc. KOH as is consumed by the sapon. of the sample. After attaching a reflux air condenser, the flask is warmed first to a temp. not exceeding 40° and then gradually heated to refluxing. Sapon. is complete after 1-1½ hrs. If the fat acids are to be detd. simultaneously, an amt. of ether sufficient to give an alc.-ether ratio of 3:1 is added, the cryst. II filtered off and washed with a 3:1 alc.-ether mixt., the fat acids passing into the filtrate. If the fat acids are not to be detd., the possibility of errors due to K₂CO₃ formation can be forestalled by neutralizing the sapon mixt. with linseed oil fat acids. Next an amt. of ether sufficient to give an alc.-ether ratio of 1:1 is added. The resulting mixt. is cooled and quickly filtered through a porcelain or glass filter. The filter residue, II, is washed with a 1:1 alc.-ether mixt.; sucking air through II is avoided as II is hygroscopic. II is dried to const. wt. by warming for a few min. in a drying oven and then allowing to stand for 2-3 hrs. over H₂SO₄ in a vacuum desiccator. The formation of II can be used as a qual. test for I. A confirmatory test consists of fusing a small portion of the substance thought to be II with resorcinol and observing the formation of fluorescein. Cf. following abstr.

The reliability of the resorcinol test for detecting phthalic acid. F. Krämer. *Farben-Zig.* 40, 1142-3 (1935).—On heating resorcinol with oxidizing agents, e. g., concd. H₂SO₄, Na₂O₂, chromic acid salts, etc., and dissolving the reaction mixt. in caustic soln., a green fluorescence is observed. For this reason, the test for phthalic acid using resorcinol and concd. H₂SO₄ is apt to give misleading results when applied to resins.

Starch and dextrin adhesives. Fred Holt, Jr. *Paper Ind.* 17, 482-5 (1935).—A brief outline of the history and chemistry of starch and dextrin, of the manuf. and analysis of starch and of its use in the paper industry.

Pastes, vegetable glues, adhesives from dextrin, casein, and gums, gelatin and animal glue. IV. Adhesives from casein. Carl Becher, Jr. *Gelatine, Leim,*

Klebstoffe 3, 163-5 (1935); cf. C. A. 29, 8172'.—Recipes and a brief discussion of characteristics are given for 11 different casein glues consisting of combinations of casein with NaOH, Na₂CO₃, borax, NH₄OH, "Preventol C," rosin soap, turpentine, and lude glue. The formulas differ considerably from those combinations of casein-lime-sodium salt that are commonly used in the U. S. V. Adhesives from gums. *Ibid.* 165-8.—A brief discussion of the physical properties of gum arabic and recipes for 9 adhesives based on gum arabic are given.

The prevention of ice accretion (on aircraft). B. Lockspeiser. *Aircraft Eng.* 7, 278-81 (1935).—The requirements for a suitable liquid are low-setting point, miscibility in all proportions with H₂O, large effect in depressing the f. p. of H₂O, low vapor pressure below 0°, and high flash point. Both ethylene glycol itself and a 10% EtOH mixt. with ethylene glycol have been used with success in flight. In test flights under ice-forming conditions, a Hart and a Gordon airplane used 1.5 and 1.7 pints ethylene glycol per hr., resp.

Waxes—animal, mineral, vegetable, synthetic. Herbert Mellan. *Chem. Industries* 37, 639-45 (1935).—A review.

Chloropicrin in modern fumigation. Conrad C. Johnson. *Soap (Sanitary Products Sect.)* 11, No. 11, 105, 107, 109 (1935).—CCl₃NO₂ is used in house, rodent or mill fumigation, it has a high toxicity to insects and high penetrative powers. It is sprinkled or sprayed in the space to be fumigated by an operator wearing a gas mask and requires little time and trouble in application. Its strong odor serves as an efficient warning during and after fumigation.

Household insecticides. R. C. Roark. *Soap (Sanitary Products Sect.)* 11, No. 11, 101, 103, 117 (1935).—HCN, (CH₃Cl), ethylene oxide + CO₂, p-Cl₂CH₃, P, NaF, certain fluosilicates, pyrethrum, derris and cube are the principal household insecticides. The properties of the last three are discussed. The trend seems to be toward the development of org. compds. that are highly toxic to insects but relatively nontoxic to man and warm-blooded animals. Phenothiazine is an example and R. suggests it should prove effective against some household pests.

Effect of lead on pyrethrum extracts. Louis S. Bake. *Soap (Sanitary Products Sect.)* 11, No. 11, 111, 113 (1935).—Oil exts. of pyrethrum stored in darkness in glass bottles with small pieces of Pb or solder were nearly decolorized in 14 days with the formation of an amorphous, light-yellow ppt. contg. 26% Pb. Similar exts. stored with Zn or Cu became greenish. Larger ppts. formed with Zn, Al, Sn, Ni and Fe appeared to be without effect. B. concludes that oil exts. of pyrethrum should not be stored in containers having either Pb or solder present, even in caps, but exts. are apparently safe from decomposition when stored in the presence of Sn, Al, Ni or Fe.

Effects of sunlight on fly sprays. David G. Hoyer. *Soap (Sanitary Products Sect.)* 11, No. 12, 105, 107, 109, 111 (1935).—Pyrethrum exts. of the same strength in 3 samples of specially treated odorless petroleum distillates and in one sample of ordinary petroleum distillate were exposed in tight flint-glass bottles to sunlight and daylight for 4 mos. and were tested at intervals biologically with house flies by the Peet-Grady method (C. A. 22, 4731) and chemically from pyrethrins I and II by the Seil method (C. A. 28, 4531^{1/2}). The sprays prepd. with an odorless base gained slightly in toxicity during the first 4 days. The other spray lost toxicity from the start and after the 4th day all sprays lost rapidly, with about a 65% loss for each of the 4 sprays at the end of 2 mos. and an addnl. loss of about 25% during the next 2 mos. II. suggests that the light caused the formation of an un-

stable toxic substance in the odorless base sprays which accounted for the increase in toxicity at the start. These sprays took on a hazy appearance within 3 hrs, this haziness increasing and being accompanied by a loss of the typical amber color. Finally a white ppt. settled out. The spray prepd with the ordinary base remained clear but had lost some of its amber color by the end of 4 mos. The chemical analyses were not consistent for the different sprays. The "apparent" pyrethrin content of one rose rapidly during the entire period while that of the one prepd. with the ordinary distillate fell slightly at first and then remained const., though during this time there was a loss in the "apparent" pyrethrin I which was compensated for by an equal gain in the "apparent" pyrethrin II. The pyrethrin contents of the other 2 sprays followed the toxicity curve well but H. believes that the development of an acidic substance in the sprays interfered with the analysis and gave a false pyrethrin content. Fifteen references

S. pat. 2,023,711) 23. Alkylated phenols [as wetting agents] (Ger. pat. 616,786) 10.

Gas masks Hugo Stoltzenberg (trading as Chemische Fabrik Hugo Stoltzenberg). Brit. 433,848, Aug. 21, 1935.

Plastic masses I. G. Farbenind. A.-G. (Wilhelm Schreier and Georg Niemann, inventors). Ger. 617,733, Aug. 24, 1935 (Cl. 336.5) High-mol. org. plastic masses, especially rubber, are colored by azo dyes insol. in water, obtained by coupling 1 or 2 mols. of diazotized *o*-aniline or its derivs. with 1 mol. of diacetoxyl-*o*-toluidine, or its derivs. Examples are given.

Plastic compositions John P. Henharen Brit. 433,994, Aug. 23, 1935. See Fr. 781,902 (C. A. 30, 1889).

Removing volatile solvents from solutions of plastic compositions Adolf Kämpfer. Brit. 434,640, Sept. 5, 1935. In the removal of solvent from layers of plastic comps. applied to the single sheets in the prepn. of laminated glass having nonsplintering intermediate layers, the sheets being dried in the sep. compartments of a container, the formation of skins on the surface of the layers is prevented by replacing the solvent-charged atm. above the layers, just prior to its satn. point, with fresh air. This substitution may be repeated until the solvent is removed, or the absorptive power of the atm. may be increased by step-by-step increase of the temp. of the atm., each compartment being heated by tubular steam heaters.

Lining pipe fittings with bituminous material Pipe Linings (Australasia) Ltd. and Einar V. Langevad. Brit. 434,221, Aug. 28, 1935. The fitting is heated, cold dies or molds forming a core are introduced into the fitting and the material, hot and liquid, is introduced between the core and the fitting. Diatomaceous earth to 10-13% may be added to the bitumen, which may be treated by the "air blown" process and respond to the penetration test at 77°F. with 35-40 units and to the ball-and-ring test between 180° and 190°F.

Bituminous coverings Deutsche Röhrenwerke A.-G. Ger. 615,175, June 28, 1935 (Cl. 293.24). Addn. to 501,539 (C. A. 28, 2927). The method of 501,539 for making masses for coating metal tubes by mixing molten dipolymerized soft rubber vulcanizates with molten mineral oil bitumen is modified by adding the molten rubber to the molten bitumen. Filling material, such as asbestos fiber, and coloring matter may be added. The mass is used for coating the insides and outsides of metal tubes.

Synthetic resin Geo. W. Seymour (to Celanese Corp.

of America). U. S. 2,022,389, Nov. 26. A synthetic resin which may be used with cellulose acetate, etc., is prepd. by treating CH_2O with the sulfonamide of a phenol ether such as an anisole sulfonamide. Various examples are given.

Synthetic resin. Charles A. Thomas (to Monsanto Petroleum Chemicals, Inc.). U. S. 2,023,493, Dec. 10. A resinous reaction product which is suitable for use as a coating is formed from a polyhydric alc. such as ethylene glycol or glycerol and a preformed unsatd. hydrocarbon resin obtained by the polymerization of a cracked petroleum distillate.

Synthetic resins Marie B. Rousset and Auguste V. Keller. Brit. 434,112, Aug. 21, 1935. Solid, opaque or transparent condensation products are made by causing urea, thiourea or their derivs. to react with an aldehyde, e. g., CH_2O , in the presence of a preferably monohydric phenolic substance of low m. p., which acts as an autocatalyst, the mol. proportions of the reacting substances being so balanced that a gradual increase of H-ion concn. is developed from the neutral soln. In an example, 33 parts CH_2O , calcd. on the 35% solid content of com. 40% CH_2O soln., is nearly neutralized to a pH of 7-8 by addn. of alkali, e. g., NaOH, 12.5 parts urea and 2 thiourea, mixed with 0.05 *p*-cresol, are added and the neutral soln. is condensed by heating at low temp. under reflux until the reaction subsides, after cooling and filtering, the mixt. is evapd. at elevated temp. under partial vacuum to remove the H_2O and the viscous product is poured into molds and dried at 70-100°. Decolorizing agents, e. g., charcoal, softeners, sucrose, glycerol, and fillers, e. g., SiO_2 , metal dust, wood flour and paper pulp, may be added.

Synthetic resins. Dynamit-A.-G. vorm. Alfred Nobel & Co. Ger. 617,855, Aug. 27, 1935 (Cl. 396.22). The hardening of $\text{PhOH-CH}_2\text{O}$ condensation products by org. bases is accelerated by using high-boiling aliphatic bases or base mixts. with a straight chain, with a pH value of over 10 and with both primary and secondary amino groups in the mol. Thus, a PhOH resin is mixed with wood meal and diethylenetriamine to form a homogeneous mass, which is pressed to form and rapidly hardens.

Synthetic resins Kurt Albert G. m. b. H. chem. Fab. Ger. 620,201, Oct. 18, 1935 (Cl. 120.26.02). A resin prepd. in known manner from a polyhydric alc., a polybasic acid and a resin acid at 220-250° (resin A) is added to a mixt. comprising a polyhydric alc., a polybasic acid and a higher aliphatic acid or its glyceride (mixt. B), and the whole is heated to 170-200°. Alternatively, resin A is mixed with a resin previously prepd. at 170-200° from mixt. B, and the whole is heated to 170-200°. Undiscolored products useful as lacquer components are obtained. Examples are given.

Synthetic resins Firma Louis Blumer. Ger. 620,202, Oct. 18, 1935 (Cl. 120.26.02). Resins prepd. from polyhydric alcs. and polybasic acids, with or without monobasic acids or their derivs., are refined by dissolving them at atm. or raised temp. in a lower aliphatic alc., e. g., MeOH or EtOH, and either cooling the solns. or adding a precipitant thereto. Resins free from unchanged starting materials and reaction products of low mol. wt. are pptd. The refined resins have a lower acid no. than the unrefined resins and are more easily hardened. Examples are given.

"CO-amide" Carleton Ellis (to Uryte Corp.). U. S. 2,022,233, Nov. 26. A urea-formaldehyde condensation product is incorporated with phthalimide and caused to react to form a resinous product which is suitable for coatings, etc. Numerous examples are given.

Molded resin ware. Poy H. Cunningham (to Bryant Elec. Co.). U. S. 2,022,587, Nov. 25. Various operative details are described for use of a highly polished mold for molding articles with a smooth nonabsorptive outer surface and a more porous texture beneath the surface, some of the surface material being removed for application of liquid coloring material to color certain areas in a desired pattern, as in the production of decorated ware of urea resin.

Coating surfaces with synthetic resins N. V. Philips' Gloeilampenfabrieken. Brit. 434,872, Sept. 10, 1935.

A layer of moldable material containing a hardening synthetic resin is applied by heat and pressure to a compressible base by first applying a high pressure for such a short time as to liquefy the material and then applying a considerably lower pressure while heating is maintained until the material has hardened. A wooden plate is covered with a thin layer of a mixt. comprising a $\text{PhOH}\cdot\text{CH}_2\text{O}$ condensation product 50 and wood dust 50%; a layer of paper impregnated with resin may be inserted between the wood and the resin powder, the plate is then pressed 3 min. at 150–160° under 70 kg. per sq. cm. pressure and afterward 7–10 min. under 10 kg. per sq. cm.

Surface coloring of synthetic resin articles Gustavus J. Esselen (to Specialty Guild, Inc.). U. S. 2,022,710, Dec. 3. The surface to be colored is softened with a water-sol. softening agent such as a phenol in aq. soln. and is then dyed with an aq. soln. of a water-sol. dye. Several examples are given.

Crank press suitable for use with artificial resins, insulating materials, etc. Karl Götz U. S. 2,023,319, Dec. 3. Mech. features.

Heat insulation Carl G. Munters and John G. Tandberg (to Carl G. Munters). U. S. 2,023,204, Dec. 3. Heat insulation comprises a low sp. gr. and highly vacuolated mass of polystyrol substantially composed of closed cells.

Thermal insulation Martin C. Huggett (to Research, Inc.). U. S. 2,023,422, Dec. 10. A film of nonmetallic mineral material having not more than a slight luster but containing a binder, such as a compn. containing Ag sulfide and casein, is secured to a supporting base sheet and then subjected to friction to give it a highly polished heat-reflective surface.

Heat-insulating material from mineral wool Edward A. Tooley (to Johns-Manville Corp.). U. S. 2,022,750, Dec. 3. After molten mineral material has been blown into fibers, the fibers, while still suspended and heated, are mixed with a normally solid, inherently water-repellent material such as Zn stearate and talc in a finely divided form. App. is described. Cf. A. 30, 191.

Insulated wire Samuel Ruben (to Vega Mfg. Corp.). U. S. 2,022,827, Dec. 3. A wire carries a surface insulation including an oxide such as finely divided Cr oxide with a resinous binder and a B compd. such as boric acid, and an overlying textile winding is impregnated with a similar mixt.

Compositions for coating cables Siemens & Halske A.-G. (Ernst Fischer, inventor). Ger. 620,232, Oct. 17, 1935 (Cl. 21c. 7.50). Comps. for protecting submarine cables, insulated with gutta-percha or like material, from marine fauna comprise a powder light metal, particularly Al, mixed with insulating or semiconducting materials.

Nonconducting coverings for heat and sound Dynamit A.-G. vorm. Alfred Nobel & Co. Brit. 433,251, Aug. 12, 1935. Addn. to 429,316 (C. A. 29, 6977*). In the prepn. of porous heat- and sound-insulating substance from polymerization products of a vinyl compd. by the addn. of a volatile solvent and subsequent heating, or by the addn. of decomposable substances evolving gases on heating, as described in 429,316, the operation is effected under vacuum. In an example, a vacuum of 3–0.2 mm. Hg was applied in the prepn. of porous polystyrol, a product of sp. gr. 0.1–0.02 being obtained.

Adhesives I. G. Farbenindustrie A.-G. Brit. 434,260, Aug. 28, 1935. Materials, e. g., wood, metal, glass, concrete, leather or rubber, are stuck together by applying to the surfaces to be united a high-mol. polymer of a purely aliphatic mono-olefin having a branched C chain and bringing the surfaces together.

Adhesive base from cornstarch Gordon G. Pierson (to Perkins Glue Co.). U. S. 2,023,973, Dec. 10. Substantially dry powd. corn starch is used with an admixed oxidizing agent such as BaO_2 , 0.4–1.5% adapted to release O and capable of liquefying the starch, and with urea, which serves as a liquefier and stabilizer and retards evapn. of water from the adhesive after its application to an object to be glued. The adhesive is prepd. for use by mixing it with water and NaOH and heating the mixt. Several examples are given.

Wetting and other agents Edmund Waldmann and August Chwala. Brit. 434,358, Aug. 27, 1935. Sulfonic acids of aliphatic amino ethers, which are carbonizing agents in free form and wetting, washing and emulsifying agents in the form of their salts with alkalis or org. bases, are prepd. by acylating a sulfonic acid of an aliphatic amino-ether, or a salt thereof, with a fatty acid containing at least 10 C atoms or a resin acid, or a chloride thereof. The original acids may be prepd. by treating with NH_3 or a primary amine the halogenated ether sulfonic acids obtained by the reaction of dihalo aliphatic ethers with alkali or NH_3 sulfite. In an example, β,β' -dichlorodiethyl ether is treated with alk. Na_2SO_3 and the product is treated with MeNH_2 and acylated with lauric acid chloride. The latter may be replaced by abietic acid chloride and EtNH_2 or PhNH_2 may be used for the MeNH_2 .

Wetting and other agents Imperial Chemical Industries Ltd. Fr. 786,925, Sept. 6, 1935. Wetting, washing and emulsifying agents are made by converting to their sulfuric esters the aliphatic hydroxy sulfides obtained by causing alkyl (C_{12} – C_{20}) mercaptans to react with halohydrins. The esters are obtained by causing the hydroxy sulfides to react with the addn. product resulting from the action of SO_2 on a tertiary amine or with substances capable of forming an addn. product of this nature (e. g., a pyrosulfate and pyridine). Thus, 2-hydroxyethyl ethyl sulfide (from cetyl mercaptan and ethylene chlorohydrin) or β,γ -dihydroxypropyl ethyl sulfide (from cetyl mercaptan and glycerol α -mono-chlorohydrin) is caused to react with Na pyrosulfate and pyridine.

Wetting and other agents Soc. pour l'ind. chim. à Bile. Fr. 786,911, Sept. 14, 1935. Tertiary amines which contain an aliphatic or hydroaromatic radical formed of at least 6 C atoms are treated with oxidizing agents capable of transforming the amines to their oxides. Examples are given of oxides formed from 1-dodecyl-4-dimethylaminobenzene, 4-dimethylamino-1-laurophenone (by condensing PhNMe_2 with lauric acid chloride in the presence of ZnCl_2 , $b.p.$ 220–60°), lauryldimethyl (and ethyl) amine, cetyldimethyl (and ethyl) amine, stearyldiethylethylenediamine, and *N*-laurylpiperidine (from lauryl chloride and piperidine), $b.p.$ 170–82°, and octadecenyldimethylamine.

Molded objects The Ferro Engineering Co. Fr. 786,570, Sept. 5, 1935. Objects are molded from an intimate mixt. of an aggregate such as silica sand, a sol. glass and not more than 1% of a common metal sulfate, e. g., FeSO_4 . The molded mass is placed on a metal plate with the interposition of a film of a sol. chloride other than NaCl, e. g., CaCl_2 , and the plate is put into a furnace to bake the mass.

Molded articles such as electric-switch cover plates James T. Walsh and Rene P. Pperoux (to Cellulose Corp.). U. S. 2,022,364, Nov. 26. A decorative facing of synthetic thermoplastic cellulose-deriv. material such as cellulose nitrate or acetate compn. is fused to a backing of a synthetic cellulose-deriv. material of nonflammable character such as one containing cellulose nitrate or acetate. Several examples are given.

Molding articles such as containers from fibrous pulp Ernest Huff and Andrew Keiding (to American Lacle Paper Co.). U. S. 2,023,200, Dec. 3. Various operative details suitable for making cups, etc. App. is described.

Molding powder containing cellulose acetate and synthetic resin Wm. H. Moss (to Celanese Corp. of America). U. S. 2,022,383, Nov. 26. Cellulose acetate is used with at least its own wt. of synthetic resin consisting essentially of a diphenylol propane formaldehyde resin, these 2 materials forming most of the plasticizable compn., which, however, also may be used with other ingredients such as china clay or triacetin.

Bitumen-fiber mixture suitable for molding, trowelling, etc. Harry C. Fisher (to Richardson Co.). U. S. 2,023,675, Dec. 10. Fibers such as those of cotton, wood or flax are mixed with and coated by bitumen and are then dispersed in water while heated.

Buttons, etc., from powdered casein Geo. Morrell (to Geo. Morrell Corp.). U. S. 2,022,895, Dec. 3.

Various details of app. and of a pressure, extrusion and heating process are described.

Casein composition suitable for sizing, etc. Carl Iddings (to Muralo Co.). U. S. 2,023,353, Dec. 3 A stable compn retaining its viscosity undiminished over long periods of time is prep'd by heating casein to about 75-99° with NH_4F or an alkali metal fluoride, finely divided silica and water.

Putty Douglas H. B. Cowman Brit 434,447, Sept. 2, 1935 A putty, particularly for glazing metal windows, comprises a filler, a drying oil, H_2O and a peroxide, with or without driers. It may be produced shortly before use by mixing a component comprising the filler, drying oil and H_2O and a component comprising a peroxide, both components preferably being pastes. In an example, the components comprise white, linseed oil, H_2O and CCl_4 , and BaO , CaO , $(\text{AcO})_2\text{Pb}$, vaseline and PbNO_3 , resp.

Leather substitute Le cuir contreplaqué Fr. 787,080, Sept. 16, 1935 Rubber latex is mixed with wood fibers, a soln of $\text{Al}_2(\text{SO}_4)_3$ is added and finally hardening or suppling agents. The paste may be made into bands, plates or cylinders using high pressure.

Coated fabrics Mitchell G. Thomson and Imperial Chemical Industries Ltd Brit 434,359, Aug. 30, 1935 In the manuf. of coated fabrics, e. g., leather-cloth or tarpaulin, comprising a cotton, hessian, paper or other base coated with a compn contg. dissolved nitrocellulose and a softening agent therefor, the latter is a brominated tritriol phosphate corresponding substantially to a di-bromotritriol phosphate in which both Br atoms are substituted in the nucleus. Other softening agents, e. g., castor oil, may also be used. The softener may be obtained by treating tritriol phosphate with Br at 55-60° in the presence of powd. Cu.

Condensation products I. G. Jarbennd A-G (Michael Jahrstorfer and Hans G. Hummel, inventors) Ger. 616,429, July 30, 1935 (Cl. 120 26 02). Addn to 608,591 (C. A. 29, 5202a). The method of 608,591 for obtaining products by condensing polyamides of carboxylic acids with CH_2O is modified by replacing the polyamides or thioamides of polyamino-N-carboxylic acids. Thus, hydrazine carboxylic acid diamide (from hydrazine sulfate and KCN) is condensed with aq. CH_2O of pH value 7.0 to give a syrupy soln hardening to a glossy transparent product. Other examples are given.

Condensation products from natural resins Josef Linapff (to I. G. Jarbennd A-G) U. S. 2,022,456, Nov. 26 A natural resin such as colophony or an ester of a resin such as the glycerol ester of colophony is treated with a phenol of an alkylated phenol or an alkyl ether or ester of a phenol, in the presence of BF_3 or a complex compd of BF_3 with an org. acid. Numerous examples are given and products are obtained with a much lower I value and higher softening point than the starting materials. Cf. C. A. 28, 919¹, 29, 6781¹.

Halogenated diphenyl oxide Edgar C. Britton, Wesley C. Stoesser and Gerald G. Goergen (to Dow Chemical Co.). U. S. 2,022,634, Nov. 26 Diphenyl oxide or a lower halogenated diphenyl oxide is treated with Cl or Br at an elevated temp. (suitably above about 145° and 75°, resp.) sufficient to maintain the reaction mixt. in a mobile fluid condition to form a halogenated diphenyl oxide mixt. having a halogen content corresponding to more than 4 and less than 10 atoms of combined halogen per mol. of halogenated diphenyl oxide. Products thus produced are of a resin like character. Numerous examples are given.

Emulsifying agents containing fatty acid esters of polyglycerols Benjamin R. Harris. U. S. 2,022,766, Dec. 3 A mixt. of polyglycerols is produced from glycerol, and the polyglycerols (usually in excess) are caused to react with higher fatty acids such as those of coconut oil, neat's foot oil, corn oil or lard or with the triglycerides of the oils and fats. Products are obtained which may be used in the prep'n of cosmetic creams, shaving preps, detergents, insecticides, etc. Various examples are given.

Emulsifying and dispersing agents Imperial Chemical Industries Ltd, Henry A. Puggott and Geo. S. J. White

Brit. 434,424, Aug. 27, 1935 The agents are prep'd by treating sod oil, degrass, molleon or like oil recovered in the manuf. of chamois leather with ethylene oxide (I), preferably in the presence of caustic alkali or a surface-active solid, e. g., infusorial earth, silica gel. The products give emulsions with animal, vegetable and mineral oils and are useful in the textile industry as leveling agents in dyeing and printing and for improving the cleansing action of sulfonic esters of the higher alcs. Among examples, (1) sod oil is treated with I to prep. products which are used to emulsify a lubricating oil with H_2O , and (2) wool is dyed with indigo in a vat contg. the product of (1).

Emulsion for filling water-cooling systems Karl Kreleler (to Shell Development Co.). U. S. 2,023,367, Dec. 3 Water is used with a small proportion of an emulsifiable mineral oil together with an alkali soap of a sulfonated naphthemic acid or mineral oil sulfonic acid.

Sulfonated fatty substances Deutsche Hydrierwerke A-G Brit. 434,452, Sept. 2, 1935 See Fr. 778,014 (C. A. 29, 3430¹). When mixts. are sulfonated, the mean I value must be at least 100. The products are wetting, washing, dispersing and emulsifying agents.

Washing agent for skin and hair. Ehrhardt Franz Fr. 786,533, Sept. 5, 1935 Washing agents comprise or contain products of the formula RXSO_2Y or $\text{RXP}(\text{O})_2\text{Y}$, (where Y is an alkali metal or an org. or an inorg. radical forming a salt, R is an org. radical, preferably aliphatic, of 10 or more C atoms, X is O, S, imino group in which the H atom is substituted by alkyl, aralkyl or aryl, a methylene, alkylene or arylene group, substituted or not, which is joined to the R either directly or by a carbonamide or sulfamide group). Examples are given.

Polishes. Walter R. Weeks Jr. 787,035, Sept. 16, 1935 Emulsions used for polishing lacquered or varnished surfaces are improved by regulating the consistency of the emulsions to a value of the order of 60-120 secs., measured by the Gardner viscometer, and incorporating a buffer soln. to stabilize the pH value at 5.2-8.

Treating clay or shales to remove impurities Marshall Lasky U. S. 2,023,426, Dec. 10 Clay or shales contg. volatilizable impurities and a high proportion of hydrated, plastic clay substance are heated in finely divided condition in contact with an oxidizing atm., at a temp. sufficient to oxidize and volatilize impurities and the material is then heated sufficiently partially to dehydrate the clay substance and to form a product that is still of plastic character. App. is described, with superposed hearths.

Alkali-resistant composition for use in manufacture of hard tiles Edmund Claxton and Martin K. Bare (to Armstrong Cork Co.) U. S. 2,022,707, Dec. 3 A calenderable mass contg. cumar, m. 100-140°, contains as a toughening modifier an oxidized siccativ oil gel such as one derived from linseed oil and menhaden oil in sufficient proportion to overcome the brittleness of the cumar but in such minor proportion that the hardness of the cumar is substantially unimpaired.

Colloidal dispersions of metals in oils John C. Bird (to Standard Oil Development Co.) U. S. 2,021,893, Nov. 26 A metal such as Ag, Bi, Hg or Cu is colloiddally dispersed in an oil such as white oil, kerosene or gasoline and as stabilizing agents there are employed org. products of disocn or reduction (suitably produced by heating) of an oil-sol. sulfonic acid salt of a metal displaceable by H and a heavy metal sulfonate of an oil-sol. sulfonic acid, such as a Ag sulfonate.

Decalcomania paper. Lewis Davis (to McLaurin-Jones Co.) U. S. 2,023,813, Dec. 10. A decalcomania paper is formed with a suitable backing sheet such as paper with a water-resistant coating to take decalcomania printing and an intervening layer of reousous water-resistant material such as gum sandarac and rosin which is substantially insol. in a solvent such as gasoline, etc., which readily dissolves the other coating, contg. "cumar". Cf. C. A. 29, 5056¹.

Adhesive carbon paper Harold W. A. Dixon and Robson S. Moore (to Columbia Ribbon and Carbon Mfg. Co.) U. S. 2,022,276, Nov. 26 A base membrane such as paper carries a layer of sol. adhesive material such as

gum arabic or dextrin or glue and a superposed layer of transfer ink compn.

Colloid reliefs. I. G. Farberind A.-G. Ger. 614,358, June 7, 1935 (Cl. 57d. 2 02). Addn. to 605,995. The method of 605,995 (C. A. 29, 1907*) for forming the above by thermoplastic masses is modified by using insol. masses which at ordinary temps. have a low viscosity. Polyvinyl chloride contg. 65% Cl dissolved in MeOH is given as an example of such a mass.

Grease- and moisture-proof paper suitable for wrapping foods, etc. John E. Schopp U. S. 2,021,917, Nov. 20, 1934. Paper or the like is treated with an aq. dispersion of approx. 23% of rubber latex, casein, modified starch, a filler such as clay, a hygroscopic plasticizing material such as glycerol or glucose and about 4% of shellac, forming when dried a flexible nontacky coating.

Moistureproof material such as regenerated cellulose suitable for wrapping foods Wm. H. Charch (to Du Pont Celophane Co.) U. S. 2,022,490, Nov. 26, 1935. A smooth nonfibrous sheet of material is provided with a thin moistureproof surface coating which does not become loosened upon prolonged contact with moist substances and which is deposited from a varnish contg. a wax, and a film-forming drying oil or synthetic resin compn. having drying characteristics (the article being flexible without losing its moistureproofness at a temp. of 0°). Numerous examples are given.

Coated sheet material suitable for films and foils Arthur L. Petersen (to Celluloid Corp.) U. S. 2,022,360, Nov. 26, 1935. A base is coated with a lacquer such as one contg. nitrocellulose and with an overlying layer of gelatin soln., another gelatin soln. layer, and with dichromate hardening soln. Several examples are given.

Draw sheets or tympan sheets for rotary printing presses Vulcan Proofing Co. Brit. 433,910, Aug. 22, 1935. A tympan for covering the impression blanket consists of fabric layers united by a resilient layer of natural or artificial rubber or of synthetic resin, with suitable fillers if desired, 1 of the layers having an oil-repellent coating composed of a reaction product obtained from the interaction of a halo-substituted olefin and an alkali polysulfide, e. g., ethylene dichloride and Na polysulfide. A suitable compn. for the uniting layer consists of rubber, 30, ZnO 25, Sb sulfide 5.25, S 3 lb., adol-a-naphthylamine 6, CaO 6, diphenylguanidine 5.4 and stearic acid 0.5 oz.

Tanning gelatinous printing layers Valentin Dietz (to Erwin B. Elliott and Maurice C. Boyd) U. S. 2,023,660, Dec. 10, 1935. Parts of a gelatinous layer such as one on celluloid or glass are tanned in agreement with the image to be printed by the layer to render such parts incapable of swelling in varying degree by the swelling medium employed, the distensible parts of the layer are caused to swell and are rendered ink-repellent in a bath contg. water, glycerol, a bile salt and an amine such as *p*-phenylenediamine, the unmoistened printing surface of the layer is inked with an ink contg. ox. gall and the inked surface is used for printing.

Noncorrosive solution suitable for use in radiators, etc. Frederick A. Weihe, Jr. (to McAleer Mfg. Co.) U. S. 2,023,755, Dec. 10, 1935. An aq. alc., glycerol or ethylene glycol soln. is used contg. a small proportion of the reaction product of triethanol and blown castor oil. Blown soybean oil, diamylamine, etc., also may be used.

Cores for pencils. American Lead Pencil Co. Brit. 413,995, Aug. 23, 1935. See U. S. 1,985,894 (C. A. 29, 1184*).

Transparent partition material. Jules E. Malivert (to L'accessoire de precision) U. S. 2,023,332, Dec. 3, 1935. At least one rigid transparent support such as a glass sheet carries a gelatinous layer of a moisture absorbing

transparent material such as a gelatin or cellulose compn. on at least one side of the support which is protected by a grid material of large mesh.

Sizing asbestos pulp. The Raybestos Co. Brit. 433,974, Aug. 23, 1935. Asbestos fibers to be felted to form sheet material are sized by adding to a dispersion thereof in a beating-engine a "glutinous single-phase soln. of a sizing material in colloidal form which is adsorbable by the asbestos" to an extent such that the adsorbed material is substantially insol. in an aq. medium of pH 8-10, the mixt. being beaten until it runs evenly and freely. The sizing material may comprise rosin, causticized starch, glue-CH₂O or casein. In an example, 2500 lb. and 500 lb. of asbestos of av. lengths of fiber of about 1/4 in. and 1/16 in., resp., are mixed in a beating-engine and causticized starch added slowly.

Coating wood with metals. Grumpelt Propellerbau G. m. b. H. Brit. 434,636, Sept. 5, 1935. Wood surfaces are metallized by spraying on a coating of a readily fusible metal, e. g., Al, and then spraying on a layer of a metal, e. g., bronze or steel, having a higher m. p. than that of the 1st coating.

Composition for waterproofing materials such as fabrics of garments John B. Cleveland U. S. 2,022,405, Nov. 26, 1935. About 2.75 oz. of a mixt. contg. paraffin 4, paracoumarin resin 2, white beeswax 1 and Al palmitate 4 parts is dissolved in each gal. of a solvent mixt. comprising xylol 3 and CCl₄ 1 part by vol.

Artificial straws, etc. British Celanese Ltd. Brit. 433,911, Aug. 22, 1935. Addn. to 328,312 (C. A. 24, 5497) and 354,273 (C. A. 26, 4482). A heavy artificial filamentary product formed from a spinning soln. contg. a cellulose deriv. and a plasticizer therefor is subjected to a molding operation under heat to produce permanent irregularities of shape, e. g., crinkles, twists, patterns, frizzed effects. The heavy filamentary product may be formed by coalescing a no. of fine filaments with a total wt. of about 75 denier. The plasticizer preferably acts as a solvent for the cellulose deriv. at elevated temps. Triphenyl or tritolyl phosphate, *p*-toluenesulfonamide, triethylene glycol, diethylene glycol, triacetin, diacetin, di-lbu tartrate, and mixts. thereof, are suitable plasticizers.

Viscous composition Nello Nardelli Jr. 786,553, Sept. 5, 1935. An elastic gum is melted and 5-20% of colophony or other resinous or bituminous substance is added. The product may be used with various addns. on roads or for waterproofing paper and cloth or as a substitute for glue.

Puncture-sealing composition Matsuharu Hagino Brit. 431,630, Sept. 5, 1935. The compn. consists of a mineral oil and powder, plaster or gypsum, suitable proportions being 10 of oil to 1 of powder. A granular material buoyant in oil, e. g., cork, may be added.

Fly-repelling livestock spray Gideon J. Malherbe (to Shell Development Co.) U. S. 2,023,140, Dec. 3, 1935. A pine oil and a mineral oil of approx. the same b. p. range are used together.

Fireproofing compositions Rudolph J. White and Wilberforce R. Dauncey. Brit. 433,645, Aug. 19, 1935. The compns. consist of equal parts of K₂CO₃ and NaHCO₃ dissolved in a suitable liquid, e. g., H₂O or a paint.

Fire-extinguishing charge Francis R. Bichowsky (to General Motors Corp.) U. S. 2,021,981, Nov. 26, 1935. A F deriv. of a hydrocarbon such as CCl₄ is used with a chemical decompd. by heat to form extinguishing gases, such as NaHCO₃. An extinguisher for use with such mixts. is described.

Automatic and manual carbon dioxide fire-extinguishing system Scott E. Allen and Orzo N. Wiswell (to C-O-Two Fire Equipment Co.) U. S. 2,023,569, Dec. 10, 1935. Various structural, mech. and operative details.

14—WATER, SEWAGE AND SANITATION

EDWARD BARTOW

Softening of industrial (process) water by means of trisodium phosphate Jeannet Tiba 13, 261, 263, 337,

330, 341, 410, 421 (1935) —Expts. are described on the processing of process water for the tanning, textile and other

industries. **Conclusions.** Practically complete softening (hardness of 1-1.5°) can be obtained, even in the cold, by the use of the theoretical quantity of Na_2PO_4 . To attain this result it is necessary first to remove CO_2 and bicarbonates, which in practice can be accomplished by preliminary treatment with lime, or with lime and soda, in a suitable app. The treatment must be adjusted to reduce the hardness to a min. while at the same time producing a softened water having an alk. such that, after Na_2PO_4 treatment, the alk. to phenolphthalein is appreciably higher than half the total alk. to methyl orange. The Na_2PO_4 treatment is carried out in a relatively small softener, as 30 mins is sufficient to obtain equl and the voluminous $\text{Ca}_3(\text{PO}_4)_2$ ppt settles rapidly. For a water having a hardness of 6° after preliminary softening, the theoretical Na_2PO_4 consumption is about 150 g. per cu. m., and this is readily attained in practice. When the alk. is too high for certain purposes, it can readily be corrected by addn. of small quantities of H_2SO_4 . A Papineau-Couture

Arc spectral analyses of some Spanish medicinal waters. III. S. Piña de Rubies and M. Amat Bagues. *Anales soc. esp. fis. quim.* 33, 765-6 (1935); cf. C. A. 26, 1049. —The presence of Ag, Mo and Be is shown in some medicinal waters. E. M. Symmes

The adsorption of phenol by activated charcoals. B. N. Rutovskii and N. I. Antropova. *J. Chem. Ind. (Moscow)* 12, 940-7 (1935).—A. Removal of 99.5% of PhOH from waste waters can be reached by passing the soln. over peat charcoal at 40° at a rate of 0.6 m. per hr. For recovery, the C_2H_5 from previous expts. is distd. directly onto the C in amts. equal to 30% of the amt. of H_2O used. The C is regenerated by passing steam over it at 170-80° for 1-1.5 hrs. H. M. Leicester

The nature and amount of the colloids present in sewage. VII. The effect of bubbles of gas and agitation on sewage liquors. E. Williams. *J. Soc. Chem. Ind.* 54, 355-61T (1935). cf. C. A. 29, 8192.—Samples of domestic sewage in 1-l. cylinders were treated with streams of (1) air, (2) O, (3) H and (4) N, which passed through glass wool, soda-lime and H_2SO_4 and entered the cylinders at the bottom through thin sintered glass filters; the rate of flow was maintained const. at 25 l. per hr. Exptl. results indicate that: (1) Coagulation of the dispersed matter in sewage can be produced by bubbling gas, all 4 gases producing the same amt. of coagulation at 25° over a 6-hr. period. (2) Over a period of 24 hrs. at 25°, O and air are superior to H_2 and N_2 , after 24 hrs. the org. C and total N values fall below those of the ultrafiltrate of the control sample. (3) Coagulation can be produced by mech. agitation out of contact with air. (4) The temp.

affects the amt. of coagulation produced, increased temp. increasing the coagulating effect. Complete exptl. data are included. G. H. Young

Treatment of effluents of paper manuf. (Brit. pat. 434,225) 23. Ca hypochlorite pellets for treating water (U. S. pat. 2,023,459) 18. App. for supplying chemicals to water mains (U. S. pat. 2,023,552) 1.

Apparatus (with a column and spiral passageway) for clarifying water by aeration and filtration. Kiyoji Tsuda (to G. K. Tsudashiki Pump Seisakusho). U. S. 2,022,329, Nov. 26. Various structural and operative details.

Apparatus for removing dissolved gases from water or other liquid by heating. Géza Székla. Austrian 143,057, Oct. 10, 1935 (Cl. 85c).

Sand filters. Norman G. Elhot. Fr. 786,601, Sept. 6, 1935. Means for removing and washing the top layer of sand.

Conduit and associated self cleaning screen suitable for water. Joseph E. Bower. U. S. 2,022,336, Nov. 26. Structural, mech. and operative details.

Water-softening apparatus. Dennis Thomas and Thomas & Clement Ltd. Brit. 433,543, Aug. 14, 1935. The app. comprises means interposed between a hopper, contg. water-softening agent, and a mixing tank, adapted to be moved to a charging position with respect to the hopper when the tank is filling and to be moved to a position to discharge its contents into the tank after the latter has been emptied and has begun to refill.

Apparatus for softening and filtering water. John A. Montgomery and Robert O. Friend. U. S. 2,021,919, Nov. 26. Various details are described of an app. comprising a tank contg. a graduated gravel bed on which other water-treating material such as a zeolite bed is placed and through which water may be passed upwardly.

Continuous apparatus for softening boiler feed water by addition of reagents. Chem. Fab. Budenheim A-G. Ger. 620,500, Oct. 22, 1935 (Cl. 85b, 2 01).

Apparatus for degassing feed water. Sergius v. Le Juge. U. S. 2,023,630, Dec. 10. Various details are described of an app. suitable for use on board ship.

Base-exchange substances. Wm. H. Sullivan, Horace Ingleson and Basil A. Adams. Brit. 434,663, Sept. 6, 1935. Base-exchange substances are obtained from clays by treating with concd. HCl or with H_2SO_4 of equiv. concn., removing adherent acid, if desired, drying and grading, heating in an oxidizing atm., e. g., to 550-600°, and treating the product with a Na silicate-Na aluminate soln. The last step may be carried out by boiling the mixt. and may be followed by treatment with a NaCl soln.

Treatment of sewage. Georg Herrmann. Ger. 620,320, Oct. 18, 1935 (Cl. 85c, 6 05). Means is described for directing a stream of fresh water or purified sewage through scum layers in sludge digestion tanks to facilitate the biol. degradation of the scum.

Apparatus for purifying sewage. Office français de travaux d'assainissement. Fr. 787,112, Sept. 17, 1935.

Sewage clarification and disposal. John Schaaf. U. S. 2,022,901, Dec. 3. A granulated filtering medium is continuously deposited upon the dry portion of a screen which is subjected to atm. pressure only and is partially submerged to intercept a sewage stream (various details of app. and operation being described).

Sewage-sludge digesting tank and associated apparatus. Henry L. Thackwell (to Dorr Co.). U. S. 2,023,295, Dec. 3. Structural, mech. and operative details.

15—SOILS, FERTILIZERS AND AGRICULTURAL POISONS

M. S. ANDERSON AND E. D. JACOB

A study of the uniformity of soil types. Franklin L. Davis. Ala. Agr. Expt. Sta., 45th Ann. Rept. 1934, 18-19.—Lab. and greenhouse studies with 22 soils of 6 different soil types showed greater differences within the type than between types in many cases. The phys. and

chem. properties of soils within a type were very variable. C. R. Fellers

The soils of Scotland. III. The central valley and southern uplands. W. G. Ogg. *Empire J. Exptl. Agr.* 3, 295-312 (1935); cf. C. A. 29, 6341¹.—Typical soil pro-

files are described and examples are given from a wide variety of parent material. Numerous data are given on pH values, loss on ignition, exchangeable Ca, Mg and H and compn. of the clay fractions. K. D. Jacob

Investigation on the soil formation near the apex of the alluvial fan of Azusa River in the central highland of Japan. Toyotaro Sakai. *J. Sci. Soil Manure* (Japan) 9, 211-51(1935), cf. C. A. 29, 1917.—The morphological feature of the profile and the chem. compn. indicate that the soil is of the weakly acid, sub-alluvial brown soil type according to S's designation Y. Kamoshita

The properties of the soil at different degrees of unsaturation in relation to the effects of calcium. L. P. Magaram. *Khimizatsiya Sotsialist. Zemledeliya* (Moscow) 1934, No. 12, 49-61.—A clay chernozem soil was treated with 0.06 N HCl until it became unsat. Portions were treated with $CaCO_3$, the quantities were varied to obtain degrees of unsat., and their moisture properties were examd. It was found that the soil fully satd. with Ca possesses the highest hygroscopicity. A slight shift toward alk. is conducive to mineralization of the humus. The various methods for detg. the exchange and hydrolytic acidity give a definite idea about the lime requirement. One and the same method is not applicable to all soils. J. S. Joffe

An attempt to intensify the cultivation of virgin loess-like podzol by means of chemization. V. F. Grogov. *Khimizatsiya Sotsialist. Zemledeliya* (Moscow) 1935, No. 1, 18-24.—Lupines are an important green manure crop for intensifying the cultivation of podzols. The podzol horizon is poor in nutrients and the incorporation of org. matter with the addn. of N, P and K fertilizers makes it possible to plow deeper and increase the feeding grounds of plants. J. S. Joffe

The theories of the soil absorbing complex from the agronomic viewpoint as a current problem in the chemization of socialist agriculture in the subtropics. V. G. Tarasovskaya. *Khimizatsiya Sotsialist. Zemledeliya* (Moscow) 1934, No. 12, 36-48.—A discussion of the properties and behavior of the soil absorbing complex in the subtropics, of methods of fertilization and of schemes, based on the laws of the colloidal behavior of soils, which are to be adopted for the most effective utilization of the soils in the subtropics. J. S. Joffe

Agrochemical study of the absorbing soil complex. F. N. Germanov. *Khimizatsiya Sotsialist. Zemledeliya* (Moscow) 1934, No. 12, 22-35.—Data of K. K. Gedroitz and his associates are presented on the importance of the exchange cations, the relation between the various cations within the complex and their effect on plants, soil microorganisms and concn. of ions in the soil soln. The disruption of the complex leads in certain soils to demobilization of P_2O_5 by chem. and microbial agencies, the activity of the latter being greatly influenced by the conditions of the weather. It is considered that a study of the relationships existing among the exchange cations, as demonstrated in the 17 tables of data, will result in a productivity classification of soils. J. S. Joffe

The peptization of soils and the separation of the organic fraction of the soil-absorbing complex. S. N. Alechin. *Khimizatsiya Sotsialist. Zemledeliya* (Moscow) 1934, No. 12, 65-9.—Mixts. of NaOH and oxalic acid in various concns. and dilns. were used in extg. the org. fraction of the soil complex. The more alk. the mixts. the more org. matter was extd. Dilns. were made on the swelling of the soil, depth of color of ext., surface tension of ext., and viscosity. The surface tension was affected but little and the viscosity changed slightly, indicating low hydrophilic properties. J. S. Joffe

The problem of studying the energy of cation adsorption. N. I. Gorkunov. *Khimizatsiya Sotsialist. Zemledeliya* (Moscow) 1934, No. 12, 61-4.—Expts. conducted on differential adsorption and retention energy of Ca, Mg and H by the soil-absorbing complex show that the energy of adsorption of Ca is higher than that of Mg which is contrary to the work of Wiegner. It is suggested that with the permutites used by Wiegner the formation of

Mg hydroxides took place, whereas, in soils it might not have formed the hydroxides. J. S. Joffe

The crystalline structure of soil colloids and new data on the exchange of cations and anions in soils. I. D. Sedletzki. *Khimizatsiya Sotsialist. Zemledeliya* (Moscow) 1934, No. 12, 69-77.—A crit. review of the subject and a discussion of the theories involved. J. S. Joffe

The influence of exchangeable sodium in soils on the growth of plants and the physical properties of the soil. I. I. Ratner. *Khimizatsiya Sotsialist. Zemledeliya* (Moscow) 1935, No. 3, 35-45.—A deep chernozem soil was treated with NaCl of different concns. making up soils with different percentage satns. of Na. It was found that even a 5% satn. with Na affects unfavorably the percolation rates of water, capillary rise of water and dispersion. Injury to plants does not become apparent until 50% satn. At 60-70% satn. the plants died. Soils high in org. matter exhibit the unfavorable properties in a higher degree than soils poor in org. matter. The injury of high-Na soil is partly due to the lack of Ca for plant nutrition. In carbonate rich soils the limit of Na injury is lower than in soils free from carbonates of Ca or Mg. J. S. Joffe

Annual report of the assistant director of agriculture, Bengal, in charge of the agricultural chemist's section, for the year ending 31st March, 1934. M. Carbery. *Ann. Rept. Dept. Agr. Bengal* 1933-34, II, 81-128.—Compn. of paddy plants. Data are given on the N, P, K, SiO_2 and SiO_2 -free ash contents of the leaves and stems and of the whole plants at different stages of growth and under different fertilizer treatments. There were extremely wide and inconsistent variations in the SiO_2 content of the plants and these variations showed no correlation with either the stage of growth or the fertilizer treatment. Soils. The N NaOH method of dispersing soils for mech. analysis was found to be inapplicable to the salt soils of Bengal which contain a considerable amt. of humified org. matter, and also to salt soils contg. but little org. matter. Chem. analyses of soils from Setabganj, Dinajpur, are given. K. D. Jacob

The nonprotein nature of a fraction of soil organic nitrogen. A. W. J. Dyck and R. R. McKibbin. *Can. J. Research* 13B, 261-8(1935).—Not all the N in org. soils is determinable by the Kjeldahl method. In every sample tested the Dumas method gave a considerably higher percentage of N. The differences in N content, as shown by the 2 methods, vary from 6.4 to 29.6%, hence it is believed that an appreciable fraction of the soil org. N may be of nonprotein nature. J. W. Shipley

Influence of light in the nitrogen cycle in the soil. N. R. Dhar. *Science & Culture* 1, 213-6(1935).—A review. E. H.

The decomposition of lime nitrogen and some derivatives of cyanamide in soils. Shutarō Teshima. *J. Sci. Soil Manure* (Japan) 9, 269-80(1935).—The formation of dicyanodiamide is retarded by the addn. of Japanese acid clay and by the volcanic Komaba soil, because the cyanamide is absorbed and hydrolyzed to urea by the soils. Dicyanodiamide formation in the soil from $CaCN_2$ is affected not only by the reaction of the soil but also by the nature of soil colloid, which causes the cyanamide to be hydrolyzed. The stabilities of dicyanodiamide and guanidine phosphate in soil depend upon the reaction of the soil; acid reaction is favorable to the latter but not to the former. In both paddy field and dry farm guanidine phosphate, guanidine nitrate and guanidine carbonate decomposed slowly at low temp. but rather rapidly at higher temp.; these salts were decomposed more easily than was dicyanodiamide. Y. Kamoshita

The chemical compositions of some algae and weeds developing in the paddy field and their decomposition in the soil. Matsunosiro Shioiri and Shingo Mitui. *J. Sci. Soil Manure* (Japan) 9, 201-8(1935).—In pot expts., slim-forming algae (*Euglena* sp. and *Pleurococcus* sp.) and *Lemna paucicostata* Hegelm., cultured in water-logged soil fertilized with $(NH_4)_2SO_4$, converted 6.09-15.28 mg. of total N of the pot into org. form. Analyses of algae and weeds (*Hydrodictyon* sp., *Spirogyra* sp.,

Iuglena sp., *Lemna paucicostata* Hegelm, *Hydrilla verticillata* Casp var. Rorburghii, *Najas graminea* Dehliile gave total N 2.20-6.62%, C:N ratio 20-14-6 and lignin 2.91-6.15%. Water-sol N increased with total N. In the paddy field algae and weeds of narrow C:N ratio accumulated NH₄ more vigorously than those of wide ratio in the earlier stage of decomposition, later no difference in NH₄ accumulation was observed between the two types. In dry farming the types of narrow C:N ratio formed more nitrate than did those of wide ratio through the whole period of decomposition. Y. Kamoshita

Reduction of nitrate to nitrite by the green plants. A. L. Sommer. Ala Agr. Expt. Sta. 45th Ann. Rept. 1934, 10-17, of C. A. 29, 5576⁹—Where precautions were taken to prevent the growth of microorganisms little or no reduction occurred in the expressed juices of the roots and tops of the tomato plant. Juices from buckwheat, cotton and wheat showed similar results. No evidence of reduction of nitrate to nitrite for soils with or without the presence of algae in the dark was obtained with the Allison app. On exposure to light the presence of nitrite was detected, the amt. increasing rapidly with the time of exposure. The presence of algae seemed to be favorable to nitrite formation. Where phosphate was not added to the soil and the light intensity was not sufficiently low, more nitrite was sometimes found in the filtered than in the unfiltered soils. The addition of phosphate to the soil greatly increased the rate of formation of the nitrite in the presence of the algae but produced no change when the algae were absent. C. R. Fellers

The lack of mineral salts, especially phosphoric acid, in our soils. Miquel C. Rubino. Rev. mensual asoc. rural Uruguay 1935, No. 6, 35-7—The widespread occurrence of osteomalacia in cattle in some parts of Uruguay is due to deficiency of phosphoric acid in the soil, the phosphoric acid content of which may be as low as 0.10 and 0.3 part per thousand. This condition is aggravated by the annual exportation of approx. 3000 toneladas of phosphoric acid in the bodies of cattle. Remedial measures are suggested. Colin W. Whittaker

The salt soluble phosphoric acid in volcanic ash soils. M. Miyoshi. J. Sci. Soil. Manure (Japan) 9, 232-60 (1935).—Normal soils of KNO₃, K₂SO₄, KOAc, K₂CO₃ and K nitrate were employed to ext. the P₂O₅ from volcanic ash soils. The amt. of P₂O₅ extd. varied with the pH, the kind of salt and the nature of soils. Y. K.

The fineness of grinding raw phosphates. N. D. Smirnov. Khimicheskaya Sotsialist. Zemledeliya (Moscow) 1935, No. 3, 45-52—Coarsely ground rock phosphate—from 80 to 60 and lower mesh—can be used on strongly acid soils, high in moisture. Where P₂O₅ has to be quickly mobilized, as for spring grains, when applied in the row, when small quantities are available, or on soils satd with bases, finely ground rock is to be preferred. There is no advantage in grinding the phosphate to colloidal size (0.001 mm.). J. S. Joffe

Drying superphosphate in relation to its physical and chemical properties. P. A. Baranov and P. A. Ruzanov. J. Chem. Ind. (Moscow) 12, 1054-7 (1935).—Superphosphate, dried at about 400° with good stirring for 3 min., has excellent properties. A satisfactory product is obtained even if the drying lasts only 0.5 min.

The influence of the composition of the absorbed cations on the development of barley and clover. O. K. Kedrov-Zikhman and O. E. Kedrova-Zikhman. Khimicheskaya Sotsialist. Zemledeliya (Moscow) 1934, No. 12, 9-21—A podzol soil was treated with the carbonates of Ca, Mg, K, Na and Mn in quantities to satisfy the hydrolytic acidity, as detd. by the Calky method. Some samples were prepd with a combination of the cations, and an excess of Ca was added to a no. of combinations. A complete fertilizer was added, the soils were placed in Mitterlich pots, and planted with barley and clover. The soils receiving lime up to 50% of the unsatn. gave a high yield of barley grain. An increase in lime beyond this point decreased the grain yield. Satisfying 80% of the unsatn. with Mg increased the yield of grain and straw

1 Above this point the increase in Mg rapidly decreased the yield. The addn. of mixts of Ca and Mg to satn. the soil from 50 to 100% had no injurious effects and the yields were just as good as those with Ca alone at 50% satn. Thus the injurious effects of Mg are diminished upon the addn. of Ca. Normal yields of barley were obtained with Ca and Mg sol. in a 5 to 1 water sol. ext. at ratios of 13.4 Ca to 1 Mg down to 1Ca:2.3Mg. With clover a 20% satn. of the hydrolytic acidity with Ca and 50% with Mg gave the highest yield in pot. expts. With mustard, winter wheat, buckwheat and beans the results were analogous. The tolerance to high concns. of Mg as compared with Ca varies somewhat with the individual crops. Addns. of Na₂CO₃ up to 30% and of K₂CO₃ up to 10% satn. showed favorable results. An increase of K markedly reduced the grain yield. MnCO₃ also gave increased yields, but the limits of favorable effects were a good deal lower—with respect to percentage satn.—than with the other cations. J. S. Joffe

The utilization of calc. tufa-travertine. O. K. Kedrov-Zikhman and V. I. Vinogradov. Khimicheskaya Sotsialist. Zemledeliya (Moscow) 1935, No. 1, 41-53—Travertine as a source of lime was compared with ground limestone and chemically pure CaCO₃ on podzol soils with clover, spring wheat, vetch and oats, and beans. This material compared favorably with other lime materials even without grinding. When ground, the travertine was superior to ground limestone. A no. of analysis of travertine and of the soils used is given. J. S. Joffe

Pasture studies. VII. The effect of fertilization on the nutritive value of pasture grass. E. W. Crampton and D. A. Finlayson. Empire J. Exptl. Agr. 3, 331-45 (1935), of C. A. 29, 1143¹.—The nutritive value of immature timothy for rabbits was greater than that of immature reed canary-grass. This superiority could not be explained on the basis of quant. differences in crude protein, Ca, P or total nutrients, for in these respects the grasses were very similar, and were equally palatable to the animals. There were strong indications of a marked difference in the nutritive value of herbage from pastures treated with mineral fertilizers (potash 100 and 16% superphosphate 500 lb./acre) as compared with herbage from similar unfertilized pastures, the chem. analyses showed no significant differences. The nutritive value of the herbage in either series was not significantly increased by the addn. of cystine. However, the difference in the nutritive values of the diets contg. fertilized and unfertilized herbage disappeared when a mixt. of cystine and casein was added to the diet of rabbits receiving the unfertilized grass. It is believed that the effect of fertilizers in increasing the nutritive value of mixed pasture grasses is due to their effect in altering the nature of the protein-complex in particular species as well as to their effect in changing the botanical compn. K. D. J.

The significance of sodium in fertilizers for increased yields of sugar beets on a number of soils. D. V. Druzhinin. Khimicheskaya Sotsialist. Zemledeliya (Moscow) 1935, No. 1, 53-62—Sylvinit is superior to the concd. K salts as a source of K₂O. Its superiority decreases whenever NaNO₃ is substituted for NH₄ sulfate which indicates the effect of the Na of the sylvinit. The NaNO₃ is especially efficient for beets on degraded and deep chernozem, being superior to (NH₄)₂SO₄ and Ca(NO₃)₂. On gray forest loams the nitrate and sulfate are almost alike, sulfate being a little better. This is ascribed to the differential content of Na in the various soils. Similar favorable results with Na-contg. fertilizers are noted on table beets. It is pointed out that in connection with nitrogenous fertilizers contg. no Na the addn. of NaCl is feasible. J. S. Joffe

Chlorine as a factor of crop yields. V. V. Butkevich. Khimicheskaya Sotsialist. Zemledeliya (Moscow) 1935, No. 2, 14 27—Exptl. evidence is presented showing that Cl is energetically absorbed by plants even though they need only small quantities of it. This fact is ascribed to the mobility and diffusion capacity of the Cl which was detd. by membrane and plant expts. It is pointed out that in view of the soly. of its compds. the Cl ion mobilizes

cations. The nitrate ion is still more efficient for it is utilized by the plant and is therefore conducive to a high cation absorption. The more efficient utilization of *Ammophos* upon the addn. of NaCl is explained by the mobility of the Cl ion which stimulates NH_4 absorption. An excess of the chlorides of Na or K decreases the Mg content of the plant and reduces the chlorophyll content. J. S. J.

The causes of the injurious effects of overliming N. V. Katalumov *Khimizatsiya Sotsialist. Zemledeliya* (Moscow) 1935, No. 2, 42-8.—Adjusting the Ca Mg ratio on 3 types of soils to which lime was added did not correct the injurious effects of overliming on flax. Addns of mixts of Mn, B, Cu, Zn, I and F, of Mn and B, Mn and Balone to the overlimed soils to which a base fertilizer of N, P and K was added brought out the following results: with the mixt of microelements, B + Mn, and B alone the flax grew normally notwithstanding the overliming. The same results were obtained with mustard. J. S. Joffe

The alleged fixation of nitrogen by germinating peas Elizabeth M. Smyth and P. W. Wilson *J. Biol.* 30, 330 (1935)—Vita (cf. C. A. 28, 5831) has maintained that legumes may fix N nonsymbiotically. This may be due to inaccuracies in the Kjeldahl method. The problem should be studied by using gasometric methods of N detn. John T. Myers

Farm manure (sources, use, composition and preservation). José Manáns *Rev. mensual asoc. rural Uruguay* 1935, No. 3, 21-8. Colin W. Whittaker

Coloring material fertilizers P. A. Baranov *Khimizatsiya Sotsialist. Zemledeliya* (Moscow) 1935, No. 1, 77-84.—I or NH_4NO_3 metanil yellow or anil yellow could be used to color it for identification purposes. For $(\text{NH}_4)_2\text{SO}_4$, Congo red or anil blue, for ferrous sulfate rose color, for NH_4Cl orange B, for a mixt. of NH_4NO_3 and *Ammophos* methyl violet, malachite green or orange, depending on whether the mixt. is 1:1, 2:1 or 1:2. J. S. J.

The preparation of concentrated fertilizers by treating phosphorite with nitric acid III. A laboratory study of the treatment of Izyum phosphorite with nitric acid and ammonia or ammonium carbonate G. I. Gorskhtin and T. I. Khakharina *J. Chem. Ind. (Moscow)* 12, 1057-61 (1935), cf. C. A. 28, 3167.—When the phosphorite is extd. with the theoretical amt. of 25% HNO_3 , 98% of the P_2O_5 is removed. When $(\text{NH}_4)_2\text{SO}_4$ is added to the HNO_3 , removal drops to 95%. If 5% less than the theoretical amt. of NH_3 is added to the soln. obtained by the action of HNO_3 , the product of evapn. of the filtrate is very hygroscopic. It is better to add $(\text{NH}_4)_2\text{CO}_3$ and filter the CaCO_3 off at 45-50°. There is then almost no $\text{Ca}(\text{NO}_3)_2$ in the evapn. residue, and it is not hygroscopic. Filtration of the solid in the original extn. goes faster if the phosphorite has first been heated to 700° for 0.5 hr., but the P_2O_5 removal is only 90-95%. Filtration should go at a higher temp. and the layer on the filter should be thin. The presence of NH_4NO_3 in the soln. slows filtration. H. M. Leicester

Plant analyses as a method of determining the fertilizer requirements on a production basis A. Yu. Levitzkii and A. A. Lesyukova *Khimizatsiya Sotsialist. Zemledeliya* (Moscow) 1935, No. 2, 48-58.—From analyses made at the various stages of growth of oats and wheat, certain ratios of N to P and K₂O to N were established for the best growth at these stages, and by detg. these ratios from production field units at the first stage of growth it is possible to add the proper fertilizer. These analyses may even afford an opportunity to remedy the conditions on the field examd. by supplementing with a top dressing. A crit. analysis of the various availability methods, as well as of the field method, is given. J. S. Joffe

Determining the placement of fertilizers with the aid of *Aspergillus niger* and *oryzae*. E. V. Bobko, O. G. Nadina and N. V. Yashnova. *Khimizatsiya Sotsialist. Zemledeliya* (Moscow) 1935, No. 2, 35-41.—Expts. are presented showing that *A. niger* and *oryzae* cultures could be used as detectors of fertilizer localizations and thereby utilize them to det. the proper placement of fertilizers. J. S. Joffe

Study of some methods for the determination of phos-

phoric acid by precipitation as ammonium phosphomolybdate. Application to the analysis of fertilizers. H. Terlet and A. Brian. *Ann. fals.* 28, 546-55 (1935); cf. C. A. 29, 2284.—Scheffer's method, which is based on that of von Lorenz, consists in pptg. P_2O_5 as NH_4 phosphomolybdate by addn. to the hot soln. of a large excess of NH_4 molybdate soln. all at one time, washing the ppt. with Na_2SO_4 soln., dissolving the ppt. in excess of 0.5 N NaOH in presence of CH_3O and titrating the excess of alkali with phenolphthalein as indicator. T. and B. confirmed that, in order to obtain complete pptn. in presence of citric acid, a large excess of precipitant is required, but if it is added all at once there is danger of entraining molybdic acid, thereby giving high results by either gravimetric or volumetric detn. of the ppt. According to Scheffer the ppt. has the following compn.: $\text{PO}(\text{MoO}_4)_2(\text{ONH}_4)_2 \cdot 2\text{H}_2\text{O}$, and soln. takes place according to $4\text{PO}(\text{MoO}_4)_2(\text{OH})_2 + 2\text{HNO}_3 + 112\text{NaOH} + 18\text{CH}_3\text{O} = 4\text{Na}_2\text{MoO}_4 + 8\text{NaNO}_3 + 4\text{Na}_2\text{HPO}_4 + 3(\text{CH}_3)_3\text{N} + 82\text{H}_2\text{O}$, so that $1\text{P}_2\text{O}_5 = 56\text{NaOH}$. This latter ratio was confirmed, and the end point in presence of CH_3O is quite sharp, but no nitric N could be detected in the ppt., which is taken as an indication of entrainment of molybdic acid by the ppt. This entrainment can be prevented by adding the precipitant, drop by drop, and using only a slight excess when no citric acid is present.

When the phosphomolybdate ppt. is washed with a neutral KNO_3 soln., as suggested by Blair (*Analysis of Iron and Steel*), a variable amt. of the NH_4 (up to 50%) is displaced by K, the same thing occurs, but to less extent and much more slowly, when the ppt. is washed with Na_2SO_4 , as recommended by Scheffer, this reaction does not affect the results of titration in absence of CH_3O , but gives low results in its presence and gives high results if the phosphomolybdate ppt. is detd. gravimetrically. Accurate results can be obtained in both cases by washing first with NH_4NO_3 in HNO_3 and then with H_2O . Detailed directions are given for attacking natural Ca phosphates, fertilizers contg. org. matter (bone phosphates, guanos, etc.), superphosphates, activated phosphates and mixed fertilizers, basic slags, and alkali phosphates, and for pptg. P_2O_5 in the soln. of the fertilizer both in the absence and in presence of citrate. A. Papineau-Couture

Spray program for fruit insect control in 1935. C. O. Liddy *Trans. Kentucky State Hort. Soc.* 1934, 134-40.—A mixt. of Bordeaux mixt. (1:5:1:5:100) and soap (1:100) was a satisfactory emulsifying agent for mineral oils, coal-tar oils and pine-tar oil. A satisfactory miscible dormant oil spray for scale insects was composed of (I) KOH (92% flakes) 2.5, oleic acid 8.5, H₂O 1.5, Cellosolve 1.5 and phenol (85%) 1.0, and (II) dormant oil 82 and iso-amyl alc. 3 parts. I and II are mixed separately, in the order given, and II is then added to I until the mixt. becomes clear. The adverse effects of hard waters on Bordeaux mixt.-mineral oil emulsions were overcome by emulsifying the oil in 2:5:7 Bordeaux mixt. and then adding water and the remaining CuSO_4 and lime to bring the mixt. up to the standard 0:6:100 ratio. The colloidal structure of Bordeaux mixt. was preserved by the addn. of 2:5:5:0 or sugar per 100 gal. of 0:6:100 mixt. The period of effectiveness of Bordeaux mixt. in controlling leaf curl of peaches was increased by the addn. of sugar. The H₂O-sol. As in Pb arsenate sprays was not increased by the addn. of 0.33-0.50 lb. of specially prep'd tar soap per 100 gal., larger quantities increased the H₂O-sol. As. The smallest amts. of H₂O-sol. As were obtained with neutral or slightly acid soaps. The pine-tar oils in insecticidal soaps absorbed small amts. of sol. As and served as a buffer for arsenical injury. The surface tension of Pb arsenate sprays was reduced from 72 to 47-29 dynes per cm. by the addn. of 0.5-3.0 lb. soap per 100 gal. of spray; larger addns. caused no further decrease. The effect of soap in decreasing the surface tension of Pb arsenate sprays was reduced by the addn. of Bordeaux mixt. K. D. J.

Control of citrus insects with oil emulsions L. L. English Ala Agr. Expt. Sta., 45th Ann. Rept. 1934, 26; cf. C. A. 29, 5533.—Oil emulsions showed marked residual effect in controlling the red spider on Satsuma oranges.

When applied in July and Sept. winter infestation was largely prevented. The tank mix oil spray was more effective than several proprietary emulsions against purple scale and white fly. Five polyhydric alcs when applied as sprays were ineffective against white fly larvae.

C. R. Fellers
Physiology of insects with reference to their control H. S. Swingle Ala Agr. Expt. Sta., 45th Ann. Rept. 1933-34, 26-7.—The speed of decomposition of the As insecticides depends on both the H-ion concn of the soil and upon the anions present. Phosphates are present in the digestive juices of leaf-feeding insects, being especially abundant in those having an alk reaction. At pH 2-5 the phosphate ion has little effect on As residue decomposition, but at pH 6-10 this ion increases both the speed and extent of decomposition.

C. R. Fellers
Northern fowl mite and its control W. A. Maw, W. E. Whitehead and L. H. Bemont. Sci. Agr. Expt. Sta., Bull. 430, 23-31 (1935).—The northern fowl mite, *Liponyssus sylvarum* C. & F., which causes severe economic losses on mature fowls and other birds is satisfactorily controlled by painting roosts and the vent area of the fowls with an ointment consisting of 2 parts of petrolatum jelly and 1 part of naphthalene powder. *p*-Dichlorobenzene is preferred in cold weather because of its greater volatility as a substitute for naphthalene. S dust gave fair control of the mite.

C. R. Fellers
Methods of controlling potato scab A. R. Albert, J. G. Milward and J. C. Walker. Wis. Agr. Expt. Sta., Bull. 430, 23-31 (1935).—Care must be taken not to lime soil reserved for potatoes as scab, *Actinomyces scabies*, seriously affects the value of the crop at soil reactions near pH 7.0. The use of such acid forming fertilizers as $(\text{NH}_4)_2\text{SO}_4$ and crop rotations are also useful in controlling this disease.

C. R. Fellers
The control of the root knot nematode, *Heterodera marioni* (Cornu) (Anguillulidae), on tuberoses by hot water and vapor heat Grace W. Sherman Proc. Helminthological Soc. Washington 2, 111 (1935).—The nematode was completely controlled by soaking the tubers in water at 116°F. for 1 hr., or at 118° or above for 0.5 hr. Exposure of the tubers to vapor heat at 124°F. for 0.5 hr. also gave complete control. None of the treatments was injurious to the plants.

K. D. Jacob
Wild-onion control with creosote kerosene spray. E. V. Smith Ala Agr. Expt. Sta., 45th Ann. Rept. 1933-34, 24-5.—Spraying badly infested plots of wild onions with a 10.90 mixt. of creosote and kerosene at the rate of 218-652 gal per acre in Dec and Jan when the fewest bulbs were dormant markedly reduced the no. of onions the following year.

C. R. Fellers
Report of the mycological section for the year 1933-34 M. J. Narasimhan Mysore Dept. Agr., Ann. Administration Rept. 1933-34, 19-22.—*Alternaria* on potatoes was effectively controlled by spraying the plants with 1 lb. Ca arsenate in 50 gal. water plus Ca caseinate as a spreader. Eradication of "Seegade Saitte" in paddy fields.—The weed, which forms a thick mat in paddy fields, was killed by application of CuSO_4 at the rate of 1 lb./3000-6000 gal. water standing in the field. Paddy was not injured by contact with the CuSO_4 soln. for 16-24 hrs. The weed roots put out new sprouts after about 2 weeks.

K. D. Jacob
Report of work done in the entomological section for the year 1933-34 T. V. Subramaniam Mysore Dept. Agr., Ann. Administration Rept. 1933-34, 23-7, cf. C. A. 29, 535.—Promising control of the larvae of the tobacco stem borer (*Phthorimaea helioptera*) was obtained by spraying the tobacco seed beds twice weekly with honey oil-resin soap mixt. (1 lb./10 gal. water). The spray was also a very good contact insecticide against the green scale of coffee (*Coccus viridis*). Fish poisons as insecticides.—A 10% aq. ext. of the roots of *Randia demetiorum* sprayed against the green scale of coffee gave an 80% mortality of the insects in 4 days. The ext. did not appear to have much toxic action either as a stomach or contact poison against surface grasshoppers. Crude-oil emulsion, applied in irrigation water, gave partial control of earthworms in betel-rine gardens.

K. D. Jacob

Derris as an insecticide. David Hooper. *Chemist and Druggist* 123, 149-51 (1935).—The history, botanical and chem. characters and insecticidal properties of derris and its preps are discussed. S Waldbott

Report of work done in the chemical section during 1933-34 B. Narasimha Iyengar, Mysore Dept. Agr., Ann. Administration Rept. 1933-34, 9-13.—Indigenous plant substances as insecticides.— CCl_4 , CHCl_3 , etc. and aq. exts. of *Mundulia suberosa* root bark and *Randia demetiorum* (outer soft portion of semiprune fruit and root bark powder, resp.) gradually deteriorated in activity when they were kept in contact with the solvent. The activity was best preserved by pptg. the ext. by pouring it along with solvent into a large quantity of water, filtering the solid and drying and redissolving it in the desired solvent just before use. The aq. ext. of the root bark of *R. demetiorum* possesses strong insecticidal properties. K. D. Jacob

The fungicidal action of sulfur. Frank Wilcoxon and S. E. A. McCallan. *J. Biol. Chem.* 109, 441-2 (1935).—S seems to owe its fungicidal power to the formation of H_2S rather than to traces of pentathionic acid in the S. J. T. M.

Household sprays R. R. Le G. Worsley. *East African Agr. J.* 1, 61-2 (1935).—Complete kills of cockroaches were obtained in 24, 48 and 72 hrs. by dusting with powd. *Derris elliptica*, *Tephrosia vogelii* (seeds of leaves) and pyrethrum, resp. Similar results were obtained with sprays prepd by extg. 0.5 lb. of the resp. powders with 1 gal. kerosene. K. D. Jacob

Physiological problems connected with the use of sodium chlorate in weed control A. S. Crafts. *Plant Physiol.* 10, 699-711 (1935); cf. Aslander, C. A. 21, 792.—A crit. review and discussion of the physiol. responses of plants to chlorates from the standpoint of the practice of weed control. There can be no universally successful method for using chlorates owing to the extreme variations in susceptibility of species and the no. of factors (climatic, etc.) affecting toxicity and absorption. Practical suggestions are given for the successful use of chlorates in (a) humid and (b) arid regions. Twenty-nine references. Walter Thomas

Sheep dips Harold Silman. *Soap* (Sanitary Products Sect.) 11, No. 11, 93-5, 117 (1935).—The specifications, preps., advantages and disadvantages of arsenical, phenolic, sulfur and nicotine dips are reviewed.

Henry H. Richardson

Research and the rubber industry [soil problems] (Eaton) 30 Colorimetric detn. of phosphoric acid in grass (Greenhill, Pollard) 7 Colorimetric method for detg. nitrate N in grass (Ashton) 7 Free flowing powd. S (U. S. pat. 2,022,796) 18

Automatic soil irrigation. Lorenzo A. Richards. U. S. 2,023,490, Dec. 10. App. is described by which water is fed to the soil from a source of supply maintained under slightly less than atm. pressure to provide a slight pressure differential.

Soil disinfectants I. G. Farberindustrie A-G. Brit. 433,944, Aug. 21, 1935. An agent for application to the soil, intended to prevent the attack of plants by rust, consists of a mixt. of an aromatic compd. that contains 1 or more halogen atoms and also 1 or more NO_2 groups in the nucleus with a fertilizer, other than NH_4NO_3 , or an agent that improves the soil. In an example, 5 parts of 1,2,4-trichloro-3,5-dinitrobenzene is mixed with 95 of NaNO_3 .

Fertilizer. Walter H. Kinsner and Charles K. Lawrence (to Atmospheric Nitrogen Corp.) U. S. 2,022,672, Dec. 3. A fertilizer is prepd by treating an acidic fertilizer material such as superphosphate material with a soln. of NH_4NO_3 and urea in an ammoniacal liquid contg. a substantial proportion of NH_3 and in which at least one of the constituents NH_4NO_3 and urea is dissolved in excess of the quantity necessary for satn. of the ammoniacal liquid in the absence of the other of said materials. U. S. 2,022,673 relates to a liquid fertilizer comprising urea, a fertilizer salt of a strong inorg. acid such as K_2SO_4 or KCl and a substantial proportion of NH_3 , at least one of

Transformation of nitrogenous matter during fermentation C Mestre Artigas and A Mestre Jané *Bol. Inst. Investigaciones Agronomicas* 1, No. 2 (July, 1935); *Ann. fals.* 28, 563—A study of the harmful influence of ale on the properties of wines obtained by fermentation of musts to which ale has been added. Conclusion: The cause of the troubles lies in the different manners in which nitrogenous compds are transformed by yeast when the latter commence their vegetative life in presence of ale.

A Papineau-Couture
The influence of frost on the structure of barley and its behavior in the steep K G Schulz *Wochschr. Brau* 52, 118-19 (1935)—Barley samples of various protein content (10.09-14.67%) were tested for mellowness by cutting the kernels both lengthwise and crosswise. The results obtained on the crosscut did not correspond with the length cut. The mellowness obtained on the length cut was higher and gives a more precise idea of the structure. There is no correlation between protein content and mellowness. Samples of very glassy barleys showed distinct improvements after being exposed to a temp. below freezing. The water was taken up somewhat faster in the steep by barley which was exposed to frost. S. J.

Influence of moisture and temperature upon the change of substances during kiln drying (of malt) P. Kolbach and E. Schud. *Wochschr. Brau* 52, 129-34, 137-41, 147-50 (1935)—The kiln drying process is divided into 3 phases: (1) while the green malt is still growing, (2) when growth ceases and enzymic reactions discontinue, (3) when no more enzymic reactions are taking place and merely chem and physicochem changes take place. While a degradation takes place in the kernel (endosperm) during the first phase, a synthesis is taking place in the acrospire. The correct moisture content required for growth is not ascertained precisely and various figures are given for the crit temp at which growth ceases. The second phase is overlapped by the first and no distinct line can be drawn between the second and third phase. The changes can be divided into 3 groups, i. e., (1) of enzymic nature during growth, (2) those of growth ceases and (3) changes which take place without the action of enzymes. Various changes required for certain "type" malts (pale, Munich, Vienna) are discussed. The technic of the expts is described. The degradation of starch is first studied on green malt of an original moisture content of 43.6% for 8 hrs at 30°, 40°, 50° and 60°, resp. Fermentable carbohydrates and attenuation of aq ext are tabulated. The same expt was repeated with 34.6 and 24.9% moisture. In another expt. one sample contg 41.9% moisture was dried at 20°, 30°, 40° and 50°, a second with 33.5% moisture dried at 30°, 40°, 50° and 60°, a third with 23.2% moisture at 40°, 50°, 60° and 70° and a fourth sample with 15% moisture was dried at 50°, 60°, 70° and 80°. A finished malt with 5.2% moisture and the same sample exposed to air until 11.5% moisture was attained were dried for 8 hrs at 60°, 70°, 80° and 90°. All results are tabulated and discussed. The same scope of expts was carried out to det the degradation of proteins. Sol N, permanently sol N, coagulable N and formol N were detd in each expt and their increase is graphically represented. Under identical conditions as described above the changes in pH , titratable acidity and titratable alkali are detd and discussed. S. Józsa

History of hot couch malting H Fink *Wochschr. Brau* 52, 97-100 (1935) S. Józsa

The interpretation of malt analyses H Lloyd Hind and E N Hammett *J. Inst. Brewing* 41, 429-38 (1935), cf. C. A. 28, 2119—By modifying Bishop's equation ($C A 28, 2118$) to $EI = E + 10.6 N - 0.22 G$, where E is the ext. of malt per quarter, an "Extract Index" is obtained, which, compared with the varietal factor A , gives information valuable in interpretation. Index of modification (I. M.) usually is taken as permanently sol N expressed as percentage of total N, it should be designated as such, other I. M. values, as ext I. M., pentosan I. M., etc., should be distinguished. Detn of each adds to the value of the analysis for interpretation. For typical 2-row and 6 row well-modified malts the

permanently sol N. I. M. values are about 36 and 30, the C. I.'s 108 and 103, resp. High cold-water ext cannot always be taken to indicate forcing, since synthetic reactions may compensate for enzymic hydrolysis. Thus total N and permanently sol N should be detd in addn to the standard analyses, these last being inadequate to assess the brewing value of the malt. Quick Landis

Deterioration of hops during storage observations and preliminary experiments A. H. Burgess *J. Inst. Brewing* 41, 467-81 (1935)— N_2 and CO_2 do not retard the deterioration of hops, O_2 accelerates it and cold storage retards it to a moderate degree only. Heating to 100° before kilning to destroy enzymes is not effective. Inoculation and sterilization expts show microorganisms to be the cause. *Mucor spinescens*, *Penicillium*, *Aspergillus niger* Van Tieghem rapidly reduce the amt of α -acid. Q. L.

The estimation of extract H Lüers and P. V. Miller *Wochschr. Brau* 52, 153-4 (1935)—Bacterial enzyme (Superclastase) is used to liquefy the starch, which is subsequently saccharified by diastase. Results on 36 samples are compared with those obtained by the methods of Graf and Rothenbach-Schultze (*C A 29, 6693*). S. J.

Difficult (wine) clarifications I. Camplonch Romeu *Bol. Inst. Investigaciones Agronomicas* 1, No. 2 (July, 1935), *Ann. fals.* 28, 563—There exist turbid wines of abnormal compn which are very difficult to clarify by the usual methods. R. studied more particularly wines obtained from incompletely matured grapes, the juice of which was prepd by a continuous pressing process and which was concd slightly to 11°. Such wines contain large amts of malic acid, pectic and albuminoid matter, and even cellulosic compds, which are refractory to filtration or clarification. From a large no. of expts R. concludes that, in order to obtain perfectly clear wines, the pH must be raised to about 4 by decacidifying with $CaCO_3$, and using large amts of gelatin for clarification. Contrary to usual procedure, the gelatin should be added before the tannin. A Papineau-Couture

Defecation with lime and determination of the volatile acidity of wines P. Jaumes *Ann. fals.* 28, 540-5 (1935), cf. C. A. 29, 2294—Defecation with CaO prior to distn in the Fr. official method for the detn of volatile acidity is shown to give high results owing to partial decompn of the sugars with formation of HCO_2H and $AcOH$ (in proportions of approx. 80 and 20%, resp.). This decompn can be avoided by carrying out the CaO treatment in the cold, but under these conditions practically no defecation occurs. A Papineau-Couture

Identification of sorbitol in sweet wines C. von der Heide and W. Zeisset *Z. Untersuch. Lebensm.* 70, 393-8 (1935)—It is possible to ppt the sugar in sweet wines as Ca saccharate and then identify the sorbitol in the filtrate. There is no notable loss of sorbitol when this method is followed. A new formation of sorbitol in the course of the sepn is not to be feared. F. L. Dunlap

Cherry brandy III The bouquet substances of cherry brandy H. Mohler and W. Hammett *Z. Untersuch. Lebensm.* 70, 329-44 (1935), cf. C. A. 29, 1934—Both the phys and chem methods employed in these expts are detailed. Biacetyl and benzyl alc have been identified. F. L. Dunlap

Report on beer samples analyzed during the months of January and February, 1935 F. Ancker *Wochschr. Brau* 52, 119-20 (1935)—Summary of 83 bottom-fermenting and 6 top fermenting beers. S. Józsa

Cold turbidity of beer K. Kretschmer and E. Emslander *Wochschr. Brau* 52, 113-17 (1935)—The presence of air during racking is injurious for protein stability and taste. Color of glass bottles did not affect turbidity. The same conclusions are drawn for natural and synthetic pitches. Metals, however, show a deleterious effect. Filtration in case of suitable filter material improves the chill-proof qualities but affects the taste adversely. The quality of beer is greatly improved when the husks are not boiled with the mash. However, the chill-proof qualities are adversely affected by this procedure. Resistance toward low temps is decreased by substances

which cause turbidity, are sol. in alc. and have a similar mental effect on the delicate hop flavor. S. Józsa

Vitamin content of beer. A. Scheunert and M. Schieblich. *Z. Vitaminforsch.* 4, 294-9(1935).—Beer manuf. in the usual way contains only vitamins of the B group, and these in small amt; 100 cc. of a dark beer with a high ext. content contained 3 international units of B₁ and approx. 7.1 biol. units of B₂. During manuf. the yeast removes the vitamins, especially B₁ from the beer and stores them. If vitamins B₁ and B₂ are added to the final product prior to its storage, they remain unaltered.

Joseph S. Hefburn

Identification of saccharin and dulcin in beer. Olli Ant-Wuorinen. *Z. Untersuchs. Lebensm.* 70, 389-91 (1935).—A simple and workable method is given for sepg these sweetening substances from drinks having a high ext. content, especially beer. The method is based on the adsorption capacity of bone charcoal. The best results are obtained by extg. the adsorbed substances with 94 wt. % alc. The methods are described in full. In case the beer contains benzoic acid, it should be removed by extn. with a solvent. Five mg. of saccharin and 10 mg. of dulcin can be identified in 1 l. of beer. Smaller amts. of these sweetening substances have no practical significance. A special advantage of this method is that the possible presence of salicylic and benzoic acids, the most common of beer preservatives, can be detected at the same time.

F. L. Dunlap

The resistance of beer toward *Saccharobacillus pastorianus* J. L. Shumwell. *J. Inst. Brewing* 41, 245-58 (1935).—*S. pastorianus* produces most of the examples of souring or "turning" of beer by further attenuation of the residual sugars in equal with the yeast. A lag phase exists, the value of which depends only on the concn. of the inhibitors, H⁺ ion, hop antiseptic and alc., after which acid formation accompanied by sudden increase in turbidity proceeds substantially independently of the inhibitors, and dependent only on the equal residual sugar level.

Quick Landis

Annual report of the fiber expert to the government of Bengal for the year 1933-34. Nirmal Chandra Basu. *Ann. Rept. Dept. Agr. Bengal* 1933-34, II, 51-6.—A new strain of yeast was isolated and found to be quite suitable for the fermentation of waste juice of sugarcane where other kinds of yeast failed. Production of alc. amounting to 2.5% by vol was obtained.

K. D. Jacob

Yeast gum. F. Stockhausen and K. Silberstein. *Wochschr. Brau.* 52, 145-7(1935).—Methods of various investigators are discussed and directions are given for a quant. method with a formula for calcg. the glycogen content.

Removing beer scale (Ger. pat. 617,555) 12. Citrates [from fermentation mash] (Ger. pat. 620,152) 10. App. for cleaning beer pipes (U. S. pat. 2,022,882) 1

Alcohol. Festi Patendi Aktiaseis. Ger. 617,868, Aug. 27, 1935 (Cl. 68, 29). Alc. is denatured by adding a small amt. of the C₁₂H₁₁ obtained by the fractional distn. of bituminous shale, with or without addn. of other denaturing agents.

Butyl alcohol by fermentation. Winfred N. McCutchan and Cornelius F. Arzberger (to Commercial Solvents Corp.). U. S. 2,023,087, Dec. 3. Filtered distn. slop from a previous fermentation is incorporated in a carbohydrate mash used for the production of BuOH by bacterial fermentation.

Butyl alcohol production by fermentation. David A. Legg (to Commercial Solvents Corp.). U. S. 2,023,368,

Dec. 3. A distn. slop derived from a previous similar fermentation is incorporated with a fermentable carbohydrate mash to be fermented by butyl alc.-producing bacteria, and serves to reduce foaming and facilitate use of a mash of high concn.

Butyl-acetic fermentation process. Hugh R. Stiles (to Commercial Solvents Corp.). U. S. 2,023,374, Dec. 3. A starch carbohydrate mash such as one prepd. from corn meal and contg. 20-40% of hydrol. is fermented by organisms of the type of *Clostridium acetobutylicum* (Weizmann) at a temp. of about 35-37° and with addn. to the mash 0.01-0.1% of an alk. compd. of an alkali metal such as Na₂CO₃, capable of forming fermentable salts of acetic and butyric acids, which serve to facilitate the process.

Denaturing hydrocarbons, alcohols and white-spirits. Bozel-Maleta (Soc. industrielle de produits chimiques). Fr. 786,510, Sept. 5, 1935. These are rendered unsuitable as fuels by adding about 3-5% of perchloroethylene.

Bacterial preparations. Hauser & Sobotka A.-G. Austrian 143,291, Oct. 23, 1935 (Cl. 2c). A culture of acid-producing bacteria is treated with, or treated so as to produce therein, a nonhygroscopic, hydrated, sparingly sol. salt of the acid produced by the bacteria. Thus, a culture of lactic acid bacteria may be treated with CaCO₃ to form Ca lactate. The mixt. is then concd. *in vacuo* to such a degree that a solid compn. is obtained on cooling. Stable compns. which neither dry up nor absorb water are obtained.

Apparatus for vinegar manufacture. Hubert L. K. Meynen (to Standard Brands Inc.). U. S. 2,022,970, Dec. 3. A vinegar generator arranged for continuous circulation of vinegar mix through it and for introducing air into the generator during normal operation is constructed so as to exclude air and prevent discharge of the mix on failure of the circulation. Various structural and operative details are described.

Fermentations. Karoline von Gebetattel (nee von Falkenhay). Fr. 786,504, Sept. 5, 1935. Fermentation is favored by adding to the wort ground soybeans from which only the bitter constituents have been removed.

"Breather" or liquid seal for fermentation kegs, vats, etc. Emidio Stella (one-half to Marino De Lorenzo). U. S. 2,023,153, Dec. 3. Various structural details.

Malt. Robert Hoffmann. Ger. 617,602, Aug. 22, 1935 (Cl. 6b 1.01). Malt is pre-treated by wholly or partly removing the husks and subjecting it to a steeping process; it is then added to mash.

Straining apparatus for separating hop residues from beer wort. Gottfried Jakob. Ger. 620,356, Oct. 21, 1935 (Cl. 6b 14).

Brewing kettle for beer, etc. Hans Zirngibl. Ger. 617,781, Aug. 26, 1935 (Cl. 6b 12).

Yeast. Aktiebolaget Båsta. Ger. 617,780, Aug. 26, 1935 (Cl. 6b 1.02). Sulfite waste lye for use as the nutrient in yeast manuf. is pre-treated by neutralizing it with one or more basic substances. The liquid is made sufficiently alk. to neutralize the acid loosely bound to the lignin. In the example, the lye is first treated with finely ground limestone and then with alkali carbonate till an alkalinity of 0.2-0.5 or more is reached. The liquid is then aerated, sepd. from solid matter, and allowed to stand for 6-24 hrs. before use as the culture medium for yeast. Cf. C. A. 29, 5985¹.

Yeast. Nikolaus Balla. Fr. 786,658, Sept. 7, 1935. Animal proteins are decomposed by hydrolysis in acid medium and the decompn. products obtained are used as nutritive substances for yeast. The animal proteins, may be replaced by keratin, gluten, chondrin, collagen or ossein.

New procedures in the chemistry of perfumes. A. Lewinson. *Rieschstoff-Ind.* 10, 201-5(1935); cf. C. A. 29, 7579¹.—A review dealing with ketones. H. M. B.

A colloidal form of quinine ("quinasol"). S. M. Gollandskij. *J. Physiol. (U. S. S. R.)* 19, 563-70(1935).—One vol. of a boiling satd. soln. of quinine sulfate in alc. is added to 1/2 vol. of a 0.25% boiling aq. soln. of a protective colloid, e. g., egg white or a vegetable protein. The mixt. is boiled for 5 min. to remove the alc. Another 1/2 vol. of H₂O, cooled to 10°, is gradually added to the mixt., which is then set aside to cool. After filtration through a Schleicher and Schüll No. 597 filter, the hydrosol is ready for use. The max. concn. of quinasol is 0.5% of pure quinine in the dispersed phase. The hydrosol is stable for 5-7 days. The therapeutic value of the prepn is being investigated. H. Cohen.

Injections of barbitals. J. J. L. Zwicker. *Pharm. Weekblad* 72, 1273-4(1935).—A non-alk. soln. suitable for injection consists of 20 g. phenobarbital (or other barbitals), 38 g. EtMe₂COH, 35 g. H₂NCO₂Et and 7 g. H₂O. A. W. Dox.

Estimation of tragacanth. Hans Will. *Apoth. Ztg.* 50, 1620(1935), cf. H. Schrader. (C. A. 29, 6360¹). It is shown that viscosity of properly treated and stored tragacanth powder decreases very little over a yr. period, and heating at 110° does not effect sterilization but on the contrary damages the product appreciably. The viscosity and η_{sp} values of good tragacanth gums are not impaired over a 2 month period. W. O. E.

Investigations on drugs, nostrums and cosmetics. C. Griebel. *Apoth. Ztg.* 50, 1649-52(1935); cf. C. A. 29, 6359¹. W. O. E.

Horse-radish. A. Kuhn and G. Schäfer. *Pharm. Zentralhalle* 76, 629-30(1935), cf. Noetzel. (C. A. 29, 4518¹). W. O. E.

Hypericum perforatum. Ernst Drafehn. *Pharm. Zentralhalle* 76, 701-4(1935).—An illustrated article descriptive of the histology and use of drugs. Twelve references. W. O. E.

Occurrence of caffeine in Brazilian drug plants. Friedr. W. Freyse. *Pharm. Zentralhalle* 76, 704-6(1935).—Of the numerous genera and species of caffeine-bearing plants cited, by far the greatest no. belong to *Sterculia* (9 genera and 23 species). The caffeine contents of some 16 different plants are reported. W. O. E.

Relationship of pharmacy to medicine. F. W. Crossley-Holland. *Quart. J. Pharm. Pharmacol.* 8, 321-30(1935).—See C. A. 29, 7018¹. W. O. E.

Thyroid standardization and dosage. R. F. Corran, J. Pritchard and F. E. Rymill. *Quart. J. Pharm. Pharmacol.* 8, 331-6(1935).—The variation in the total I and thyroxine I contents of fresh and dried defatted glands is so great that there can be no satisfactory correlation between thyroid Brit. Pharm. 1932 and prepns expressed in terms of fresh gland or unstandardized dried defatted gland. The relative activities of thyroid U. S. Pharm. X and thyroid Brit. Pharm. 1932 are approx. 74 = 12-100. The direct detn. of I on the acid insol. ppt. contg. thyroxine yields uniform results giving a useful check on the Brit. Pharm. method. W. O. E.

Determination of the mercury content of mercuriochrome. R. F. Corran and F. E. Rymill. *Quart. J. Pharm. Pharmacol.* 8, 340-3(1935).—By the Brit. Pharm. Codex method of assay no. manuf.'s sample examd.

1 conformed to the required standard. Furthermore, the results obtained by the Codex procedure show an appreciable variation. Assay by alk. KMnO₄ oxidation for Hg appears to yield more reliable and consistent values than the Codex method. W. O. E.

Determination of ferrous iron in presence of organic matter by Heisig's method. G. J. W. Ferrey. *Quart. J. Pharm. Pharmacol.* 8, 344-50(1935).—Attention is directed to the suitability of the iodate method for the assay of the saccharated Fe compds. of the Brit. Pharm. and the Brit. Pharm. Codex, and of ferrous lactate. Ferrous Fe can be titrated with accuracy by iodate in the presence of liquid glucose, acacia, tragacanth, sucrose, invert sugar in small amts., levulose, dextrose, lactose, glycerol, lactic and citric acids. Invert sugar in great excess produces a small error. The method is unsatisfactory in the presence of liquorice, marshmallow, gumme, and aq. cochineal ext. W. O. E.

Preparation and properties of iodoform and thymol iodide. Norman Glass. *Quart. J. Pharm. Pharmacol.* 8, 351-60(1935).—Comments are made on the various requirements of the Pharmacopoeia. The prepn of CHI₃ from Me₂CO, KI and NaClO₂ is considered in some detail. Micrographs of CHI₃ from various solvents are shown. Two methods of prepn. thymol iodide were studied. The substance resulting from direct iodination differs from that produced when NaClO₂ is the intermediary, since by this procedure a certain amt. of chlorination is effected. W. O. E.

Assay of glyceryl trinitrate tablets. Wilfred Smith. *Quart. J. Pharm. Pharmacol.* 8, 370-4(1935).—Previously published methods are reviewed in connection with a procedure depending on distn., hydrolysis, reduction with reduced Fe, and colorimetric detn. of the NH₄, whereby only 5 tablets are required for analysis. W. O. E.

Assay of glyceryl trinitrate tablets. H. O. Meek. *Quart. J. Pharm. Pharmacol.* 8, 375-7(1935).—The conclusions formed from a study of colorimetric methods for detg. small quantities of glyceryl trinitrate in tablets are briefly presented, in connection with a procedure depending on the colorimetric detn. of nitrate by means of phenol-disulfonic acid, which has proved reliable and not difficult of control. W. O. E.

Percolation of cinchona and belladonna root—rate of alkaloid extraction and effect of degree of comminution. A. W. Bull. *Quart. J. Pharm. Pharmacol.* 8, 378-85(1935).—Percolation of moderately fine powd. cinchona (44/85) gave better extn. of both alkaloids and total solids, when compared with percolation of either a fine powder (85) or a moderately coarse powder (22/60), thus indicating that an optimum degree of comminution exists for percolation of this drug. The relative percentages of alkaloids to other solids increase in successive fractions of percolate. When the powders were graded and packed in the percolators in progressive sizes, it developed that the most satisfactory extn. occurs when that portion of drug most difficult of extn. (i. e., the finest powder) is packed on top and thus comes into contact with fresh menstruum. With belladonna root similar results were obtained with respect to an optimum degree of comminution. When the ratio of alkaloids is considered it is seen that the relative alkaloidal contents of successive fractions diminish, showing that the alkaloids of this root are more easily extd. than the other extractable material. W. O. E.

Isopropyl nitrite. C. L. M. Brown. *Quart. J. Pharm. Pharmacol.* 8, 380-9(1935).—Isopropyl nitrite can be conveniently prepd. in a state of purity at normal room temp. without serious loss. The yield appears to vary with the area of exposure, hence the best yield is obtained by using a narrow-mouth container. If excess of alc. is used a dild. product results containing approx. 38% by vol. of alc. and having a boiling-range of 42-42.5° and d. 0.8445. These figures agree with those of Kissel (43-44°), and of Silva (45°, d. 0.856 at 0° and 0.844 at 25°). The purified product obtained by B. b. 39.5-40° and had d₄ 0.8634. These values agree closely with those

of Sidgwick, b. 39°; and Bewad, b. 39-39.5°. A soln. of isopropyl nitrite in iso-PrOH is more stable than sweet spirits of niter. W O E

Melting point of chloral formamide. C. T. Bennett and N. R. Campbell. *Quart. J. Pharm. Pharmacol.* 8, 395-400 (1935).—In view of results obtained on some 20 com. samples and others specially prepd. in the lab., it appears that the m. p. of chloral formamide, as given in the Brit. Pharm. Codex 1934, is not in accord with expt. and that it would be more correctly recorded as 124-6°, with pharmaceutical limits between 122° and 126°. W O E

Alcohol content and specific gravities of the tinctures of the British Pharmaceutical Codex, 1934. C. T. Bennett and F. C. L. Bateman. *Quart. J. Pharm. Pharmacol.* 8, 406-8 (1935).—The const. and percentages of the tinctures in question (70 preps.) are presented in classified form for purposes of comparison. W O E

Use of rabbits in the assay of digitalis, strophanthus and squill. G. N. Rapson and S. W. F. Underhill. *Quart. J. Pharm. Pharmacol.* 8, 409-23 (1935).—The rabbit is less sensitive than the cat to ouabain, strophanthus or squill, but more sensitive than the dog or guinea pig to the 2 former. To digitalis it is the most resistant of these 4 species. The advantages in the use of rabbits lie in the short duration of each expt., and the ease with which a stock of animals can be obtained, the disadvantage is the fact that to attain the same degree of accuracy more animals must be used for each test. Where comparison has been made results obtained on rabbits agree with those obtained with the use of cats. W O E

Deterioration of atropine eye ointments on storage. Noel L. Alport. *Quart. J. Pharm. Pharmacol.* 8, 429-34 (1935).—All the atropine eye ointments examd. became weaker in atropine after storage. Ointments contg. atropine base, with or without HgO, deteriorated more rapidly when stored in glycerol-gelatin capsules, which, however, do not accelerate the deterioration of ointments made with atropine sulfate. Yellow eye ointment with atropine Bnt. Pharm. Codex, 1923 loses alkaloidal strength rapidly and is an unsatisfactory prepn. The alkaloidal content of eye ointment of atropine with HgO Bnt. Pharm., 1932 falls to about 1/2 of its original value in about a month and then remains nearly const. for a considerable time. The alkaloidal strength of CH₂I₂ and atropine eye ointment Bnt. Pharm. Codex, 1934 was well maintained during the period of the observations. W O E

Improved method for the estimation of the essential oil content of drugs. T. Tusting Cocking and G. Middleton. *Quart. J. Pharm. Pharmacol.* 8, 435-42 (1935), cf. C. A. 29, 7014.—The app. previously described (C. A. 27, 564) for the direct detn. of essential oils in drugs and spices has been simplified (illustrated). The effect of powdering on the yields of oil obtained is shown. Details of the conditions of distn. are given for a no. of drugs and spices. Results of the examn. of a no. of samples of drugs and spices are also recorded. W O E

Relative merits of maceration and percolation for the preparation of tincture of digitalis. H. Berry and H. Davis. *Quart. J. Pharm. Pharmacol.* 8, 443-6 (1935).—The processes of percolation and maceration have been compared on a sample of standardized digitalis leaf. The total solids extd. and the potency of the tincture have been detd. for a variety of conditions. Maceration for 2 days, with occasional shaking, exts. the active principle as effectively as percolation, and should give more uniform results. W O E

Spectrographic absorption of ergometrine in relation to the British Pharmacopoeia color test. Noel L. Alport and Sydney K. Crews. *Quart. J. Pharm. Pharmacol.* 8, 447-52 (1935).—Samples of ergometrine have been examd. by the *p*-dimethylaminobenzaldehyde color test and the results compared with the coeffs. of extinction at 316 mμ. The purest specimen of ergometrine obtained, exhibiting an E value of 155 and m. 164°, gave a color by the chem. test equiv. to that produced by 1.78 times its wt. of ergotamine base. Ergometrine in aq. tartaric acid

soln. shows an absorption band in the ultraviolet region with a max. at 316 mμ. The same band is exhibited by solns. of ergotamine. The color produced when ergometrine is submitted to the *p*-dimethylaminobenzaldehyde test is spectroscopically identical with that produced by the ergotamine under like conditions. W O E

Determination of lead in its official compounds and preparations. S. Wetherell. *Quart. J. Pharm. Pharmacol.* 8, 453-63 (1935).—The Brit. Pharm. 1932 methods for the assay of Pb preps. have been studied and found to be inaccurate. Alternate methods of assay, which combine sufficient accuracy with easy and rapid manipulation, are suggested as substitutes for the present official methods. Assay procedures for the suppository and plaster are considered and methods of estn. proposed. W O E

Stability of aqueous solutions of ouabain and *k*-strophanthin. H. Berry. *Quart. J. Pharm. Pharmacol.* 8, 464-71 (1935).—Variation in pH affects the stability of aq. solns. of *k*-strophanthin and ouabain, but the latter is stable over a wider range of pH than the former. In order to insure perfect stability of *k*-strophanthin solns. under ordinary dispensing conditions they should be buffered at about pH 6.5. With ouabain this is unnecessary. *k*-Strophanthin solns. buffered at 6.5 can be sterilized by the official process of autoclaving (115° for 1 1/2 hr.) without loss of activity and should be very stable during storage. Unbuffered ouabain solns. can be similarly sterilized, and should be very stable during storage. Glass containers for *k*-strophanthin solns. should comply with the tests for limit of alkali. W O E

Analysis of some complex ointments of the Brit. Pharm. Codex. D. C. Garratt. *Quart. J. Pharm. Pharmacol.* 8, 472-8 (1935).—Methods are given for the complete analysis of compound benzoic acid, Me salicylate, and simple and compound resorcinol ointments. W O E

Examination of the extractives of capsicum. H. Berry. *Quart. J. Pharm. Pharmacol.* 8, 479-83 (1935).—The so-called oleoresins of capsicum vary in appearance, solv. and degree of pungency according to the solvent used for extn. Oleoresins of capsicum extd. with Et₂O or Me₂CO are sol. in Et₂O, Me₂CO, fixed oils and turpentine, but insol. in alc., while those extd. with alc. (90%) are insol. in Et₂O, Me₂CO, fixed oils and turpentine, but sol. in alc. (90%). When extd. with 60% alc. the oleoresin is insol. in 90% alc. and any of the above solvents. Both Et₂O and alc. ext. much nonpungent matter from capsicum. Oleoresin of capsicum Bnt. Pharm. Codex 1934 is prepd. by extg. an Et₂O oleoresin with 90% alc. and is sol. in Et₂O, 90% alc., Me₂CO, C₆H₆, CHCl₃, petr. spirit, fixed oils and turpentine. It has a greater pungency value than any of the other oleoresins of capsicum, the pungency being about 3 or 4 times that of the Codex of 1923, which was extd. with 60% alc. W O E

The microscopy of powdered desiccated endocrine glands. Heber W. Youngken. *Am. J. Pharm.* 107, 463-71 (1935).—The more important results of studies made by Y. upon the microscopy of powd. desiccated endocrine glands obtained from cattle and hogs and, in the case of thyroid and pituitary from sheep also, are presented with a view toward providing microscopical standards for these prod. products which are becoming more and more extensively employed in modern organo-therapy. Descriptive microscopical standards are presented for powd. desiccated thyroid, suprarenal, whole pituitary, anterior pituitary, posterior pituitary, ovary, ovarian residue and corpus luteum. W. G. Gaessler

The manufacture of bath crystals and bath cubes. M. Lovat Hewitt. *Perfumery Essenc. Oil Recd.* 26, 400-12 (1935). E. H.

Vanishing cream. A. G. Arend. *Perfumery Essenc. Oil Recd.* 26, 423-5 (1935). E. H.

The usefulness of anesthetic agents. L. S. Lundy. *Can. Med. Assoc. J.* 33, 490-4 (1935).—A review. G. H. W. Lucas

The stabilization of plants in relation to phytochemical study and its application in galenic pharmacy. Em. Perrot and A. Cornu. *Bull. sci. pharm.* 42, 513-19

(1935)—The fresh plants are heated in an autoclave in vapors of 95% EtOH to 0.5 kg pressure. This destroys enzymes which cause chemical changes during the usual drying process. Exts and alc tinctures prepd. from stabilized drugs are more uniform than such as prepd. from dry material. The active constituents are preserved as present in the fresh plant. A. E. Meyer

International congress of medicinal and aromatic plants. Propositions of modifications to No. 1 of C. Lagneau. Analysis of essential oils and unification of its methods. R. Delaby. *Bull sci pharmacol* 42, 520-3 (1935), cf C A 30, 567⁴. A. E. Meyer

Sulfur ointments and their assay. Charles E. Brady and Henry M. Burlage. *J. Am Pharm Assoc* 24, 945-8 (1935).—Schulek's method (C. A. 28, 853⁴) and his iodometric titration of the KCNS (C. A. 17, 3465) is applicable to the assay of the official S ointments and was applied with promising results to samples of the 3 official ointments carefully prepd. in the lab and to 2 com. samples of which one was stated to be twice the official strength. A. Papineau-Couture

Note on the assay of mass of ferrous carbonate. John C. Krantz, Jr., and C. J. Jeff Carr. *J. Am Pharm Assoc* 24, 958-9 (1935).—The U. S. P. XI prescribes titration of mass of FeCO_3 with 0.1 N $\text{K}_2\text{Cr}_2\text{O}_7$, with diphenylamine as inside indicator. Titration with ceric sulfate, instead of $\text{K}_2\text{Cr}_2\text{O}_7$, gives results that are closer to the theoretical, and the end point is much sharper. When pure FeSO_4 is titrated in the absence of honey and sugar the results with the 2 reagents are identical. A. Papineau-Couture

Studies on cudbear. E. H. Wirth, L. E. Martin and P. G. Soderdahl. *J. Am Pharm Assoc* 24, 949-59 (1935).—Sixteen samples obtained from various sources representing in a fair degree the av. cudbear on the U. S. market were exam'd to ascertain its uniformity, quality and purity. While the com. samples exam'd. exhibited a surprising uniformity in tinctorial value, several of them had been intentionally dild., the most common diluent being potato starch. A colorimetric method for the detn. of quality and a color standard are advised. Solv. tests are of questionable value in estg. quality. The discussion of purity involves (1) studies on ash content which reveal that many of the com. samples run well under the N. F. max. requirements, (2) microscopic studies which indicate considerable adulteration, both intentional (addn. of potato starch as a diluent) and unintentional (presence of woody, bark and leaf tissues). The usual methods for the detection of dye woods do not give satisfactory results, the presence of dye woods as adulterants of cudbear is, however, probably exceedingly rare. The As content varied from 0.25 to 4325 p. p. m., those produced in 1933 and 1934 had smaller As contents, indicating that the presence of As is probably due to carelessness. An As limit of 10 p. p. m. is tentatively suggested. A. P. C.

Assay of liniment of camphor. D. A. Overbye and R. E. Schoetzel. *J. Am Pharm Assoc* 24, 961-3 (1935).—A lab.-prepd. sample of liniment of camphor contg. 20.00% camphor gave 20.01% when assayed polarimetrically (correction is made for the rotation of the oil), 19.89% when assayed by the U. S. P. XI method (heating 2 hrs. at 110° in a stream of CO_2 and applying a correction of -0.13% obtained by running a blank on the oil), and 19.92% by heating in air (applying a correction of +0.62% obtained by running a blank on the oil). In order to obtain accurate results a blank should be run on the particular oil used in any given liniment of camphor, especially when the assay is carried out by heating in air. A. Papineau-Couture

Tincture of opium. P. L. Burrin and F. E. Bibbins. *J. Am Pharm Assoc* 24, 964-6 (1935).—Tincture of opium prepd. according to the U. S. P. contains a very large amt. of light, muddy ppt. in a short time. It is suggested that the directions be modified so as to obtain a product which will remain clear for a considerable length of time, and the following method has been found satisfactory. Dissolve 100 g. granulated opium in about 200 cc. of hot water, let stand overnight, filter, wash to a total

vol. of about 250 cc., boil for 15 min., let stand overnight, add 50 g. of paraffin, heat to melting, beat thoroughly, let cool, puncture the paraffin pellicle and drain off the liquid, wash the paraffin with water to a total vol. of about 800 cc., filter and add 200 cc. alc. The amt. of ppt. in tincture prepd. in this way was materially reduced and at the end of 18 months had not shown any further sedimentation, an assay of the clear supernatant liquid showed no loss in potency during this period. Use of caramel as a coloring agent causes an addnl. ppt. which is undesirable. A. Papineau-Couture

Study of compound cresol solution. K. L. Kaufman and C. O. Lee. *J. Am Pharm Assoc* 24, 969-70 (1935).—The U. S. P. X formula for compd. cresol soln. is objectionable because the time required for prepn. is too long, 2 alkalies are used where 1 is sufficient, there is possible a loss of cresol and changes in the product due to continued heating. The following formula has been found free of these objections and is proposed. Place 80 g. KOH in 80 cc. H_2O , when soln. is about 75% complete add 10 cc. alc. and stir till soln. is complete, add to 300 g. of oil which has been previously warmed to about 60° and stir gently, when sapon is complete add 500 cc. of cresol in small portions with stirring, remove from the water bath, cool and adjust to 1000 cc. with distd. H_2O . The following oils were studied and were found to be equally suitable for making this prepn.: soybean, linseed, olive, peanut, corn, almond, sunflower and sesame. A special study of the suitability of soybean oil showed that the objections which have been raised to its use are unfounded, the problem of gelatinization, which has been reported by several workers, was encountered at times, but in every case the difficulty was traced to the use of inferior grades of cresol, U. S. P. grade cresol giving no trouble. Relative surface tension measurements, detd. by means of a Cenco-du Noüy precision tensiometer, of 2 different dilns. of 8 samples of cresol soln. are given. A. P. C.

A history of dentifrices. Martha E. Foull and Elizabeth Pickering. *J. Am Pharm Assoc* 24, 975-81 (1935).

Evaluation of the bactericidal power of essential oils by determination of their phenol coefficients. Y. R. Naves. *Parfums de France* 13, 273-84 (1935) (in French and English).—A description of the technic of the detn. of phenol coeff., more particularly by the Hygienic Lab. and by the U. S. Food & Drug Administration methods (the latter being considered the better of the two), with a discussion of its application to essential oils. A. Papineau-Couture

Essential oil from the rhizomes of *Cyperus rotundus*. Linn. B. Jagannath Hegde and B. Sanjiva Rao. *J. Soc. Chem. Ind. Ind.* 54, 387-8T (1935).—The low-boiling fraction was found to be mainly 1- α pinene with traces of cineole. The camphoraceous odor of the oil is due to these substances. In Indian tubers there is less than 0.5% The higher-boiling hydrocarbons are a mixt. of tri- and bicyclic sesquiterpenes, the latter predominating, and belong to the eudalene group. A good yield of eudalene is obtained from them on dehydrogenation. A mixt. of 2 secondary bicyclic alcs. forms about 10% of the oil and has a delicate rose odor. Most of the alcs. are tertiary and combine with H_2BO_3 . A new alc., called *isocyporel* ($\text{C}_{15}\text{H}_{24}\text{O}$), is bicyclic and belongs to the eudalene group. E. R. Rushton

Air conditioning in a pharmaceutical manufacturing plant. C. W. Swenson. *Heating and Ventilating* 32, 31-2 (1935).—Air in the tablet room has 92° dry bulb, 31% relative humidity. M. W. Schwarz

Pharmacy in the Ionian islands. I. M. F. Emmanuel. *Chemist and Druggist* 123, 158-9 (1935).—A historical review of pharmacy in the Ionian islands since the time of Venetian dominion. S. Waldbott

Cod-liver oil. John F. Ward and H. E. F. Nottton. *Chemist and Druggist* 123, 246-7 (1935).—The Brit. Pharm. should define the oil as being "obtained from various species of the *Gadus* family"; this would exclude admixts. with shark oil (high in unsapon. matter, often high in vitamin A; almost no vitamin D), herring oil and

seal oil (both devoid of unsaponifiable matter and vitamins A or D). Detn. of the vitamin value, notably that of D will disclose an inferior oil. Vitamin standardizing by color tests, the bioassays of A and D and the spectrometric detn. of A and D (cf. Morton, Heilbron, *et al.*, *C. A.* 21, 3037; 24, 8801; 25, 3380; 26, 5903, 29, 4791) are explained and discussed. S. Waldbott

Cologne and lavender waters, modern small scale manufacture. O. W. Jarvis. *Chemist and Druggist* 123, 373 (1935).—Formulas are suggested, based on the use of (British) denatured alc. S. Waldbott

Rapid identification of cinchona preparations by the erythroquinine and the thalloquinine reactions. R. Monnet. *J. pharm. chim.* 21, 450-6 (1935).—A list of quantities of alkaline cinchona preps. to be used in testing is given. Mix or dissolve each in 10 cc. H_2O , render alk. with 10 drops NH_4OH or 5 drops $NaOH$, add 5 cc. $CHCl_3$ and shake well, filter over anhyd. Na_2CO_3 through cotton and collect about 4 cc. $CHCl_3$ ext.; test 2 cc. for erythroquinine (A) (cf. *C. A.* 27, 5149, 5362) and 2 cc. for thalloquinine (B) (cf. Christensen, *C. A.* 11, 1253; French Codex, 1927, 566). A is preferred to B, for exts. and powders it may serve in an approx. detn. of alkaloids. S. Waldbott

Determination of silver in organic medicaments, application to pomade of colloidal silver. Georges Antoine. *J. pharm. chim.* 21, 457-63 (1935).—The Kahane method of destroying org. substances by the $HClO_4$ technique (cf. *C. A.* 28, 1954; 5283, 7420) permits rapid and accurate detn. of Ag in medicinal org. compds. By greasing the walls of the mortar with vasolanolin mixt., before prep. and incorporating the aq. colloidal soln. of Ag, a homogeneous pomade contg. 10.5% Ag (Codex) is obtained, otherwise, results may vary from 7.15 to 8.80%. Twenty-two references. S. Waldbott

The Yugoslavian pharmacopoeia, 1933. Ivan Kalituchanatz. *J. pharm. chim.* 21, 554-8 (1935).—Descriptive, with a few crit. notes. S. Waldbott

Hygroscopic properties of the dry extracts of the new (Swiss) pharmacopoeia. Ch. Régün. *Pharm. Acta Helv.* 10, 151-5 (1935).—On definite wts. of 7 typical dry exts. the percentage increase of wt. was detd. after 1, 3 and 10 min. and then upon longer exposure under different conditions of humidity in air. Increase during the 1st min. was strongest for digitalis and opium exts. (1.02 and 0.58%). Incorporation of other ingredients must be done rapidly to obtain homogeneous mixts., and the containers must be securely stoppered. S. Waldbott

Oil content (petroleum ether extract) of the cotyledons of *Laurus nobilis* L. L. Rosenthaler. *Pharm. Acta Helv.* 10, 135-7 (1935); cf. *C. A.* 17, 850.—The wt. of 100 cotyledons varied from 0.132 to 0.403 g.; av. 0.249 g., petr. ether ext. heated to const. wt. at 100°, 17.44%, 34.95%; av. 23.32%; the oil content of both cotyledons of the same seed is practically the same; differences hardly exceed 2%. S. Waldbott

Karkade, K. Leupin. *Pharm. Acta Helv.* 10, 138-42 (1935).—Karkade consisting of the dried, fleshy, red calyces of *Hibiscus saffordii* L., is recommended as a mild laxative in the form of an acidulous drink. The acid taste of the drug was found by fractional microsublimation to be owing to large quantities of oxalic, malic, citric and tartaric acids. A botanical description of the drug, and 16 references are given. S. Waldbott

An incompatible shaking mixture containing zinc oxide, bismuth nitrate and glycerol. P. Casparis, P. Kämpf and Helene Mitter. *Pharm. Acta Helv.* 10, 143-6 (1935).—The mixt. turns black in sunlight, more slowly in diffused light, also in that of the quartz lamp. The following hypothesis is completely verified by expt.: ZnO (but no other oxide) converts glycerol into its aldehyde when exposed to light and air; the aldehyde then reduces the Bi salt to Bi, again only when exposed to light. In the presence of H_2O , aldehyde and the Bi salt, blackening in the light did not at first take place, owing to HNO_3 being set free by hydrolysis of the Bi salt; but addn. of ZnO or other basic oxide caused the mixt. to become black. The black substance was identified as Bi after sepp. it in

aq. mixt. by centrifuging; finely divided Bi proved sol. in weak $AcOH$. Darkening on exposure to light also occurs when glycerol is replaced by glycol or mannitol. S. Waldbott

The British Pharmaceutical Codex. A systematic list of vegetable drugs. T. A. Sprague. *Pharm. J.* 135, 214, 232-3 (1935).—A botanical classification of all the vegetable drugs of the Codex is given, with frequent brief indications of their functions, e. g., whether an adulterant or admixt., a host plant of a fungus or insect, a substitute, a pathogenic microorganism. S. Waldbott

Strong anticonvulsant of mercuric nitrate. Brit. Pharm. 1932. I. H. Giltlett and J. C. Jameson. *Pharm. J.* 135, 230 (1935).—A pale-yellow ointment of the correct consistency is obtained by following the Brit. Pharm. directions in prep. the Hg soln. and adding it to the mixt. of lard and olive oil, except that this mixt. is heated to 95°, not 150° as directed. Heating with const. stirring was continued for 45 min. S. Waldbott

Nonstaining iodine ointments. C. L. M. Brown. *Pharm. J.* 135, 271-2 (1935). cf. Richardson, *C. A.* 29, 4000.—Terbene seems to be a suitable base for the prep. of a nonstaining I ointment, or for stabilizing the pre-v types made with fixed oils. Two types of ointment are possible, lemon-yellow or deep green, depending on the relative quantities of terbene and I used. When I and a fixed oil are heated together in a closed system (reflux), the constituents tend to set up an equal so that a small percentage of I is always present. A formula and method can be used in the prep. of a standard "iodized terbene", from this the ointment can be made by simple diln. An analogous method is suggested for manifold purposes. For dispensing purposes, a mixt. of 1 (22 grains), $CHCl_3$ and peanut oil (120, 180 minims) was heated on a boiling water bath for 30 min. (with a test-tube cooler suspended in the vapor); terbene (60 minims) and soft paraffin (to make 1 oz.) were added and the mixt. was heated again for 15 min. The product contained no free I; it was deep green and nonstaining to the skin. S. Waldbott

Acriflavine emulsions. I. A. Lum. *Pharm. J.* 135, 457 (1935).—The oil-in- H_2O type of this emulsion (cf. Woodard, *C. A.* 27, 4020) is clinically more efficient than the H_2O -in-oil type (cf. Brit. Pharm. Codex; or Clarke, *C. A.* 26, 1304). The use of solns. of acriflavine (I) in normal saline solns. instead of emulsions is urged, as the oil present seems to detract from its bactericidal efficiency. Alk. fluid, e. g., $Ca(OH)_2$ soln., increase the bactericidal action of I (J. W. Tomb, *The Prescriber*, June 1935, 207). Aromatic acriflavine emulsion. W. Trillwood. *Brit. J.* 457.—An antiseptic desiccant in wound dressings is prep. by adding 3 ml. of a mixt. of guaiacol 12.5 ml., eucalyptus oil 25.0 ml., thymol 6.25 g., Me. salicylate 25.0 ml., oil of lemon to make 100 ml., to 100 ml. of T's emulsion of I, prep. from 1 g. H_2O 100 ml., olive oil 100 ml., oleic acid a few drops, sufficient saccharated soln. of lime (Brit. Pharm. Codex) (about 10 ml.) and olive oil or liquid paraffin to make 1 l. S. Waldbott

Digitalis leaf. T. Dewar and T. E. Wallis. *Pharm. J.* 135, 565-6 (1935).—The macroscopical and microscopical characters, pharmacol. potencies and constituents of *Digitalis purpurea* L., *D. lanata* Ehrh., *D. lutea* L. and *D. thapsi* L. are tabulated and discussed. The botanical characters which differentiate the nonofficial from the official species are emphasized. For the chem. constituents, 15 references are given. S. Waldbott

Ferrous sulfate in mixtures. T. O. Martin. *Pharm. J.* 135, 571 (1935).—Neither sirup nor D -glucose seems to prevent oxidation of $FeSO_4$ in mixts. but addn. of dil. H_2SO_4 Brit. Pharm. (1 minum) to $FeSO_4$ (5 grains) in H_2O (2 fluid drachms) will prevent it. S. W.

Properties and uses of some homologs of α -arylcinnamaldehyde (in perfumery) (Forné) 10. Mineral or tar oil compounds, [for cosmetic or medicinal purposes] (Ger. pat. 620,760) 22. Alkylated phenols [as intermediates for prep. of drugs] (Ger. pat. 616,783) 10.

Medicinal preparations I G Farbenindustrie A-G, Brit 433,938, Aug 23, 1935 Polyglycols and their ethers are used as liquefying agents in the production of preps. of stable sterilizable substances such as are suitable for injection and comprise barbituric acid derivs., vitamins or hormones, trihalogenated Et alcs and their urethans, therapeutically active glucosides and alkaloid or synthetic alkaloid like substances. Glycol mono- and di hydroxy-, methoxy- and ethoxy-ethyl ethers are suitable.

Medicinal substances Oswald Silberrad Brit 433,062, Aug 8, 1935 Nonfreezing oily substances, suitable for the treatment of rheumatism by rubbing on the skin, are obtained by heating an anhyd salt of salicylic acid with esters of chloroacetic acid in which the ester group consists of 1 or more open chain alc. residues having not less than 3 or more than 8 C atoms, the products being salicylyl glycolic esters. Iso-Pr, Bu, Am, hexyl and octyl esters are thus obtainable. By mixing these compds with the known Me and Et esters, the tendency of the latter to crystallize is inhibited.

Pure lecithin I G Farbenindustrie A-G (Gustav Klein and Karl Taubock, inventors). Ger. 617,508, Aug 20, 1935 (Cl. 53: 110). Crude lecithin or materials containing lecithin are extd. with acetone or a similar solvent and the lecithin pptd. from the ext. by a sol. of an oxide of a trivalent metal or of Si. Thus, crude soybean lecithin or egg yolk is extd. with acetone or CCl₄ and the pure lecithin pptd. by Al₂O₃ or SiO₂ sol. Cf. C. A. 29, 70214.

Theretin from the kernels of "exile nuts" X. Kuai Chen and Amy Ling Chen (to Eli Lilly and Co.). U. S. 2,022,617, Nov 26, 1935 The kernels are defatted with ether, the residue is extd. with MeOH, the MeOH ext. is evapd. to dryness, the residue is dissolved in abs. EtOH, the soln. is allowed to stand until a sediment forms, the sediment is sep'd., and the supernatant liquid is subjected to fractional pptn. with ether to produce a ppt. of theretin.

Amino alcohols. Chemische Fabriken Joachim Wiernik & Co. A-G (Gustav Heilner, inventor). Ger. 615,412, July 3, 1935 (Cl. 12: 32.21). Addn. to 611,501 (C. A. 29, 60604). The alc. 1-phenyl-2-(diethylaminoethyl)-amino-1-propanol is prep'd. by treating 1-phenyl-2-amino-1-propanol with diethylaminoethyl halide or the corresponding sulfonic acid esters or their salts. The reaction takes place in the presence of an acid-binding agent. The alc. b. about 140° at 0.5 mm. and m. 182-183° with decomposition. It is used in therapy for bronchial ailments. Cf. C. A. 29, 58567.

Amines. Knoll A-G Chemische Fabriken (Wilfried Klavehn, inventor). Ger. 617,506, Aug 26, 1935 (Cl. 12: 19.03). Secondary and tertiary unsatd. amines are prep'd. by treating 6-amino-2-methyl-2-heptene or its secondary derivs. with an alkylating agent. The prep'n. of the above amine or its derivs. and the alkylation may take place in a single operation. In an example, 6-amino-2-methyl-2-heptene is treated with EtBr to give 6-ethylamino-2-methyl-2-heptene, b. 186-188°. Prep'n. is described of the following, in which the symbol [1] denotes 2-methyl-2-heptene, 6-methylamino-[1], b. 175-4°, 6-benzylamino-[1], b. 160-161° at 12 mm., 6-dimethylamino-[1], b. 183-5°, 6-methylbenzylamino-[1], b. 164° at 5 mm., and 6-methylethylamino-[1], b. 197-9°. The compds. are used in medicine.

Stable colloidal dispersion of iodine Wm. M. Malisoff (to Mackie-Henkels, Inc.). U. S. 2,022,729, Dec 3, 1935 A compn. suitable for use as a therapeutic and antiseptic is prep'd. by agitating free I with a dispersion of α-amylase and starch residues substantially free from β-amylase.

Acridinium compounds I G Farbenindustrie A-G Brit 434,497, Sept 3, 1935 See Ger. 605,123 (C. A. 29, 12124).

Guaiacol compounds Salo Rosenzweig U. S. 2,023,551, Dec 10, 1935 Therapeutic compds. are formed by reaction of a phosphoric acid partially esterified with guaiacol such as diguaiacolphosphoric acid with an org. basic compd. such as triethanolamine, quinine or ethylenediamine.

Alkyl chlorodihydroxybenzenes Wm. E. Austin U. S. 2,023,160, Dec. 3, 1935 Germicidal and antiseptic

compds. of the general formula C₆H₂Cl(OH)₂CR₁R₂R₃, where R₁, R₂, R₃ are alkyl groups, either straight-chained or branched, and the OH groups being either in ortho, meta, or in para position to each other, such as the tertiary butyl, the tertiary amyl the tertiary hexyl, the tertiary heptyl, the tertiary octyl and the tertiary nonyl derivs. of chloropropylcatechol, of chlororesorcinol and of chlorohydroquinone, may be prep'd. by introducing the Cl into the corresponding tertiary alkyl dihydroxybenzene, or by introducing the desired tertiary alkyl group into the chlorodihydroxybenzene derivative. *tert*-Butylchlororesorcinol, *tert*-amylchlororesorcinol, *tert*-amylchlorohydroquinone, mono-*tert*-octylchlororesorcinol, *tert*-amylchloropropylcatechol and mono-*tert*-octylchloropropylcatechol are all described, with details of their production.

Colloidal sulfur solutions The Drug Products Co., Inc. Brit. 433,833, Aug 21, 1935 An isotonic soln. for injection purposes is prep'd. by causing aq. solns. of a sulfide and SO₂ to react in the presence of a dispersing agent and in correct proportions to insure isotonicization.

Common salt composition Siegfried Michael Ger. 617,772, Aug 26, 1935 (Cl. 53k 1.01). A diet-therapeutic substance free from alkali and halogen for addn. to common salt consists of an aliphatic hydroxy acid, such as malic acid, neutralized with an aliphatic base containing one or two NH₂ groups and two or more OH groups in the mol., such as 1-amino-2,3-propanediol.

Sex hormones Schering-Kahlbaum A-G Brit. 434,380, Aug 30, 1935 Alcs. containing a tertiary OH, obtained from follicle hormones according to the process of specification No. 30297/8/34, in so far as they are of aromatic or unsatd. character, are hydrogenated to the satn. of the double bonds. In an example, 1.5 g. of the tertiary alc. of formula C₁₇H₂₅O₂ prep'd. by the action of CH₃MgI on cryst. follicle hormone is dissolved in 150 cc. glacial AcOH and 200 mg. Pt oxide added according to the method of Adams Schringer, the mixt. is shaken for 18 hrs. in a H atm. and the catalyst removed, a product being obtained of formula C₁₇H₂₅O₂.

Whooping-cough vaccines Schering-Kahlbaum A-G Brit. 433,910, Aug 22, 1935 Multivalent vaccines are prep'd. from whooping-cough bacilli by cultivating a no. of stocks of the bacillus Bordet-Gengou taken from different epidemics, selecting those stocks which after long continued cultivation upon artificial culture media show const. cultural properties and toxin formation, combining them and working them up together to form a vaccine. The bacteria may be disintegrated into an amorphous mass by repeated freezing and cooling, if desired while suspended in physiol. salt soln., and the product is then centrifuged to sep. the antigen-contg. liquid. By exposure to heat, e. g., at 100°, for 10 min., the poisonous antigens may be eliminated and a nonpoisonous vaccine produced. The culture media should contain a high proportion of blood.

Antigangrene serum Franz Schütz. Ger. 617,668, Aug. 23, 1935 (Cl. 304 6). A mixt. of toxic substances which produce skin gangrene are introduced into animals, blood serum is obtained from the animals and this is worked up in the usual way. The toxins for inoculation may be obtained from a gangrenous animal.

Maggot extract Stanton K. Livingston U. S. 2,022,890, Dec 3, 1935 A substantially physiol. salt soln. is used for extg. maggots to obtain an ext. which can be used for therapeutic purposes.

Antiseptic and therapeutic aryl mercuric heterocyclic carboxylates. Carl N. Andersen (to Lever Bros. Co.). U. S. 2,022,997, Dec 3, 1935 Compds. such as phenylmercuric furoate, m. 115°, phenylmercuric pyridine-2,3-dicarboxylate, m. 163-5°, phenylmercuric 2-phenylquinoline-4-carboxylate, m. 206-8°, phenylmercuric nicotinate, m. 193-5°, phenylmercuric 6-methyl-2-phenylquinoline-4-carboxylate, m. 162-3°, and phenylmercuric coumarin-carboxylate, m. 205-6°, are produced by the reaction together of the heterocyclic acid involved and a Hg compd. such as phenylmercuric hydride. Various examples with details of procedure are given.

Fungicides suitable for killing ring-worm organisms. Herman A. Bruson (to Resinous Products & Chemical Co.), U. S. 2,022,185, Nov. 26. Solns., ointments or dusting powders are used contg. active agents such as *p*-isopropylsahelylic acid, *p*-sec-butylsahelylic acid, *p*-tert-butylsahelylic acid or various other similar alkylated sahelylic acid derivs.

Isinglass plasters. Johnson & Johnson Brit. 433,460, Aug. 9, 1935. Dried fish sounds are immersed in H_2O , the mass is brought to the b. p. to render it sterile, an antiseptic, e. g., $PhOH$, cresol, hydroxyquinoline, $HgCl_2$, or mercuriochrome, is added and the mass is immediately spread on fabric or other backing to form the plaster which is then dried, cut to shape and rolled on storage reels. The soln. may be filtered and decolorized with animal charcoal before addn. of the anti-septic.

Cosmetics. I. G. Iarbusindustrie A. G. Brit. 431,142, Aug. 9, 1935. Insol. nonpoisonous metal salts of aliphatic acids contg. at least 7 C atoms and contg. an odd no. of C atoms are used as ingredients of cosmetics. Among examples, (1) a rice powder contains rice flour, Ti white, Zn or Mg undecylate and $MgCO_3$, and (2) a

face cream contains stearin saponid. in an aq. mixt. of borax, glycerol and K_2CO_3 , and then mixed with Zn or Mg undecylate.

Cosmetic pastes. J. G. Mouson & Co. Ger. 620,843, Oct. 28, 1935 (Cl. 30h, 13). Addn. to 601,475 (C. A. 28, 7434f). The mixt. of colloidal silicic acid and $Al(OH)_3$ according to Ger. 601,475 is replaced by other inorg. gels, e. g., hydrated MgO or TiO_2 . Sp. compns. are described.

Face cream. Barney J. Dryfuss and Eugene F. Aubry, Jr. U. S. 2,023,125, Dec. 3. A face cream is formed chiefly of condensed buttermilk having its protein content in substantially unhardened form and unctuous material such as lanolin and liquid petrolatum emulsified with the condensed buttermilk.

Face paints. Hélène Winterstein (nee Viethaler). Fr. 787,071, Sept. 10, 1935. See Austran 112,033 (C. A. 29, 6366f).

Rouge for lips. Sébastien Sabatay. Fr. 780,828, Sept. 10, 1935. In addn. to the ordinary constituents rouge contains fat acid salts of triethanolamine, e. g., the stearate, and glycerol or other liquid polyhydric alc.

18—ACIDS, ALKALIES, SALTS AND OTHER HEAVY CHEMICALS

R. M. SYMMES

The preparation of chemically pure hydrochloric acid. T. V. Polyanski. *J. Chem. Ind. (Moscow)* 12, 921-3 (1935).—Crude HCl gas is passed slowly through a HCl soln. and a column of cold, activated charcoal into a column of C heated to 200–300°. The gas leaving this column should not be below 250°. It then passes through a cond. HCl soln. contg. suspended C, and another column of cold C, and is absorbed in distd. H_2O . Conn. app. is described.

Intensity of acid formation in the interaction of sulfur dioxide and nitroso acid. I. N. Kuz'minikh and I. I. Surkov. *Khimstrol* 7, 473-9 (1935), cf. C. A. 29, 297f, Kuz'minikh and Yudin, C. A. 28, 7433f.—A discussion, with math. treatment, is based chiefly on the previous investigations.

Calculation of the oxidation of nitrous oxide in the sulfuric acid systems. A. M. Savinov. *Khimstrol* 7, 110-20 (1935).—Improvements of the Beskov nomograms (cf. C. A. 28, 4181f) are proposed.

A most rational method of feeding sulfuric acid towers with nitrogen oxides. A. Urinson. *Khimstrol* 7, 494-7 (1935).—A discussion, with math. treatment.

Washing the Gay Lussac tower of the tower sulfuric acid system. G. I. Iolova and I. A. Kuziak. *J. Chem. Ind. (Moscow)* 12, 921-3 (1935).—Details are given of washing such towers with H_2O and recovering the weak acid so formed.

New type of acid sprayer. M. A. Ilmich. *Khimstrol* 7, 431-5 (1935).—A device for acid spraying in the production of H_2SO_4 is illustrated and described in detail.

Handling and storing acids. T. J. Dixon and I. Roffey. *Oil Colour Trades J.* 88, 1633-42 (1935).—A consideration of the materials of construction resistant to corrosion and a description of certain items of equipment. The materials considered include: cast Fe, mild steel, alloy steels, Al, Pb, Ag, Cu, rubber, glass, stoneware, vitreous enamel, and synthetic resin compds. Also in *Chemistry & Industry* 1935, 1104-9.

Laboratory apparatus for ammonia synthesis. V. A. Postnikov. *Trans. Inst. Chem. Tech. Ivanovo (U. S. S. R.)* 1, 66-7 (1935).—Illustration, with construction details.

American potash mines prepared to produce over a million tons of crude salts annually. Howard I. Smith. *Am. Inst. Mining Met. Engrs., Contribution No.* 84, 11 pp (1935).—Recent developments in the domestic potash industry are discussed.

New method for barium chloride. Alden H. I. mery. Decomposition of barium sulfate by calcium chloride in aqueous solution. R. Norris Shreve and Wm. N. Pritchard, Jr. *Ind. Eng.*

Chem. 27, 1488-91 (1935). In cond. aq. solns., $CaCl_2$ decomposes $BaSO_4$, forming $BaCl_2$ and $CaSO_4$. Study of the reaction was possible only by the use of org. or non-ionizing solvents, e. g., ethylene glycol, or better a $MeOH$ -ethylene glycol mixt., which is less viscous at high $BaCl_2$ concns. Conversions up to 90%, even at 100° in 12 hrs., are obtained, and by fusion, up to 95%. The solvent may be recovered.

The quality of the lime used in producing chloride of lime. M. F. Pozin. *J. Chem. Ind. (Moscow)* 12, 926-32 (1935).—The fineness of particle size, rapidity of slaking and reactivity of lime toward Cl_2 are increased when it is prepd. from $CaCO_3$ by igniting at the lowest possible temp. In practice, this is 1000–1100°. No free CaO should be left in the $Ca(OH)_2$, since during chlorination this will be slaked, and will cause local overheating. A moisture content of 0–7% in the lime does not greatly affect chlorination, but the product keeps better if it is drier; hence the lime should contain about 0–0.5% H_2O before chlorination. The dispersity of the lime particles increases with standing, hence older lime chlorinates better.

Production of sodium ferrocyanide. T. I. Kunin. *Trans. Inst. Chem. Tech. Ivanovo (U. S. S. R.)* 1, 73-6 (1935).—In the production of $Na_2Fe(CN)_6$ from animal waste, a considerable part of Na_2CO_3 in the melt can be replaced by $NaCl$, without affecting the yield and crystn.

The production of sodium ferrocyanide from calcium cyanamide. V. F. Postnikov, T. I. Kunin and A. Kh. Iironnikov. *Trans. Inst. Chem. Tech. Ivanovo (U. S. S. R.)* 1, 77-86 (1935).—The effect of various factors in the production of $Na_2Fe(CN)_6$ from $CaCN_2$ by decomposing the charge in a gas-heated oven and converting the $NaCN$ into $Na_4Fe(CN)_6$ was investigated. The charge should be heated with a reducing flame and a gas with only a few tenths of 1% of O_2 , because of the adverse effect of O_2 on the yield of $NaCN$. In batches consisting of a mixt. of $CaCN_2$, Na_2CO_3 and C (coal) a large excess of Na_2CO_3 (about 100%) gave increased yields of $NaCN$. The best results, with 27.65% N utilization, were obtained by heating the charge at 800° for 10 min. A 100% substitution of $NaCl$ for Na_2CO_3 in the charge produced only 5.6% N utilization. By replacing 30–50% of Na_2CO_3 with $NaCl$, the yield of $NaCN$ was increased. The best results were obtained with a mixt. of 43.1% $CaCN_2$, 21.11% Na_2CO_3 , 21.11% $NaCl$ and 8.6% C by heating it at 950° for 10 min. By a sudden cooling of the melt (plunging the baker into cold water) the reverse reaction was stopped and the N utilization was increased from 32.2 to 39.1%. Addn.

of Fe or Fe_2O_3 to the mixt. gave neg. results. Freshly prep'd and unoxid. CaCN_2 gave better results. In the conversion of NaCN to $\text{NaFe}(\text{CN})_6$, an excess of 5% FeSO_4 improved the yields. After 1 recrystn., 98.5% $\text{NaFe}(\text{CN})_6$, free from Na_2CO_3 , NaCl and other impurities was obtained. Similar results were obtained with the use of recovered Na_2CO_3 and with com. Na_2CO_3 and NaCl .

Chas. Blanc

Trisodium phosphate and its commercial uses. Ernesto Turegano *Quim. e ind.* 12, 182-7 (1935); cf. *C. A.* 29, 7024^a.—Com. uses of Na_3PO_4 as a detergent are described.

L. E. Gilson

Interaction of sodium sulfate and pyrites. V. P. Postnikov, A. Kh. Bronnikov and I. P. Kamilov. *Trans. Inst. Chem. Tech. Izv.* (U. S. S. R.) 1, 68-72 (1935).—Neg. results were obtained in the decompn. of a mixt. of botation pyrites and dry Na_2SO_4 in a current of air at 1200°, 1300° and 1400° for the production of SO_2 and Na_2FeO_4 .

Chas. Blanc

Liquefaction of nitrogen dioxide under pressure. Direct production of concentrated nitric acid. P. I. Pronin. *Khimistrol* 7, 325-401 (1935).—For the direct production of 97-85% HNO_3 by autoclaving a mixt. of dil. HNO_3 and liquid N_2O_4 at 70°, the N_2O_4 was obtained from a mixt. of NO_2 and N_2O , prep'd. from NaNO_2 and H_2SO_4 , with different proportions of O at 6, 9 and 10 atm. pressure and at various temps. and gas velocities. The app. and procedure are illustrated and described in detail. The optimum temp. of liquefaction is between -10° and -15°. The practical liquefaction effect is somewhat higher than the theoretical, because the water vapor in the system forms with N oxides HNO_3 , which gives a mixt. with N_2O_4 with slightly lower vapor tension than that of pure N_2O_4 . The use of welded Al in the app. is practicable. CaCl_2 cooling brine causes destruction of Al parts.

Chas. Blanc

Adsorption of nitrous oxides by activated carbon. V. T. Ruff. *Khimistrol* 7, 408-72 (1935).—Comparative lab. expts. with the recovery of NO_2 from waste gases of the HNO_3 production from NH_3 showed that activated C is a better adsorbent than silica gel. The best results are obtained by cooling C with running water at 10-12°. The regeneration of the activated C is best effected at 150°. The C is unchanged after repeated operations of adsorption and desorption of NO_2 .

Chas. Blanc

The purification of gases from hydrogen sulfide by oxidation on activated charcoal. S. Kazanovskii and K. Pisarev. *J. Chem. Ind. (Moscow)* 12, 913-21 (1931).—Gas contg. 25% excess O over the amt. required to oxidize the H_2S to S is heated with 3% NH_3 to 70-85° and passed over C. The temp. of the reaction rises to 115-20°. If much H_2O is present, or is formed, higher temps. are required. The C is ext'd. for 1 hr. at room temp. with $(\text{NH}_4)_2\text{S}$ soln. The soly. of the S is roughly proportional to the concn. of the soln. The ext. is heated to 95° to recover the S.

H. M. Leicester

Investigations in the preparation of iodine from seaweeds. I. Dry distillation of seaweeds. Chieh Ma. *Pharm. Chem. Research Rep.* (China) 1, No. 1, 51-9 (1935).—Dry distn. of a typical Chinese seaweed gives C 35.8, mixed salts 11.7, black alk. distillate (d_4 1.021) 12.5, yellow alk. distillate (d_4 1.027) 7.1, tar 1.0 and gases (by difference) 31.9%.

C. I. Tseng

A new method for reworking of animal waste into cyanogen compounds. V. F. Postnikov and T. I. Kunin. *Trans. Inst. Chem. Tech. Izv.* (U. S. S. R.) 1, 87-9 (1935).—Destructive distn. of animal refuse (hooft and leather waste, contg. about 10% N) at 800° and conducting of the decompn. gases over C at 100° are described. By dilg. the decompn. gases with the waste gives a yield of 11-13.5% HCN and 50% NH_3 , or about 60% utilization of the available N, was obtained. The waste gases are used as a fuel. About 4% of an oil was obtained as a by-product.

Chas. Blanc

Peat blacks. A. V. Pankov. *Trans. Inst. Chem. Tech. Izv.* (U. S. S. R.) 1, 158-61 (1935).—Chem. and phys. properties of blacks obtained by carbonization of peat at 600-1000° are described.

Chas. Blanc

Removing SO_2 from flue gases (U. S. pat. 2,021,936) 21.

Nitric acid. Giacomo Fauser. Fr. 787,053, Sept. 16, 1935. Gases obtained by the combustion of NH_3 are cooled to a temp. at which a portion of the NO_2 seps, as liquid, and washed with dil. HNO_3 to absorb the remaining NO_2 . A part of this soln. is heated to give off NO , which is caused to react, along with the NO_2 from the other step, with O and a soln. of N_2O in dil. acid, under pressure. Conc'd HNO_3 is obtained.

Bubble tower for use in the production of nitric acid. E. I. du Pont de Nemours & Co. Brit. 433,272, Aug. 6, 1935. Divided on 432,898 (C. A. 30, 578^a). The tower comprises cooling coils and deflecting means supported on the trays and surrounding the bubbler caps, said deflecting means, e. g., of crushed quartz, ceramic rings, fins or metal grids, being limited in extent so that a considerable space exists between the upper surface of the material and the next higher tray.

Nitrogen oxides. Bama-Meguan A-G. Fr. 786,953, Sept. 14, 1935. Gases from the combustion of NH_3 are submitted to a very rapid cooling during which the water seps; they are then submitted to oxidation and washed with very conc'd. HNO_3 . Very conc'd. HNO_3 is obtained.

Absorbing nitrogen oxides. N. V. de Bataafsche Petroleum Maatschappij. Brit. 434,302, Aug. 29, 1935. See Fr. 777,042 (C. A. 29, 3791^a).

Sulfuric acid. Henry F. Merriam (to General Chemical Co.) U. S. 2,023,203, Dec. 3. A SO_2 -contg. gas heated to at least about 650° is passed into contact with catalytic material to form SO_3 , and during the conversion reaction heat is removed sufficient to permit formation of com. yields of SO_3 . The catalytic reaction is carried out in a plurality of stages, vaporization of a heat-transfer liquid serving to cool the first stage and resulting vapor being used to cool catalytic material in a second stage. App. is described.

Sulfuric acid. Metallgesellschaft A-G. Brit. 433,676, Aug. 19, 1935. In producing highly conc'd. H_2SO_4 by the condensation of gaseous mixts. of SO_2 and H_2O vapor, the gases, at above 300°, are passed upwardly through an irrigation tower, whereby a portion of their H_2SO_4 content is condensed, they are then subjected to elec. pptn. to remove the residual H_2SO_4 , the acid recovered by the pptn. being used for irrigating the tower. Cf. C. A. 29, 3788^a.

Conditioning hydrated alkali metal silicates. Edwin Cowles and The Electric Smelting and Aluminum Co. Brit. 434,635, Aug. 26, 1935. This corresponds to U. S. 1,975,407 (C. A. 28, 6954^a). The treatment prevents caking during storage and is restricted to hydrated alkali metal silicates.

Synthetic ammonia. I. G. Farbennid A-G (Christian Schneider and Heinrich Butsch, inventors). Ger. 617,645, Aug. 26, 1935 (Cl. 12: 1.01). A N-H mixt. suitable for the synthesis of NH_3 is obtained by dust dried bituminous fuel in a shaft furnace with a series of horizontal or slightly inclined grates fixed at intervals up the shaft. A conduit is arranged just above each grate to run back to the space below the grate. In the example, dried lignite gives CO 20.2, CO 22.1, H 36.0, N 17.9, H_2S 1.0 and hydrocarbons 2.8%.

Lithium compounds from impure solutions. Henry S. Colton (to Gracelli Chemical Co.). U. S. 2,021,989, Nov. 26. A soln. contg. Li, Na and K comds. such as one from ore treatment is treated with Na metasilicate to ppt. Li silicate, and the ppt. is sepd. and treated with an acid such as HCl to form a desired sol. Li salt, the soln. of which is sepd. from the insol. ppt. U. S. 2,021,987 relates to a process in which Li, Na and K comds. are leached from an ore residue, Li is ppt'd. as carbonate from the hot soln., the ppt. is sepd., the soln. is cooled to sep. Na and K comds. from unrecovered Li values and the residual soln. is returned to the leaching step. An arrangement of app. is described. U. S. 2,021,988 involves a process in which Li carbonate and other carbonates are ppt'd. with a reagent such as Na_2CO_3 and in which

a Li compd. is recovered from the ppt. by use of an acid such as HCl. Li_2PO_4 also may be formed.

Alumina and alkali phosphates from aluminum phosphate. Chem. Werke vorm H. & L. Albert Ger. 620,901, Oct. 30, 1935 (Cl. 12, 31). Addn to 516,460 (C. A. 26, 3741). As the caustic alkali soln. required for the process of Ger. 516,460, use is made of the mother liquors, contg. caustic alkali and alkali aluminate, obtained in the known process wherein (1) AlPO_4 is heated to 600–800° with caustic alkali, alkali carbonate or alkali sulfate and C, and (2) the melt is poured into water or into a part of the mother liquor from the treatment of a preceding batch of AlPO_4 .

Basic alkali Kalunite Co. Ger. 620,171, Oct. 15, 1935 (Cl. 12, 7). This corresponds to U. S. 1,914,176 (C. A. 27, 4355), but gives addnl. details.

Ammonium nitrate Thaddäus Hobler Ger. 614,324, June 6, 1935 (Cl. 12, 6). Addn to 539,642 (C. A. 26, 2284). The method of 539,642 for prep. NH_4NO_3 by neutralizing 50% or over HNO_3 with NH_3 is modified by treating the NH_4NO_3 lye with HNO_3 under pressure in several stages.

Ammonium sulfate Irederic M. Pyzel (to N. V. de Bataafsche Petroleum Maatschappij) Brit. 474,622, Sept. 5, 1935. This corresponds to Fr. 774,815 (C. A. 29, 2317). The SO_2 content of the sludge being reduced to 2% or less of its H_2SO_4 content before treatment with NH_3 . App. is described.

Ammonium sulfate from acid sludge Jan D. Ruys (to Shell Development Co.) U. S. 2,022,813, Dec. 3. Acid sludge from treating oil or tar with H_2SO_4 is neutralized with NH_3 so that the resulting liquid contains less than 1% free H_2SO_4 while maintaining a temp. below 95° during the neutralization and effecting the neutralization in a zone approx. satd. with $(\text{NH}_4)_2\text{SO}_4$. An arrangement of app. is described.

Barium hydroxide Chemische Fabrik Coswig Anhalt G. m. b. H. (Lduard von Drathen, inventor) Ger. 620,170, Oct. 15, 1935 (Cl. 12, 1). $\text{Ba}_3(\text{PO}_4)_2$, obtained as a by-product in the manuf. of H_2O_2 from BaO and H_2PO_4 , is heated with C to yield BaC_2 and P. The BaC_2 is treated with water to yield C_2H_2 and $\text{Ba}(\text{OH})_2$. The P may be reconverted into H_2PO_4 .

Calcium hypochlorite pellets suitable for treating water, bleaching, etc. Walter S. Bachman U. S. 2,023,459, Dec. 10. Stable Ca hypochlorite pellets are produced by mixing a CaSO_4 material such as plaster of Paris with a hypochlorite such as bleaching powder and with addn. of more than sufficient water to hydrate the sulfate, permitting the sulfate to hydrate at least partially and then subjecting the mass to rapid dehydration to set the hydrated sulfate and avoid hypochlorite decompos.

Anhydrous calcium sulfate. Sydney F. W. Crundall (to Peter Spence & Sons, Ltd.) U. S. 2,021,910, Nov. 26. For producing anhyd. CaSO_4 in extremely finely divided and amorphous form, hydrated CaSO_4 is treated with H_2SO_4 for removing the combined water from and effecting disintegration of the material, under conditions such as to avoid dissolving of the CaSO_4 or formation of sol. acid sulfate.

Tin oxide. Marcel Leroy and Henri Migout (trading as Migout Frères & Cie.) Brit. 434,150, Aug. 27, 1935. In the production of SnO_2 by oxidation of pulverized molten Sn with hot air, the furnace chamber supplying the mixt. of molten metallic Sn and hot air to a combustion chamber and the combustion chamber itself are initially heated, e. g., to 1000°, to start the process, whereafter the temp. in the combustion chamber is maintained by the heat of combustion and a portion of this heat is recuperated to maintain the temp. in the furnace chamber. Cf. C. A. 29, 563⁹.

Stabilizing aqueous hydrogen peroxide solutions Albert Kunz. U. S. 2,022,940, Dec. 4. Antipyrine is used as a stabilizer.

Apparatus for production of carbon monoxide and hydrogen gas from hydrocarbons such as natural gas Charles V. Maier (to Thomas B. Swift). U. S. 2,022,778, Dec. 3. Various details are described of an app. with a porous

refractory catalytic mats, for effecting reaction of hydrocarbons such as natural gas with air for producing a gas mixt. consisting essentially of H and CO and which is substantially free from CO_2 and water.

Reducing iron contamination of caustic soda solutions. Albert H. Hooker (to Hooker Electrochemical Co.). U. S. 2,023,271, Dec. 3. For reducing the contamination by Fe in 42–51% solns. of NaOH that have been concd. by evapn. from solns. initially satd. with respect to the combined soly. of NaOH, salts from which it was originally formed and any other salts assocd. therewith or present as contaminants and allowed to cool, the soln. is agitated in contact with its own natural sludge not less than 24 hrs. at a temp. of 15–35° and is clarified.

Lithium Hans Heinrich Hütte G. m. b. H. (Conway Friedrich von Giese and Hans Weidmann, inventors). Ger. 616,379, July 29, 1935 (Cl. 12, 16). Addn. to 600,704 (C. A. 28, 743⁹). The method of 600,704 for obtaining Li by smelting Li compds. with Na_2SO_4 and K_2SO_4 is modified by replacing the Na_2SO_4 wholly or partly by alk. earth sulfates, e. g., CaSO_4 or MgSO_4 or a mixt. of these. An example is given.

Sulfur Raymond F. Bacon Ger. 620,159, Oct. 15, 1935 (Cl. 40, 2 (a)). See Brit. 375,370 (C. A. 27, 4039).

Free flowing powdered sulfur Ferd W. Wieder (to San Francisco Sulphur Co.) U. S. 2,022,796, Dec. 3. A mineral oil, such as a light lubricating oil (suitably in a proportion of about 1% or less), is incorporated in molten S and the S is then cooled and ground, and is suitable for dusting on vines, etc.

Sulfur from hydrogen sulfide The Girdler Corp. Ger. 620,326, Oct. 19, 1935 (Cl. 12, 17). See Fr. 762,364 (C. A. 28, 4574⁹).

Sulfur and sulfur dioxide from pyrites Raymond F. Bacon Ger. 617,003, Aug. 22, 1935 (Cl. 12, 21). In molten ground pyrites is heated as an air suspension to form S and FeS . The FeS , still as an air suspension, is burned in air to give SO_2 . App. for carrying out the process and collecting the S and SO_2 is described.

Apparatus for the continuous production of carbon black by the incomplete combustion of carbonaceous materials and deposition on a cooled surface Jan Dusi. Brit. 434,391, Aug. 30, 1935.

Active carbon Franz Krezl Brit. 434,461, Sept. 2, 1935. See Fr. 785,427 (C. A. 30, 584⁹).

Active masses I. G. Farbenind. A.-G. (Fritz Stöwener, inventor). Ger. 617,591, Aug. 22, 1935 (Cl. 12, 4 (1)). Active masses, especially for catalytic uses, are prepd. by drying irreversible colloids comprising a colloidal carrier substance and a catalyst. Thus, H_2SO_4 is added to Na water-glass to give a clear SiO_2 sol. This is allowed to form a jelly which is ground up with $\text{UO}_2(\text{NO}_3)_2$, HgNO_3 or $(\text{NH}_4)_2\text{VO}_4$. The mixt. is strongly heated to give a porous active mass. Other examples are given.

Catalysts. I. G. Farbenindustrie A.-G. Brit. 434,141, Aug. 27, 1935. Addn. to 379,335 (C. A. 27, 4041). Metal sulfide catalysts for destructive hydrogenation and other reactions are prepd. by the action of this salts on compds. of metals, other than alkali and alk. earth metals, while dispersed in a liquid medium. Thus salts of Cu, Sn, V, Sb, As, Mo, W, Cr, Re and Ge contg. an alkali or alk. earth metal or NH_4 as cation are mentioned. The metal compd. may be an oxide, hydroxide or salt of a heavy metal of groups I to VIII. Among examples, a soln. of TiCl_4 in C_2H_6 is added to a soln. of NiH_2 thioacetate in cyclohexylamine, the ppt. is filtered, washed and treated with H at 300–400°.

Mineral wool. John L. Morrow and Jesse B. Barnitt (to Aluminum Co. of America). U. S. 2,022,811, Dec. 3. Residues such as those left in obtaining alumina from bauxite are mixed with an aluminate-forming material such as lime or Na oxide in the amt. necessary to produce a final mixt. contg. an amount of aluminate-forming material at least equal to that required to convert the alumina in the mixt. into aluminate, the mixt. is melted and the molten material is passed through a stream of gaseous fluid such as air or steam delivered at high pressure.

19—GLASS, CLAY PRODUCTS, REFRACTORIES AND ENAMELED METALS

G. E. BARTON AND C. H. KERR

Calculation of the melting temperature of a glass batch on the basis of the chemical composition V. F. Yuferev *Trans Inst Chem Tech Ivanovo* (U S S R) 1, 95-7 (1935)—The Bertrand formula (C. A. 20, 209) was used with fairly good results Chas Blanc

Melting glass with dust like sand A. N. Dauvalter *Keram. i Steklo* 11, No. 8, 15-18 (1935)—Comparative expts made with various kinds of sand used for melting glass are described Glass melted with dust-like sand was of higher quality than that melted with ordinary sand Tables show the results M. V. Kondoidy

Drying-ovens for glass-melting sand. F. Jochem. *Glasstech Ber* 13, 391-9 (1935) J. F. Hyde

Theory and practice of accelerated drawing of glass by the Fourcault method I. I. Kitagorodskii *Keram. i Steklo* 11, No. 7, 3-7 (1935)—The chief defects of the Fourcault glass produced in the U. S. S. R. are its low chem resistance, great striation, and the presence of various inclusions, such as stones, cryst. formations and bubbles, these defects are due chiefly to an incorrect compn of the glass The latest investigations in Europe and the U. S. dealing with the compn., melting, coloring and cooling of glass are discussed, and the results of studies made by the Russian Inst. of Glass analyzed. Conclusions. (1) A coarse-grained batch melts much more slowly than a fine-grained batch, (2) during the melting of such a batch, the process of glass formation occurs very rapidly Constructional details to improve Fourcault machines are discussed M. V. Kondoidy

Selection of glasses with equal coefficients of expansion V. P. Uspenskii *Trans Inst Chem Tech Ivanovo* (U S S R) 1, 98-100 (1935)—Application of the Schott and Winkelmann formula (*Ann Phys Chem* 51, 735 (1894)) in the production of plate glass is discussed Chas Blanc

The time law of extraction of glasses E. Berger and W. Geßlein *Naturwissenschaften* 23, 817-18 (1935)—

Attack of glass by acids, alkalis, water, etc., follows the law $dx/dt = k e^{-kx}$, in which x is the amt of glass decomposed and t the time The same function applies to cond. change of water during the extn of glass powder The law holds as long as the SiO_2 skeleton remains intact, it is generally valid for activated adsorption (cf. Roginskii, C. A. 29, 10454) This view is supported by the fact that the dependence of k upon acid concn follows the Langmuir adsorption equation The same time law also holds for oxidation of metals in air (Tammann), elastic after effect, vol change, etc., of chilled glass, change of transparency with radiation and grain growth in cold-worked metals This is probably due to the fact that the equation represents a special soln of the diffusion problem B. J. C. van der Hoeven

Extraction and analysis of gases from glass. R. H. Dalton *J Am Chem Soc* 57, 2150-3 (1935)—An app is described for collecting and analyzing the gases evolved by glass when heated electrically in vacuum up to 1400°. By means of a Pyrex-to-porcelain seal all wax and grease joints are eliminated. One to 0.01-cc samples of gas, are taken and analyzed for H_2O , CO_2 , SO_2 , O_2 , H_2 , CO and by difference for N_2 and other gases Results with some typical glasses show that H_2O is usually the most abundant constituent CO is also nearly always present, though often in small quantity CO and H_2 are rarely present and there is never an appreciable residue of inert gas The amt of SO_2 , O_2 or CO_2 is considerable in special glasses P. S. Roller

Application of highly refractory sillimanite materials in the glass industry A. A. Litvakovskii *Keram. i Steklo* 11, No. 8, 26-8 (1935)—Details of expts made with kyanite linings for pot and tank furnaces are given The results show that. (1) kyanite linings resist the attack of the glass mass well, and (2) the character of corrosion is different from that appearing in grog bricks while grog mixes acquire a "shell"-like appearance on their

surface, kyanite linings become only uniformly thinner. M. V. Kondoidy

Black residue waste of the potassium ferrocyanide production as a substitute for alkalis V. F. Yuferev and N. P. Podlopaev. *Trans Inst Chem Tech Ivanovo* (U S S R) 1, 90-4 (1935)—A good grade of glass suitable for the manuf. of bottles and other articles of dark color was obtained by a partial substitution (up to 75%) of the black residue for Na_2CO_3 Chas Blanc

Effect of temperature on the resistance of bottles K. H. Borchard and H. H. Achmed. *Glashtüte* 67, 547 (1935)—Expts with dark bottles showed that their resistance diminishes by about 15% per degree on heating The resistance of light green bottles of the same compn for pasteurizing diminishes by 13% between 23° and 71°. Resistance to thermal shock by heating from 23° to 80° yielded a breakage of 23% Progressive heating reduces breaking to 0 M. V. Kondoidy

Bottle glass V. F. Yuferev and V. P. Uspenskii *Trans Inst Chem Tech Ivanovo* (U S S R) 1, 101-9 (1935)—The use of various industrial alk. waste products, such as flotation nephelite tailings, $NaHSO_4$, Na_2SO_4 , slag, etc., as substitutes for Na and K salts in the production of bottle glass is discussed The practical application of the Teichsner formula with Keppeler's correction (*Glasfabrikation* 1, 100 (1911)) is recommended C. B

Gem glass Rudolf Hohlbaum *Glashtüte* 65, 407-9, 420-2, 435-7, 436-7, 469-71, 531-3 (1935)—The production of imitation gem glass is described. This glass is manufd in small plants and the methods of production and compn are kept secret. The manuf consists of 3 main parts (1) production of the basic or "composed" glass; (2) grinding, and (3) working the polished glass so that it will be similar to gems The basic glass or "Strass" (the name of a famous jeweler from Nuremberg of the 17th century) is a glass with a high lead content or is free from lead but contains boric acid This glass is colored with metallic oxides An account of the obtaining of imitation diamonds, topazes, rubies, emeralds, sapphires, amethysts, aquamarine, garnets, opals, etc., is given M. V. Kondoidy

Quality control [in ceramic manufacture] F. M. Thorman *Bull. Am Ceram. Soc.* 14, 355-9 (1935) C. H. Kerr

Influence of grain of magnesite brick on its properties Hermann Salmang and Paul Nemitz *Spreerkal* 67, 717-19, 729-31, 745-7, 759-61, 775-8 (1934)—Compressive and transverse strengths are increased by an increase in forming pressure and of fine grain content Increase of pressure in prepressing raises the temp of deformation, a certain content of coarse grain also raises the temp of the beginning of deformation The apparent porosity can be substantially reduced by prepressing and suitable grain size. The firing shrinkage is decreased one-third with prepressure and suitable grain packing Microscopic examn. shows that increased fusion, increased prepressure and an increase of fine grains give a periclase aggregate and better knitting of the grains with each other C. B. Jenn

Kaolin and clay Their difference in shrinkage and porosity. Albert Vasel *Keram. Rundschau* 43, 543-4 (1935); cf. C. A. 30, 409° The greater shrinkage of clay is explained by its smaller mol The greater porosity of kaolin after firing is explained by a liberation of SiO_2 and formation of mullite, whereas with clay metakaolin is formed and no SiO_2 is liberated. P. S. Roller

Increasing plasticity of kaolins and clays R. Angenitzkaya and I. Romankevich. *Keram. i Steklo* 11, No. 7, 27-32 (1935)—Various theories dealing with plasticity are discussed and studies made by the authors described. The increase of the capacity of absorbing through only "exchange" reactions with Na under the effect of $NaOH$ is very limited, and the plasticity of clay material is, therefore, increased little The increase of the plasticity of clay

material by means of the exchange of cations can be obtained by a simultaneous increase of the capacity to absorb by introducing admixts. with a great absorption and high adsorbing properties.

M. V. Kondoidy

Obtaining feldspar by means of flotation. G. Gerth. *Glashütte* 65, 510-17(1935).—Attempts to sep. feldspar and quartz from impurities present in pegmatites, granites, syenites and feldspar sands were successful.

M. V. K.

Saggars H Tives *Keram Rundschau* 43, 493-4, 507-10, 510-22, 531-3(1935).—A discussion of compn., properties and prepn.

P. S. Roller

Deterioration of refractory brick in melting furnaces due to cracking. E. T. Richards. *Feuerungstechnik* 23, 49-52 (1935).—This deterioration is due to thermal and mech causes or to a modification of the structure of the brick. Cracking is due chiefly to rapid variations in temp. The sensitivity of bricks depends on structure, d. and coeff. of dilatation. The more elastic and porous (up to a certain limit) the brick is, the better it resists temp. variations. The structure is modified during service because of the effect of temp. and chem. action, this change starts on the hot side of the brick and causes the two sides to have different structures, which may produce cracks.

M. V. Kondoidy

Effect of insulation on the silica refractories of an open-hearth steel furnace roof. Lewis B. Miller. *Bull. Am. Ceram. Soc.* 14, 357-64(1935).—Silica refractories after service show 3 zones. The hottest zone consists chiefly of cristobalite, the middle zone chiefly tridymite and the outer zone chiefly quartz. The iron silicate liquid formed during service is less destructive when the roof is insulated. Insulating will prolong the life of the silica refractories.

C. H. Kerr

Rammed mixes for cupola furnaces. Alfred Borsch. *Feuerungstechnik* 23, 41-3(1935).—Rammed mixes are usually mixes. of high-grade refractory quartzites with addn. of clay or kaolin as bond, having an acid character. The furnace should be heated slowly. The critical temp. of highly siliceous materials lies between 10° and 900°. If this span is passed too rapidly, the mix may crack, spill or its structure becomes loose.

M. V. Kondoidy

Laboratory control in dry-process enameling. R. D. Cooke. *Bull. Am. Ceram. Soc.* 14, 373-4(1935).

C. H. Kerr

Evaluation of clay for enameling. L. Vielhaber. *Emailwaren-Ind.* 12, 273-5(1935).—The properties of clay required for enamels are discussed. The ratio of Al_2O_3 to SiO_2 in clay is not determinative. Settling tests do not show the suspending power of the enamel and are not comparable as the amt. of water used is not known and the varying amt. of alkalis from the enamel when dissolved changes the results. The effect of alkalis may be considered as const., however, in ordinary enamels, and the clay can be evaluated on its action alone. Expts with various German clays are described.

M. V. Kondoidy

Mixing and melting enamel. C. A. Ottersbach. *Glashütte* 65, 520-1(1935).—Directions for working and mixing the raw materials, and firing the enamel are given. Various types of furnaces are discussed. The melting temp. varies between 800° and 1000°. An overmelted white enamel becomes translucent, has a vitreous appearance and has needle tappings.

M. V. Kondoidy

A method for testing the adherence of ground coats to metal. C. J. Kinzie and J. B. Miller. *Bull. Am. Ceram. Soc.* 14, 371-3(1935).—The machine is a modification of the Friction ductility testing machine and is essentially a No. 3 Arbor press with necessary accessories.

C. H. Kerr

One cover-coat enamel finishes. P. R. Porter and G. L. Bryant. *Bull. Am. Ceram. Soc.* 14, 367-9(1935).—A single cover-coat reduces the thickness of the enamel and lessens chipping and cost. Precautions in manuf. are stressed.

C. H. Kerr

Enamel thickness gage. M. A. Rusher. *Bull. Am. Ceram. Soc.* 14, 365-7(1935).—The gage depends for its operation upon the magnetic circuit passing through the coil of the gage head and through the sheet of steel directly

under the enamel where the gage head is placed.

C. H. Kerr

Measuring temperature during enameling and its application in practice. Oskar Kerstan. *Glashütte* 65, 517-20, 535-7(1935).—The advantages of automatic control of temp. are pointed out. The temp. should be measured continuously in enamel ovens, muffle kilns, flue pipes and drying ovens. The temp. of the air-steam for gas generators, that leaving it, and that entering the burner should be measured periodically. The control of the chem. compn. of gas and flues, pressure in the gas collector, steam and air pressure, are very important. Diagrams are given and analyzed, and defects due to excessive or insufficient firing are discussed.

M. V. K.

Minimum radius of curvature for enameled parts. H. H. Holscher. *Bull. Am. Ceram. Soc.* 14, 369-71 (1935).—The min. radius of curvature of iron to be

enameled $1\frac{1}{2}$ in.

C. H. Kerr

Powdered enamel for bath tubs. H. J. Karmaus. *Sprechsaal* 67, 778-80, 792 7(1935).—Prepn. of castings for enameling is discussed. Compn., analysis, charge to the wet mill and prepn. of the ground enamel and frit are outlined. The analyses and compn. of different powd. enamels are tabulated and their characteristics explained.

C. B. Jenni

Significance of plastic masses, ceramic materials and glass for the development of domestic raw materials (Spielvogel) 13 Kjeldahl flasks and other vessels from As-free glass (Lockemann) 1 Kaolin and clay (Vasel) 8 Trays for use in heat-treating ceramic articles (U. S. pat. 2,022,283) 9

Glass I G Farlenund A.-G. (Paul Huppert and Hans Wolff, inventors). Ger. 620,317, Oct. 10, 1935 (Cl. 32b 2). In the manuf. of phosphatic glass transparent to ultraviolet rays, a salt of NH_4 is included in the melt, whereby the tendency of the glass to change in compn. under the action of the rays is restrained. A phosphate of NH_4 or a salt of NH_4 having a volatile anion, e. g., $(NH_4)_2CO_3$ or NH_4NO_3 , may be used. The formation of blisters may be avoided by addn. of an oxidizing agent, e. g., an alkali nitrate or BaO_2 . In one example, a mixt. comprising K_2CO_3 13.77, KNO_3 6.71, $CaCO_3$ 8.03, $BaCO_3$ 3.22, $MgCO_3$ of 84.75 purity 18.53, H_2BO_3 31.04, Al_2O_3 28.8 and $(NH_4)_2HPO_4$ 48.7 parts by wt. is fused in a quartz crucible to yield a glass of the compn. K_2O 12.5, CaO 8, BaO 2.6, MgO 7.5, B_2O_3 17.5, Al_2O_3 28.8 and P_2O_5 26.2%. Other examples are given.

Continuous renewal of glass in a drawing-off basin attached to a glass furnace. Emile Roissant (to Soc. anon. d'études et de constructions d'appareils mécaniques pour la verrerie). U. S. 2,023,745, Dec. 10. In drawing off glass in a rotating basin supplied by a glass furnace and covered for the larger part by the hood of the furnace, the drawing off is effected at a fixed station by means of molds successively immobilized at this fixed point and there is imparted to the basin an intermittent movement of rotation such that a mass of glass cooled by a drawing-off operation effects several revolutions before again coming to rest at the fixed drawing-off station. App. is described. U. S. 2,023,746 also relates to details of drawing off glass in a rotary basin of generally similar character.

Stirring molten glass in a continuous tank furnace. Wm. C. Taylor (to Corning Glass Works). U. S. 2,022,223, Nov. 20. A stirring rod is mounted intermediate the ends of the melting chamber for rotation about a substantially horizontal axis and carries a bent stirring thimble on its end for contact with the glass.

Cooling large masses of molten glass. Geo. V. McCauley (to Corning Glass Works). U. S. 2,022,215, Nov. 20. Glass such as a large telescope disk of high silica glass is rapidly cooled through its crystn. range to a temp. below its softening point but above its annealing point, and the exposed surface of the mass is reheated to permit the exterior to yield and compensate the shrinkage of the interior, and annealing is effected. App. is described.

Apparatus for manufacture of glassware such as bottles Edward Miller (to Lynch Corp.). U. S. 2,022,939, Dec. 3 Mech features

Apparatus for forming and glazing glassware. John C E Schwab (to Hazel-Atlas Glass Co.) U. S. 2,022,780, Dec 3 Mech features

Apparatus for forming glass lens blanks Albert N Cramer (to Alice B Cramer) U. S. 2,023,781, Dec 10 Mech and operative details

Finishing the edges of glass sheets Gerald White (to Libbey-Owens-Ford Glass Co.). U. S. 2,022,530, Nov 26 In finishing the edges of a sheet of laminated safety glass which have been previously sealed, an abrasive tool is used while supplied with a solvent for the sealing material such as kerosene and a diluent for the solvent such as water when pitch or the like has been used as a sealing material App is described

Polishing glass by brushing with metallic bristles carrying a moist abrasive Bernard Long (to Soc anon des manufactures des glaces & produits chimiques de Saint-Gobain, Chauny & Crey). U. S. 2,023,275, Dec 3 Various details of app and operation

Apparatus for tempering sheets of glass Raymond Meer Fr 786,514, Sept 5, 1935

Step by-step conveyors for glass-annealing leers Otto Maetz Brit 434,513, Sept 3, 1935

Partitioned glass containers such as ink wells Carl G Hilgenberg and Charles B Garwood (to Carr-Lowrey Glass Co.). U. S. 2,023,474, Dec 10 Various operative details

Designs or lettering on bottles or other glass articles Alex Kneip (to Winthrop Chemical Co.). U. S. 2,023,175, Dec 3 Designs are formed with an artificial resin hardened to an insol and infusible state, a soft filling agent such as asbestos powder and a dyestuff pigment

Preventing blurring of glass Feldmuehle A G vorm Loeb, Schoenfeld & Co., Rorschach Fr 786,726, Sept. 9, 1935 The glass is coated with a layer of transparent material which will absorb water without modification, e g, viscose, casein or gelatin

Multicellular glass Soc anon des manufactures des glaces et produits chimiques de Saint-Gobain, Chauny & Crey Fr 786,818, Sept 10, 1935 A mixt of ground glass or fritted and ground vitrifiable materials with one or more powd substances capable of liberating gases or vapors either by reaction between the added substances or with the glass or by simple decompn is heated to the temp at which the glass welds together by simple contact A mixt of C, a carbide, Carborundum, Si or Fe-Si and a glass contg an excess of alkali or alk earth sulfate, or a mixt of glass, white SiO₂, Na₂SO₄ and C, or a mixt of glass and talc or kieselsaure may be used.

Compound glass Wm L Monro (to American Window Glass Co) Brit 434,314, Aug 29, 1935 Laminated glass comprises a sheet of glass, the inner surface of which is fire polished and the outer surface ground and polished, united to a 2nd sheet, both surfaces of which are fire polished, by a cementing layer having preferably the same refractive index The cementing layer may be formed by applying a soln of polyacrylic acid ester to the surface of each sheet, drying and uniting; or it may consist of a sheet of cellulose acetate or nitrate united by adhesive

Safety glass Wm H Simmons, Henry Tumms and Plastic Safeglass Syndicate Ltd Brit 434,229, Aug 28, 1935 Compound glass is made by applying to a glass sheet a soln of partly polymerized vinyl acetate and a plasticizer, e g, benzyl alc, in a volatile solvent, e g, AcOBU, evap the solvent at below 100°F, applying a 2nd glass sheet to the coated surface, pressing the assembly while raising the temp gradually to 150°F, and removing the compn extruded at the edges

Safety glass Adolf Kampfer Fr 786,555, Sept 5, 1935 App for removing solvent from the intermediate layers

Laminated glass James W H Randall (to Libbey-Owens-Ford Glass Co) U. S. 2,022,479, Nov 26 Each sheet of glass to be joined is provided with a skin of resin material such as a polyhydric alc-polybasic acid

resin and the sheets are joined by an intervening transparent material such as a sheet of a cellulose ester compn placed between the coated surfaces and treated with a high-boiling low-vapor-pressure solvent such as dibutyl phthalate

Apparatus (with rolls and bonding agent supply) for laminated glass manufacture George B Watkins (to Libbey-Owens-Ford Glass Co.) U. S. 2,022,484, Nov 26 Various structural, mech and operative details

Endless-chain tamping machines for molding bricks, etc. Wm Geo Chapman and Dunns' Engineering Works Ltd Brit 433,761, Aug 20, 1935

Title for use in the construction of furnace arches and walls, having a head portion formed to engage an anchoring member. M H Detrick Co Brit, 432,526, July 29, 1935 The title has on at least 1 face series of projections with intervening depressions, the ribs and grooves alternating both along the length of the face and transversely across it.

Ball mills with ceramic ware jars or linings Theodore J Volkmer (to Vitro Mfg Co.) U. S. 2,022,552-3, Nov 26 Various details are described of mills suitable for grinding glazes, enamels, etc.

Purifying granular sand Rob R. McGregor and Edwin W. Tilton (to Macbeth-Evans Glass Co) U. S. 2,023,278, Dec 3 Sand contg impurities such as Fe oxides, etc, which have a lower softening temp than that of the sand is heated to 1000-1600° for a time sufficient to form agglomerates contg impurities, and the agglomerates are removed from the sand

Tunnel ovens, primarily for pottery. Bernard J Moore Brit 433,637, Aug 19, 1935 The temp. of the main heating zone, which is at a substantial distance from the entrance to the tunnel, is maintained mainly by combustion of fuel, e g, in muffles, while in the secondary or entry heating zone the heat is maintained mainly by elec. resistances adapted to heat this zone throughout its entire cross-section and situated at a relatively low level on the walls of the tunnel

Electric furnace for baking porcelain with means for modifying the atmosphere Siemens-Schuckertwerke A-G. Ir 787,009, Sept 16, 1935

Trucks for conveying pottery ware through kilns Bernard Joseph Moore. Brit 433,473, Aug 15, 1935

Trucks for conveying pottery ware through kilns Bernard Joseph Moore and Christopher Clifford Brit 433,497, Aug 15, 1935

Checker brickwork structure for regenerator furnaces Bonnybridge Silica and Fireclay Co Ltd and Walter McBryde Brit 433,762, Aug 20, 1935

Building and refractory blocks, etc Leslie E. Hamson and The Brinworth Brick & Tile Co Ltd Brit 434,127, Aug 23, 1935 Bricks, etc, for ovens, kilns, furnaces, etc, are formed by extrusion with a large no of relatively small and closely spaced apertures arranged so that the sepg walls are uniform in thickness

Casting hollow refractory articles such as those from fused alumina Geo J Laster (to Carborundum Co) U. S. 2,023,044, Dec 3 In a mold which may be formed of suitably refractory material, a core is used of low-thermal capacity which may be formed of chromite or magnesia and which has a higher coeff of thermal expansion than the material being cast

Apparatus for sintering refractory material such as in the manufacture of cemented carbides George P Taylor (to General Elec Co) U. S. 2,022,528, Nov 26 Structural details comprising a hollow tube of metal such as Mo within which is placed a contacting hollow refractory heat-conducting C cylinder which serves to hold a charge under treatment

Abrasive compositions Philippe Vogel Jaggi and Diamantschleiferi Voegel & Wirtz A-G Brit, 434,402, Aug 30, 1935 The compns comprise diamond, particles, graphite, Fe₂O₃ as English red or colcothar and a bond of PhOH-aldehyde resin In an example, a compn comprises diamond 26, charcoal powder 50, graphite 50, colcothar 75 parts, a little powd PhOH aldehyde resin and sufficient liqnd PhOH-aldehyde resin to make a paste

SiC in amt. equal to that of the diamond may be added. The compn. may be molded onto a base of PhOH-aldehyde resin and the whole may be fixed to a metallic support.

Abrasive articles. The Carborundum Co. Brit. 433,725, Aug. 20, 1935. A bonded polishing article, e. g., a wheel, comprises a polishing powder, e. g., pptd. Al_2O_3 , green chromic oxide, rouge, crocus and a bonding material, e. g., resin, in the form of substantially discrete particles. The preferred method of making the articles comprises intimately mixing polishing powder and dry powder, resin of approx. the same fineness, compacting the mixt. without the simultaneous application of heat under a pressure only high enough to form the article and curing at an elevated temp. without the application of such pressure as to compact the article further to any substantial extent.

Rubber bonded abrasive articles Richard H. Martin (to Norton Co.). U. S. 2,022,893, Dec. 3. An article such as an abrasive wheel comprises grains of abrasive such as $cryst. Al_2O_3$ or SiC united by a bond of hard vulcanized rubber contg. an insol. fluoride such as CaF_2 , which improves the heat resistance and strength of the rubber at normal grinding temps. Cf. C. A. 29, 312.

Abrasive layers suitable for emery paper Gerhard Balke, Franz Grom and Karl Wolf (to I. G. Farbenind. A.-G.). U. S. 2,023,191, Dec. 3. Abrasive particles are used with a bond including a hardened condensation product of maleic acid or its anhydride with castor oil, etc.

Abradant device suitable for use on rollers of floor

1 abrading machines. Ludwig K. Heinrich (one-half to Edmund R. Aller). U. S. 2,022,199, Nov. 26. A sheet of flexible metal such as steel carries a flat layer of fluffy steel wool, fibers of which are fused to the metal sheet.

Glasses. Rolf Vassel. Ger. 620,166, Oct. 15, 1935 (Cl. 80b 23.03). In the manuf. of glasses contg. B, the latter is added as a mixt. of two or more unfused naturally occurring minerals contg. B, at least one of the minerals contg. an alkali compd. of B and at least one other of the minerals contg. an alk. earth compd. of B. Synthetically prep'd compds. of B may be added to the mineral mixt. if desired. If the glaze so prep'd. contains an excess of alkali, this may be eliminated by addn. of an alk. earth chloride, whereby an alkali chloride, which vaporizes at the working temp., is formed. If the minerals contain sulfates as impurities, the mixt. may include also a reducing agent, which may be an agent which is eliminated at the working temp., e. g., graphite, or an agent useful as a component of the glaze, e. g., Pb. A sp. compn. is described.

Roller apparatus for dry-cooling fused enamels Firmatana Metallkeramik G m b H Ger. 620,271, Oct. 17, 1935 (Cl. 48c 1).

Steel enamel-coated ware Jacob E. Rosenberg (to O. Hommel Co.). U. S. 2,022,434, Nov. 26. The surface to be enameled is treated with an ammoniacal soln. of a Co compd. and the soln. is evap'd with escape of NH_3 and pptn. of Co hydroxide, the coated surface is then covered with a slip of prep'd. enamel rendered fluid with water, which is dried and then fired.

20—CEMENT AND OTHER BUILDING MATERIALS

J. C. WITT

Cement-water ratio a simpler method. Geo. R. Wernisch. *Concrete* 43, No. 12, 7-8(1935).—Diagrams and computations are presented which show that the cement-water ratio is more easily used than the water-cement ratio in designing concrete mixts. R. W.

Clay-gypsum cement—composition and manufacture Peter P. Budnikoff. *Concrete* 43, No. 7, 37-8, 42 (1935).—Compressive strengths of mixts. of clay, anhydrite and hydrated lime are given. R. W.

A study of the preparation of a specification for high-strength portland cement. C. Rupert Gause. *J. Research Natl. Bur. Standards* 15, 421-39(1935)(Research Paper No. 859) P. S. Roller

Lime modulus, lime saturation and lime standard of portland cement. Hans Kuhl. *Tonind-Zig.* 59, 1221-4 (1935).—Different formulas are compared. P. S. R.

Productivity of rotary portland cement kilns V. I. Serdyukov. *Trans. Inst. Chem. Tech. Ivanovo* (U. S. S. R.) 1, 110-15(1935).—A crit. discussion of the performance of Danish, American and German kilns. C. B.

The "blown" cement kiln. A. W. Catlin. *Pit & Quarry* 28, No. 5, 23-4, 36(1935).—A "blown" kiln is one in which all the secondary air is blown under pressure through the load immediately prior to its discharge at the end of the shell. It has the following advantages. Considerable fuel saving, initial cooling of the clinker, greatly improved combustion with higher flame temp., steadier operation, pos. control of combustion air, greatly improved quality of product, better grindability of the clinker, less dust in the clinker and exit gases with greater steaming capacity of waste-heat boilers, and reduced maintenance costs. Each advantage is discussed. One plant reports savings of 23 lb. of coal per bbl., another 19 lb. Alden H. Emery

Addition of peat ash to lime in the formation of hydraulic solutions V. F. Yuferev and V. I. Serdyukov. *Trans. Inst. Chem. Tech. Ivanovo* (U. S. S. R.) 1, 116-31(1935).—The use of fresh and calcined peat ash as an ingredient in a hydraulic mortar, concrete and building stones is discussed. Chas. Blane

The expansion and corrosion of hardened mortar of various cements. H. Shochiro Nagai, Kuma Matsuoka

and Kenji Nomi. *J. Soc. Chem. Ind., Japan* 38, Suppl. binding 500-3(1935), cf. C. A. 29, 5245¹.—Sulfate solns., especially Na_2SO_4 and $MgSO_4$, attacked all mortars considerably, particularly those made from portland cements. Chloride solns., as $NaCl$ and $MgCl_2$, do not attack the mortars so much. Cement mixts., such as blast-furnace slag cement and high-alica portland cement, showed good resistant properties to the salt solns. High-alumina cement was very stable toward the action of the solns., but its binding and compressive strength were greatly affected. Exptl. data are given. Karl Kammermeyer

Flexural strength predetermined E. W. Bauman. *Concrete* 43, No. 11, 9-10, No. 12, 11-15(1935).—A description of methods for designing concrete for a specified modulus of rupture. Raymond Wilson

The protection of concrete in sea water. Richard Grün. *Tonind-Zig.* 59, 1185-6, 1202-3, 1213-15(1935).—A lecture. P. S. Roller

Increasing the fire resistance of masonry by suitable mortar composition of the plaster. Kristen. *Tonind-Zig.* 59, 1209-13(1935).—Masonry was surfaced with a mortar consisting of cement, lime and sand with different addns. of gypsum, calves' hair and grog. After 3 months the masonry was tested for fire resistance. Ten % gypsum proved to be the best addn. both from the standpoint of resistance and of strength. P. S. Roller

Light-weight building materials with foamy structure. Hans Wolf and Hans Welsch. *Angew. Chem.* 48, 642-4 (1935).—A discussion covering the available types, mfg. processes, mixing proportions and phys. properties. Five references. Karl Kammermeyer

Preservatives and antitermite protection of timber. C. Demere. *Ind. Eng. Chem.* 27, 1303-5(1935).—Three preservatives developed by the E. L. Bruce Co. for the protection of wood against decay and insect attack are described. β -Naphthol is the toxic constituent. 5-A consists of β -naphthol in soln. in a combination of 2 grades of black fuel oil; 5-B uses as a carrier a colorless petroleum distillate; 5-C same as 5-B but contains asphalt. A. L. K.

Decay in structural timbers. Ernest A. Rudge and Harold Lewis. *J. Soc. Chem. Ind.* 54, 385-77(1935);

cf C. A. 29, 3488¹—A skirting board removed from a modern house showed dry rot, and the extent of decay as previously defined by R. and L. (cf C. A. 29, 8276¹) was not correlated with the more advanced stages of fungal attack. This was shown by making chem. analyses of various portions of the wood (i. e., detg. ash, FeO, CaO, hot-H₂O-sol matter, alkali-sol matter, cellulose, lignin and pentosans) and comparing these with mycological data obtained from the Forest Products Research Lab. Those parts of the board which showed the highest mech. strength, the highest cellulose content and the lowest alkali-sol matter, showed the most advanced stages of fungal attack, by mycological examn. In these findings, R. and L. claim further confirmation of their inorg. infiltration theory. The following precautions are given for wooden structures: (a) careful attention should be paid to damp-coursing, to remove the source of ions concerned in inorg. decay, (b) unprotected wood should not be fixed to lime plaster surfaces, (c) fixing timbers to wooden plugs with iron nails is to be discouraged.

Louis E. Wise
"Inorganic infiltration" theory of wood decay. W. G. Campbell. *J. Soc. Chem. Ind.* 54, 372-4T (1935), cf C. A. 29, 4542¹, 8276¹.—Polemical. Reply Ernest A. Rudge. *Ibid.* 374T.

Louis E. Wise
Minimizing wood shrinkage and swelling. Alfred J. Stamm and L. A. Hansen. *Ind. Eng. Chem.* 27, 1480-4 (1935), cf C. A. 29, 3487¹.—Cellulose as an intermediary has been used for impregnating green or dry wood with water-insol. waxes, oils and resins, this prevents to a large extent subsequent dimension changes and shrinkage. The treatment serves as a combined seasoning and anti-shrink impregnation particularly applicable to refractory species of wood.
J. W. Shipley

Pitch [for road construction] (Brit. pat. 433,826) 21
Plastic compn. [in prepn. of floor and wall coverings] (Brit. pat. 433,994) 13. Tar [for roadmaking] (Brit. pat. 433,248) 21. Viscous compn. [for use on roads] (Fr. pat. 780,533) 13

Cement. Chemische Fabrik Grünau Landshoff & Meyer A.-G. Fr. 780,997, Sept. 14, 1935. The early or rapid resistances and the process of setting of cement are regulated by adding a mixt. of salts contg. the cations Ca and Al and the anions Cl, NO₃, CNS, CH₃COO and HCOO, and basic substances such as CaO, Al₂O₃ or salts having a basic reaction. The Al may be partly replaced by Sn or Ti or other metals, salts easily decomposed by hydrolysis are formed. Cf. following abstr.

Cements. Chemische Fabrik Grünau Landshoff & Meyer A.-G. (Walter Kirschner, inventor). Ger. 620,393, Oct. 21, 1935 (Cl. 80b. 1 05). The hardening of hydraulic cements is accelerated by adding a mixt. contg. AlCl₃, CaCl₂, and either a third metal chloride or HCl. The third chloride is preferably an easily hydrolyzed chloride, e. g., a chloride of Ti, Sn or Fe. Alternatively, FeCl₃ or a chloride of a metal of the 4th periodic group may replace AlCl₃ or CaCl₂ in the mixt. No proportions are specified. Cf. preceding abstr.

Cements, etc. Emilio Polzinetti. Fr. 786,631, Sept. 6, 1935. The capillary holes between the grains of cements, mortar, etc., are stopped up by a mixt. of ppts. of different sp. wts. and mol. sizes. This effect is obtained by adding to the water used substances which will cause the pptn. of stearates of Ca, Fe, Zn and Al.

Sorel-cement mixture containing bituminous material. Hiram S. Lukens (to Magnesium Cement Laboratories, Inc.). U. S. reissue 19,779, Dec. 3. A reissue of original pat. No. 1,724,945 (C. A. 23, 4792).

Apparatus for molding tubular articles from cementitious and other materials. Harry E. Dunn and Wm. E. Dunn. Brit. 433,591, Aug. 10, 1935.

Asbestos-cement sheets, etc. Eric R. Hartarp. Brit. 433,977, Aug. 23, 1935. A hard glossy surface, which will not effloresce, is produced on the sheets, tiles, etc., by treating the surface with 1 or more oxides, hydroxides or insol. salts of Zn, Ca and Mg and then either with an alk.

silicate and a chloride soln. or with 1 or more solns. of a chloride, sulfate or phosphate that will react to yield the corresponding oxychloride, oxy sulfate or oxyphosphate. In 1 example, a base mixt. of ZnO 5, Ti white 2, SiO₂ 1.5 and H₂O 20 parts is applied to the moist sheets and smoothed, a 2nd layer of soap 1, ZnO 2 and H₂O 320 parts is then applied and the surface is brought to a gloss by hot irons, when the cement has set hard, the surface is treated with a soln. of Na or K silicate and the sheet is dried and stored at about 300°F., after which it is treated with a ZnCl₂ soln. (20-30° Twaddle) and dried again. Cf. C. A. 30, 599¹.

Bags suitable for holding cement, etc. Joseph D. Cramer (to Chase Bag Co.). U. S. 2,022,501, Nov. 26. Various details are described of a cloth bag lined with crepe-paper plies and with a layer of asphaltic material securing together the plies of paper and with a binder of other material, less readily softened by heat than asphalt, uniting the cloth and paper plies. A latex adhesive may be used.

Rotary drum for pretreating cement meal or like materials with furnace gases. Fried Krupp Grusonwerk A.-G. (Georg Ruppert, inventor). Ger. 620,440, Oct. 21, 1935 (Cl. 80c. 14 10).

Rotary kilns. Johan S. Fastang. Brit. 433,224, Aug. 12, 1935. In a cement kiln having in the drying and preheating zones groups of heat-transmitting elements, e. g., chains, in contact with which the gases flow in series, the charge is divided into sep. streams, each stream coming into contact with 1 group only of said elements, and all the streams are united to flow through the hotter zones of the kiln.

Rotary kilns and coolers for the manufacture of cement, etc. Mikael Vogel-Jørgensen. Brit. 432,892, Aug. 6, 1935. The chains suspended therein have circular links. Concrete. J. G. Farbernd and A.-G. Ger. 617,867, Aug. 27, 1935 (Cl. 80b. 1 05). A concrete resistant to chemicals and of great hardness, suitable for constructional work, is made by mixing sand and cement with an Fe oxide mixt. obtained by reducing org. nitro compds. with Fe. PhNO₂ slurry reduced by Fe is given as an example of the Fe oxide mixt.

Concrete containing powdered aluminum. Karl P. Billner (to Indurated Concrete, Inc.). U. S. 2,023,001, Dec. 3. To a concrete mixt. comprising cement, sand and aggregate, there is added about 0.06% (or less) the wt. of the dry cement powder of powd. Al which serves to produce a concrete of high strength.

Treating fresh concrete. Orla E. Hood. U. S. 2,023,887, Dec. 10. An exposed cement concrete surface such as that of a concrete pavement is treated with a blanket of heat-insulating foam such as may be formed of sulfite cellulose liquor, glycerol foams and Ca-Mg chloride, following initial set and within the period of final set, which serves as a protecting and water-retaining material.

Light cellular aggregate suitable for use in concrete. Andrew L. Gladney (one half to Marshall S. Hanrahan). U. S. 2,021,956, Nov. 26. Broken pieces of well-consolidated tuff or pumice are subjected to a temp. to cause incipient fusion and generation of gas within the pieces substantially to increase their bulk, while tumbling the pieces about to prevent agglutination.

Apparatus for centrifugally molding hollow concrete pipe sections. Geo. E. Mitchell. Brit. 434,538, Sept. 4, 1935.

Concrete-block-making machines. Thomas Malone. Brit. 434,963, Sept. 12, 1935.

Road materials. J. R. Geigy A.-G. Brit. 434,150, Aug. 27, 1935. See 1r. 778,033 (C. A. 29, 4917¹). The bituminous substances may be omitted.

Material for road surfaces and paving blocks. Bernard W. D. Lacey and Percy J. Bawcutt (to Dunlop Rubber Co. Ltd.). U. S. 2,023,688, Dec. 10. To a base such as concrete blocks, successive layers of rubber crumb are applied in admixt. with a relatively highly concd. aq. dispersion of coagulated rubber, the successive layers differing in proportion of crumb and dispersion and contg. differing portions of compounding ingredients such as

NH₄ oleate, latex, cement, etc., to give different degrees of hardness and resiliency.

Bituminous paving material Walter H. Hood, U. S. 2,023,068, Dec. 3 Mineral aggregate such as sand, stone or gravel is coated with bituminous material such as an asphalt cement, and powder Al stearate or the like is added to sep. the coated particles. Oil may be used with Al stearate, etc., in a modification of the process.

Aqueous bituminous emulsions suitable for use in road building, etc. Ulric B. Bray and Lawton B. Beckwith (to Union Oil Co. of Calif.) U. S. 2,022,229, Nov. 26 An emulsion of the slow-breaking type is prep'd by commingling melted bitumen with an aq. soln. contg. an emulsifying agent such as NaOH or a soap and after cooling to below about 38° adding a small proportion of a stabilizing agent such as Na caseinate, the stabilizing effect of which is lessened when added at higher temps.

Macadamized roads I. G. Farbenindustrie A.-G. Brit. 433,957, Aug. 23, 1935 Solid particles of MgCl₂ which has a thawing and dust-laying action, are incorporated in a road structure, each particle being embedded in or enveloped by a solid or plastic medium adapted to allow gradual access of moisture thereto. Wax, paraffin, tar, pitch or bituminous substances may be used to envelop the particles.

Expansion-joint filler suitable for use in highway construction Herbert C. Jussen (to Philip Carey Mfg. Co.) U. S. 2,023,529, Dec. 10 A slab-like product comprises a core of resilient rubber material interspersed with sep. air cells and surface layers of weather-resisting plastic material such as asphalt compn. adapted to be displaced by pressure so that it may be carried over and form a shell on the edge of the core.

Rubber compositions I. G. Farbenindustrie A.-G. Brit. 433,741, Aug. 20, 1935 Building mortars are prep'd by treating an aq. emulsion of vulcanized or unvulcanized rubber with an alkali silicate and a powder contg. a substance sparingly sol. in H₂O and capable of reacting with alkalis. The basic character of the alkali silicate is thus destroyed so that hardening and coagulation take place. The H₂O of the mortar may be absorbed by the addn. of, e. g., CaSO₄, cement, kieselguhr. Emulsions, e. g., of asphalt or C₁₈H₃₆, may be incorporated. In examples, mixts. of borax, pulverized quartz and *p*-toluenesulfonate or Na₂SiF₆ are added to a rubber emulsion contg. Na silicate.

Building material Ernst Köppe, Ger. 620,293, Oct. 18, 1935 (Cl. 806 21 04) Waste Ca compds from the ammonia-soda process are mixed with cement and a filler of low sp. gr. and after addn. of aq. waterglass soln. the mixt. is compressed into bricks or plates and then dried. A specified compn. contains dried waste Ca compds 50, portland cement 30, wood shavings 15 and waterglass 5%.

Building slabs. Evan O. Williams and Arthur P. Laurie, Brit. 434,837, Sept. 10, 1935. The slabs are formed of granulated cork mixed with a binding agent comprising Na silicate and reinforced with a flexible fibrous material embedded in the slab and (or) secured to at least 1 surface thereto. The cork may be treated with a soln. of Na silicate and molded into a slab as described in Brit. 290,042 and 346,516. After drying, the slab may be treated with CaCl₂ soln.

Filling cracks, etc., in masonry structures Perry M. Moore, U. S. 2,022,547, Nov. 26. A filler for cracks, fissures, etc., in masonry comprises a waxy substance such as ceresin wax and a smaller quantity of a solid inert mineral matter such as diatomaceous earth which has a greater affinity for the waxy material than does the masonry structure to be treated. Cumar resin also may be added.

Slabs for floors or walls Richard Lattorf (to The United Lummer and Vorwöhle Rock Asphalt Co. Ltd.) Brit. 433,017, Aug. 7, 1935 A slab having sound and heat insulating properties is provided with an upper or wearing surface of artificial stone, formed of granular natural stone of rough texture with a matrix such as portland cement mortar, united with an underlayer of asphalt with or without other ingredients.

Asphalted felt-base roofing material Charles J. Merriam (to Stephen G. Wright) U. S. 2,022,429, Nov. 26. An asphalt-sat'd felt base is provided with an air-blown asphalt coating over an intervening layer of dusted-on inert powder such as talc or mica or Zn stearate.

Apparatus for saturating roofing felt with molten asphalt Geo. P. Heppes (to Patent and Licensing Corp.) U. S. 2,023,019, Dec. 3 Various structural, mech. and operative details.

Facing floors and walls Diespeker and Co. Ltd. and Leonard T. Rackham, Brit. 433,913, Aug. 22, 1935 Floors, etc., are faced with a mixt. of cement and granulated cork, e. g., portland cement 1 and cork 2 parts, which is troweled off, rolled and, when set, rubbed smooth with a stone.

Preserving vegetable-fiber materials such as wall-boards, etc. Francis L. Cislak (to Peter C. Reilly), U. S. 2,022,231, Nov. 26. The material is impregnated with a fungicidal water-insol. borate such as that of Zn or Cd and also with acenaphthene, fluorene, anthracene, phenanthrene, carbazole, a tar acid which is solid at 40° and which may be chlorinated or nitrated, or a metal salt of such a tar acid.

Paper for plaster boards, etc. Wm. A. Richardson, Brit. 434,778, Sept. 9, 1935. In the manuf. of paper to be used in making gypsum laths, etc., anhyd. hydrated or partly hydrated CaSO₄ is included in sufficient amt., e. g., 1-10%, to insure that when such paper is applied to a mixt. of plaster of Paris and H₂O there is no retardation of the crystal bond between the paper and the plaster.

21—FUELS, GAS, TAR AND COKE

A. C. FIELDNER AND ALDEN H. EMERY

The manufacture of liquid fuel from vegetable oils. Eugene C. Koo and Shu-Ming Cheng, *Chinese Industry* 1, 2021-39 (1935).—The vapor-phase and catalytic cracking of vegetable oils are studied. By carrying out the vapor-phase cracking of rapeseed oil at 1000°F. and feeding the oil at the rate of \$30 cc./min., a 76% yield of crude oil (sp. gr. 0.837) is obtained. The slower the rate of addn. of the vegetable oil, however, the higher is the percentage of gasoline fraction in the crude oil. Too slow a rate of addn. causes, on the other hand, excessive decomposition and hence lowering in the yield of crude oil. The highest yield of gasoline fraction is obtained by adding the vegetable oil at the rate of 2.15 cc./min., when the cracking is carried out at 1000°F., the yield of crude oil (sp. gr. 0.817) in that case being 70%, of which about 40% distills below 200° (gasoline fraction). Similar expts. with soybean oil, cottonseed oil and China wood oil (tung oil) gave similar results. In the study of catalytic

cracking, NaOH or CaO is used as the catalyst, better results being obtained with the stronger alkali (NaOH). At 800°F. rapeseed oil yields 56-25% of crude oil, of which 52-7% belongs to the gasoline fraction. In either of these processes, a higher fraction obtained on redist. the crude oil resembles kerosene and can be used in its place. By mixing the crude oil with the vegetable oil itself, an oil suitable for use as fuel oil in Diesel engines is obtained.

Motor fuels of high-octane-blending value produced by thermal process. P. C. Keith, Jr., and J. T. Ward, *Oil and Gas J.* 34, No. 28, 36, 37, 39 (1935). J. R. Strong Sulfur compounds present in motor fuels affect lead responsiveness. W. A. Schulze and A. E. Buell, *Oil and Gas J.* 34, No. 21, 22-4 (1935).—See C. A. 29, 8306*.

Petroleum refiners view development of high-speed Diesel-engine fuel. Wm. Mendius, W. Ainslee and C. H.

Schlesman *Oil and Gas J.* 34, No. 26, 76, 70-80(1935).—The specifications for Diesel fuels are given. Two grades of Diesel fuel are thought to be sufficient if the engine builder would cooperate with the refiners. J. R. Strong

Characteristics of internal-combustion engines using butane-air mixtures C J Vogt *Oil and Gas J.* 34, No. 26, 52, 54, 56(1935). J. R. Strong

Cost of operating automotive Diesels compared with gasoline motors C G Anthony *Oil and Gas J.* 34, No. 27, 35-36(1935).—A shows graphically that operation of Diesel-powered trucks costs 72% as much as gasoline trucks. J. R. Strong

Fuel for high-speed Diesels G C Wilson *Power* 79, 553(1935), cf C A 29, 7609¹.—Typical Diesel-fuel specifications are tabulated. Viscosity and ignition characteristics are the 2 most important properties. Cetene no. for fuels from Am. crude oils are 33-75 and 35-55 for gas oils from cracked stocks. Alden H. Emery

The qualities of fuels for Diesel motors I J. Mesurier and R. Stanfield *Rev. Combustibles liquides* 13, 291-8(1935), cf C A 28, 7495¹.—The construction of very sensitive motors has led to the adoption of too restrictive specifications for fuel, based on incomplete theory. From the conclusions of the committees of the various societies, the readiness of combustion and viscosity is the most important. Too much importance is placed on the distn. curves. Lab. tests for C residue are not sufficiently indicative, a 4% (Conradson method) residue fuel having functioned satisfactorily for 7000 hrs. The corrosion effects of S are negligible, especially when contrasted with other elements of wear, up to 2% S. For ash and sediment, ordinary filtration is insufficient. For hard asphalt, 1% is the max. Halsey B. Sullivan

Factors of regulation of Diesel motors. René Rataec. *Rev. Combustibles liquides* 13, 338-51(1935).—Photomicrographs are shown of sprays of liquid fuels in which different types of injectors are used. H. E. S.

Characteristic regulations of various countries concerning dissolved cylinder acetylene. Bloch-Sée and Pierre Rosenberg *J. acetylene* No. 95, 980-93(1935).—A summary of the cylinder acetylene regulations in the following countries: Germany, England, Australia, Austria, Belgium, Canada, Spain, U. S., Egypt, France, Greece, Holland, Hungary, Italy, Japan, Morocco, Norway, Poland, Portugal, Switzerland, Syria, Tunis, Czechoslovakia, Yugoslavia, U. S. S. R. and International (Convention of Berne, 1924). Albert S. Carter

Conversion of methane to acetylene. M. C. Simon *J. acetylene* No. 94, 973-77(1935).—A review. Albert S. Carter

Use of calcium carbide in low-temperature fractional distillation. J. Arnoul de Grey. *J. acetylene* No. 96, 1005(1935).—In the destructive distn. of low-grade fuels, e. g., French lignites, CaC₂ was added up to 5%. In proportions up to 2%, improvement was observed; a 57% increase was obtained in oil b. below 220° with 100% increase in gasoline cut (essence) after phenol removal and refining. Albert S. Carter

Some coal researches—their significance to the coal industry A McCulloch *Chemistry & Industry* 1935, 997-1004.—A review of the work done in pure coal research on the action of solvents, oxidizing agents and Cl on coal and coal carbonization. Joseph H. Wells

The "Chance" sand-flotation system of washing coal A B Price *Iron & Coal Trades Rev.* 131, 719-21, 762-3(1935). D. S.

The clarification of washery water and the recovery of coal slurry J L. Lewis *Colliery Guardian* 151, 895-7(1935). E. H.

"Sensitization" and other observations on slurry flocculation E T. Wilkins *J. Soc. Chem. Ind.* 54, 391-37(1935).—Starch and gelatin are good flocculators for coal washery slurries. Starch is capable of flocculating suspensions of closely graded coal particles up to 0.3 mm diam. Negatively charged slurries appear to be flocculated by either negatively or positively charged gelatin. Wetting agents had little effect on the settling rate of a slurry. Certain difficult slurries could be sensitized by

the addn. of wetting agents so that they became more easily flocculated by starch or gelatin. J. H. W.

The determination of nitrogen in coal by the Kjeldahl method, using selenium as a catalyst H E. Crossley, *J. Soc. Chem. Ind.* 54, 397-97(1935).—The effects of the rate of heating, moisture, temp. of the boiling soln. and the after-boiling period were investigated. The following modified Kjeldahl method was developed: Thirty cc. of concd. H₂SO₄ is added to a mixt. of 1 g. coal, 20 g. K₂SO₄ and 0.2 g. Se. The flask is loosely stoppered with a glass bulb and heated at a predetd. rate. This rate shall be the min. one of the min. time of clearing. Digestion is carried out for 1 hr. after clearing and the N detd. as usual. Joseph H. Wells

Dust in coal mines, its formation and control. A. M. Bryan. *Iron & Coal Trades Rev.* 131, 807-10(1935). D. S.

Selection of steam-generating equipment to preparation, selection and burning of bituminous coal E G Bailey *Am. Inst. Mining Met. Engrs. Contribution* No. 93, 10 pp(1935). Alden H. Emery

Purified steam economics. Frederick C. Straub *Paper Ind.* 17, 572-4(1935).—A discussion of the difficulties which may be caused by impurities in steam, and of the economies effected by purifying steam. A. P. C.

Marshland utilization and peat cooking W. Wielandt. *Angew. Chem.* 48, 632-6(1935); cf. Boyle, C. A. 29, 5251¹.—A comprehensive discussion of the economic and tech. aspects of the problem. Karl Kammermeyer

Further experiments upon the water-gas process J. G. King, B. H. Williams and R. V. Thomas *Depts. Sci. Ind. Research, Fuel Research Tech. Paper* No. 43, 58 pp(1935), cf. C. A. 26, 2302¹.—Clunker accumulation in the generator is eliminated by keeping the temp. of the hottest part of the fuel bed sufficiently low to avoid fusion of the coke ash into hard conglomerate masses and by keeping the zones of high temp. away from the walls of the generator by inducing the air currents to flow mainly in the center of the coke charge. Under these conditions the output may be reduced by about 50% but the thermal efficiency increases about 20%. The higher the fusion temp. of the ash the less is the reduction in output. For greater efficiency during the blow cycle, the rate of blowing should be as great as practical limitations allow, the period of blowing being reduced so that the optimum temp. is not exceeded. In this way the percentage of CO and other thermal losses are reduced. Alteration of the size of the coke between 2- and 3 in. pieces and from 0 to 1-in. breeze has only a slight effect upon the thermal efficiency of the process. A greater output can be obtained with the smaller coke by increasing the vol. of air per blow. Gas cokes made in horizontal and vertical retorts from the same coal behave nearly alike. The thermal treatment to which the coke is subjected in the upper part of the generator levels out any differences that may originally exist. Low-temp. coke behaves differently owing to its greater activity to CO₂ during the blow and its higher content of volatile matter. Joseph H. Wells

Dew point of flue products from manufactured gas combustion. Jesse S. Yeaw and Louis Shindman *Ind. Eng. Chem.* 27, 1476-9(1935).—Expts. were carried out to det. the actual condensation temp. (dew point) of flue gases from combustion of manifold gas as compared with the calcd. temps. The true dew points were found to be about 10° higher than the calcd. temps. with no excess air. The difference is attributed to the effect of SO₂ derived from the combustion of 9 grains of S per 100 cu. ft. of the manifold gas. J. W. Shipley

Improved low-temperature analysis for measuring gas residue content W. W. Robinson, Jr. and F. N. Laird *Oil and Gas J.* 34, No. 28, 26-27(1935).—R. and L. describe improved app. for measuring residue on low-temp. analysis of gas. This eliminates the inaccuracy of empirically calcd. the residue as hexane in the case of wet gas and pentane in the case of dry gas. J. R. S.

Rubber in the gas industry (Austen) 30 Pulverized coal for blast-furnace use (Campbell) 9 System for fractionating natural gas and other gas mixtures by liquefaction (Ger. pat. 620,077) 1 NH_4 sulfate from acid sludge [from treating tar with H_2SO_4] (U. S. pat. 2,022,813) 18 Catalysts [for hydrogenation] (Brit. pat. 434,141) 18

Motor fuel Rudolf Pawlikowski. Ger. 620,259, Oct. 17, 1935 (Cl. 23b 4 02) In the manufacture of powdered coal or coal-oil mixtures for use as motor fuel, the powdered coal is pretreated by sepg. it by a known wet sepg. process into fractions of high- and low-ash content, the latter fraction being then reground in a liquid. Various details are given.

Liquid fuel Arthur A. Roberts. Brit. 434,109, Aug. 27, 1935 Fuel for burners or Diesel engines is obtained by emulsifying a minor proportion of H_2O in oil fuel by means of casein or a carbohydrate colloid, e. g., starch. Agents controlling combustion, e. g., B compounds and (or) NaCl , and C_2H_4 to reduce the viscosity, may be added. Cf. C. A. 30, 598²

Liquid fuel Arthur A. Roberts and Clifford W. Smith (legal representatives of Arthur A. Roberts, deceased). Brit. 434,180, Aug. 27, 1935. Divided on 433,348 (C. A. 30, 598²) Liquid fuel, e. g., oil or coal-oil suspensions, has a B compound insol. in H_2O or oil distributed therein to control combustion or increase the effective temp. of combustion. Up to 10% of H_2O may be added; the viscosity may be reduced by a "cutback," e. g., C_2H_4 . In an example, 40 lb. of coal passing a 200-mesh screen is stabilized in 55 lb. of petroleum oil by 0.2 g. casein in 0.6 g. H_2O , together with 1% of a borosilicate.

Atomizer for liquid fuels. John G. McKean and Robert F. Jones. U. S. 2,023,767, Dec. 10 Structural and operative details.

Hydrogenating carbonaceous materials International Hydrogenation Patents Co. Ltd. Brit. 434,624, Sept. 5, 1935 This corresponds to Fr. 775,202 (C. A. 29, 2066⁴), all parts of the app. coming into contact with the hot reagents being so coated.

Hydrogenating carbonaceous materials International Hydrogenation Patents Co. Ltd. Fr. 780,937, Sept. 14, 1935. In treating carbonaceous materials with hydrogenating gases in the presence of halogen, halohydric acids or compounds, capable of liberating halogen or halohydric acids under the conditions of working, e. g., PHCl , CCl_4 , NH_4Cl or HCl , the reaction is carried out in the presence of finely powdered metals disseminated in the materials treated. Fe, Ni, Co, Zn, Al, Sn, Pb, Cd, Cr, Mn, Ti, Ag, Cu, Mg, Be, Ge, or alloys such as bronze, magnalium or Al bronze may be used.

Destructive hydrogenation. International Hydrogenation Patents Co. Ltd. Brit. 434,307, Aug. 29, 1935 In the destructive hydrogenation of coal dispersed in oil, the dispersion is heated in a preheater so that the time of sojourn therein at 200–410° is less than 200 sec., preferably less than 100 sec. The time of sojourn in the range 370–410° is preferably more than 20–40 sec. The time of sojourn is adjusted by adding H at different points in the preheater or by adjusting the dimensions of the preheater.

Vertical retorts. Frederick J. West, Ernest West and West's Gas Improvement Co. Ltd. Brit. 434,562, Sept. 4, 1935 A carbonizing retort with a minor axis of normal length has its major axis dimension considerably increased and is provided, at the lower end, with 2 vertical helical

coke extractors arranged side by side in the direction of the major axis and driven in unison from a common shaft.

Vertical retort settings John Roberts. Brit. 433,702, Aug. 19, 1935 The setting comprises superposed sets of intercommunicating horizontal heating flues supplied by burners which are so set and spaced that a general circulation of heating gas is maintained at high velocity.

Oven for the production of gas and coke Didier-Werke A-G Ger 617,739, Aug 26, 1935 (Cl 26a 1 02)

Revivifying gas purifier waste Gastechnik G. m b H Brit 433,823, Aug 21, 1935 In the removal of S compounds from gases by passage of the gas through layers of porous bodies, comprising mainly Fe(OH)₃, and subsequent regeneration of the porous bodies by aeration, only completely sulfided layers are so treated. The formation of S shells around the porous bodies as a result of the rapid alternation of sulfation and aeration is thus avoided.

Removing sulfur dioxide from flue gases Henry I Johnston (to Board of Trustees of the Univ of Ill) U S 2,021,936, Nov 26 The gases, contg free O, are washed with a soln. contg ferric and Mn ions in soln as catalysts and promoters to increase the oxidation of the SO₂ into H₂SO₄ by the free O in the gases, the concn of the ferric ions being greater than that of the Mn ions. App is described and such app is claimed in U. S. 2,021,937.

Tar Lonza Elektrizitätswerke und Chemische Fabriken A-G Brit 433,248, Aug. 12, 1935 In treating

tars for obtaining binders suitable for roadmaking, insulation purposes, etc., by subjecting them, contg thickening agents, to an oxidizing treatment at elevated temp, while stirring the mass, the lighter oils, boiling up to 170°, are distd. off and the middle and heavy oils, of b p 170-350°, are retained in the reaction mass during the oxidation process or returned to the same after the oxidation. Bitumen, asphalt, artificial or natural resins or PhOH-aldehyde condensation products, which last may be formed *in situ*, are used as thickening agents. App is described.

Fractional distillation of tar, etc Thermal Industrial and Chemical (T. I. C.) Research Co Ltd, Wm. J. Chadder and Wm. H. Miller Brit 434,541, Sept 4, 1935, Fr. 786,783, Sept. 9, 1935 In the fractionation of tar, C₁₂H₁₀, etc., the condensate and the vapor leave the dephlegmator through a common outlet and flow to a separator. The app. comprises a distn. column integral with a dephlegmator chamber communicating through 1 or more ducts extending within the chamber of the upper part thereof, a condensing worm being arranged in the chamber so that condensate cannot enter the ducts.

Pitch Alexander Wacker Gesellschaft für elektrochemische Industrie G m b H Brit 433,826, Aug 21, 1935 See Fr. 773,577 (C A 29, 16147)

Pitch and tar Thermal Industrial and Chemical (T. I. C.) Research Co Ltd. and Carl O. Condurp. Brit. 432,998, Aug. 7, 1935 Gums, i. e., sticky or resinous materials, are obtained by distg. tar down to a hard pitch residue, removing an oil fraction boiling above 325°, treating the fraction with a reagent, e. g., an acid or alkali, sepg. the gum-contg. layer from the oily layer obtained, and recovering the gums therefrom.

Coke Eduard Deisenhammer and "Salvus" A-G für Nahrungsmittel und chem. Ind. Austrian 143,090, Oct 19, 1935 (Cl 10c) Coal of low-bitumen content, from which coke of poor quality only is ordinarily obtained, is mixed with about 8-10% of natural or artificial bitumen or like material and then coked at above 500° and a pressure above 2 atm. Hard coke is obtained. Sp. processes are described.

Means for compressing coal in coke-oven chambers Gustav Hilger. Ger. 620,398, Oct 21, 1935 (Cl 10a 15)

Addn to 610,659 (C A 29, 56367).

Means for compressing coal in discontinuously operated coke ovens Gustav Hilger Ger 618,970-1, Sept 19, 1935 (Cl 10a 15) Addns to 610,658 (C A 29, 56367).

Coke ovens Gwynne Cellan-Jones Brit 432,777, Aug 1, 1935 A heating-wall comprises vertical up burning combustion flues interspersed between, and connected at their upper ends to, downcast flues adjacent to the oven walls.

Coke ovens Carl Stull G m b H. Brit. 434,403, Aug 30, 1935. In the production of low- or medium-temp coke, the oven chamber is divided along its length into a no. of radiation spaces between which the fuel is contained and carbonized.

Coke ovens of the retort type The Koppers Co of Delaware. Fr. 788,585, Sept. 5, 1935

22—PETROLEUM, LUBRICANTS, ASPHALT AND WOOD PRODUCTS

W. F. PARAGHER

Laboratory investigations on acid treatment of oil sands F. B. Plummer and R. B. Newcome, Jr. Am Inst Mining Met Engrs Contributions No 83, 13 pp. (1935)—Acid treatment of fine-grained, impure limestone (common in reservoir rocks) results in large loss in permeability, because of clogging of pores by very fine insol. residues of acid-insol. silicates mixed with a little colloidal SiO₂ and traces of colloidal org. matter.

Alden H. Emery The development of torbanite in South Africa. W. Duff S. African Mining Eng. J. 46, Pt. II, 103-7 (1935)—The origin of oil shale and torbanite, mining methods and various types of retort for the recovery of oil are reviewed.

The bleaching action of fuller's earth E. Erdheim Petroleum Z 31, No 29, 7-8 (1935); cf. C. A. 29, 8303—Decolorizing tests were made with a natural bleaching agent, fuller's earth; an activated bleaching agent, Montana Z; and an activated charcoal, Nucbar. After decolorization, the bleaching agents were extd. with alc. The color of the ext. and the residue after evapn. indicated that the decolorization with fuller's earth gives a color lake.

Modern contact filtration and pressure filters C. E. Mossman Petroleum Z 31, No 23, 1-7 (1935)—Lubricating oil is clarified by a combination H₂SO₄ treatment and contact filtration with fuller's earth. The process and equipment used are shown in the form of a flow-sheet.

The method of prep. and activating the fuller's earth are discussed. A Turbo-mixer is used to agitate the fuller's earth and the acidified oil. Pressure filters of the Sweetland or Kelly types are more frequently used to sep. the finely divided fuller's earth from the oil. Characteristics of the filters and accessory equipment of the process are discussed. C. B. Jenni

Gasoline survey for 1934. H. McD. Chantler. *Can. Dept. Mines, Mines Branch Rept. No. 764*, 22 pp (1935).—Detailed analyses of 117 samples of gasoline are given. The knock rating of the av. gasoline sold in 1934 was 66 octane no. The av. Reid vapor pressure was 7.5 lb per sq. in. Less than 5% of the samples contained more than 10 mg. of gum per 100 ml. All but 1 gave a neg. corrosion test by the Cu strip. There was an increase in volatility. Alden H. Emery

Hydrogenation at Billingham. Anon. *Steam Engr. 5*, 76-7, 80(1935).—The yield of gasoline from coal is 60-70% by weight; from low-temp. tar and creosote oil, 60-90%. Output is 100,000 tons of gasoline from coal per yr. and 50,000 tons from creosote oil and low-temp. tar. Four tons of coal is used to give 1 ton of gasoline. Raw coal is cleaned to less than 2 1/4% ash, and mixed with oil to give a 50% paste. This mixt. is treated at 450° and 230 atm. pressure. Alden H. Emery

Synthetic gasoline from carbon monoxide and hydrogen. I. S. Tsutsumi. *Rept. Imp. Fuel Research Inst. Japan No. 31, J. Fuel Soc. Japan 14*, 110-16 (in English) (1935).—The paper includes: (1) general procedure; (2) effect of conditions upon the gasoline yield, such as effect of reaction temp., gas velocity and compn. of raw gas; (3) research on catalysts, such as effect of carrier (catalysts used are Ni-Mn, Ni-U, Co-Cu, Co-Ni-Cu and Co promoted by Ag; and (4) mechanism of gasoline formation from CO and H₂. Summary: An optimum reaction temp. and gas velocity for the formation of gasoline exist. It is preferable to use a gas mixt. contg. an excess of H over CO; H₂ = 1:2. The catalyst prep. from acetate showed the same activity as that from nitrate. Ag was found to be superior to Cu as a promoter. F. I. N.

Continental methods of testing lubricating oils. A. Kufferath and Edmund R. Thews. *Can. Chem. Met. 19*, 305, 321(1935).—A brief review. W. H. Boynton

Pressure resistance of lubricating oils. Theodor Rabunovich. *Petroleum Z. 31*, No. 28, 9-14(1935).—Theories of lubrication are reviewed. The moment of rotation of an expl. shaft was measured by a torsion dynamometer. The temp. of the lubricating layer was measured by a thermometer and the load by a lever transmission. The chief advantage of the machine is its adaptability. Test procedure and data are discussed in detail, along with the calcn. and expression of results. Relations between temp. increase and av. surface pressure for oils of different viscosities are plotted. C. B. Jenni

The determination of the bromine or iodine number of mineral lubricating oils. Emil E. Casimer and M. Dimitriu. *Petroleum Z. 31*, No. 33, 1-4(1935).—The McIlhenny and Wijs methods are used to det. the degree of unsat. of an oil. In the McIlhenny Br method, secondary reactions may produce HBr and cause erroneous results. Moisture in the reagents, instability of the Br derivs. of some hydrocarbons, relation of time of reaction and excess Br, and the effect of the compn. of the solvent are contributing factors to the irregularities mentioned. Data are given for the addn. and substitution indices for a few Roumanian, French and American lubricating oils, as detd. by the McIlhenny method. Significance of the time of reaction and excess halogen by the Wijs method is also noted. C. B. Jenni

Lubricating grease—a technical material—methods of manufacture. R. N. Smith. *Can. Chem. Met. 19*, 302, 304(1935).—Methods are outlined of prep. several types of grease, such as lime-base cup-grease, soda-base grease, semisolid grease, Al-base and Pb-base grease, solid lubricant and high-pressure grease. W. H. Boynton

Graphite lubrication and bearing metal. W. Lenx. *Petroleum Z. 31*, No. 33, 14(1935).—A brief review of the

literature on the use of graphite as a lubricant. The kind of bearing material is no more important in graphite lubrication than in oil lubrication. C. B. Jenni

The use of oils and fats and lubrication. Rudolf Pläcker. *Svensk Papperst.-Tidn. 62*, 791-2(1935).—Factors detg. the selection of lubricants for various purposes are discussed. J. W. Perry

Selection and use of lubricants for mining plant and machinery. Wilfred E. Gooday. *S. African Mining Eng. J. 46*, Pt. I, 803-4(1935). Alden H. Emery

Color testing of bitumen. D. M. Wilson. *Chemistry & Industry 1935*, 1040-2.—The prepn. of solns. in different solvents, and an app. with a photoelectric cell for measuring the light transmission is described. Data on various bitumens are given and the value of the method in testing and control is discussed. E. R. Rushton

Analysis of bitumen- and tar-mineral mixtures. H. Nussel and H. Henneke. *Bitumen 5*, 143-9(1935).—The detn. of free C in tar and insol. org. matter in bitumen is considered. Insol. matter from the extd. mixt. can be analyzed either by combustion or by oxidation with H₂SO₄ satd. with CrO₃. Practical examples and results are given. C. B. Jenni

The economic-technological importance of bitumens to German industry. Th. Temme. *Bitumen 5*, 161-6(1935).—Methods of obtaining bitumens from petroleum are briefly reviewed. Applications in road construction are described. Other uses discussed include bituminous paints, roofing paper, binding agents, insulating papers, cable coatings, insulating materials and rubber. C. B. Jenni

Plastic properties of asphalt bitumen. R. N. J. Saal. *Chem. Weekblad 32*, 435-41(1935).—A short review of the properties of asphalt bitumens, particularly dealing with methods for detn. of τ -D curves (Couette, Pochettino, torsion and capillary viscometers). For low shear stresses the Couette app. is used, for high stresses the pressure capillary meter is preferred and the results are interpreted in τ -D terms (S. and Koenig, C. A. 27, 2795). The temp. sensitivity, elasticity and thixotropy of several asphalt species were studied and curves for their behavior are given. The general conclusions are: asphaltic bitumens have differences in hardness as well as in type. Usually, high-temp. sensitivity, low plasticity, elasticity and thixotropy go together and vice versa. The result as applied to routine detns. show that for nonplastic asphalts, penetration and viscosity η are related: $\eta = (5.1 \times 10^4) / \text{penetration}^{1.1}$ poises. The ring and ball temp. corresponds to a 10-20 000 poise viscosity. High plasticity usually accompanies a flat ductility-temp. curve. B. J. C. van der Hoeven

Resin extraction in German forests by a new process. M. Hesseland. *Angew. Chem. 48*, 636-9(1935).—Exptl. large-scale results on *Pinus sylvestris* are reported. The outer rough bark of the tree is first removed for 1/2 of the diam., care being taken not to injure the cambium. Then 2 incisions at right angles are made and a vertical incision is made downward from the apex (further pairs of incisions are added at intervals of 10 to 14 days). The incisions are then stimulated with some inorg. acid, alkali or salt; e.g., 3-5 drops of 25% HCl. Stimulation resulted in increased yields without impairing the quality of the sap, which had an approx. compn. of 23.4% of oil of turpentine, 70.4% of resin and 5.7% of H₂O. The oil of turpentine b. 160-200° (50% at 163°) and had a d₂₀ of 0.863, and a sp. rotation of +20.6° at 20° [p]. Cost calcns. are appended. Four references. K. K.

Petroleum refiners view development of high-speed Diesel engine fuel (Mendius, et al.) 21. Waxes—mineral (Mellan) 13. Origin of petroleum (Krejci-Graft) 8. App. for treatment of substantially immiscible liquids as in treating oil fractions with H₂SO₄ (U. S. pat. 2,022,205) 1. Emulsifying and dispersing agents (Brit. pat. 434,424) 13. Torpedo for shooting oil wells (U. S. pat. 2,023,831) 24. NH₄ sulfate from acid sludge [from treating oil with H₂SO₄] (U. S. pat. 2,022,813) 18.

Solvent extraction of petroleum John V. Starr (to Standard Oil Development Co.). U. S. 2,022,259, Nov. 26. Various details of app. and operation are described for countercurrent treatment as in the treatment of petroleum oils with a solvent such as phenol, SO_2 , etc.

Sweetening petroleum oils Walter A. Schulze and Lovell V. Chaney (to Phillips Petroleum Co.). U. S. 2,022,942, Dec. 3. For improving petroleum oil contg. S compds with oxidizing properties which have been formed during the sweetening of the oil with an alk. hypochlorite soln., a mercaptan is added to the oil while it is out of contact with the hypochlorite soln. so that such S compds are converted into disulfides.

Chlorinating petroleum hydrocarbons Benjamin Galls-worthy (to Texas Co.). U. S. 2,022,619, Nov. 26. A lubricating oil or paraffin wax is treated with an aq. soln. of HCl and HOCl at a temp. of about 65-93° and under a pressure of 25-500 lb per sq in. App. is described.

Stabilizing cracked petroleum distillates LeRoy G. Story (to Texas Co.). U. S. 2,023,385, Dec. 3. Deterioration and gum formation on storage are inhibited by adding about 0.01-0.1% of a diaminophenol such as 2,4-diaminophenol.

Cracking petroleum oils Charles B. Buerger (to Gulf Refining Co.). U. S. 2,023,063, Dec. 3. Oil to be cracked is passed through a serially arranged tubular heater, and is heated to cracking temps. in one zone of the heater subjected to the hottest gases of a furnace, and is further heated in a 2nd zone of the heater subjected to furnace gases already used in the first-mentioned zone (the oil and gases passing countercurrentwise in the 2nd zone) and the heated oil is delivered to other app. for further treatment. Various features of app. arrangement are described.

Cracking oils Fritz Uhlmann (to Aktis A.-G.). U. S. 2,023,754, Dec. 10. Oil or oil vapor is passed over coke within a high-frequency field, and at the same time water is "cracked" by electrolysis within the high frequency field to liberate H_2 for combining with the oil vapors. App. is described.

Cracking hydrocarbon oils Wm. L. Gornory (to Standard Oil Development Co.). U. S. 2,022,280, Nov. 26. Oil is heated to cracking temp. in a coil, passed to a vaporizing zone from which a reflux condensate is collected which is subjected to distn. in a sep. reflux stripping zone, an unvaporized liquid fraction from the latter being passed to the heating coil. Uncondensed vapors from the vaporizing zone are fractionated in a sep. fractionating zone, and the vapor fraction evolved in the reflux stripping zone is in part conducted to the vaporizing zone and in part to the fractionating zone, vapors from the fractionating zone are removed and condensed. App. is described. Cf. C. A. 29, 5907.

Cracking hydrocarbon oils Gustav Egloff (to Universal Oil Products Co.). U. S. 2,022,803, Dec. 3. A vaporous mixt. of hydrocarbons such as vapors from a fuel oil is fractionated to obtain relatively heavier and lighter cuts of higher b. p. than gasoline, a portion of the heavier cut is heated to a cracking temp. while maintained under sufficient pressure to retain a substantial portion in the liquid phase, the lighter cut is separately cracked in the vapor phase by heating it to a higher temp. than the heavier cut; another portion of the heavier cut is diverted from the liquid phase heating step and introduced to the lighter cut after the vapor-phase cracking of the latter, and the commingled vapors are subjected to dephlegmation and condensation. App. is described.

Cracking hydrocarbon oils Lev A. Mekler (to Universal Oil Products Co.). U. S. 2,022,810, Dec. 3. Vapors formed in another stage of the process are passed to a fractionating zone where they are fractionated in contact with charging oil to form a mixt. of charging oil and primary reflux, and the vapors are further fractionated out of contact with charging oil to form a relatively light secondary reflux, the mixt. mentioned is passed through a heating zone and heated to a cracking temp. under sufficient pressure to maintain a substantial portion in the liquid phase, and, simultaneously, a substantial portion of the secondary reflux is vaporized and the resultant

vapors are heated independently of and to a higher cracking temp. than the mixt. mentioned; the thus heated vapors and the heated mixt. mentioned are introduced into an enlarged reaction zone maintained under cracking conditions of temp. and pressure, the vaporous and liquid conversion products are removed as a mixt. from the reaction zone and the pressure on them is lowered; vapors and residue are sep'd. under the reduced pressure, and the vapors are fed to the fractionating zone as first mentioned, the fractionated vapors being finally condensed. App. is described.

Cracking hydrocarbon oils I. G. Farbenmnd. A.-G. (Georg Stern and Robert Hasenclever, inventors.). Ger. 617,710, Aug. 24, 1935 (Cl. 23b. 1.04). Heavy oils are vaporized and heated with a large amt. of the vapor of oils of lower b. p.

Cracking heavy hydrocarbon oils Neal S. Olsen (to Universal Oil Products Co.). U. S. 2,023,205, Dec. 3. A mixt. of oil such as an asphaltic base oil and a finely divided hydrogenating catalyst such as finely divided Fe is heated to a cracking temp. under pressure, atomized with H_2 and the atomized mixt. is subjected to a temp. of about 425-605° under a pressure in excess of 1000 lb per sq in. App. is described.

Distilling and cracking hydrocarbon oils Guy O. Shefstad (to Texas Co.). U. S. 2,023,619, Dec. 10. App. and procedure are described involving passing charging stock as a crude petroleum contg. crude residual constituents, lower-boiling constituents and natural gasoline fractions through a heating coil to heat the oil to a temp. to vaporize a given fraction, passing the heated oil into a distg. and fractionating zone under approx. atm. pressure, fractionating vapors thus evolved to sep. a distillate contg. natural gasoline fractions, taking off the stripped oil and passing it, under superatm. pressure, through a coil heated to a cracking temp. and thence into an enlarged chamber maintained under a relatively high pressure and at a cracking temp. and thence passing vapors to a fractionating column under pressure materially greater than that in the distg. and fractionating zone mentioned, to form an overhead vapor fraction and a reflux condensate. The reflux condensate is passed into the distg. and fractionating zone to strip from it the lower-boiling constituents and combine the heavier portions with the liquid in such zone, and the combined liquid is thence passed to the cracking coil as charging stock.

Cracking heavy naphtha Arthur E. Pew, Jr. (to Sun Oil Co.). U. S. 2,021,923, Nov. 26. A heavy naphtha having a crit. temp. within its cracking range but below the temp. at which it can be effectively cracked is heated, as a continuously flowing stream, to a temp. within its cracking range and so close to but below its crit. temp. as to effect a rise in its crit. temp. and the temp. of the oil in the flowing stream is increased, while still maintaining it below its rising crit. temp., and a suitable pressure is maintained.

Apparatus for cracking hydrocarbon oils Universal Oil Products Co. Ger. 617,950, Aug. 29, 1935 (Cl. 23b. 1.04).

Polymerizing olefins in an oil-cracking process Frederick W. Sullivan, Jr. (to Standard Oil Co. of Ind.). U. S. 2,022,221, Nov. 26. Various details of app. are described and of a process in which a stream of oil is cracked in the presence of recycled normally gaseous hydrocarbons formed in the process and from which substantial amts. of H_2 and CH_4 have been removed and in which unsat'd. hydrocarbons are polymerized and included in the final product to obtain a gasoline of relatively high antiknock properties. Various details of sepn., fractionation, etc., are described.

Return bend suitable for hydrocarbon-oil-conversion apparatus Andrew T. Dudley (to Texas Co.). U. S. 2,023,805, Dec. 10.

Hydrocarbon-oil conversion Richard F. Trow (to Texas Co.). U. S. 2,023,775, Dec. 10. A flowing stream of clean oil such as a clean gas oil is heated to a high temp. of conversion, transferred to enlarged zones whence evolved vapors are transferred to a coil in which they are heated to a temp. higher than that to which the stream of

oil is heated; a depositing residue is withdrawn from the enlarged zones, highly heated vapors are removed from the coil and commingled with a cooler portion of the charge oil to heat the latter to a conversion temp.; the residue withdrawn from the enlarged zones is commingled with the vapors and admixed oil, the commingled products are passed into a reaction and distn. vessel, a stream of charge oil is delivered into the upper portion of this vessel, resultant total vapors are scrubbed in the distn. zone, and the scrubbed vapors are transferred and fractionated to develop an overhead ultimate motor fuel and the clean oil first mentioned while withdrawing residue from the reaction and distn. vessel. App. is described.

Purifying acid-treated light hydrocarbon oils to remove sulfonic esters Francis M. Archibald and Philip Janssen (to Standard Oil Development Co.). U. S. 2,022,208, Nov. 26. The oil is subjected to flash distn. in the presence of previously sepd. sulfonic esters which catalytically promote the liberation of further quantities of sulfonic esters, and the purified oil distillate and sulfonic esters are separately removed. App. is described.

Hydrocarbon oxidation products Standard Oil Development Co. Brit. 434,311, Aug. 29, 1935. Petroleum or slop wax is treated to reduce its oil content to 25% or less and is then oxidized, either directly or after distn., which may be accompanied or followed by cracking or dehydrogenation. The reduction of the oil content may be effected by extrn. with a selective solvent for the oil. The wax may then be distd. without decompn. at 600°F., or it may be cracked at 850-900°F., at atm. or reduced pressure. Dehydrogenation may be effected at 850-900°F. at atm. or slightly raised pressure in the presence of a catalyst, H may be present during dehydrogenation. Oxidation is then effected in the liquid phase at below 400°F. with air or other gas contg. free O. Al-lined vessels may be used and a catalyst may be present.

Hydrogenating oils I. G. Farbenindustrie A.-G. (to International Hydrogenation Patents Co. Ltd.). Brit. 433,593, Aug. 16, 1935. Addn. to 424,531 (C. A. 29, 5239). In refining hydrocarbons contg. unsatd. compds., by a 1st stage hydrogenation at below 300°, followed by a 2nd stage treatment at higher temps. and pressures, as described in 424,531, the 2nd stage is carried out under atm. or low pressures up to 20 atm. A fraction, boiling at 100-200°, of the products obtained by cracking gas oil at 100° is led with H under 50 atm. and at 200° over WC. The products are led with H at atm. pressure and 400° over a catalyst produced by treating Ni molybdate with H₂S at 450°.

Refining mineral oils Clarence R. McKay and John H. Smith (to Sinclair Refining Co.). U. S. 2,022,338, Nov. 26. For refining and stabilizing of color, a metal hydrosulfide such as Ca(OH)₂ is added to an acid-treated oil so as to effect consolidation of the sludge without fully neutralizing the morg. acid in the oil, the sludge is settled, and the clarified oil is treated with a solid adsorbent material such as infusorial earth while heated, and then sepd. App. is described.

Refining mineral oils Willem J. D. van Dyck (to Shell Development Co.). U. S. 2,023,375, Dec. 3. An oil such as one already treated with liquid SO₂ is extrd. with a solvent comprising an org. compd. other than a nitrated monocyclic aromatic hydrocarbon, which contains a nitro group, such as nitromethane, an org. compd. other than a thiocyanate which contains a —CN group, such as propionitrile or benzonitrile or with methyl thiocyanate, which serve to sep. paraffinic and naphthenic compds. Several examples are given.

Fractionating mineral oils by solvent treatment Willem J. D. van Dyck (to Shell Development Co.). U. S. 2,023,109, Dec. 3. An oil such as a lubricating fraction and at least partially immiscible solvents such as benzene and liquid SO₂ or MeOH and CS₂ are brought into contact with each other in counterflow. App. is described.

Apparatus for refining mineral oils Aktiebolaget Separator-Nobel. Brit. 433,584, Aug. 16, 1935. In the continuous refining of oils by acid, the tanks, pipes, mixers and other app. are so vented that gas pockets

are not formed, any gases being carried off by the mixt. or escaping at suitable points of the system. App. is described.

Mineral- or tar-oil compositions Kerasin A.-G. Ger. 620,260, Oct. 17, 1935 (Cl. 23c. 3). Comps. which are solid at atm. temp. are obtained by mixing mineral or tar oils with small proportions of soap (3-6%) and beeswax (3-10%) at a moderately raised temp. The soap is preferably a Na soap, and is advantageously added in an org. solvent, e. g., alc. The beeswax may be replaced in part by paraffin wax, but at least 1% of beeswax must still be used. Appropriate addns., e. g., perfumes or therapeutic substances, may be included in the compns., which may be used, e. g., for cosmetic or medicinal purposes or as lubricant greases.

Pour-point reduction of mineral oils Hyman Limburg (to Shell Development Co.). U. S. 2,023,309, Dec. 3. For obtaining a soln. of concd. pour-point-reducing substances from a mixt. contg. them such as wool fat, the substances desired are sepd. from the mixt. with an adsorbing agent such as paraffin or silica gel and the latter, with adsorbed substances, is sepd. and treated with a solvent such as pyridine in which the pour-point-reducing substances readily dissolve.

Low-pour-point mineral-oil composition suitable for lubrication Adrianus J. van Peski (to Shell Development Co.). U. S. 2,022,900, Dec. 3. A wax-contg. mineral oil is used with an admixt. of a relatively small proportion (suitably about 0.5%) of a condensation product (such as that of sucrose and stearic acid) which serves to lower the pour point of the oil and which is derived from a sugar having at least one cyclic nucleus and not more than 2 monosaccharide groups in its mol. and an aliphatic acid.

Hydrometer suitable for use with a stream of hydrocarbon distillate Oscar H. Fairchild (to Universal Oil Products Co.). U. S. 2,023,196, Dec. 3. Structural details.

Countercurrent system suitable for treating oils with sulfonic acid Evert T. Pummil (to Socony-Vacuum Oil Co.). U. S. 2,023,545-6, Dec. 10. Various details of app. and operation.

Removing deposits from conduits of oil-conversion apparatus Harold R. Snow and Russell L. Zimmerman (to Standard Oil Co. of Ind.). U. S. 2,022,935, Dec. 3. Structural and operative details are described of an app., including a plunger, etc.

Protective device for holding casinghead drips Orf B. Zeek (to Magnolia Petroleum Co.). U. S. 2,022,267, Nov. 26. Various structural details.

Antiknock motor fuel Nicolaas Max (to Shell Development Co.). U. S. 2,023,142, Dec. 3. A hydrocarbon motor fuel mixt. is prepd. contg. a small proportion (suitably about 0.02-0.06% of the metal) of salicylal-methyl (or allyl) amine-Cu or -Co or other suitable heavy metal compd. of the general formula R¹R²C:NR³, in which R¹ represents an alkyl group of H, R² represents a hydrocarbon grouping directly linked to at least one hydroxyl group other than that contained in a carboxylic acid, and R³ represents an alkyl group, the heavy metal present being one capable of forming a complex compd. with NH₂.

Stabilizing the color of cracked hydrocarbon motor fuels Robert E. Wilson (to Gasoline Antioxidant Co.). U. S. 2,023,110, Dec. 3. Cracked motor fuel treated with a gum-formation-inhibiting agent such as α -naphthol, α -naphthylamine or p -phenylenediamine, tending to cause color degradation of the fuel, is also treated with a small proportion of a polyhydroxy benzene compd. such as pyrogallol, hydroquinone, catechol or gallic acid to retard the color degradation.

Regenerating spent sodium plumbite solution used for treating gasoline or kerosene, etc. Frederick W. Stone and James N. Garrison. U. S. 2,022,550, Nov. 26. A body of the spent soln. is heated and subjected to relatively violent and then to relatively gentle agitation to break up the emulsion so that the oil rises and is skimmed off; air is discharged into the remaining spent soln. and intimately mixed with it and the treatment is continued until the regenerating reaction is complete. App. is described.

Inhibiting gum formation in cracked motor fuels Louis A. Clarke and Charles C. Towne (to Texas Co.) U. S. 2,023,871, Dec. 10. About 0.01% of monochloro-hydroquinone or the like is added to a material such as a cracked gasoline or kerosene to retard deterioration and gum formation.

Sweetening light naphthas Arthur F. Endres (to Standard Oil Co. of Ind.). U. S. 2,022,847, Dec. 3. In prepreg light naphthas comprising mostly butanes and pentanes from crude light naphtha, the latter is sweetened with an alk. soln. of Na plumbite before it is stabilized. App. is described.

Treating acid sludge from sulfuric acid treatment of cracked oils and naphthas Arthur B. Brown and David W. Bransky (to Standard Oil Co. of Ind.). U. S. 2,023,800, Dec. 3. "Oleum liver" is added to the sludge and the mixt. is dild. with water until an acid concn. of about 30% is reached, the mixt. is heated to about 93° and agitated, then allowed to settle, and the acid layer is withdrawn and concd.

Dewaxing oils Leo D. Jones (to The Sharples Specialty Co.) Brit. 434,579, Sept. 4, 1935. In dewaxing oils by a succession of dewaxing stages consisting of chilling and sepg. the wax, the partially dewaxed oil is heated between each stage to bring the residual wax into soln. A crude oil is mixed with a diluent, e. g., naphtha, $C_{10}H_8$, $C_{12}H_{10}$, C_6H_6 , and the mixt. cooled slowly to -20°F., the wax is removed by centrifuging or filtration with the use of kieselguhr or similar filter aid, the oil contg. fine particles of wax is heated to above 30°F. and again chilled, preferably to a lower temp., e. g., from -30° to -60°F., than in the 1st stage, to yield a further amt. of wax which is sepd., a low cold test lubricating oil being left. Cf. C. A. 30, 280°.

Dewaxing hydrocarbon oils Earl Petty (to Alco Products Inc.) U. S. 2,023,181, Dec. 3. For dewaxing hydrocarbon oils bearing a wax-crystn. retarder in the form of coloring material, the oil is blended with a diluent such as naphtha and propane and the soln. thus formed is chilled to a temp. at which the retarding effect of the coloring material is overcome, such a portion of the coloring material is removed (suitably by use of H_2SO_4 or SO_2) that the wax-crystn.-retarding effect of the remainder will not prevent substantially complete wax pptn. on further chilling, and the soln. is "sub-chilled" and wax thus pptd. is sepd. Various details of procedure are described. Cf. C. A. 29, 6043°.

Doctor solutions for sweetening sour oils Byron F. Dooley, Jr. (to Texas Co.). U. S. 2,022,558, Nov. 26. Impure Pb sludge in spent doctor soln. is sepd. and extd. with an org. solvent such as naphtha or kerosene to remove org. impurities and the purified sludge is dissolved in a caustic soln. maintained at an elevated temp. while blowing with air, to obtain a regenerated soln. substantially free from substances tending to impart color and gum instability to naphthas treated with the soln.

Lubricating oils I. G. Farbenindustrie A.-G. Brit. 434,295, Aug. 29, 1935. The oils are improved as regards turbidity, setting point and color by an addn., e. g., 0.05-3%, of an oil-sol. vacuum residue, solid at ordinary temps., derived from de-asphalted hydrocarbon products contg. cyclic constituents, e. g., tar, asphalt-basis or mixed basic mineral oils, especially from hydrogenation products or from the destructive hydrogenation of coals or coal tars. The initial material is treated with flocculents, e. g., benzene, gas oil or liquefied normally gaseous hydrocarbons, to ppt. asphalts, and, after sepn., the oil is subjected to vacuum distn., preferably up to 300-350° and under 78 mm. Hg pressure. In an example, a destructive hydrogenation product boiling above 350° is treated with C_6H_6 and centrifuged to remove solid constituents, then with a light benzene contg. petr. ether to sepd. asphalt, after which the larger portion of the precipitant is distd. off and the mixt. is then refined with H_2SO_4 and then NaOH, the washed and dried oil is distd. up to 350° under 8 mm. Hg pressure to yield a red-brown resin as residue.

Lubricating oils Texaco Development Corp. Fr.

1786,581, Sept. 5, 1935. Oils contg. paraffin are dissolved in a mixt. of solvents contg. liquid SO_2 and an agent modifying the properties of the solvent, e. g., $PhCl$ and C_6H_5Cl , in proportions such that at below -18° the mixt. has a practically complete solvent action on the liquid hydrocarbons and practically no solvent action on the solid hydrocarbons of the oils. The mixt. is cooled to -18° or lower and the solid hydrocarbons are sepd. Thus, a solvent contg. SO_2 , 30 and $PhCl$ 70% may be used.

2 Lubricating compositions; electrical insulations Standard Oil Development Co. Brit. 434,626, Sept. 5, 1935. An elec. insulation or lubricating compn., especially for use at high temps., consists of a high-boiling aryl ester of an inorg. acid, e. g., triphenyl or tritolyl phosphate or borate, and an oxidation inhibitor, e. g., resorcinol, pyrogallol, α -naphthol, naphthylamines, thiophenols, thionaphthols, sol. thereon. The ester may be mixed with thickening or thinning agents, e. g., Pb , diphenyl oxide, dimethylnaphthalene, glycol phthalate, Et. oleate, sol. $PhOH$ - CH_2O resins, volatilized oils. Na, Ca or Pb soaps may also be added.

Lubricants, motor fuel Carl M. Clementson and Sven O. H. Clementson (trading as C. & S. Clementson). Brit. 434,240, Aug. 28, 1935. Lubricants that inhibit corrosion consist of mineral, vegetable or animal oils mixed with the soln. resulting from the mixing of an alkali peroxide with $MeOH$, or other alc., and a homogenizing agent, e. g., hydrogenated $PhOH$ or cresol. The lubricant may be added to the fuel for an internal-combustion engine. Lubricants Standard Oil Development Co. Brit. 434,058, Aug. 20, 1935. See Fr. 779,896 (C. A. 29, 5648°).

Lubricants Pierre A. Deloche Fr. 787,075, Sept. 16, 1935. App. is described for mixing by opposing jets and circulation by pump, mineral oil with castor oil (1-20) and halides, stearic acid or stearates (1-3%).

Reconditioning used lubricating oils Geo. R. Pierce and Leslie B. Denning, Sr. Brit. 433,570, Aug. 22, 1935. See Fr. 769,519 (C. A. 29, 596°). App. is described.

Filtering and regenerating apparatus for used oil Samuel Levine Fr. 786,925, Sept. 14, 1935.

Rectifying polluted oil such as that from automobile engines Robert P. Moyer and Fredella H. Moyer U. S. 2,022,731, Dec. 3. Various details of app. and operation are described, the oil being dild. with a volatile solvent such as naphtha or CCl_4 and centrifugally filtered and solvent vapors being sepd. and condensed.

Removing viscous hydrocarbon deposits from the interior surfaces of tanks, etc. Verne J. Todd U. S. 2,023,496, Dec. 10. Steam is used to apply to a detergent mixt. including a saponified fat, Na_2PO_4 , Na_2CO_3 , Na silicate and a hydrocarbon solvent such as furnace oil. Various details of app. and operation are described.

Asphalt emulsion Robert K. Franke, Henry W. Moreton and Charles W. Hill. U. S. 2,023,540, Dec. 10. Asphalt about 36 gal. is emulsified with a colloidal soln. formed of colloidal hydrous Mg silicate 10 lb. and water 20 gal., and 420 cc. of a 0.1 N HOAc soln., together with addl. water. App. is described.

Bituminous dispersions I. G. Farbenindustrie A.-G. Brit. 433,550, Aug. 16, 1935. Coarse dispersions, where H_2O -insol. org. substances, e. g., humic acid, lignic acid, acids of high mol. wt., $PhOH$ -like substances, soot, finely ground resins, waxes or pitches, are used as emulsifying agents, are obtained by using such proportions of bitumen and H_2O that a stiff magna that is difficult to stir is obtained. Fused bitumen and H_2O are added alternately, preferably with cooling, to a paste of the emulsifying agent contg. little H_2O . After each addn. of bitumen, stirring becomes difficult. H_2O is then added until the mass can just be stirred again. Alternatively, the components are added at 2 or more parts of the dispersing vessel so that at some points stirring is impossible, because of addn. of bitumen, and at other points the mass can be stirred, because of addn. of H_2O . The product is a stiff mass, which is dild., after the final addn. of bitumen, to form a dispersion contg. about 50% bitumen.

Bituminous compositions. I. G. Farbenindustrie A.-G. Brit. 433,874, Aug. 22, 1935. The compns. contain Fe oxide obtained by the reduction of aromatic nitro compds with the aid of Fe. In compns. contg. bituminous emulsion and (1) sand, (2) Rhine sand (I) and basalt chips (II), or (3) I, II and portland cement, increased compressive strength is obtained when part of the sand is replaced by the Fe oxide.

Rubber and bitumen compositions. Internationale Vereniging voor de Rubber- en Andere Cultures in Nederlandsch-Indie Brit. 434,317, Aug. 20, 1935. This corresponds to Fr 783,041 (C. A. 29, 706S⁸).

Bituminous compositions. Planktoll chemische Fabrik G m b H and Johannes B. Carpozow Brit. 434,926, Sept. 11, 1935. Sea-water mud, in a moist state and after drying at a low temp. in the absence of air, is mixed with

bituminous substances, e. g., natural or artificial asphalts, or coal tars, if desired in emulsified form, and the whole is heated *in vacuo* at 180° until the constitutionally bound H₂O of the mud is completely expelled. Before use, the mud may be sepd. from cryst. matter.

Apparatus and method for carbonizing wood. Paul Guillaume. Brit. 433,256, Aug. 12, 1935. In the production of wood charcoal, during a period of slow carbonization the gaseous hydrocarbons and distillates of tar or oils suspended in the gases are caused to remain in contact with, and are recirculated through, the mass of charcoal while the latter is cooling.

Wood oil. Sommer-Schmidding-Werke Vertriebs G. m b H Ger. 617,849, Aug. 27, 1935 (Cl. 22A. 2). Addn. to 594,920 (C. A. 28, 4594⁹) App. for obtaining pure heavy oil from wood oil is described.

23—CELLULOSE AND PAPER

CARLETON E. CURRAN

The nature of cellulose. E. Heuser. *Paper Trade J.* 101, No. 21, 39-46, No. 22, 35-41, No. 23, 39-42 (1935).—A historical review with bibliography of 59 references.

A. Papmeue-Couture

Separation of cellulose with chlorine. V. I. Minaev and S. S. Frolow. *Trans. Inst. Chem. Tech. Lianoto* (U. S. S. R.) 1, 196-203 (1935).—In the preliminary communication lab. expts. are described for the sepn. of cellulose from various cellular waste materials by steeping them in H₂O or Ca(OH)₂ soln. and treating the products with Cl by the Pomilio-Cataldi method. Chas. Blanc.

The application of the modified one-step process as a general method of determination of cellulose. Yuan-Chi Tang and Hsiob-Li Wang. *Naturwissenschaften* 23, 577 (1935); cf. C. A. 29, 8333⁸.—The "one step" method (Schmidt, et al., C. A. 26, 1772) was modified and shortened: A 1.5% ClO₂ soln. and 1 to 1.5% pyridine soln. are now used. The phloroglucinol reaction disappears some time before the destruction is finished.

B. J. C. van der Hoeven

Ammonia-cellulose (preliminary communication). K. Hess and C. Trogus. *Ber.* 68B, 1986-8 (1935).—This report is published because of the appearance of a brief abstr. (*Cellulose-Chem.* 16, 64 (1935)) of a paper by Peterson, King and Barry presented at the New York meeting of the Am. Chem. Soc. in April, 1935. It had been shown in an earlier paper (C. A. 26, 591) that cellulose (I) reacts with aq. solns. of diamines to form a new type of double compounds with characteristic Röntgen diagrams. The study has been extended to NH₃, whose aq. solns. have hitherto been considered as being indifferent toward I, and it has been found that liquid NH₃ markedly alters the lattice of I. When NH₃ gas, carefully dried over KOH, is allowed to act on dry I at -70° to -80°, the NH₃ condenses over the fibers without producing any perceptible alteration (swelling) in their external appearance. If the NH₃ is distd. off (again in the absence of moisture), there remain the apparently unaltered fibers which, however, show a Röntgen diagram entirely different from that of the original material (photograph given). A table of the equatorial interferences of this product (II), which is possibly an NH₃-poor ammonia-cellulose or a 3rd modification of I and is provisionally called *cellulose III*, shows that the new diagram cannot be confused with those of the 2 hitherto known forms of I (natural cellulose and hydrate cellulose). If, after evapn. of the NH₃, the fibers are transferred to water, MeOH or concd. aq. NH₄OH, the diagram of the original fibers is in no case restored. Photographs and interference positions of the products treated with MeOH and aq. NH₄OH are given. Whether these diagrams represent further modifications of I or addn. compds. of I with the liquids can be detd. only by further expts., but the ease with which the Röntgen picture can be changed shows that II is a very reactive form of I. C. A. R.

Cellulose triacetate. Jean Grand. *Compt. rend.* 201,

678 (1935).—The following procedure yields a cellulose triacetate of good quality, more resistant to sapon. by H₂O than the commercial acetates, completely sol. in methylene chloride-alc. mixt. The cellulose is treated for 15 min. with a mixt. of equal parts of HOAc and 0.5 N HClO₄, dried completely and immersed in a bath of 1 part Ac₂O and 5 parts of CCl₄ maintained at a temp. below 10° and agitated.

Rachel Brown

Benrylcellulose. A review of properties and uses. R. C. Bickmore. *Chem. Industries* 37, 445-7 (1935).

E. H.

Nitration of cellulose with nitrogen pentoxide vapor. René Dalmon. *Compt. rend.* 201, 1123-4 (1935), cf. C. A. 30, 282¹.—Pure N₂O₅ was passed over dried cotton in a tube by a current of dry air or O₂ at the ordinary temp. The reaction proceeds according to C₆H₇O₂(OH) + 3N₂O₅ = C₆H₇O₂(NO₃)₃ + 3HNO₃, the HNO₃ appearing as dew on the cotton. After washing, etc., the product is pure trimtrate (14.12% N).

C. A. Silberrad

The decomposition of cellulose in the nitrating and denitrating processes. Z. Rogovin and M. Shlyakover. *Angew. Chem.* 48, 647-50 (1935).—See C. A. 29, 6754⁹.

Karl Kammermeyer

Mechanical properties of mixed nitrocellulose films. A. I. Medvedev. *Trans. Inst. Chem. Tech. Ivanovo* (U. S. S. R.) 1, 204-13 (1935), cf. C. A. 28, 3892¹.—Films were obtained by mixing 3% acetone solns. of nitrocellulose and its fractions with 18, 30, 46 and 66% of Glyptal. The addn. of Glyptal to nitrocellulose solns. greatly improves the mech. properties of films. Elongation curves for the mixed films run somewhat higher than those for pure films. The general elongation of mixed nitrocellulose films is slightly decreased, while that of denitrated films is increased, but to a less degree than that of films with polyvinyl acetate. In denitrated films the favorable action of Glyptal on the elastic properties is greater than that of polyvinyl acetate. The mech. properties of heated films, with and without the addn. of Glyptal and polyvinyl acetate, change with a considerable decrease of the strength, increase of general elongation and reduction of the time of deformation. At 50° the elastic properties of films with polyvinyl acetate are lower and with Glyptal are higher than those of pure nitrocellulose.

Chas. Blanc

Advances in colloid chemistry (Cellulose and paper.) Rudolf Lorenz. *Zellstoff u. Papier* 15, 193-6, 235-6, 276-9, 313-19 (1935).—A detailed review with 99 references.

S. I. Aronovsky

Literature of lignin. Bror Holmberg. *Scensk Pappers-Tid.* 38, 556-7 (1935); cf. C. A. 17, 3783, 23, 5575; 24, 3358, 6007; 26, 6132; 27, 5099, 28, 1529¹, 5854¹; 29, 5151¹, 5651¹, 7634¹.—By means of numerous references and quotations H. shows that the objections raised by Klason (cf. C. A. 29, 7396⁹) in regard to the chem. compn. of lignin are not well founded.

W. S.

Action of formaldehyde and acetic anhydride on viscose

rayon V I Minaev and S S Frolov. *Trans. Inst. Chem. Tech. Ivanovo* (U. S. S. R.) 1, 166-73(1935).—Tests with viscose rayon confirmed essentially the expts of other investigators (cf. Schenk, *C. A.* 26, 296, 27, 3602; Wood, *C. A.* 26, 1254, 27, 3602) on the action of CH_3O and Ac_2O on cellulose. Better results were obtained by treating viscose rayon with CH_3O vapors and with solns of CH_3O in Me_2CO than in H_2O . The action of Ac_2O is considerably weaker, the results depending more on the conditions of treatment than with CH_3O . C. B.

The acid content of rayons and its determination. Max Ludtke. *Angew. Chem.* 48, 650-1(1935).—The acid in rayons was detd by means of the reaction $(\text{CH}_3\text{CO}_2)_2\text{Ca} + 2\text{RCO}_2\text{H} = (\text{RCO}_2)_2\text{Ca} + 2\text{CH}_3\text{CO}_2\text{H}$ with a 1 N acetate soln and 0.01 N NaOH soln for the titration. Exptl results on 14 kinds of rayon are presented. The acid no., e.g., the amt. of acid present in 1 g of dried solid, expressed as cc of 0.01 N soln (relative values), was lowest (100) for an acetate rayon prepd from linters, and also quite low for 2 Cu rayons likewise prepd from cotton linters (1.53 and 1.78). These results confirm previous observations that products prepd. from bleached cotton possess a much lower acid no. than those prepd. from cellulose. A nitro-rayon gave a value of 3.66. Viscose rayons which were known to have been subjected to a long ripening period showed high values (4.23 to 5.31), while the other viscose rayons varied from 1.87 to 4.97. Acid nos. are also reported for a viscose rayon which had been dyed with various substantive dyes. While the original material showed a value of about 4.37, the values of the dyed rayons were all higher (4.54-6.14), because of the presence of sulfonic acid residues, and these differences can be used as a comparative scale for the amt of fixed dye. Eight references. Karl Kammermeyer.

Rayon from egg white G Salzmänn Meland. *Textilber.* 16, 705-7(1935).—A review of processes for making rayon from egg white and other proteins.

The Southern States as a future center for American pulp and paper industry. Erland Waldenström. *Swensk Pappers-Tid.* 38, 588-603(1935).—Descriptive. Wilhelm Segerblom.

Technical advances in the paper pulp industry of the northern countries (Europe) in 1933-1934. C. A. Ernst. *Zellstoff u. Papier* 15, 141-6, 241-3, 282-4, 357-8(1935).—A discussion of the mech and chem advances in the manuf of ground wood pulp, sulfite pulp and in bleaching. S. I. Aronovsky.

Advances in paper and pulp testing in 1934. B. Korn. *Zellstoff u. Papier* 15, 353-6(1935).—A brief review of the newer microscopic, chem, mech and phys methods of testing pulp and paper, including 56 references. S. I. Aronovsky.

Modern heat insulation in the pulp and paper industry. G. E. Grimshaw. *Paper Ind.* 17, 566-71(1935).—A brief discussion of modern heat insulation, showing how improvement in lab equipment for the measurement of heat transfer has rendered it possible to judge of the efficiency of insulation and hence permitted improving heat-insulating materials. A. Papineau-Couture.

Arc welding builds longer life into pulp and paper mill equipment. R. R. Kondal. *Paper Trade J.* 101, No 18, 50, 52(1935).—A brief outline of the merits of arc welding for sulfite digesters. A. Papineau-Couture.

Pulping treatment and fiber properties. Geo. A. Richter. *Paper Trade J.* 101, No 19, 36-40(1935).—A review of the important properties of sulfite, soda and kraft pulps and the improvements that have been made in these pulps in recent yrs. The contributions of new paper properties that have been made by new pulps are outlined. A. Papineau-Couture.

The morphology of cellulose fibers as related to the manufacture of paper. Geo. J. Ritter. *Paper Trade J.* 101, No 18, 92-100(1935).—A description of the morphology of cellulose fibers as depicted by different investigators, together with a brief discussion of both generally accepted and controversial views regarding the morphology and

some of the attendant phys. properties of fibers.

Some effects of mechanical treatment of fibers on sheet structure. R. H. Doughty. *Paper Trade J.* 101, No 18, 31-3(1935).—An outline of material properties and the operation of unit processes, together with a review of semiquantitative data on the influence of fiber treatment on fiber properties and thence on sheet structure to show how one part of this science can be developed.

Wood handling and preparing. J. W. Patterson. *Pulp Paper Can.* 36, 551-4(1935).—A description of the layout and equipment of the wood room of the mill of the E. B. Eddy Co. Ltd., Hull, Que. A. Papineau-Couture.

The influence of hydrogen ion concentration with pretreatment of wood on its subsequent delignification. A. J. Corey and O. Maass. *Can. J. Research* 13B, 289-93(1935), cf. *C. A.* 30, 2837.—The results obtained by the authors in a previous investigation have been checked. The influence of an acid, a salt and a base on the pretreatment of wood at 130° has been detd. It is shown that pretreatment of wood meal decreases the rate of subsequent delignification. Pretreatment was carried out over the temp range 100° to 140° and the effect of temp. is shown to be very marked. As it was found that the p_H of the water after pretreatment decreased, pretreatment was carried out on a chip in which the p_H was kept more const. by a forced flow of water through the chip. It is shown that the rate of delignification is increased. Pretreatment was carried out in buffer solns and it is shown that there is a p_H value for which the influence of pretreatment is a min. The inferences drawn in connection with sulfite cooking are briefly discussed. J. W. S.

Investigations of methods for determining the strength of chemical wood pulp. Sigurd Köhler. *Statens Provingsanstalt, Medd.* No 47, 1-38(1930).—By the strength of chem. wood pulp is meant the strength properties of sheets made from the pulp after the latter has been disintegrated. Any suitable arrangement can be adopted to disintegrate the pulp in water, provided that the pulp is not subjected to a noticeable degree of beating. Comparative tests have been made to det. the beating degree ("Slowness") by use of 2 different Schopper-Riegler "beating degree testers" and a Green "freeness tester." It was found that the values of the 2 Schopper-Riegler testers did not tally. To obtain check results when operating one and the same Schopper-Riegler app., it is necessary to standardize the technic. Systematic tests have been made concerning the effect of different pressing processes and of the uniformity of the sheets in regard to weight, breaking length, etc. It was found that the breaking length of paper from different sections of the same sheet varies owing to the impossibility of obtaining uniform distribution of fibers in all portions of the papers. If the no. of fibers lying lengthways is greater at a certain place in a sheet of paper than at another, then the sheet is stronger in that one direction. Duplex sheets are found to be 8% stronger than that of the single sheets. Stirring the pulp in the dezzle-box by means of a perforated plate showed a decided improvement in uniformity in the tensile strength of different parts of the sheet. J. W. Holst.

Some recent developments in bleaching chemical wood pulps. John D. Rue. *Paper Trade J.* 101, No 18, 87-90(1935). A. Papineau-Couture.

Fungal attack on wet groundwood pulp. W. Schmid. *Papierfabr.* 33 (Tech. Teil), 380-2, 387-9(1935); cf. *C. A.* 29, 4937.—The various sources of primary and secondary infection and methods of inhibiting fungal attack are discussed. Special emphasis is placed on conditions existing in open and closed white water systems. No new exptl. data, but 10 references, most of them to the recent Scandinavian literature are included. Louis E. Wise.

The chemistry of sulfite pulping. XXXII. Production of sulfite pulp with digesting acid containing selenium. Erik Hägglund, C. H. Bäckström, Mladen Karanovic, Lars Runquist and Olaf Vincent. *Swensk Pappers-Tid.*

38, 650-66, 695-701(1935); cf. C. A. 28, 1528⁴.—When sulfite digesting acid is heated alone its stability rises with the increasing base content. The formation of H_2SO_4 decreases with increasing base content. This applies to pure digesting acid as well as to that containing Se. This is probably due to the fact that the change of thiosulfate to pentasulfate in the formation of sulfate decreases with the concentration of the H ions. In the production of sulfite pulp with chemically pure digesting acid either with or without the presence of Se it has turned out that the limit of injurious Se concentration is distinctly higher than has been thought. A Se content of 0.75 mg per l. does not diminish the strength of the pulp. Only when the Se concentration rises to 1 or 2 mg per l. does any evident impairing of pulp yield appear. When the digesting acid contains other substances besides Se which can occur in fluctuating amounts in the cooking acid the permissible limit of Se content decreases materially.

Standardization of the method for determining the whiteness of sulfite pulp. A. M. Katz. *Bumazhnyaya Prom.* 14, No. 7, 33-8(1935).—The Kondratik differential photometer is better suited for the determination of the whiteness of sulfite pulp than are the Ostwald and Puffinrich photometers.

Paulson process for spent sulfite liquor utilization. Sidney D. Wells. *Paper Trade J.* 101, No. 19, 40-2(1935). *Paper Ind.* 17, 659-60(1935).—A progress report on the Paulson process of evap. and burning sulfite waste liquor (U. S. pat. 1,393,241, C. A. 16, 495). A heat balance is given. The introduction of indirect heating of the liquor and the use of screw presses to remove liquor from the pulp from the blow pits are the most recent refinements to the process.

Sulfate pulp quality control—sampling and testing of individual digester cooks. Carl I. Ahlstrom. *Paper Trade J.* 101, No. 21, 37-8(1935).—A description of the procedure developed at the Longview, Wash., mill of Longview Fibre Co. for sampling each cook individually as it is being blown to the diffusers and for the rapid determination of the bleachability (degree of cooking) by Wiles' $KMnO_4$ method (C. A. 28, 2896⁵) in order to control the cooking operation at reasonably short notice. By the use of this procedure, modification of the cooking conditions to obtain a desired change in pulp quality is effected in a much shorter period than previously.

Pulp from sawdust. I. A. Il'inski. *Bumazhnyaya Prom.* 14, No. 8, 86-90(1935).—Spruce and pine sawdusts cooked, with stirring, with 16° Bé sulfate liquor at 8 atm. for 4 hrs. and then bleached with a consumption of 3% of active Cl gave 35-2% of pulp suitable for the production of good grades of paper.

Use of waste chips resulting from alkaline extraction of rosin in paper production. P. D. Zotov. *Bumazhnyaya Prom.* 14, No. 9, 45-54(1935).—Preliminary lab. expts. showed that the waste chips obtained from the extraction of rosin with NaOH can be used in the production of sulfate and mech. pulp comparable in quality to regular stocks.

Chemical composition of flax chaff. B. P. Osanov and A. G. Suova. *Bumazhnyaya Prom.* 14, No. 7, 72-3(1935).—Four samples of flax chaff were sifted through a nest of 4 sieves of different mesh, giving 2-18.8% bast fiber, 21-4-62.6% coarse and 21.1-60.7% fine chaff and 5.5-23.1% dust. The samples and their fractions were analyzed and cooked. The coarse and fine fractions of chaff are of similar composition. The bast fraction contains the greatest percentage of cellulose. The greater part of the dust consists of inorganic matter. To obtain uniform pulp, it is necessary to remove the dust from the chaff and to separate the bast fibers.

Belt conveyors prove efficient means of handling black ash in Pacific Coast pulp mill recovery room. D. L. Shurley. *Paper Trade J.* 101, No. 18, 34-5(1935).—A description of the Sandvik steel conveyor-belt system recently installed at the St. Helens Pulp & Paper Co., St. Helens, Ore.

Forced circulation in pulping digesters. S. A. Fotiev. *Bumazhnyaya Prom.* 14, No. 10, 7-21(1935).—A discussion

of various forms of forced circulation and types of digesters used in sulfite pulping.

The centrifugal (pulp) screen. Egon Strobach. *Wochbl. Papierfabr.* 66 (Tech. Teil) 852-4(1935).—A detailed description of the "Erfkensator" without new experimental data.

United States patents on paper making. Third quarter, 1935. Clarence J. West. *Paper Trade J.* 101, No. 17, 39-41(1935); cf. C. A. 29, 7649⁴.—A list in numerical sequence of patents relating to pulp and paper making issued at Washington during July, Aug. and Sept., 1935.

Utilization of *Pinus insignis* in paper making. L. Vidal, M. Brot and M. Aribert. *Bull. inst. pap.* 1935, 181-5.—See C. A. 29, 7650⁴.

Production of fine papers from cotton waste and flax-hemp shuffings. A. Ya. Goncharov. *Bumazhnyaya Prom.* 14, No. 7, 66-71(1935). cf. C. A. 29, 339⁴.—A good grade of pulp, suitable for reworking into copying and cigarette paper, was obtained from various cotton waste and flax-hemp screenings by cooking with 18% NaOH + Na₂S at 3-5 atm. pressure for 12 hrs. and subsequent 2-stage bleaching with 5-6% Ca(ClO)₂.

The optical characteristics of paper. II. A precision opacimeter. F. A. Steele. *Paper Trade J.* 101, No. 17, 31-5(1935). cf. C. A. 29, 3832⁴.—A description is given of the technical details of the design, construction and calibration of the instrument used for measuring paper opacity that was used for establishing the previously reported mathematical relationships in regard to the optical characteristics of paper. The sample is placed over an opening in the top of a sphere constructed of thin Al. and is diffusely illuminated by the walls of the sphere, which in turn are illuminated by means of elec. bulbs mounted inside the sphere, the bulbs being shielded so that they do not shine directly on the sample. Light reflected from the sample passes down through a vertical collimator tube, at the bottom of which is a sensitive photoelectric cell. Provision is made for inserting color filters above the cell if desired. The current generated in the cell is measured by means of a suitable galvanometer set up. In measuring the opacity of paper, the reflectance of the sample is determined when covered with a black and with a white background, resp., so that the problem of measuring opacity is essentially one of measuring reflectance.

Sulfur dyestuffs in paper making. Maurice Dérénb. *Papeterie* 57, 870-4(1935).—A brief outline of the preparation of S dyestuffs and of the manner of using them in the coloring of paper.

Factors of importance in the drying of paper. F. C. Clark. *Paper Trade J.* 101, No. 10, 33-5(1935).—The importance of preventing overdrying of paper at any stage in its manufacture and the importance and difficulty of maintaining the correct moisture content are discussed.

Study of the drying of paper and of the effect of hot-air blasts. Paul Vidal. *Papeterie* 57, 829-33, 874-81, 918-26(1935).—A mathematical discussion, based on observations on 2 paper machines 2 m. wide and running at 60 to 100 m. per min. on ordinary and medium grades, showed that the advantages and disadvantages of ventilation by means of hot air blasts just about balance.

A forward step in the control of paper drying. A. H. Stanton. *Paper Trade J.* 101, No. 18, 62, 64(1935).—A description of the principle and advantages of the "Tenso-Temp" system in which the steam-admission valve supplying steam to the driers is operated by a single air-controlled system under the joint action of a tension-control unit and a temp. control unit.

Effect of drier drainage on the drying of paper and its control. H. G. Cram. *Paper Trade J.* 101, No. 17, 36-9(1935).

Presence of lumps in paper. D. C. M. Pappay. *Papeterie* 57, 834, 837(1935).—Presence of fiber lumps in the best prepd. of fine papers is due to agglomeration and adhesion of fibers caused by agitation in the chests or by rolling together of the fibers by friction in passing through

pipes. It is suggested that the trouble can be appreciably reduced by diminishing as far as possible unnecessary agitation and formation of eddies, and more particularly by dropping the beaters singly into the chests, or at most 2 at a time.

A Papineau-Couture
New physicochemical method of determining sizing [in paper] I I Koralevskii *Pulp Paper Can.* 36, 546-51 (1935).—See C. A. 29, 2333.

A. P. C.
Progress in the production of water-resistant bitumen papers Friedrich Huth *Wochl. Papierfabr.* 66 (Tech. Teil) 887-8 (1935).—Deals largely with the application of asphalt emulsions used in impregnating paper.

Louis C. Wise
Consumption of sulfuric acid in parchmentization of paper N A Laskovich *Bumashnaya Prom.* 14, No. 7, 14-25 (1935).—A considerable economy in the consumption of H_2SO_4 can be effected by parchmentizing paper with 42.5-47% H_2SO_4 (65.5-65.9° B ϕ) and passing the paper through 2 wash baths. The waste acid should be directly coned to 31-4° B ϕ .

Chas. Blanc
New methods for measuring the waterproofness or impermeability of paper Maurice Dénéré *Papeterie* 57, 966-70 (1935).—J. Grant's method (C. A. 29, 1633) has been modified to render it quicker for papers that exhibit high impermeability or resistance to water. The sample is placed over a small jar provided with a screw top which holds the sample in place and provided with a central opening for placing the indicator on the paper. The bottom of the jar is provided with a side tube connected with a vertical graduated tube, so that by using a suitable liquid (e. g., Hg in the tube and bottom of the jar and water or any desired soln. in the top of the jar), the test can be carried out under a suitably hydrostatic head and thus accelerated. In the case of the original Grant test, "creeping" of the water or soln. over the edges of the paper can be prevented or minimized by dipping the latter over a width of 3-5 mm. in molten paraffin.

A Papineau-Couture
Determination of water vapor permeability of cellulose wrapping materials W. H. Charch and A. G. Scroggie. *Paper Trade J.* 101, No. 14, 31-9 (1935).—A detailed description is given of a test that has been found satisfactory for determining the permeability to water vapor of the most highly moistureproof wrappers, such as moistureproof Cellophane. It is based on the exposure of a small dish containing H_2O and sealed tightly with the membrane to be tested, to a practically dry atm. for a period of 24 to 30 hrs. at const. temp. The dish is weighed before and after this exposure and the loss in wt. is calculated to a standard basis for comparison. It is suggested that the method should give even more accurate results when used with wrappers exhibiting a high rate of moisture transmission. The factors influencing its accuracy are discussed, and a special thermostat is described which has a capacity for over 500 test dishes, will hold a given temp. const. within $\pm 0.2^\circ$ at any one point, and will maintain an atm. of less than 2% relative humidity over periods of days.

A Papineau-Couture
Can the coated paper industry advantageously replace casein by other adhesives? Fritz Hoyer *Gelatine, Leim, Klebstoffe* 3, 174-6 (1935).—The German casein industry is not in position to meet the demands of the coated paper industry. Of the possible substitutes starch can be obtained domestically but it has disadvantages (lack of water resistance and difficulties in operating technique) that limit its use. Animal glues have been used but the domestic industry is not self-supporting.

D. B.
Modernized coating equipment Frank W. Egan *Paper Trade J.* 101, No. 18, 90-1 (1935).—An outline of recent developments in paper coating equipment.

A Papineau-Couture
Improvements in the Fourdrinier machine Karl Bachmann *Papierfabr.* 33 (Tech. Teil) 361-5 (1935).—Mech. innovations in the wet end of the paper machine are fully described and illustrated. These are covered by German patents 606,174 (C. A. 29, 1633^a); 583,291 (C. A. 28, 324^a); 583,034 (C. A. 28, 323^a); 585,508 (C. A. 29, 1537^a) and 585,525.

Louis E. Wise
Degree of polymerization of cellulose and its application in characterizing pulps August Noll. *Papierfabr.* 33 (Tech. Teil) 377-80 (1935).—Using the technique and applying the definitions of Staudinger and his coworkers (cf. C. A. 29, 6753^a) N. assumes that the sp. viscosity of a cellulose sol is a function of the length of the thread-like cellulose mol. (i. e., the mol. wt.), and that the degree of polymerization (I) is the mol. wt./162. The α -cellulose content, alkali-sol. matter, Cu no., viscosity of xanthate and cuprammonium sols, "mol. wts." and I, were determined in the case of 20 pulps. The following list gives, resp., the source of the pulp, the no. of samples examined (in parentheses), and the ranges for I in each type of pulp: aspen (2) 275, beech (2) 340-410, spruce (11) 295-625, pine (1) 295, cotton linters (3) 350-445; cotton wadding (1) 500. On beating an individual pulp in a *Jokro* mill for 2 hrs., from 14^a Schopper Riegler to 94^a Schopper Riegler, no appreciable change in I occurred, although the initial tearing length of 1800 mm. had increased to 8640 mm. This is evidence that even protracted beating does not rupture the macromols. The relationships between xanthate viscosities and I, and between cuprammonium viscosities and I for all pulps examined are shown graphically. These curves are similar, and show that in control tests nothing is gained by detg. I of a sp. pulp sample. Viscosity detns. are sufficient. There is no obvious relationship between I of a pulp and its Cu no. or α -cellulose content.

Louis C. Wise
Innovations in paper-machine construction Wintermeyer. *Wochl. Papierfabr.* 66 (Tech. Teil) 806-9, 829-31 (1935).—An address.

Louis E. Wise
The autonomy electrode in paper making Maurice Dénéré. *Papeterie* 57, 933-41 (1935).—An explanation of the principles of the Sb electrode and of the technique of its use in the measurement of pH.

A Papineau-Couture
Stock control apparatus Geo W. Dodge. *Paper Trade J.* 101, No. 18, 70-1 (1935).—A brief description of the Precision Regulator and the Precision Regulating and Metering Device, made by Paper & Industrial Appliances, Inc., New York.

A Papineau-Couture
"Stainless" (steel) in the paper industry. J. C. C. Holding. *Paper Trade J.* 101, No. 18, 65 (1935).—Though there is no known commercially practicable metal or alloy that will stand up forever under the severe chem. punishment to which most paper mill equipment is subjected, various stainless steels have amply demonstrated sufficient superiority over ordinary C steel and other alloys to justify their adoption.

Refuse disposal at the New Brunswick International Paper Co., Dalhousie, N. B. F. L. Allen. *Pulp Paper Can.* 36, 555-9 (1935).—Descriptive.

A. P. C.
Refuse disposal. W. T. Bennett. *Pulp Paper Can.* 36, 489-90 (1935).—A description of the wood refuse-disposal plant at the mill of Can. International Paper Co., Gatineau, Que.

A Papineau-Couture
Experiments in printing P. H. Prior. *Paper Trade J.* 101, No. 15, 39-44 (1935).—See C. A. 29, 457^a.

A Papineau-Couture
Fluorescence of colored papers Maurice Dénéré. *Papeterie* 57, 797-800 (1935).—A table is given showing the fluorescence of a no. of com. dyestuffs on paper (bleached and unbleached sulfite, with or without admixt. of ground-wood) when exposed to a Hg arc lamp. The fluorescences of the various dyes are not as bright when fixed on paper as on other usual fibers (rayon, cotton, wool, silk). Interesting distinctions can be made in the case of yellow, orange and red papers, but not with the other colors. Dyestuffs in mixts. can be identified in spite of the fact that they frequently are partially masked by one another.

A Papineau-Couture
The tanning of gill links of the bronze-powder type when in contact with paper. O. J. Schierholtz. *Pulp Paper Can.* 36, 609-13 (1935).—Acidity in paper originating in the hydrolysis of papermakers' alum is shown to be a primary cause of the tanning of gill gums which are frequently used to decorate wallpapers, etc. Treatment of the paper, prior to gilding, with a soln. of alk. earth bicarbonates prevents tanning due to alum or other

tarnish-producing constituents normally present in com. papers. An effective alternative method is to apply an alk. earth hydroxide soln. followed immediately by a soln. of CO_2 in water. During tarnishing of gilt papers a gas (probably SO_2) is produced which itself has a tarnishing effect on gilt. Comparatively few types of com. papers are free from tarnish-producing ingredients. The tarnishing of gilt gum is an extremely delicate test for SO_2 , being much more sensitive than the usual qualitative reagents.

A. Papineau-Couture
Suffness testing of paper and cardboard. Kurt Berndt *Papierfabr.* 33 (Tech. Teil) 397-8 (1935).—A new instrument is described, which measures the force in g. required to bend (i. e., to cause the deflection of) a clamped sample strip (15 mm. wide and of any convenient length up to 250 mm.) to any definite convenient angle (usually $5-20^\circ$). The results of stiffness tests with a no. of board samples are shown graphically. The advantages claimed for the new tester are (1) detn. of abs. instead of comparative values, (2) paper as well as heavy board may be tested without modification in the instrument, (3) the latter is simple in construction, and is easily and rapidly regulated and operated, (4) very short as well as long sample strips may be used.

Making fiberboard elastic and resistant to water. I. Ettingof and E. Kormer. *Bumashnaya Prom.* 14, No. 7, 54-8 (1935), cf. Ettingof, *Iskusstvennaya Kosha* Nos. 7-8 (1933), Nos. 11-12 (1934).—Good elasticity and water-resistance were imparted to fiberboard by treating it with petrolatum jelly and Ca, Mg, Al, Zn and Mn naphthenates.

Notes on the testing of corrugated cardboard. L. H. M. et Argy. *Pulp Paper Can.* 36, 607-8 (1935).—See C. A. 29, 3834.

Boxboard. W. Höppler. *Wochbl. Papierfabr.* 66 (Tech. Teil) 850-2 (1935).—No new data are given but the mfg. processes and properties of the finished product are outlined.

Starch [and its use in the paper industry] (Holt) 13
 Treatment of boiler feed water and water used in the [paper] plant (List) 14. Lignin and related compds. (Brauns, Hibbert) 10. System $\text{CaO-SO}_2\text{-H}_2\text{O}$ [delignification of wood] (Gishler, Maass) 2. App. for sifting or straining materials suspended in liquid, such as wood pulp (Brit. pat. 434,069) 1. App. for testing the permeability of porous materials such as paper (U. S. pat. 2,021,048) 1. Yeast [sulfite waste lye as nutrient in yeast manuf.] (Ger. pat. 617,780) 16. Viscous compn. [for waterproofing paper] (Fr. pat. 786,553) 13.

Cellulose. British Celanese Ltd., Walter H. Groombridge and Eric V. Mellers. Brit. 433,783, Aug. 16, 1935. Cellulose suitable for the manuf. of paper or cellulose derivs. is made from wood, straw, grass, etc., by extg. the lignin by soln. in a solvent mixt. comprising at least 20% H_2O and an org. solvent from at least 2 of the following classes: monohydric alcs. of the fatty series, simple aliphatic ketones; cyclic diethers; aromatic hydrocarbons. Resins may be extd. from the materials with CaH_2 or $\text{CaH}_2\text{-alc}$ before the process. In 1 example, wood chips are sprayed with an equal wt. of a mixt. of concd. HCl 30 and glacial AcOH 70 parts, are left at atm. temp. for 6 hrs. and then washed and mixed with 8-10 times as much of a mixt. of Me_2CO 15, H_2O 35 and alc. 50 parts in an autoclave and heated to $150-200^\circ$ for 2-3 hrs. The solvent is withdrawn, preferably without reduction of pressure and further solvent is introduced. In the 2nd or later stages of the extn. the temp. may be $210-220^\circ$.

Cellulose from lignocellulose materials. Henry Dreyfus U. S. 2,022,654, Dec. 3. Lignin is extd. from materials such as wood, straw or grass with use of an org. solvent medium such as dioxane, etc., at an elevated temp. (suitably about $170-200^\circ$) under a pressure in excess of that developed by the solvent medium at the temp. employed. Numerous examples are given.

Cellulose from lignocellulose materials. Walter H.

Groombridge and Eric V. Mellers (to Celanese Corp. of America). U. S. 2,022,664, Dec. 3. Lignin is extd. from materials such as spruce chips by use of org. solvents such as an EtOH soln. contg. inorg. basic substances such as NaOH 0.5-8.0%.

Bleaching cellulosic fibers. La Société des produits peroxydés. Fr. 786,938, Sept. 14, 1935. Fibers such as cotton are bleached by solns. of per compds. under a pressure of 1.5-4 atm. and at temps. of at least 80° . The temp. may be increased to 115° as the operation progresses. In the case of a preliminary boiling, a bleaching bath is used to which no substance of alk. reaction need be added or a bath is used contg. no NaOH but to which Na silicate, an alkali ortho- or pyro-phosphate or alkali oxalate is added. Cf. C. A. 29, 3534.

Cellulose esters. Deutsche Kunstseiden-Studenges. m. B. H. Ger. 620,300, Oct. 18, 1935 (Cl. 12a, 0). A cellulose ester of a lower aliphatic acid, after sepn. from the reaction mixt. in which it was prepd., is treated in a solvent with a halogen compd. of P, e. g., POCl_3 , PCl_5 or PCl_3 . The temp. during this treatment must not exceed 50° , and the proportion of P compd. must not exceed about 3%, calcd. on the ester. A small proportion of an org. base may be added. Esters of high viscosity, which retain their soly in acetone, are obtained. An example is given of the treatment of cellulose acetate.

Cellulose organic acid esters. Wilhelm Walter and Rudolf Hofmann (to I. G. Farbenind. A.-G.). U. S. 2,022,446, Nov. 26. In prep. an ester such as cellulose acetate, the H_2SO_4 catalyst in a crude ester soln. such as obtained from esterifying cellulose with an aliphatic acid anhydride such as Ac_2O in the presence of H_2SO_4 and with addn. of a solvent (such as HOAc and ethylene chloride) for the ester formed is neutralized (suitably with NaOAc) and water is added in such quantity that the aliphatic acid present is dissd. to an aq. soln. of about 50-80% strength, and the reaction mass is heated to about $60-100^\circ$ for 1-3 hrs. to effect stabilization.

Cellulose mixed ester compositions for sheets, films, etc. Hans T. Clarke and Carl J. Malm (to Eastman Kodak Co.) U. S. 2,021,887, Nov. 26. A mixed org. ester of cellulose such as cellulose acetate-propionate or -butyrate is used with an amt. of a triaryl phosphate such as triphenyl phosphate sufficient to increase the flexibility of a sheet or film substantially beyond the inherent flexibility of an unplasticized sheet or film of the mixed ester, without substantial impairment of transparency.

Cellulose ester sheets. Kodak Ltd. Brit. 434,265, Aug. 28, 1935. Cellulose ester sheets are superficially saponified on 1 or both faces and are subjected to a depolishing treatment to render them capable of carrying impressions, writings, designs and tracings. The saponification may be caustic alkali, NH_4OH or an amine. For depolishing, a swelling agent, e. g., EtOH , a mixt. of alc. and Me_2CO , is applied to the sheet which may then be pressed into contact with a roughened cylinder, which may be heated. Resin or wax may be added to the saponified liquid to avoid any tendency of ink to smudge when applied to the finished sheet.

Cellulose acetate. Clifford I. Haney (to Celanese Corp. of America) U. S. 2,022,856, Dec. 3. For producing cellulose acetate of relatively high-viscosity characteristics, a cellulose of relatively low-viscosity characteristics, having a viscosity of 25-100 centipoise, is treated with an acetylating material comprising H_2SO_4 , Ac_2O and an amt. of HOAc 2.0-2.5 times the wt. of the cellulose, under such conditions as to produce a cellulose acetate which when hydrolyzed to acetone soly. has a viscosity of over 10. Various examples are given. Cf. C. A. 29, 3156.

Cellulose derivative compositions suitable for films, filaments, lacquers, etc. Henry B. Smith (to Eastman Kodak Co.). U. S. 2,021,901, Nov. 26. An org. cellulose deriv. such as cellulose acetate is used with tributyl phosphate as a plasticizer. U. S. 2,021,902 relates to the use of tributyl phosphate with cellulose org. esters such as cellulose acetate-propionate.

Artificial filaments, etc. British Celanese Ltd. and Percy F. C. Sowter. Brit. 434,426, Sept. 2, 1935. Cellu-

lose acetate soln. is extruded into a coagulating bath contg at least 40% Me₂CO and which may have as non-solvent H₂O, MeOH or EtOH and may contain salts, sugars, mannitol, sorbitol, α -cellulose and other substances which reduce the soly of the solvent in the non-solvent. Cf C. A. 30, 614¹

Artificial filaments, etc., of cellulose derivatives such as cellulose acetate. Henry Dreyfus U. S. 2,022,411, Nov. 26. Artificial filaments, ribbons, etc., are formed of an org. deriv. of cellulose such as cellulose acetate, formate or benzyl cellulose with which about 1-15% of an alkyl borate such as triethyl borate is incorporated.

Dry spinning artificial filaments from material such as cellulose acetate. Ettore Viviani (to Ruth-Aldo Co.). U. S. 2,022,260, Nov. 26. Various structural and operative details of a spinning cell are described.

Artificial threads from cellulose acetate or the like. Hans Altwegg and Armin Eichler (to DuPont Rayon Co.). U. S. 2,022,838, Dec. 3. A thread of normal luster is formed by the dry spinning of a soln. of the cellulose deriv. contg. a normally nonvolatile org. acid or anhydride such as stearic acid and the luster is subsequently reduced by treating the thread with a substance such as BaCl₂ in soln. which reacts with the acid or anhydride to form a substantially insol. compd. Cf C. A. 29, 1984¹

Fabrics containing cellulose acetate. Camille Dreyfus U. S. 2,022,410, Nov. 26. Filaments or the like are formed by extrusion of a soln. of cellulose acetate into a setting medium, and the material is withdrawn from this medium while still contg. at least 0.1% of volatile solvent, and in such condition formed into a fabric such as a knitted fabric (suitably while contg. about 0.1-4.0% of a solvent such as acetone).

Viscose fibers. Deutsche Hydrierwerke A.-G. (Walther Schrauth and Richard Hueter, inventors). Ger. 617,851, Sept. 5, 1935 (Cl. 295 3 02). The viscose is spun in a bath contg. the water-sol. reaction products of H₂SO₄ and high-mol. said or unsatd. aliphatic alcs with at least 10 C atoms, and, optionally, pptg. acids or salts. Higher alcs. such as cyclohexanol or other fat solvents may be added to the bath. In an example, viscose is spun in a bath comprising an aq. soln. of H₂SO₄ and sulfonated oleyl alc.

Rayon. Edward G. Budd Manufacturing Co. Fr. 786,561, Sept. 5, 1935. App. for making filaments of high denier no. and high resistance.

Modified rayon. I. G. Farbenindustrie A.-G. Fr. 786,659, Sept. 7, 1935. Albuminous substances such as casein or albumin along with substances which fix the albuminous substances or give condensation products therewith, such as choleic acid, formamide or acetamide are incorporated in the spinning soln.

Device for receiving freshly spun rayon. Feldmuehle A.-G. vorm. Loeb, Schoenfeld & Co., Rorschach. Ger. 617,791, Aug. 20, 1935 (Cl. 29a. 6 13).

Spinning nozzle for rayon. Werkstätten für Präzisionsmechanik G. m. b. H. Ger. 617,790, Aug. 26, 1935 (Cl. 29a. 6 10); Fr. 786,665, Sept. 7, 1935.

Pot-spinning machines for rayon. Paul H. Minck. Ger. 620,091, Oct. 15, 1935 (Cl. 29a. 6 06). Means is described for recommencing spinning after a pot has been changed. Cf C. A. 29, 927¹

Treating cellulose material such as wood pulp, paper or cotton linters. Alma Dobry (to Compagnie de produits chimiques et électrométallurgiques Alais, Forges et Camargue). U. S. 2,022,589, Nov. 26. Cellulose material is treated with a concd. soln. of a perchlorate such as a satd. soln. of Be or Al perchlorate and with a liquid such as water adapted to effect the sepn. of the cellulose from the perchlorate soln. by pptn.

Cellulose pulp from wood. Clinton K. Textor (to Northwest Paper Co.). U. S. 2,022,872, Dec. 3. For producing a substantially lignin-free cellulose, wood is digested with a soln. contg. alkali metal salts of sulfurous and carbonic acids as the 2 essential chem. ingredients, sufficient sulfite being used, in excess of the amt. required to release the cellulose, to prevent staining. U. S. 2,022,873 relates to a process in which so-called hardwood

or short-fibered wood is digested, until cellulose is released, with an alk. Na₂SO₃ liquor, contg. sufficient excess of Na₂SO₃ to prevent staining and sufficient of a Na carbonate to give a pH of 7.5-9.5, at a temp. of 175-185° and at the corresponding satd. pressure for 3-7 hrs., of which the first 1-2 hrs. are used in attaining the specified temp. and pressure. Numerous details are given.

Cellulose digester. Friedrich Schulte. Austrian 142,580, Aug. 10, 1935 (Cl. 55c). Correction of patent no. 2 (see C. A. 29, 831¹).

Cellulose digester. Jens W. A. Elling. Ger. 616,156, July 20, 1935 (Cl. 55b 2 01). Addn. to 689,751 (C. A. 28, 2530¹). A treble digester for fibrous materials is described.

Sulfite pulp digester. Paul B. Lacy, Edwin F. Libby and Ralph V. Metz (to Industrial Chemical Sales Co.). U. S. 2,022,378, Nov. 26. A steel shell carries a firmly adherent, impervious, sprayed lining of a corrosion resisting metal such as Cd, monel metal, stainless steel, Sn, Pb or bronze.

Pulps containing hard binder substances and suitable for forming sheets on a paper machine. Harry C. Fisher (to Richardson Co.). U. S. 2,022,311, Nov. 26. A substantially homogeneous plastic mass is formed of a binder such as gilsonite or asphalt and fibrous material in which the fibers are included within the body of the binder; more fibrous material and water are then added and the product is beaten to form a pulp so that the product contains coated and uncoated fibers.

Sulfite solutions. Siemens Lurgi-Cottrell Elektrofilter-Ges. m. b. H. für Forschung und Patentverwertung (Friedrich Wilhelm Hoss, inventor). Ger. 620,401, Oct. 21, 1935 (Cl. 12a. 21). In the manuf. of sulfite solns., particularly for cellulose manuf., from crude gases contg. SO₂ and impurities such as As and Se, the gases are purified by passing them in direct succession first through a washing tower and then through an electrofilter constructed as an indirect cooler.

Forming webs such as those of felted fibers and impregnating them with latex, etc. Izador J. Novak (to Raybestos-Manhattan, Inc.). U. S. 2,022,687, Dec. 3. Various details of app. and operation are described.

Utilizing waste wood-pulp liquor for combustion in a boiler furnace with recovery of inorganic constituents. Josiah H. Rohrer (to Badeniahausen Corp.). U. S. 2,023,031, Dec. 3. Various details of app. and operation.

Paper. Paul Lindner and Hugo Rumppe. Ger. 617,684, Aug. 23, 1935 (Cl. 55c 11 10). App. for sifting, washing and disintegrating vegetable-fiber waste, especially old paper, is described.

Paper making apparatus. Maurice O. Neilson U. S. 2,022,298, Nov. 26. Structural and mech. features.

Felts of paper-making machines. Tom Milnes and Ayres Ltd. Brit. 434,521, Sept. 3, 1935.

Apparatus for straining fibrous suspensions for making paper, etc. Erich Winkler and Franz Schönemann. Ger. 620,278, Oct. 17, 1935 (Cl. 55d 2 10).

Drying machines for paper. Samuel Milne. Brit. 433,544, Aug. 15, 1935. The felts of a paper-making machine are dried by steam-heated cylinders to a low moisture content and raised to a higher temp. than that of the paper web passing about drying-cylinders.

Hollander. Aldo Galliani. Austrian 143,159, Oct. 25, 1935 (Cl. 55a).

Treating card or paper stock for use in duplicating processes. Raymond S. Jones U. S. 2,021,938, Nov. 26. The material is superficially treated with a compn. (such as specified glycerol mixts.) which imparts hygroscopicity to the faces only of the material.

Waterproof printing or writing paper. Heinrich Kraut and Hermann Burger. Ger. 615,348, Nov. 1, 1935 (Cl. 55f 15 20). A mixt. of spermaceti and a resin, e. g. colophony, is used as the waterproofing agent.

Apparatus suitable for coating paper or cloth by friction calendaring. Geo. E. Pelton U. S. 2,022,322, Nov. 26. Structural, mech. and operative details.

Coated parchmentized paper suitable for use as an

imitation leather, etc. Ervin E. Strawn (to Paterson Parchment Paper Co.), U. S. 2,027,711, Dec. 10. One surface of a porous cellulosic material such as waterleaf paper is provided with a very thin coating of material such as "film scrap liquor" which is not affected by chemicals used for parchmentizing and which is anchored in the pores of the material underneath and the latter is then parchmentized as by treatment with H_2SO_4 to form a firmly bonded product.

Cigarette wrappers Nathan Sulzberger. Brit. 433,228, Aug. 12, 1935. The wrapper is impregnated with a dil. soln. of a H_2O -resisting cellulosic material, e. g., cellulose esters or ethers, collodion, celluloid, pyroxylin, cellulose acetate or nitrocellulose in Et_2O , alc., Me_2CO or other solvent, that will evaporate readily without leaving a perceptible odor or flavor and without forming a surface film or coating. The soln. may contain coloring matter, a "flattening" agent, e. g., paraffin, plasticizers, e. g., di-Bu or di-Am phthalate, medicinal and aromatic substances, e. g., menthol, oil of cloves, tobacco ext.

Treatment of effluents of paper manufacture, etc. John Dickinson & Co. Ltd., Julius Grant, Dorr-Oliver Co. Ltd., Robert I. Stewart and Philip Evans. Brit. 434,225, Aug. 28, 1935. Paper mill and like wastes contg. esparto or other washings having high O -absorbing characteristics are mixed with effluents from other parts of the paper mill, etc., which contain oxidizing agents or substances capable of forming oxidizing agents, e. g., effluents or sludges from causticizing, or bleaching plant, to form a harmless effluent for direct discharge into a river. App. is described.

24—EXPLOSIVES AND EXPLOSIONS

CHARLES E. MUNROE AND C. G. STORM

Deflagration of explosive substances by ultrasonic waves Neda Marinescu. *Compt. rend.* 201, 1187-9 (1935).—Calc. shows that the temp. of a small air bubble in a liquid subjected to ultrasonic waves by means of a piezo-quartz oscillator operating under a p. d. of 10,000 v at a frequency of 10^4 would be raised adiabatically to about 234° . This is confirmed by the fact that certain explosives which deflagrate at a temp. below that, e. g., NI_3 , Ag fulminate and some peroxide mixts., when placed in a liquid that does not wet them, i. e., so as to be surrounded by air, deflagrate when the liquid is subjected to such waves, or in some cases, e. g., NI_3 , without intervention of any liquid. The temp. is given by $T = A(aF)^{1/3}$, where a is the amplitude, F the frequency of the waves, and A a const. No increase in a or F sufficed to explode any nitro deriv.

C. A. Silbrade. Liberation of nitrous oxide during the decomposition of nitrocelluloses Robert Vandoni. *Compt. rend.* 201, 674-5 (1935).—The gaseous products of decompn were detd. for the following: (1) gun cotton heated at 108.5° ; (2) a fiber nitrated to 12% N heated at 60° with 25% HNO_3 ; (3) a fiber nitrated to 14% N heated in a sealed tube at 130° with H_2O .

Rachel Brown

Brisance and its determination A Majrich and I. Sorm. *Z. ges. Schiess- Sprengstoffw.* 30, 295-9, 337-40 (1935); cf. *C. A.* 28, 3901^a, 5085^a, 29, 4585^a, 4941^a, 5271^a.—The brisances of various explosives were compared by means of a fragmentation test. The explosives (1-2.6 g.) were compressed at 2000 kg./sq. cm. to approx. equal heights in steel cylinders 40 mm. high \times 25 mm. diam., with central cavity 30 mm. deep \times 6 mm. diam., and fired with a detonator consisting of 0.1 g. PbN_3 and 0.1 g. pentaerythritol tetranitrate pressed at 500 kg./sq. cm. in a Cu shell 25×6 mm. The fragments of the steel cylinder were collected, screened, counted and weighed. The results were compared with those obtained by various other methods proposed for measurement of brisance, the Trauzl test, Pb-plate test and compression test. The relative brisances of various explosives vary according to the method used in detg. this factor. Each method has its definite limitations. Among the various formulas proposed for expressing brisance, that of Kast (*C. A.* 15, 1217) is favored.

C. G. Storm. Detonating fuse without metal covering Anon. *Z. ges. Schiess- Sprengstoffw.* 30, 333-4 (1935).—A detonating fuse manuf. at the Bofors (Sweden) plant of the Nobel Co. contains a core of pentaerythritol tetranitrate with a covering of cotton tape and cord impregnated with gum. It withstands a water-resistance test of 48 hrs. under 25 m. of water, and is not detonated by either flame or impact.

C. G. Storm

Induction period in gaseous thermal explosions O. K. Rice, Augustine O. Allen and Hallock C. Campbell. *J. Am. Chem. Soc.* 57, 2212-22 (1935).—By integrating the differential equation involving temp. and time in an exothermic gas reaction, a sudden temp. rise, corresponding to an explosion, is noted above a definite pressure. From such curves an approx. method for calcg. the induction period in thermal explosions was devised and applied to explosions of azomethane and ethylazide (*C. A.* 29, 2359^a, 5273^a). Approx. values for the heat of decompn of these compds. were thereby obtained.

C. G. Storm. Explosion regions XXVI. Shape of explosion regions and their diameters I. W. P. Jorissen. *Rec. trav. chim.* 54, 888-92 (1935), cf. *C. A.* 27, 3875.—A mathematical discussion and analysis of explosion limits for combustible gas or vapor diluted by the addn. of a non (or difficultly) combustible gas.

B. E. Anderson. Why compressor explosions A. F. Rieber. *Power* 79, 522-3 (1935).—The main causes of compressor explosions are excessive oil for cylinder lubrication and failure of intake or discharge valves to function properly.

Alden H. Emery. Dust explosions. A. A. Van der Dussen. *Rec. trav. chim.* 54, 873-84 (1935).—See *C. A.* 29, 3162^a.

C. G. Storm. Sensitized explosions I. The hydrogen-oxygen reaction catalyzed by nitrogen peroxide S. G. Iord and R. G. W. Norrish. *Proc. Roy. Soc. (London)* A152, 196-220 (1935).—The region of ignition of H and O which occurs between narrow concn. limits for the catalyst, NO_2 , is bounded by regions of easily measurable slow reaction. Light, which generates O atoms from the NO_2 , increases the velocity of the slow reaction but does not affect the ignition limits. Induction periods occur for both slow and ignition reactions, those for the slow reaction are terminated by a sharp pressure increase, followed by a reaction whose velocity rapidly decreases to a steady value. At const. temp. a curve of these induction periods runs continuously from the region of slow reaction to that of ignition, passing through a min. corresponding to the max. of catalytic effect. Irradiation reduces the induction period from values of 20-200 sec. to less than 1 sec. It is concluded that branching initially exceeds the extinction of chains over the whole catalysis region, that an equil. concn. of reaction chains is ultimately imposed on the slow reaction, that ignition occurs as a thermal effect when the no. of chains exceeds a critical value, and that NO_2 affects the origin, branching and extinction of the chains.

L. E. Steiner. Explosion at Reinsdorf on June 13, 1935 Anon. *Z. ges. Schiess- Sprengstoffw.* 30, 332 (1935).—Fire, followed by several explosions, occurred in a building where TNT residues from spent acid were purified by washing with hot water and soda soln. Flying missiles caused the explosion of a dryhouse 660 m. distant, where the drying of a wet mixt. of nitrocellulose and nitroglycerin for use in the manuf. of smokeless powder was conducted. Another

nearby dryhouse merely burned. The nitroglycerin plant, 200 m distant from the TNT residue plant, also exploded, presumably as a result of damage caused by the first explosion. Other explosions occurred in the TNT nitrating plant. Structural damage to buildings was caused at a distance of 1400 m. Eighty-two were killed and over 800 injured. C. G. Storm

Explosive blasting charges Wm R. Farren and Joseph Smith, Jr. (to Atlas Powder Co.) U. S. 2,023,784, Dec. 10. A charge of blasting explosive is held in a container of flexible and extensible material formed of 2 laminae of creped paper cemented together by an asphaltic compn.

Blasting apparatus John W. Sanford (to Sullivan Machinery Co.) U. S. 2,021,898, Nov. 26. Structural details of app. carrying a blasting charge in the lower end of a loading tube assoc. with a concentric wash-water tube.

Torpedo for shooting oil wells Alfred E. Ellis U. S. 2,023,831, Dec. 10. An explosive-contg. vessel which may be formed of Sn inner and outer shells is proportioned to float in liquid in the well, in an inclined position adjacent the surface of the liquid.

Toy torpedo. Wm L. Kann U. S. 2,022,770, Dec. 3. A capsule of readily deformable material contains an explosive mixt. and an impact igniter and is held under compression to prevent shifting of the impact igniter.

Shot-gun shells Edwin L. Johnson (to E. I. du Pont de Nemours & Co.) U. S. 2,023,888, Dec. 10. Paper shells are first coated with a cellulose ester compn. such as one of cellulose nitrate or acetate, and the wall of the paper contained between the inner and outer surfaces is then impregnated with a paraffin compn.

Ignition compositions Oswald F. Wyss Brit. 433,117, Aug. 6, 1935. This corresponds to Ger. 595,068 (C. A. 29, 1252).

Semipyrrophoric metals Oswald F. Wyss Brit. 433,174, Aug. 6, 1935. Divided on 433,117 (preceding abstr.). Metals in semipyrrophoric form, i. e., in such state that their ignition temp. is between 50° and 300°, are manuf. by the reduction of metal compds. by thermal decompn. in the presence of inert gas or gases or by chem. reduction with H at raised temp., the temp. and reaction conditions being maintained throughout the reaction intermediate those required to produce nonpyrrophoric metals and those to produce pyrrophoric metals. For chem. reduction, oxides, nitrates, carbonates, sulfates, oxalates, tartrates or citrates may be used, for thermal decompn., oxalates, tartrates or citrates. Alternatively, metal compds. may be reduced so as to produce pyrrophoric metals, the latter being then cooled in a current of H and when cold treated in inert gases, air being excluded. Cf. C. A. 29, 1252.

Gas-detecting miners' lamps Wm M. Thornton and Wm Maurice Brit. 433,570, Aug. 16, 1935

25—DYES AND TEXTILE CHEMISTRY

L. A. OLNEY

Analysis of azo dyes with hyposulfite V. I. Minaev and V. N. Kisel'nikov. *Trans. Inst. Chem. Tech. Ivanovo* (U. S. S. R.) 1, 59-65 (1935); cf. C. A. 26, 1543; 27, 4084. The method was applied with good results to the analysis of a no. of azo dyes. Chas. Blanc

The vat dyes of the benzanthrone series XIII. Some 6,6'-derivatives of isovanilanthrone. Toshio Maki and Yoshio Sago *J. Soc. Chem. Ind., Japan* 38, Suppl. binding 560-4 (1935), cf. C. A. 29, 8337. The 6,8,2,1-dichlorobenzanthrone (I) condensed in the PhOH-alc.-KOH melt at 143° mainly to 6,6'-dichloroisovanilanthrone (II) which dyed cotton blue-violet. The Cl atoms in 6- and 8'-positions were completely inert toward KOH and remained unchanged. The yield of pure II (purified with glacial AcOH, hyposulfite and PhCl) was 54.5% of the theoretical. A hyposulfite-insol., PhCl-sol., gray substance also formed was called "B-dye"; it changed to a vat dye when heated with concd. H₂SO₄, coloring cotton a dark violet-gray. The yield of "B-dye" was 23.9% of the theoretical. On account of the great stability of the Cl atoms in 6,8'-positions, their methoxylation was difficult. Long and repeated heating with MeOH-KOH and subsequent recrystn. gave a small amt. of pure 6,6'-dimethoxyisovanilanthrone, which dyed cotton dark blue in the hyposulfite vat. The Cl atoms of II were hardly hydrolyzed at all in the PhOH-KOH melt at 183°, but at 200° the corresponding 6,6'-dihydroxyisovanilanthrone (III) was formed, which gave an acid-sensitive, blue-violet cotton dye. Boiling III with p-O₂NCH₂COCl in PhNO₂ gave the bis(p-nitrobenzoate) which dyed cotton dark blue-violet. The 6,6'-substituents of isovanilanthrone in general exert a moderate bathochromic action. Structural formulas are given. The expts. are described in considerable detail. XIV. Some 8,8'-derivatives of isovanilanthrone. Ibid., 564-7. The 8,8'-derivs. were prep. in a like manner from 8,8,2,1-dichlorobenzanthrone (IV). The main product of the PhOH-alc.-KOH melt at 143° was 8,8'-dihydroxyisovanilanthrone (V), with a yield of the pure compd. (purified with glacial AcOH and PhCl) of about 24% of the theoretical. V gave a red-violet, but somewhat acid-sensitive cotton dye. A considerable amt. of a gray-violet, PhCl-sol., and hyposulfite-sol. dye was also formed, which was likewise called "B-dye." It may have been a mixt. of trihydroxy and chlorodihydroxy compds. Heating with concd. H₂SO₄,

changed the "B-dye" to a dark gray-violet vat dye, difficultly sol. in org. solvents. Methoxylation of V gave the corresponding 8,8'-dimethoxy deriv., which gave a rather brilliant red-violet and acid fast dye. With p-O₂NCH₂COCl the 8,8'-bis(p-nitrobenzoate) was prep. from the dihydroxy deriv. The Cl atom of IV in 8-position is so labile that it is easily hydrolyzed by KOH at a relatively low temp. (143°) and exchanged for the OH group, while the Cl atom in 6-position of I is very stable. The 8,8'-derivs. of the isovanilanthrone, in contrast to the 6,6'-derivs. are easily sol. in alk. hyposulfite, even at a relatively low temp. The 8,8'-derivs. exert almost no bathochromic action and give mostly red-violet dyes. Structural formulas are given and the expts. are described in considerable detail.

Karl Kammermeyer

The theory of wool dyeing with particular reference to acid dyes in colloidal solution. F. L. Goodall *J. Soc. Dyers Colourists* 51, 405-14 (1935).—A summary of available information and some theoretical considerations tending to make clear the fundamental difference in behavior in relation to wool, between dyes colloiddally dispersed and those almost completely ionized in soln. Nineteen references.

W. H. Boynton

Dyeing acetate cotton unions, with special reference to mercerized fabrics. R. H. Bourdon. *Silk J.* 12, No. 137, 32-3 (1935).—Various operations are cited to overcome different difficulties in the processing of mercerized cotton and acetate rayon.

Silk fabric printing with direct colors J. M. Hill *Silk J.* 12, No. 137, 33-4 (1935); cf. C. A. 29, 6764.

Halsey E. Siliman

Printed sleeve linings II N. N. Caruthers. *Textile Jfr.* 61, 469-9 (1935).—Printing formulas and procedure for some special cases are given. While many textbooks advocate for fast color silk effects steaming for 1 hr. at the usual pressure, practical experience has shown that sufficient fixation takes place on hot calendaring to coagulate the albumin and hold the ZnO.

H. E. S.

Printing plush and velours of rayon F. Weber Schultze. *Rev. ges. mat. color* 39, 385-8 (1935).—Complete formulas for printing are given. Plush and velours are printed in a similar manner. Velours of regenerated cellulose are more fragile than those of acetate. Vat colors are used for acetates and direct colors for viscose.

H. E. S.

Bibliography on the physical testing of textiles (1909 to

1934). Ellery H. Harvey. *Am. Dyestuff Repr.* 24, 703-4, 714-15 (1935).

The determination of the degree of the porosity of (textile) goods. J. Geissler. *Spinner u. Weber* 53, No 50, 1 (1935)—The degree of porosity is a measure of the amt. of air enclosed within the fibers of a fabric and can be detd. from measurements of the wt., thickness and sp. gr. as follows. Place a weighed piece of the fabric (10 X 10 sq cm) between 2 glass plates of known thickness (6 mm) and measure accurately the total thickness. The various textile fabrics have these sp. grs.: cotton 1.47-1.5, flax 1.43-1.46, hemp 1.48, jute 1.44, bleached ramie 1.5, sheep wool 1.32, degummed natural silk 1.37, nitro, Cu and viscose rayons 1.52 and acetate rayon 1.33. For a sample of cotton weighing 4 g., with a thickness of 2 mm and having a sp. gr. of 1.5 the surface was 100 sq cm, the vol. 20 cc, the cotton content, therefore, 4/1.5 = 2.66 cc, the air content 17.34 cc, i. e., degree of porosity 86.70%. Similar examples are given for 3 other textile fabrics.

Leopold Scheffan. Leopold Scheffan. Degumming of real silk materials. A. J. Hall. *Textile Mercury* 93, 303, 307 (1935). cf. Mosher, C. A. 29, 70854.—With Japanese raw silk yarn max degumming was obtained at both pa 1.0-3.0 and 9.0-11.5 at 212°F. However, for max strength and max degumming a pa of 0.5-10.5 was required.

F. H. Moser. Accelerated aging test for weighted silk. Wm. D. Appel and Daniel A. Jessup. *Proc. Am. Assoc. Textile Chem. Colorists* 1935, 350-1, 334-5; *Am. Dyestuff Repr.* 24, 706-7, 710-11 (1935)—Specimens of the cloth suitable for warp and filling breaking strength tests are exposed for 20 hrs. to the radiation from a glass-enclosed C-arc lamp operated on d. c. of approx 13 amp with the voltage across the arc approx 140 v. The distance from the specimens to the center of the arc is 15 in. (38.1 cm). Specimens are enclosed in a cabinet glazed with window glass about 0.32 cm thick between the specimens and the arc. The air of the cabinet is maintained at 75-77% relative humidity and 63° to 67°. The breaking strength of the cloth after exposure in the direction, warp or filling, showing the greater change in strength is taken to be indicative of the probable relative stability of the fabric with respect to exposure to light, heat and moist air. Relative breaking strengths of accelerated aged silk, a comparison of natural and accelerated aging, and accelerated aging of typical dress fabrics are shown in curves. Also in *J. Research Natl. Bur. Standards* 15, 601-8 (1935) (Research Paper No. 853).

W. H. B. Flax yarn qualities and types. V. S. A. G. Caldwell. *Textile Mfr.* 61, 402-3 (1935). cf. C. A. 29, 56641.—The methods of dealing with yarn test results and the effects of twists in flax yarns are explained.

H. E. S. Flax yarn qualities. S. A. G. Caldwell. *Textile Mfr.* 61, 443 (1935); cf. preceding abstr.—The apparent densities of Courtra and Irish flax yarns and the effects of twist are described.

Halsey E. Sullivan. The valuation of surface water for the textile industry. H. Bauch. *Melliand Textilber.* 16, 757-60 (1935).—A review.

F. H. Moser. Bleaching procedure. Otto Mecheles, G. Dierkes, E. Feller and E. Rudolf. *Melliand Textilber.* 16, 725-9 (1935).—To obtain max. whiteness for cotton and rayon textiles, peroxide bleaches should be heated to 80° in about 30-45 min. and from 80° to 100° in about 3.5 hrs. Iron or rust in the bleach reduces its efficiency. Peroxide bleaches of mercerized cotton and of viscose rayon showed greater whiteness, lower luster and greater softness than similar Cl bleaches.

F. H. Moser. Rational utilization of the bleaching properties of sodium hypochlorite. V. I. Minaev. *Trans. Inst. Chem. Tech. Inyetro* (U. S. S. R.) 1, 174-80 (1935); cf. Minaev, et al., *Moskovsk. Tekst.-Ind.* 44, Nos. 2, 3 (1929).—White, boiled talco was bleached with NaOCl at 18° for 2.5 and 10 min. at a concn. of 1 g. NaOCl in 1 l. H₂O, without and with the addition of 2, 4 and 8 g. (mol. of NaHCO₃) to 1 g. (mol. of NaOCl) and (or) 2 g. of a wetting agent (α-nakal and org. acids) per 1 l. of the NaOCl soln. In all cases on addn. of NaHCO₃ or a wetting agent the bleaching

time was reduced 5 times and the formation of oxycellulose did not exceed 0.2%. The addn. of 2 and 4 mols. of NaHCO₃ produced after 2 min. of bleaching 79.5% and 80.94% whiteness, resp. with 40% reduction in the Cl consumption. The use of 8 mols. of NaHCO₃ showed no advantage. The addn. of wetting agents gave in 2 min. 87.76% of whiteness but at a considerably greater Cl consumption as compared with the bleaching in the presence of NaHCO₃. With the addn. of NaHCO₃ and a wetting agent the degree of whiteness and the Cl consumption were still more increased without an increase in the oxycellulose formation. The acceleration of the bleaching reaction can be conceived either as a result of the liberation of HOCl from the NaOCl solns, or as a hydrolysis $\text{ClO}^- + \text{H}_2\text{O} \rightleftharpoons \text{ClOH} + \text{OH}^-$, or as a double decompn. of NaOCl and NaHCO₃: $\text{NaOCl} + \text{NaHCO}_3 = \text{Na}_2\text{CO}_3 + \text{HOCl}$ or $\text{HOCl} + \text{NaOCl} + 2\text{NaHCO}_3 = \text{Na}_2\text{CO}_3 + \text{HOCl} + \text{NaHCO}_3$. If the mechanism of the bleaching reaction is conceived according to the scheme: $\text{NaOCl} + \text{HOH} \rightarrow \text{HOCl} + \text{NaOH}$, then the addn. of NaHCO₃ is necessary to neutralize the gradually accumulating NaOH to prevent the reversion of the hydrolysis reaction. On the basis of the exptl. data and the theoretical consideration the addn. of NaHCO₃ to NaOCl solns. (obtained by satg. NaOH soln with Cl and contg. 0.5-1% excess of NaOH) for the stabilization of the system should be detd. stoichiometrically according to the formula $[(n \text{ NaOCl} + m \text{ NaOH}) + \{(n + m) \text{ NaHCO}_3\}] = \{(n + m) \text{ Na}_2\text{CO}_3 + m \text{ H}_2\text{O}\} + n \text{ HOCl}$, with the addn. of a slight excess of NaHCO₃. The NaOCl solns. of the given concn. when treated with NaHCO₃ decompd. slowly, i. e., about 50% in 200-250 hrs.

Chas. Blanc. The behavior of starch and dextrin in solutions in relation to the usual additions to the finishing and sizing baths. F. Dittmar and H. Kober. *Melliand Textilber.* 16, 734-8 (1935).—Solns. of similar textile starches show great differences in turbidity. Addn. of large amts. of salts or colloids show only a slight increase in turbidity. However, addn. of small amts. shows a considerable change in the flocculation threshold. Clarity of the soln. does not insure clarity in the film. Differences in the turbidity of solns. of similar starches are due to different amts. of hydrolysis in soln. Those solns. that remain clear are from starches more homogeneous in compn.

F. H. Moser. The chemical examination of furs in relation to dermatitis. VI. Identification of vegetable and other dyes. H. E. Cox. *Analyst* 60, 793-801 (1935). cf. C. A. 29, 56644.—Dermatitis rarely results from irritation caused by the common vegetable dyes used on furs. The characteristics of logwood, quercitron, fustic, henna, turmeric, catechu, gall nuts and oak bark and pyrogallol are discussed and a simple scheme of analysis based on boiling the fur with HCl and then boiling for half a minute with Na formaldehydesulfoxylate soln. is outlined, by means of which the dyes used can be detected in most cases.

W. T. H. Dry-cleaning rayon fabrics. H. Roché. *Silk J.* 12, No. 137, 38 (1935).—Suitable methods for cleaning are outlined, in consideration of the more recent developments in chemicals and machinery. Trichloroethylene is fairly safe with the improved drying machinery at low temp. to prevent softening. It is also safer physiologically than most agents.

Alkylated phenols [as intermediates for the prepn. of dyes] (Ger. pat. 616,786) 10. Viscous compn. for waterproofing cloth (Fr. pat. 786,553) 13.

Dyes I G Farbenind. A-G. (Ludwig Zeh and Claus Heuck, inventors). Ger. 617,727, Aug. 24, 1935 (Cl. 22e 7 02) Water-sol. derivs of vat dyes are obtained by converting acid H_2SO_4 esters of leuco vat dyes into salts with amines which contain both etheral and OH groups in an aliphatic chain and which are optionally substituted at the N atom by alkyl, aralkyl, cycloalkyl or alkylene residues. The alkylene residue may be interrupted by a hetero atom such as O, S or N. In an example, the pyridine salt of the acid H_2SO_4 ester of leuco-2,1-naphthothindigo is heated in water with a base formed by heating piperidine, water and C_2H_5O . The product is a water-sol. basic salt of the above acid ester of the leuco vat dye. Other examples are given.

Dyes I G Farbenind. A-G. (Georg Kalischer and Werner Zerweck, inventors). Ger. 620,340, Oct. 19, 1935 (Cl. 22e 4) Dyes of the oxazine series are obtained by condensing α -aminophenols contg a nitro group with p -quinones or halo p -quinones, e. g., chloranil. The reaction may be effected by stirring the reagents in alc. contg anhyd. $NaOAc$. The nitroaminophenol may contain addnl substituents, e. g., a SO_2H or another NO_2 group. The products are useful as pigment dyes or, if they contain a keto group, as vat dyes for wool or, if a SO_2H group is present, as acid wool dyes. Examples are given.

Fulling-fast dyes Chemische Fabrik vorm. Sandoz Ger. 618,000, Aug. 30, 1935 (Cl. 22b 3 02). Arylamino anthraquinones with an unsubstituted 4'-position in the aryl nucleus are treated with aldehydes or substances yielding these in a neutral or acid medium, and further H_2SO_4 groups are introduced into the product, if not sol. enough. Thus, 1-amino-4-phenylaminoanthraquinone-2-sulfonic acid is suspended in H_2SO_4 and heated with BaH_2 . The resulting dye colors wool from an acid bath in fulling- and light-fast greenish blue shades. Other examples are given. Cl. C. A. 30, 294¹.

Dyeing compositions I G. Farbenind A-G (Ludwig Zeh and Erich Konrad, inventors). Ger. 617,718, Aug. 27, 1935 (Cl. 8m 3 02). A compn. contains salts of leuco H_2SO_4 esters of dyestuffs obtained from benzanthrone and salts of compds contg the SH group. Thus, a 2% addn of Na dimethyldithiocarbamate to a printing paste contg salts of the leuco H_2SO_4 ester of dimethoxydibenzanthrone renders the paste more stable.

Azo dyes Mordecai Mendoza (To Imperial Chemical Industries Ltd.). U. S. 2,021,917, Nov. 26. Dyes which dye wool various red shades are formed by coupling tetrazotized m -toluidine with one equiv. of 2-naphthol 6,8-disulfonic acid and one equiv. of 2-naphthol-3,6-disulfonic acid or the like.

Azo dyes Lmmet F. Hitch, Miles A. Dahlen and Martin L. Friedrich (to E. I. du Pont de Nemours & Co.). U. S. 2,023,590, Dec. 10. Water-insol. dyes of the ice color series which may be used to form insol. pigments or coupled on the fiber, are produced by coupling a diazotized arylamine with a fluorinated arylamide of 2,3-hydroxynaphthoic acid or the like. Numerous examples are given. U. S. 2,023,591, Dec. 10. Dyes (most of which dye red shades) which may be developed on the fiber, are produced by coupling a diazotized fluorinated arylamine with an ice-color coupling component. The fluorinated arylamine is preferably of the benzene or naphthalene series, and may have substituted thereon one or more of the well known nonwater-solubilizing groups. The ice-color coupling component is preferably an arylamide of 2,3-hydroxynaphthoic acid, the arylamide nucleus of which may have substituted thereon one or more nonwater-solubilizing groups. Numerous examples are given.

Azo dyes Gerhard Schrader (to General Aniline Works). U. S. 2,023,773, Dec. 10. Insol. azo dyes yielding, when produced on the fiber, generally yellow to red to blue to black shades of good fastness to light, are obtainable by coupling in substance or on the fiber a diazotized aromatic primary amine free from a substituent inducing soly. in water with α -naphthothiazole substituted in the 1-position by alkyl or aryl and in the 6- or

7-position by OH and the 7- or 6-position by $RNHC=O$, in which R is a benzene or a naphthalene ring. The dyes produced in substance are generally yellow to red to blue to black powders, suitable for prep. lakes, while those produced on the fiber, especially cellulose fiber, according to the usual printing process or according to the method of prep. ice colors, generally yield yellow to red to blue to black shades of good fastness to light. Numerous examples are given.

Azo dyes I. G. Farbenindustrie A-G. Brit. 434,243, Aug. 28, 1935. This corresponds to Fr. 777,850 (C. A. 29, 4593¹). Not only aromatic diazo but also diazoazo and tetraazo compds of the character described may be combined. The aromatic α -hydroxycarboxylic acid amides must be free from $COOH$ and SO_2H groups. The products are sol. in hydrocarbons, alcs, ethers, ketones, paraffin, fats, waxes and oils and may be used for coloring them and in the manuf. of colored nitrocellulose lacquers, films, candles, polishing-waxes and shoe polishes.

Azo dyes J. R. Geigy S. A. Fr. 789,775, Sept. 9, 1935. See Swiss 175,355 (C. A. 30, 296¹).

Azo dyes J. R. Geigy S. A. Fr. 787,009, Sept. 16, 1935. Dyes insol. in water are made by coupling a negatively substituted diazo component free from solubilizing groups with a tertiary amine of the formula $PhN(R)R'$, (R is a dihydroxypropyl and R' an alkyl group and the position para to the amino group is free). Thus, 6-chloro-2,4-dinitroaniline \rightarrow 3-ethyl(dihydroxypropyl)-amino-4-methoxytoluene dyes acetate silk blue shades and may be used for coloring lacquers. Other examples are given.

Azo dyes Imperial Chemical Industries Ltd. Fr. 786,733, Sept. 9, 1935. Yellow and orange dyes are prep. by coupling diazotized α -mononitroaniline with a N -sulfatoethyl deriv. of an amine of the $C_{10}H_7$ series which may be coupled in the position para to the NH_2 group. Thus, α -mononitroaniline $\rightarrow m$ -toluidine N -ethyl sulfate dyes wool, silk and rayon orange shades. Other examples are given. Cl. C. A. 29, 7087¹.

Azo dyes I G Farbenind A-G. Ir. 786,608, Sept. 6, 1935. Dyes insol. in water are prep. by coupling the usual coupling components for insol. dyes with compds of the formula $R^1COR^2(NH_2)COR^3$, in which R^1 , R^2 and R^3 are aryl residues of the $C_{10}H_7$ or $C_{10}H_5$ series which may contain substituents other than solubilizing groups. Thus, 1-amino-2,5-dibenzoylbenzene \rightarrow 1-(2',3'-hydroxynaphthylamino)-4-chloro 2,5-dimethoxybenzene dyes cotton a fast scarlet shade. Other examples are given.

Azo dyes I G Farbenind A-G. Fr. 780,755, Sept. 9, 1935. Dyes are prep. by combining aromatic diazo compds. with hydroxyalkyl ethers of aromatic hydroxy-alkylamines, e. g., compds. obtained by the action of ethylene oxide on $PhNH_2$, m -phenylenediamine, m -toluidine, m -chloroaniline, monobutylresorcinol or $PhNHCH_3$.

Azo dyes I G Farbenind A-G. Fr. 780,756, Sept. 9, 1935. Aromatic diazo compds. free from SO_2H or $COOH$ groups are combined with tertiary aromatic amines of the formula $XN(CH_3)_2R$ (X is an aromatic radical capable of combining in the para position and R is an alkyl group contg at least 2 C atoms, an aralkyl or cycloalkyl group). Thus, p -nitroaniline $\rightarrow N$ -methyl- N -benzylaniline gives an intense red on acetate silk. Several examples are given.

Azo dyes I. G. Farbenind. A-G. (Hermann Winkler, inventor). Ger. 620,344, Oct. 19, 1935 (Cl. 22a 1). The diazo compds. of aniline-3- or 4-sulfonic or -carboxylic acid anilides, substituted in the SO_2NHPh or $CONHPh$ residue with a $COOH$ and a OH group in α -position to one another, but not substituted with an acylamino group, are coupled with 1-(2'-hydroxy-3'-carboxyphenyl)-3-methyl-5-pyrazolone or a deriv. thereof. The dyes so obtained are convertible into Cr compds. which generally yield fast yellow shades on animal fibers. The Cr compds. may be produced in substance or on the fiber. Examples are given.

Azo dyes I. G. Farbenind A-G. (Heinrich Chingstein, Hans Roos and Carl Heuser, inventors). Ger. 620,461, Oct. 22, 1935 (Cl. 22a 7). Diammononaphthalenesulfonic

acids, not contg. NH_2 groups in *o*- or *para*-position to one another, are condensed with 2 mols. of a nitrobenzoyl chloride and the products are reduced. The diamines so obtained are tetrazotized and coupled with 2 mols of 1-(3'-aminophenyl)-3-methyl-5-pyrazolone or 1-(3'-aminophenyl)-5-pyrazolone-3-carboxylic acid or an alkyl ester thereof. Alternatively, 1 mol of one of the specified pyrazolone derivs and 1 mol of another yellow component not contg. a diazotizable NH_2 group may be used. A modified process consists in condensing a monoacyldiaminonaphthalenesulfonic acid of the type specified with 1 mol of a nitrobenzoyl chloride, reducing and diazotizing the product, coupling with a yellow component not contg. a diazotizable NH_2 group, splitting off the acyl group, diazotizing and coupling with one of the specified pyrazolone derivs. Yellow or orange dyes of good discharging properties are obtained. Examples are given.

Azo dyes. Soc pour l'ind chim. à Bâle. Ger 617,999, Aug 30, 1935 (Cl 22a 2). Mixts of chromable monoazo dyes of which at least one is a diazotized aminonaphtholmono-, -di- or -trisulfonate coupled with a naphthol residue, are treated with an alk. chroming agent and an org. compd. contg. a OH group. Thus the dye from diazotized 1-amino-2-naphthol-4-sulfonic acid and 1-naphthol is mixed with the dye from diazotized 1-amino-2-naphthol-4-sulfonic acid and 2-naphthol and the mixt. stirred with water. The product is treated with a chromite soln made from $\text{Cr}(\text{OH})_3$ paste, glycerol and KOH . The resulting dye colors wool from an acid bath in fast marine-blue shades. Other examples are given.

Azo dyes, dyeing. I G Farbenind A-G (Friedrich Muth, inventor). Ger 620,459, Oct 22, 1935 (Cl 22a 1). Aromatic or heterocyclic diazo compds are coupled, in substance or on the fiber, with arylides of 2-hydroxycarbazole-*o*-carboxylic acids substituted on the nuclear N atom by a hydrocarbon radical. Water-insol. dyes of various colors are obtained. Numerous dyes are described.

Azo dyes, dyeing. I G Farbenind A-G (Gerhard Schrader, Albert Schmelzer and Fritz Ballauf, inventors). Ger 620,836, Oct 28, 1935 (Cl 22a 1). Addn to 481,445 (C A 24, 245). The diazo compds of unsulfonated 3-amino-2-alkoxycarbazoles are coupled, in substance or on the fiber, with arylides of 2,3-hydroxynaphthoic acid. Blue dyes are produced. Examples are given.

Water-insoluble azo dyes, dyeing. I G Farbenindustrie A-G. Brit 434,209, Aug 28, 1935. See Fr 768,884 (C A 29, 608).

Water-insoluble azo dyes, dyeing. I G Farbenindustrie A-G. Brit 434,433, Sept 2, 1935. See Fr 768,931 (C A 29, 609). For "X and Y are H, CH_3 , or alkoxy" read "X and Y are halogen, CH_3 , or alkoxy".

Green azo dyes. Wm G Reid (to Imperial Chemical Industries Ltd.). U. S. 2,023,614, Dec. 10. Green dyeing is effected by impregnating cellulose material with a diacylacyldiamino compd. of the class consisting of diacylacyl-*o*-toluidide, diacylacyl-1,4,4'-diaminobenzophenone, diacylacyl-1,4,4'-diaminodiphenylurea, diacylacyl-1,4,4'-diaminodiphenylmethane and bis(benzoylacyl)-*o*-toluidide, and then treating the impregnated material with a diazotized 1-substituted amino-1-amino-anilinoanthraquinone. Several examples are given with details of procedure. U. S. 2,023,615 relates to the production of green dyes by coupling a diazotized amino-aryleneaminoanthraquinone compd. such as that of 1-methylamino-4-(4'-aminophenyl)aminoanthraquinone with a diacylacyldiamino compd. in which the acylacyl groups are substituted on sep. amino groups such as diacylacyl-*o*-toluidide. Several examples with details of procedure are given.

Yellow chromable monoazo dyes. Ench Fischer and Herbert Kracker (to General Aniline Works.). U. S. 2,023,933, Dec. 10. Diazotized 3-halo-2-aminobenzene-1-carboxylic acids are combined with pyrazolone derivs such as 1-(4'-sulfophenyl)-3-methyl-5-pyrazolone, 1-(2'-chloro-5'-sulfophenyl)-3-methyl-5-pyrazolone, 1-(2',5'-dichloro-4'-sulfophenyl)-3-methyl-5-pyrazolone,

1-(4'-chloro-2'-sulfophenyl)-3-methyl-5-pyrazolone, 1-(2'-hydroxy-3'-carboxy-5'-sulfophenyl)-3-methyl-5-pyrazolone, 1-(4'-methyl-2'-sulfophenyl)-3-methyl-5-pyrazolone, 1-(4'-sulfophenyl)-5-pyrazolone-3-carboxylic acid ethyl ester, 1-(4'-sulfophenyl)-3-methyl-5-pyrazolone, and the like. Cf. C A 29, 6433.

Chromicform azo dyes. Soc pour l'ind chim. à Bâle. Brit 434,139, Aug 27, 1935. Cr compds of azo dyes are made by treating the azo dyes such as an *o*-aminonaphthol-sulfonic acid, which contains no NO_2 , with a 2-hydroxynaphthalene with an alk. chroming agent and with an org. compd. contg. at least 1 OH at not above 90° or with a complex compd. obtained by the action of an org. compd. contg. at least 1 OH on an alk. suspension of Cr hydroxide. They yield navy blue shades, faster to rubbing than the dyes of Brit 186,635 (C A 17, 886). For an example, cf. Swiss 172,555 (C A 29, 5668).

Azo dyes containing chromium. Soc pour l'ind chim à Bâle. Ger 617,949, Aug 29, 1935 (Cl 22a 2). Chromed dyes are prepd. by the action of a chroming agent on a mixt. of chromable azo dyes contg. at least one diazotized aminonaphtholmono-, -di- or -trisulfonic acid coupled with a naphthol residue. An alk. soln. of Cr_2O_3 in such amt. that there is 1 atom of Cr to each chromable azo dye, is used as the chroming agent. In an example, a paste of Cr_2O_3 , KOH and 2-hydroxynaphthalene is added to diazotized 1-amino-2-hydroxynaphthalene-4-sulfonic acid. On completion of the coupling, a concd. soln. of diazotized 1-hydroxy-2-amino-4-methylbenzenesulfonic acid is added. The resulting dye colors wool from a H_2SO_4 bath in reddish blue shades. Other examples are given.

Azo dyes containing chromium. Soc pour l'ind chim à Bâle. Ger 620,200, Oct 17, 1935 (Cl 22a 2). A mixt. is prepd. contg. at least one Cr compd. of an azo dye and at least one chromable azo dye. The mixt. must contain at least one dye, chromed or unchromed, obtainable by coupling a diazotized *o*-aminonaphtholmono-, -di- or -trisulfonic acid with a naphthol. The mixt. is then heated in an aq. medium with a substantially undehydrolyzed alkali salt, e. g., Na_2SO_3 . The products are blue dyes applicable to animal, vegetable or artificial fibers or useful for coloring lacquers or as pigment dyes. Examples are given.

Azo dyes containing chromium. Soc pour l'ind chim à Bâle. Ger 620,257, Oct 17, 1935 (Cl 22a 2). The dyes obtained by coupling diazotized *o*-aminonaphthol-sulfonic acids with naphthols or their substitution products, are heated with any of the usual chroming agents in the presence of a water-sol. salt of an organic carboxylic or sulfonic acid. The proportion of chroming agent must be such that less than 1 atom of Cr is present for each chromable group in the dye. Blue dyes for animal fibers are obtained. The products are faster than the corresponding Cr-contg. dyes prepd. in the absence of a salt of an org. acid. Numerous examples are given. Cf. C A 29, 2366² and 2 preceding abstrs.

Disazo dyes. Hans Krukalit and Walter Limbacher (to General Aniline Works.). U. S. 2,023,176, Dec. 3. This corresponds to Ger 607,678 (C A 29, 4185²). The coupling compd. may also contain the group $\text{RNH-SO}_2\text{R}'$.

Disazo dyes. J R. Geigy A-G. Ger 620,258, Oct. 17, 1935 (Cl 22a 6). Tetrazotized 4,4'-diamino-2,2'-dimethylbiphenyl is coupled with components not contg. a COOH or SO_3H group. Water-insol. dyes of various colors are obtained. The dyes are sol. in all the usual org. solvents, and are useful for coloring cellulose ester or spirit lacquers, or as components of printing inks. Examples are given.

Disazo dyes. Durand & Huguenin S. A. Fr. 786,649, Sept. 6, 1935. Mordant dyes are prepd. by diazotizing a sulfonic amine of the C_6H_4 series, coupling with a dialkyl ether of aminohydroquinone, rediazotizing and coupling with an *o*-hydroxybenzenecarboxylic acid. Thus, 1-amino-4-chlorobenzene-3-sulfonic acid \rightarrow aminohydroquinone dimethyl ether \rightarrow salicylic acid gives deep brown-

red shades on cotton mordanted with Cr Other examples are given

Disazo dyes, dyeing I G Farbenindustrie A-G. Brit 434,416, Sept 2, 1935 Dyes, insol in H_2O , are made in substance, on a substratum or on the fiber by diazotizing a substitution product of 2-amino-1,1'-azobenzene and coupling with an arylide of 2,3-dihydroxynaphthoric acid, only such components being used as do not contain groups kindling sofly They are faster to boiling NaOH soln than the corresponding dyes from diazotized p -aminoozo compds (cf Brit 378,555 (C A 27, 4089)). In examples, the following dyes are made on cotton: (1) 4-methyl 2-amino 2',4'-dichlorobenzene \rightarrow 1-(2',3'-hydroxynaphthylamino) - 2-methyl - 4-chlorobenzene (Bordeaux-red), and (2) 6-methyl-4-methoxy-2-amino 2',4'-dichlorobenzene \rightarrow the amide (red-brown, Cf C A 29, 3172)

Brown disazo dyes Francis H Smith (to E. I. du Pont de Nemours & Co.) U. S. 2,022,606, Nov. 25 A diazotizing acid such as HCl is added to a mixt of water, $NaNO_2$ and a diamine such as m -phenylenediamine or the like in the continuously maintained presence of a salting-out agent such as NaCl in sufficient amount to salt out the dye substantially as fast as it is formed

Dry compositions for producing azo dyes on the fiber Compagnie nationale de matieres colorantes et manufactures de produits chim du Nord réunies établissements Kuhlmann Ger 620,247, Oct 17, 1935 (Cl 8m 13). See Fr 772,061 (C A 29, 1650)

Vat dyes I G Farbenindustrie A-G (Norbert Stenger and Eduard Albrecht, inventors) Ger 617,726, Aug 27, 1935 (Cl 22a 7 01) Lysim indigoid dyes are obtained by condensing 4,7-dimethyl-6,7-dihydroxydihydroxythionaphthene or their reactive 2-derivs, with different indigoid dye forming compds The products may be further halogenated In an example, 4,5-dimethyl-6,7-dichloro-dihydroxythionaphthene is condensed with 4-methyl-6-chlorohydroxythionaphthene-2- p -dimethylaminoal in the presence of glacial AcOH to give a vat dye which colors cotton in fast bluish red shades Other examples are given

Vat dyes I G Farbenindustrie A-G (Werner Zerweck and Ernst Honold, inventors) Ger 618,811, Sept. 16, 1935 (Cl 22b 3 03). Addn to 602,336 (C A 29, 6117) Dyes of various colors are obtained by forming amides from α -amino compds of the anthraquinone series and arylmethazolo-mono- or -di-carboxylic acids substituted with an anthraquinonyl residue The reaction may be effected by heating α -aminoanthraquinones with the acid chlorides, or a halo anthraquinones with the acid amides The acids used as starting materials are obtainable by condensing anthraquinonealdehydes with α -aminomercaptoaryl carboxylic acids Examples are given Cf C A 30, 623

Vat dyes of the dibenzanthrone series. Edward T. Howell (to E. I. du Pont de Nemours & Co.) U. S. 2,022,584, Dec 3 In prep a dibenzanthrone compd, such as 6,6'-dichlorodibenzanthrone, the corresponding 2,2'-dibenzanthronyl compd is heated with $AlCl_3$ and an oxidizing agent such as KNO_3 (suitably at a temp. of about 105-150° in a melt of NaCl and KCl). Several examples are given

Vat dyes of the pyranthrone series Georg Kranzlein, Heinrich Vollman and Werner Schultheis (to General Aniline Works) U. S. 2,022,926, Dec 10 Dyes which produce orange shades on cotton are formed by condensing pyrene with an aromatic carboxylic acid deriv. of the general formula aryl-COR in which R represents halogen or the group $OCOAr_1$ (the 2 aryls being of the benzene or naphthalene series and being identical), such as benzoyl chloride, m -chlorobenzoyl chloride, p -toluyl chloride or n -naphthyl chloride, in the presence of $AlCl_3$ and while introducing a dehydrogenating agent such as O or air or a solid oxidizing agent such as a heavy metal oxide, into the reaction mixt

Halogenated vat dyes of the benzanthronylaminooanthraquinone series Ernst Honold and Rudolf Müller (to General Aniline Works) U. S. 2,022,240, Nov. 20. In-

tial materials such as those obtained by the action of benzoyl chloride on an alk condensation product of benzanthronyl-1-aminoanthraquinone, Bz -1-benzanthronyl-1-amino-5-aminoanthraquinone or the like are converted into dichloro derivs. by use of a reagent such as sulfuryl chloride in $PhNO_2$ to produce vat dyes generally dyeing cotton from a hyposulfite vat bluish green to olive green shades Several examples are given Cf. C. A. 29, 4185¹¹

Vat dye printing pastes Philip H. Stott and Earl E. Beard (to L. I. du Pont de Nemours & Co.) U. S. 2,022,748, Dec 3. The printing qualities of a vat dye of the algal series are improved by incorporating into the printing paste conig. the dye an acylaminoanthraquinone of high soly in the alk hyposulfite vat such as dibenzoyl-1,8-diaminoanthraquinone, etc. Various examples are given

Metalized dyes See pour l'ind chim à Bâle. Fr. 786,920, Sept 14, 1935 Dyes of the formula $R \rightarrow R' - R$, in which R represents diazo compds one at least of which contains groups capable of forming lakes, and R' is an aryl compd. conig. at least 2 amino groups capable of coupling twice, are treated with metallizing agents The 2nd coupling may take place after the metallization. Thus 4-nitro-2-aminophenol \rightarrow 1,7-diaminobenzene \rightarrow 4-nitro-2-amino-1-phenol-6-sulfonic acid is metallized with $FeCl_3$, giving a dye which gives fast deep olive-brown shades on Cr-tanned leather. Several examples are given Cf C A 29, 8348⁴

Dyes of the anthraquinone series Henry Dreyfus U. S. 2,022,956, Dec 3. Dyes which are suitable for use with cellulose acetate, etc., are produced by the reaction of an amino alc. such as β -aminoethyl alc. on α -negatively substituted anthraquinone, such as α -chloroanthraquinone, in which the neg substituent is capable of being replaced by an amino group by the action of an amine.

Acid wool anthraquinone dyes. I. G. Farbenindustrie A-G Brit 434,429, Sept 2, 1935 The dyes are obtained by causing a polynuclear aromatic base which is partially hydrogenated to react with an anthraquinone deriv. that contains no SO_2H group and either contains in 1,4-, 1,5-, or 1,8 position substituents known to be exchangeable for amino radicals by reaction with amino compds or contains such an exchangeable substituent in 1 of these positions besides other substituents in any position, and then sulfonating the products thus obtained Cf. C. A. 29, 935⁴

Azabenzanthroneacridine dyes Max A. Kunz, Karl Koerberle and Gerd Kochendoerfer (to General Aniline Works) U. S. 2,023,470, Dec 10 Numerous examples are given of the production of dyes by treating with condensing agents azabenzanthrones which are connected in one peri position with an org. radical by means of a linking member which may be a N, O, S, SS, Se or CO bridge. Hereby products are formed corresponding to the general formula $X-Y-Z$, in which X stands for an azabenzanthrone radical, Y for the bridge and Z for an org. radical, at least the linkage X-Y being attached to a peri-position of the azabenzanthrone radical, preferably the two linkages attached to X are in the two peri positions of the azabenzanthrone E.g. from Bz -1- α -anthraquinonylamino-8-azabenzanthrone by treatment with H_2SO_4 or $ClSO_3H$, an orange-yellow dye is obtained By treatment with alk potash, Bz -1- α -anthraquinonylamino-8-azabenzanthrone yields an olive green dye Bz -1- N -Pyrazolanthronyl-8-azabenzanthronyl is converted into 8-azabenzanthronepyrazolanthrone From the reaction product of thioglycolic acid or an anthraquinomercaptau on Bz -1-bromo-8-azabenzanthrone, condensation products conig. S are obtained by alk. condensation

Dibenzanthrone dyes E. I. du Pont de Nemours & Co Brit 434,132, Aug 27, 1935 This corresponds to Ger 613,179 (C A 29, 5670) but is restricted to the products obtained from the monoisopropyl or monoisobutyl ether of Bz -2, Bz -2'-dihydroxydibenzanthrone They are presumed to be dibenzanthrones wherein the Bz -2, Bz -2'-positions are linked as parts of a pyran ring

structure. Further dyes may be obtained not only by nitrating, sulfonating or halogenating but also by nitrating and reducing, by oxidizing to yield hydroxy derivatives or by condensing with an org. carboxylic acid in the presence of an AlCl₃ condensing agent. Among examples, (1) *Rs-2'-di*hydroxydibenzanthrone monoisopropyl ether is heated to 170–180° in CH2Cl2, CHCl3 or CCl4 in the presence of AcONa and, optionally in the presence of benzal chloride, BiH3, mono- or di-chlorohydrin, CH2Cl2, *p,p'*-dibromodibenzophenone dichloride, diphenyldichloromethane or dibromostilbene as catalysts, the product may be purified by treatment with H2O, for conversion to the sulfate, which is sep'd and decomp'd by H2O, or by heating in CH2Cl2 and filtering, it dyes cotton fast green shades, (2) the product of (1) is treated with MnO2 in H2SO4 at 18–20° and then with Na2SO4 to give a hydroxy deriv. (yellowish green), and (3) the product of (1) is condensed with α -chloroanthraquinone- β -carboxylic acid chloride in a melt of AlCl3 and SnCl4 at 110–120° (dyes greenish blue).

Indigoid dyes I G Farbindustrie A G Ger 780,737, Sept. 9, 1935 Violet to blue vat dyes are prep'd by condensing 4,7-dichloro-5-methyl-3-hydroxythiophthalate (1) to form thiophthalene-(2) indol (2) indigo, and, if necessary, subsequently halogenating I, in 160–161°, is obtained by converting 2,5-dichlorotoluene to the sulfonyl chloride to 2,5-dichloro-4-methylphenyl-1-thioglycolic acid, m 104°, and closing the ring 1 examples are given Cf C A 29, 2307¹

Pyrene dyes I G Farbindustrie A G Brit 434,027, Aug. 26, 1935 This corresponds to Fr 769,837 (C A 29, 6139), the starting material being 2,5,7,10-tetrachloropyrene-3,8-quinone. Most of the products dye cotton and some may be converted into leuco-sulfur esters and used according to known methods.

Triarylmethane dyes I G Farbindustrie A G (Carl Winter and Paul Krebs, inventors) Ger 620,402, Oct. 22, 1935 (Cl 226 10) As components in the manuf. of triarylmethane dyes by standard processes, use is made of comp'ds. of the formula $R'N(R'')CN$, in which R is an aryl group, R' is H or an alkyl, hydroxyalkyl or aralkyl group, and n is a whole no. The substitution or sapon products of these comp'ds. may also be used, or the CN group may be sapon'd after the dye has been produced. A typical product is obtained by heating 4,4'-tetrachlorodibromobenzophenone with α -naphthylamino- β -propionitrile (obtainable from α -naphthylamine and acrylonitrile) to 55° in toluene in the presence of POCl3, the product is a water-sol. blue dye applicable to paper, rayon mordanted cotton, and silk. Other examples are given.

Rendering water soluble dyes soluble in organic solvents and insoluble in water Wolf Krutichsky, Carl J. Beckert and Jack Braver U S 2,022,678, Dec. 3 A dye such as Naphthol yellow S (C I No 10) is rendered sol. in org. solvents such as CH2Cl2, acetone, alc. and "mineral naphtha" by combining it with α -hydroxyethanolamine hydrochloride or various suitable comp'ds. of the general formula $AcYN, NR_2$ in which Ac is an acyl group linked to Y, Y represents O, N, S, P and I, X is a hydrocarbon radical which may be substituted by a hydroxy or alkoxy radical forming the chemical linkage between Y and N, n is a whole number and R represents H or an alkyl group which may be substituted by a hydroxy or alkoxy radical. Numerous examples are given.

Diazoamine compounds, azo dyes. I G Farbindustrie A G Brit 433,578, Aug. 22, 1935. See Fr. 769,838 (C. A. 29, 6099)

Diazonium compounds. Anton Osenbeck and Ernst Tietze (to General Aniline Works) U S 2,022,923, Dec. 3. Numerous examples are given of the production of diazonium salts of the general formula $RN_2NSO_2R'NHX$ where R stands for the radical of a diazotized non-sulfonated aromatic component suitable for producing azo dyes, R' stands for an aromatic radical and X stands for the radical of a carboxylic acid which is attached with the C atom of the CO group to the N atom of the NH group. The comp'ds. are generally stable, yellow to orange,

cryst. substances sol. in water, and are useful as intermediates in the manuf. of dyes Cf C. A. 28, 3079¹.

Dyeing Soc. pour l'ind. chim. à Bâle. Ger. 617,644, Aug. 23, 1935 (Cl 8m. 2.03) The absorptive capacity of animal fibers for dyes is diminished by employing dye baths contg. sulfonated condensation products of aromatic hydroxy comp'ds. and benzoin. By this means, two-color effects are produced on cotton and wool or like textile mixtures. Thus, a half wool and cotton fabric is dyed in a bath contg. chloraniline and 8 RN (Schultz Dye Tables 7 420), Na2SO4 and a small addn. of the product obtained by condensing Na 2-hydroxy naphthalene-6-sulfonate with benzoin in cond. H2SO4. After washing, rinsing and drying the fabric, the wool is scarcely colored while the cotton is dyed deep red. Without the addn. of the above condensation product, the wool is also dyed deep red. Other examples are given.

Dyeing I G Farbindustrie A G (Othmar Drapal, inventor) Ger 620,422 (Oct. 19, 1935 (Cl 8m 12). In producing water-insol. azo dyes on the fiber, use is made of an aq. alk. bath which contains an arylide of a cyclic α -hydroxy carboxylic acid and to which has been added a mixt. of Turkey red oil, sulfate cellulose lye, and Na2PO4. Addn. of this mixt. prevents the pptn. of Ca salts in the bath and leads to dyings of better fastness to rubbing than those ordinarily obtained. Other wetting agents and (or) solvents may also be added to the bath. An example is given.

Dyeing with vat dyes Richard G. Clarkson and Frank W. Johnson (to I. du Pont de Nemours & Co.) U S 2,021,932, Nov. 26 A dye soln. is applied to fiber or fabric in the presence of a cellulose comp'd. such as Na cellulose glycolate which is adapted to be dispersed in alk. soln. and serves as a retardant.

Dyeing textiles Soc. pour l'ind. chim. à Bâle Fr 780,671, Sept. 7, 1935 Fast shades are obtained by transforming in known manner on the fiber or on other appropriate supports, the NH comp'ds. of aromatic hydrocarbons formed of more than 3 condensed rings. Examples are given of dyings obtained by oxidizing diaminopyrene, and by diazotizing it and coupling with 2,3-dihydroxy naphthoic acid.

Dyeing wool Irma C. F. Plouquet (Theodor Walter, inventor) Ger 617,512, Aug. 20, 1935 (Cl 8m 1.01) Indigo blue effects are produced on wool by passing the fabric through an open jigger contg. the indigo or bromoindigo dye in a roller vat, to effect the basic dyeing. The fabric is then overdyed with bromoindigo. Examples are given.

Dyeing skins, hair and feathers I G Farbindustrie, A-G (Trichl chem. int., inventor) Ger 617,047, Aug. 30, 1935 (Cl 8m 10 02) The above substances are treated with an oxidizing bath contg. a salt of 1,5-dihydroxynaphthalene and aminodiphenylamine optionally substituted by alkyl, cycloalkyl, aralkyl, hydroxyalkyl or alkoxy groups. Thus, a salt of 1,5-dihydroxynaphthalene and 4-amino-diphenylamine is dissolved in water and a 3% soln. of H2O2 add'd. A white dog skin mordanted with Fe salt is soaked in the bath for 3 hrs. and the hair becomes blackish blue and the leather blue. Other examples are given.

Dyeing and printing textile materials Miles A. Dahlen (to I. du Pont de Nemours & Co.) U S 2,021,911, Nov. 26 Bright fast colors (brown, orange and red in examples given) are produced on goods such as cotton in a "one-bath" process by use of compas. comprising diazonium comp'ds. of the general formula: $aryl-N-NR$ in which aryl represents an aryl nucleus of the benzene, azobenzene, biphenyl, diphenylamine, naphthalene, carbazole or anthraquinone series contg. no solubilizing group, but which may contain groups such as alkyl, alkoxy, halogen, nitro and benzoylamino, and R represents a pyrrolidine or piperidine nucleus contg. at least one solubilizing group; and any of the well-known ice-color coupling components such as the arylamides of 2-hydroxy-3-naphthoic acid, hydroxy carbazole, hydroxy naphtho-carbazole, and hydroxyanthracene-carboxylic acids, α - and β -naphthol, acetoacetyl derivs. of arylamines, and phenylmethylpyrazolone. The material is treated with

the mixt comprising one of the well-known ice-color coupling components and a diazomino compd., and developed by subjecting it to the action of a dil acid at elevated temps. Several examples with details of procedure are given.

Printing textiles. Imperial Chemical Industries Ltd., Samuel Howard and Alce Wormald. Brit. 433,803, Aug. 19, 1935. White resist effects are produced on cellulosic material by printing with a resist paste contg. a salt of a primary, secondary or tertiary amine or a quaternary NII, halide, overprinting or padding with a prepn. contg. a sulfonic ester of a leuco vat dye having affinity for cotton and further treating to develop the vat dyeing. Among 6 samples, cotton cloth is printed with an aq. paste contg. British gum and benzylpyridinium chloride, dried, overprinted with an aq. paste contg. Solodon jade green, neutral starch tragacanth thickening and NaNO_2 , again dried, passed through dil. H_2SO_4 at 60° , washed and soaped at the boil.

Colored pattern effects on textile materials. Geo. H. Ellis and John Allan (to Celanese Corp. of America). U. S. 2,022,413, Nov. 26. In forming colored pattern effects on textile materials such as a cotton or cellulose acetate fabric by discharge of ground color, there is applied to selected areas, before moist heat treatment, both a compn. comprising a discharging agent for the ground color and a coloring matter resistant to such discharging agent, and a compn. comprising an agent which will discharge the ground color and also the coloring matter of the other compn., the materials are then subjected to moist heat treatment to effect discharge and color fixation.

Machine for dyeing hanks of yarn. Smith, Drum & Co. Ger. 617,974, Aug. 30, 1935 (Cl. 8a 8 01).

Piece-dyeing jigger. Hans Geduldiger. Ger. 617,933, Aug. 29, 1935 (Cl. 8a 9 50).

Apparatus for dyeing hat bodies. Turner, Atherton and Co. and Albert Turner. Brit. 434,024, Aug. 26, 1935.

Apparatus for applying dye solutions or other liquids to traveling yarns such as those of natural or artificial materials. Ernest L. Greenwood (to Celanese Corp. of America). U. S. 2,022,854, Dec. 3. Structural details of a siphon wick device.

Apparatus for producing azo dyes on knitted tubular fabrics. I. G. Farbenind. A.-G. (Carl Vorck, inventor). Ger. 620,323, Oct. 19, 1935 (Cl. 8m 12).

Printing machine for fabrics. Radebeuler Maschinenfabrik August Koebig G. m. b. H. Ger. 617,875, Aug. 27, 1935 (Cl. 8c 7 01).

Apparatus (with a photoelectric cell) for comparison of colors such as those of textile materials. Harold H. Sheldon (to Sheldon Elec. Corp.). U. S. 2,022,327, Nov. 26. Structural features.

Apparatus (with lamps and color filters) for matching colors such as those of dyed clothing, etc. Harold H. Sheldon (to Sheldon Elec. Corp.). U. S. 2,022,326, Nov. 26. Structural features.

Artificial threads. Siemens-Schuckertwerke A.-G. I. r. 786,669, Sept. 7, 1935. Threads made from polymerization products of aryl olefins such as polystyrene, "vinifol," "vinilytes" and "chlorvin" are made up of a no. of individual very fine strands. The strands may be mixed and worked with animal or vegetable wool, silk or asbestos.

Treating artificial filaments, fabrics, etc., dyeing. British Celanese Ltd., Albert Mellor and Ralph J. Mann. Brit. 434,203, Aug. 28, 1935. Artificial threads, yarns, etc., are treated with a solvent, swelling or softening agent under such conditions that the agent does not completely penetrate the filaments, etc., and are then subjected to dyeing or other wet textile operation in rope or other folded form. In examples, (1) cellulose acetate fabric is padded with a 10% aq. soln. of HCOOH , AcOH or ethylene glycol monoacetate, given an air run for 30 sec. and washed, and (2) similar fabric is passed through a bath contg. $\text{C}_2\text{H}_5\text{Cl}$, 60 and PhMe 20% for about 2 min., washed with PhMe and dried, in each case before dyeing or other wet textile operation on the fabric in rope form.

Apparatus for drying wound rayon threads. Vereinigte

1 Glanzstoff-Fabriken A.-G. Ger. 619,778, Oct. 7, 1935 (Cl. 29a 6 08). Addn. to 600,236 (Cl. A 28, 65769).

Textile fabric. Frederick B. Smith (to Celanese Corp. of America). U. S. 2,022,391, Nov. 26. For producing a fabric having a full hand, a process is used of assoc. together yarns of cellulose acetate and yarns of regenerated cellulose which, after having reached the set condition, have been subjected to a stretching operation in alternating relationship in such manner that a fabric is formed wherein at least part of the cellulose acetate yarn floats, and then subjecting the fabric to a treatment which causes the regenerated cellulose yarn to shrink.

Rayon. British Bemberg Ltd. Brit. 434,320, Aug. 29, 1935. Freshly spun and washed cellulose hydrate rayon in wound form is treated with an aq. emulsion of a fat or oil at above 70° , freed from excess of liquid and dried without intermediate washing. Any mineral, animal or vegetable oil or fat may be used. In an example, freshly spun, decoppered and washed skeins of cuprammonium rayon are treated 30 min. in an aq. emulsion contg. 15% olive oil at 99° , centrifuged and dried.

Crepe fabrics. Heberlein & Co. A.-G. Brit. 433,902, Aug. 22, 1935. Figured effects are produced on crepe fabrics having overwristed threads by printing them locally with reserves that exert a cementing action on the threads and are resistant to subsequent wet treatments and then treating the fabric in a crepe-setting bath, followed by any further processing treatment. The reserving effect may be obtained by treatment with albuminous substances that are subsequently rendered insol. by coagulation by heat or tanning, or by the application of natural or artificial resins, cellulose esters or regenerated cellulose.

Coated fabrics. Sandura Co., Inc. Brit. 434,489, Aug. 20, 1935. Decorative sheet material for covering walls and floors is made by applying to 1 side of a fibrous sheet a liquid backing compn., e. g., clear or pigmented oil or lacquer, dye, glue, latex, casein, wax or resin, in controlled amt. to penetrate the sheet but not fill the pores and then applying to the other side decorative coloring material, e. g., paint, ink or dye, which penetrates well down into the body of the sheet. Before application of the decorative material, a moistening agent, e. g., a soln. of bodied linseed oil in a light hydrocarbon, may be applied to the face of the sheet as described in Brit. 434,490 (below). In 434,490, Aug. 26, 1935, the decorative material is applied 1st and a toughening agent, e. g., oil, latex or lacquer, then introduced so that the fibers are coated but the pores incompletely filled. The fibrous sheet may be moistened with a soln. of bodied linseed oil in naphtha or C_4H_8 before decorating, e. g., by printing. A backing material may be applied to the sheet before moistening or decorating, as described in Brit. 434,489 (above).

Coating textiles. Julien Baude. Fr. 786,897, Sept. 11, 1935. Textiles are made less permeable to air and liquids and fireproof by a coating compn. contg. CaCO_3 , powdered metal, Na silicate and a pigment.

Apparatus for binding cut edges of pile fabrics. Wm. A. Anderson (to Charles H. Davison). U. S. 2,023,378, Dec. 3. Numerous structural and operative details of an app. applying cement to the edges to be bound.

Washing wool. I. G. Farbenind. A.-G. (Hermann Schutte, inventor). Ger. 616,797, Aug. 5, 1935 (Cl. 29b 1). Crude wool is washed by solns. of acid H_2SO_4 esters of the higher alcs. obtained by oxidizing paraffin hydrocarbons, or by water-sol. salts of such esters. Thus, a washing bath contains the neutral Na salt of the acid H_2SO_4 esters obtained from a mixt. of higher alcs. obtained as above.

Delustering regenerated cellulose filaments. Franz Hoelkeskamp (to American Bemberg Corp.). U. S. 2,022,961, Dec. 3. A soln. of viscose or cuprammonium cellulose is spun, with stretching, to form filaments which are pptd. in the presence of a water-sol. metal salt such as BaCl_2 and subsequently coagulated with a compd. contg. one or more acid H atoms such as H_2SO_4 , which reacts with the metal salt to form a water-insol. ppt. App. is described.

Apparatus for drying fabrics in the open width. Sur

New products and problems in construction painting
C. F. Rassweiler. *Ind. Eng. Chem.* 27, 1294-7 (1935) —
Many problems arising from new construction methods and
materials have been solved by use of synthetic resins such
as glyceryl phthalates (I) and $\text{PhOH-CH}_2\text{O}$ (II). The
crit. properties of modern interior finishes are rapid drying
(no longer incompatible with durability), good hiding and
retention of appearance. Important quick-drying prod-
ucts are architectural white enamels and floor varnishes,
contg. I and II, resp., and wall paints, contg. processed
oils and Ti pigments, the degree of penetration into porous
surfaces being controlled by the state of dispersion of the
ingredients. Crit. properties of modern exterior finishes
are protection of metal, durability on wood and alk. sur-
faces (cement, plaster and asbestos board), and retention of

appearance. I and II confer exceptional H_2O imper-
meability and exposure resistance, which are further in-
creased by "metal-protective pigments." Pre-finished
construction units are of interest because max. resistance
of paint films develops after aging. Marine paints con-
tain I; acid- and alkali-resistant paints contain II or
chlorinated rubber. The problem of adhesion on galvanized
Fe may be solved by Zn dust as pigment. Impermeability
of synthetic-resin house paints causes them to peel off as
 H_2O works its way out. This difficulty is increased by
modern wall construction and air conditioning but may be
solved by priming both sides of clapboard in the mill.
Paints contg. I are easily cleaned and do not change color.
Durable "self-cleaning paints," in which a slow chalking
carries away the dirt, have now been formulated.

Arnold M. Collins

Ulrich *Farben-Zig* 40, 1037 (1935) — A discussion of the possibility of using dehydrated castor oil, oiticica oil and specially treated oils (prepd by heat-treating linseed oil, fish oil or soybean oil with or without simultaneous air blowing) as components of protective coating compns J W Perry

Reduction of linseed oil consumption in the production of linoleum A V Pamsilov and E G Ivancheva. *Trans Inst Chem Tech Ivanovo (U S S R)* 1, 139-42 (1935) — Formulas are given for the substitution of 50% of Ca salts of naphthenic acids for linseed oil in the production of oilcloth Chas Blanc

Fish-oil stand oil as a substitute for linseed-oil stand oil Gottfried Kaempfe *Farben-Zig* 40, 1009 (1935) — Fish-oil stand oil, prepd by removing the sord and less highly unsatd components from fish oil and simultaneously heat-treating the remaining highly unsatd constituents, has excellent drying properties and is well suited for use in paints and varnishes, either with or without admixt. of other stand oils J W Perry

The moisture sensitiveness of linseed oil coats W. H. Droste. *Angew Chem* 48, 644-7 (1935) — Investigations were carried out on the weathering of coats shortly after application. The addn of diluents results in a loosening of the coat and an increase of the sol part. Addn of 20% of polymerized oil to 80% of linseed oil did not give any notable improvement. The sol substance of inert pigment contains free split acids. The amt of sol matter is influenced by sol salts which are probably present in the pigment. The metals contained in the drier also go partially into soln. The sol matter in basic pigments is not smaller than that in inert pigments. The acids going into soln are completely neutralized by the basic components of the pigment, except with white lead. Zinc white and its mixts behave alike, mainly Zn soaps being dissolved, and their soly does not change with increasing age of the coat. The sol part in a two-day-old coat of red lead, however, is very great, but decreases considerably after 28 days, and the soly of Pb soaps decreases parallel with it. White lead does not show this behavior in such a marked manner, as it cannot neutralize the resulting free acids as fast on account of its lower basicity. The test results have definitely shown that sol substances are formed in all linseed oil coats, independently of the choice of the pigment. The amt of sol substance increases if unfavorable weather conditions exist during the first drying period. After these substances are removed by becoming washed out, further exposure of the film to the air results in the renewed formation of sol substance, whose amt is again a function of the weather conditions. Exptl results are presented and theoretical considerations are discussed. Four references. Karl Kammerneier

Heat treating oiticica oil. H Kemner. *Farbe u Lack* 1935, 545-6 — Heating oiticica oil to 250° for 15 min yielded a stand oil having optimum properties. The tendency to "wrinkling" may be further reduced by addn of resins, litharge or glycerol before or during the heat treatment. Oils treated with glycerol yielded films very sensitive to water J W Perry

The use of the "Höppler" viscometer for oils, lacquers and varnishes D Cannegieter *Verfahrenstechnik* 8, 252-4 (1935) — The construction, use and advantages of the Höppler viscometer are discussed J W Perry

The cultivation and processing of flaxseed R Heublyum. *Seifensieder-Zig* 62, 689-90, 720-1 (1935) — A review of recent progress J W Perry

The purification and standardization of kauri gum J R. Hosking. *New Zealand J Sci Tech* 17, 369-87 (1935) — Aside from the direct effects of the general eco-

nomic depression the decrease during later years in the consumption of kauri gum is a result of its high cost compared with that of other natural resins, nonstandardization, doubt by consumers as to the continuity of supply, competition with artificial resins and the demand for quick-drying varnishes. The main uses of kauri gum are discussed. The better grades are used for oil varnishes and the poorer grades in the manu of linoleum, the latter industry absorbing about 70% of the output. In regard to the conditions detg the future of the kauri gum industry the conclusions are drawn that (1) the continuity of the kauri gum industry depends on the utilization of the lower grades of gum, (2) a much purer product is demanded than has hitherto been produced; (3) the lower grades should be standardized and (4) the price of the standardized material should be kept low. Ests indicate that there is at least as much kauri gum remaining in the soil as has so far been produced. Present methods of purification are described (MacLaurin's salt vacuum process, the Hoyland process and the Buchan process). Solvent extrn produces a purer and more homogeneous product than flotation. An improved solvent process is described for the utilization of low-grade kauri in the production of gum of approx 93.5% resin content and possessing all the properties of a good-grade fossil gum. A mixt of 7 parts benzene and 3 parts acetone was found to be a rapid working solvent at 50° for kauri gum of most ages and allowed a quick settling of the impurities. A detailed diagram of the mfg process is given. The purified kauri gum is better suited to the requirements of the linoleum industry and has a wider field of utilization than unpurified grades D Thuesen

Mechanical properties of plastic films A Vila and F. Tesson. *Compt rend* 201, 1031-3 (1935) — An arrangement is described for testing the viscous flow on stretching and elasticity of films of paints, etc., as formed on surfaces for protection, after subjection to artificial aging (e.g., by V.'s method, *C. A.* 29, 6141). The results are shown by curves, and indicate a red ochre paint to give the most, tar contg Al the least, elastic film, while the tar and a red lead paint showed the greatest viscous flow

Evaporation of lacquer solvents W. K. Lewis, Lombard Squires and C E Sanders. *Ind Eng Chem* 27, 1395-6 (1935) — Exptl results show the inaccuracy of the assumption that a solvent mixt of const b p. at the drying temp of the film is a const-evap mixt. The mechanism of the evapn. is studied W. H. Boynton

Various nitrocellulose lacquers. A Kraus. *Nitrocellulose* 6, 199-201 (1935) — A review. E. M. Symmes

Phenolic resin varnishes. Influence of linseed oil on film properties V. H. Turkington, Robert J. Moore, W. H. Butler and R. C. Shuey. *Ind Eng Chem*, 27, 1321-5 (1935), cf. *C. A.* 25, 423, 4419 — The properties of varnishes made under comparable conditions from varying proportions of Bakelite (I), China wood oil (II) and linseed oil (III) were systematically investigated and data presented in triangular diagrams. Increasing I increased drying rate, durability (as detd by both checking and loss of gloss), and resistance to NaOH and boiling H₂O. III could be substituted for II without much change in durability or H₂O resistance (blistering) but drying time increased (particularly in long oil formulas) and NaOH resistance decreased (particularly for short oil varnishes). Arnold M. Collins

Synthetic varnishes and enamels, their manufacture, working and uses Tr. Kolke. *Farben-Zig* 40, 1198-9, 1220-1 (1935) — A general discussion of the use of synthetic resins in protective coating compns J. W. P.

Electrochemical methods in varnish and pigment industry A. V. Pamsilov. *Trans Inst Chem Tech Ivanovo (U. S. S. R.)* 1, 132-8 (1935) — The progress made in the application of electrochem methods in the lab control and in the production of mineral pigments is reviewed Chas Blanc

"Wrinkling" of wool-oil varnishes. The effect of the drier H. Wolff and G. Zeidler. *Farben-Zig* 40, 1010 (1935) — The wrinkling of a no. of varnishes, which con-

tained the "wrinkling"-preventing agent "Mittel 109 J," and which were prep'd. from various resins and an improperly heat-treated China wood oil, was more severe with a Mn-Pb combination drier than with a Co drier.

J. W. Perry
Varnish-blending graph. R. C. Shuey. *Ind. Eng. Chem.* 27, 1391-4 (1935)—A graphical method is described for detg. wt. percent and wt.-vol. relationships of the volatile and nonvolatile components of oleoresinous varnishes. See samples and their soln. are given.

W. H. Boynton
Natural resins for the varnish industry. C. L. Mantell, C. H. Allen and K. M. Sprinkel. *Ind. Eng. Chem.* 27, 1369-73 (1935)—The natural varnish resins are classified, their grading is explained, and their properties are tabulated. Methods of pretreatment for varnish making are discussed, including mastication (cf. C. A. 28, 2550). Wider use is recommended because of uniformity (controlled by government supervision), steady supply, cheapness (av. 5-7 cents/lb.), freedom from patent domination, and performance equal to best synthetic resins, in China wood oil varnishes. Arnold M. Collins

Corrosion problem—paints and anticorrosive coatings (Genin) 9 Tarnishing of gilt inks of the bronze-powder type when in contact with paper (Scherholtz) 23 Action of alk. solns. on ultramarine blue (Leschewski, Podschus) 2 Plastic compns. (in prep'n. of linoleum and oil-cloth) (Brit. pat. 433,994) 13. Azo dyes [for coloring lacquers] (Fr. pat. 787,000) 25. Acetyl compds. [as starting materials for paints] (Ger. pat. 617,080) 10. Disazo dyes [for coloring lacquers] (Ger. pat. 620,258) 25.

Apparatus for filtering paints. Pierre L. T. J. Petit. Fr. 780,543, Sept. 5, 1935

Apparatus for demonstrating reflecting properties of surface finishes such as paints. Earl L. Canfield. U. S. 2,022,402, Nov. 26. Structural details

Pigment dispersion in nitrocellulose. Harry E. Stone. U. S. 2,021,949, Nov. 26. A mixt. of a black carbon pigment, nitrocellulose, Cu butyl phthalate and a plasticizer such as tricresyl phosphate is subjected to a roll-grinding process to produce a mass which is hard and brittle at room temps. and is suitable for use in making lacquers.

Titanium compounds; pigments. Titangesellschaft m. b. H. Brit. 433,960, Aug. 23, 1935. See Fr. 753,585 (C. A. 29, 6261).

Zinc pigments. I. G. Farber and A. G. (Elkbert Lederle and Max Günther, inventors). Ger. 618,868, Sept. 17, 1935 (Cl. 22f 5). Addn. to 603,113 (C. A. 29, 5631). Solns. of Zn salts generally are treated simultaneously with an alkali sulfide (or (NH₄)₂S) and NaOH (or soda), and the pptts. are washed and dried.

Zinc sulfide pigment. Harlan A. Depew (to American Zinc, Lead & Smelting Co.). U. S. 2,021,690, Nov. 26. Steam is mixed with a ZnS pigment to be purified and the material is passed into a furnace and there treated with a current of inert gas and the pigment is compacted into a seal within the furnace at the point where it enters the furnace so that the volatilization of the volatile material creates a gas pressure which assists in the sealing effect. App. is described and the furnace treatment serves to remove S-O acid components. U. S. 2,021,691 relates to app. of the same character and use.

Chrome yellows. Elkbert Lederle and Max Guenther (to General Aniline Works). U. S. 2,023,928, Dec. 10. A chrome yellow stable to light is obtained by pptg. a

material comprising neutral Pb chromate and at least one salt such as Pb sulfate crystd. in rhombic crystals, capable of forming with Pb chromate an isomorphous series of mixed crystals and capable of being converted into a monoclinic modification, and heating the material suspended in an aq. medium at a temp. above the conversion point at which conversion into the monoclinic modification occurs until such conversion is substantially complete. A temp. of about 60° for 2 hrs. is suitable. Several examples are given.

Drying oils. N. V. Koninklijke Pharmaceutische Fabrieken v/h Brocades-Scheerman & Pharmacia. Ger. 617,728, Aug. 24, 1935 (Cl. 22h. 2). Drying oils, together with asphalt-like products, are obtained in the purification of mineral and tar oils with H₂SO₄. The oils are treated with excess of conc'd H₂SO₄ at about 50° and the resulting sulfonic acids converted to their salts. These are dry-dist'd., leaving an asphalt-like residue. The oils are purified by washing with NaOH lye and finally vacuum dist'd. to give a drying oil. An example is given.

Rosin drying oil. Robert C. Palmer and Paul O. Powers (to Newport Industries, Inc.). U. S. 2,022,978, Dec. 3. Partially esterified wood rosin is heated to about 260-325° with fuller's earth until the acid value of the mixt. has been considerably reduced. The product can be used in printing inks and varnishes. U. S. 2,022,974 relates to the use of a product of like character in bronzing-ink vehicles by admixt. with about 10-30% of a high-viscosity refined petroleum oil, a liquid ester of phthalic or abietic acid, castor oil or tricresyl phosphate as a softening agent. Such mixts. form a nonbrittle film.

Coating compositions containing drying oils. Robert L. Sibley (to Rubber Service Laboratories Co.). U. S. 2,022,301, Nov. 26. A dimethylhydroquinoline or other alkyl substituted hydroquinoline is employed in varnishes or the like contg. drying oils such as tung oil to control oxidation. U. S. 2,022,302 relates to the similar use of a hydroacridine such as methylidihydroacridine.

Nitrocellulose lacquers. Charles Bogn and Vaughn Kelly (to Commercial Solvents Corp.). U. S. 2,023,363, Dec. 3. For preventing gelling, livering or agglomeration of nitrocellulose lacquers contg. basic Zn pigments and esters of lactic or hydroxybutyric acid, the lacquers are mixed with 0.1-1.5% of a hydroxy "polybasic" aliphatic org. acid such as citric, tartaric or malic acid or with an alkali metal salt of such an acid.

Lacquer containing synthetic resin. Melville M. Wilson (to Sharples Solvents Corp.). U. S. 2,022,331, Nov. 26. A lacquer which is free from bluish on drying contains an oil-sol. resinous condensation product formed from tertiary amyl phenol and a CH₂-contg. substance, a vehicle comprising a hydrocarbon oil, a cellulose ester such as cellulose nitrate, a relatively small proportion of a dialkyl phthalate, and an ester gum or polyhydric alc. "polybasic" acid resin in a quantity at least two-thirds that of the first-mentioned condensation product. Several examples are given.

Printers' varnishes. Walter K. R. Hartmann and Carl P. L. Hartmann (trading as Chemische Fabrik Halle-Ammendorf Gebr. Hartmann). Brit. 434,450, Sept. 2, 1935. In a process for the production of high-gloss overprints, an overprinting varnish is used comprising a drying oil, an oil-sol. natural or synthetic resin and a small amt. of an oil-swellable org. salt of Mg, alk. earth or earth metal, e. g., soaps of these metals. Driers may be added and the varnishes may be colored by Victoria blue base, Rhodamine base, Sudan dyes, Miliori blue, Fanal green, Permanent red, etc. The org. salts may be formed in the varnish by adding separately, e. g., Al(OH)₃ and stearic acid.

27—FATS, FATTY OILS, WAXES AND SOAPS

E. SCHERUBEL

Thermal properties of fats. M. Ravich. *Masiobolno Zhivoe Delo* 11, 376-8 (1935).—Thermal properties of oils and fats for the production of margarine are discussed. Chas. Blanc

New methods for producing animal fats. R. Strauss. *Fettechem. Umschau* 42, 190-3, 209-13 (1935).—A review of recent progress with 31 references. J. W. Perry
Saponification of fats with formation of concentrated

glycerol waters M. Nikiforov. *Masloboino Zhiroroe Delo* 11, 355-7 (1935) — A procedure is described for a repeated use of glycerol waters in the sapon of fats with kerosene as a contact agent Chas Blanc

Rapid method for factory control of fat saponification G. Klein, N. Kaminski and P. Yunchman. *Masloboino Zhiroroe Delo* 11, 502-3 (1935) — Withdraw a sample of sapon fat at 70-90° with a 5-cc pipet, heated to 60-70°, into a 200-cc tared flask, allow to cool and weigh. Add 100 cc of satd NaCl at 60-70°, 30 cc of refined sunflower oil at 60-70° and 3 drops of 1% methyl orange, and titrate H₂SO₄ with 0.5 N NaOH. Introduce into the mixt. 10 drops of 10% phenolphthalein and titrate with 0.5 N NaOH with shaking. The percentage of sapon = $(a - b) \times 0.141 \times 100/H$, where $H = g$ of sample, $a = cc$ of 0.5 N NaOH consumed in the titration of fatty acids, 0.141 = titer of 0.5 N oleic acid (the mol wt. of oleic acid was accepted as equal to that of all the fatty acids); b = correction for the acidity of the 30 cc. of sunflower oil (determined by a similar procedure). The detn is made in 5 min with an accuracy to 1% as compared with the standard method Chas Blanc

The determination of the acetyl number of fats II. Carrying out the acetylation. K. Tafel, M. de Mingo and H. Thaler. *Fettechem Umschau* 42, 141-4 (1935); cf. C. A. 28, 7565¹ — In order to select the most suitable method for quantitatively and selectively acetylating the hydroxyl groups of fatty substances, the acetylation of tetrahydroxystearic acid (I) m 156°, hexahydroxystearic acid (II), dihydroxystearic acid (III), castor oil (IV) and grape seed oil (V) were studied by (Method A—cf. *Essentielle Untersuchungsmethoden für die Fett- und Wachstumsindustrie*, 2nd Ed. Stuttgart, 1930, page 90) refluxing with Ac₂O and petr ether or, more preferably, Et₂O, by (Method B—cf. Franchimont, *Compt rend* 89, 711-13 (1879)) warming the substance dissolved in Ac₂O contg. a small amt of H₂SO₄ to a temp not exceeding 45°, dissolving the reaction product in ether, washing the ether soln successively with an aq 50% AcOH soln, a satd NaCl soln contg. KHCO₃ and a satd NaCl soln, then drying the ether soln over anhyd Na₂SO₄, and finally distg off the ether and drying over H₂SO₄ in a vacuum and (Method C—cf. Verley and Bolsing, *Ber* 34, 3351-62 (1901)) by heating the substance on the water bath with an excess of Ac₂O and a small amt of pyridine, pouring the reaction mixt. into water, taking up the acetylated product with ether and proceeding as outlined under Method B. In all cases the bound AcOH was detd. by Freudenberg's method (C. A. 18, 234), which had been previously shown (C. A. 28, 7565¹) to be best suited for this purpose. Method B gave the most readily reproducible and most nearly theoretical results with I, II and III, while methods A and C were distinctly inferior. The 3 methods gave fairly concordant results with IV but not with V. This was due, perhaps, to the relatively large amts of free fatty acids in V as indicated by an acid no. of 48.2. This surmise was supported by expts showing that free fatty acids, especially those which are not too high up in the homologous series, e. g., lauric, react with Ac₂O under the conditions of methods A, B and C to form mixed anhydrides which do not decompose rapidly on contact with water. The pos. error caused thereby is apt to be more serious than is commonly realized. Method B is recommended as the best suited for fat investigations. An improved prepn of III based on Hilditch's work (C. A. 20, 3280) is described J. W. Perry

Oiticica fat and its fundamental difference from China wood oil C. P. A. Kappelmeier. *Fettechem Umschau* 42, 145-52; *Verftech* 8, 279-83 (1935) — Various samples of oiticica fat (I), obtained either direct from Brazil or extd from freshly ground nut kernels preferably with ether or benzene or, less suitably, with petr. ether, had the following consts: acid no. 2-8, sapon. no. 187-193, I no. (Wij's—after reacting 2 hrs.) 140-150, Ac no. 30-40, hexabromide test neg., gelatination temp. 260-70°, d_{4}^{20} 0.9670-80, n_D^{20} 1.5140-80, n_D^{25} = n_D (dispersion) 0.0170-0.0185. (Since I ordinarily has a buttery consistency, the last 3 consts were detd. on melted, supercooled samples—

a procedure which is not recommended.) Removing the break from I by rapidly heating to 200° and then centrifuging failed to prevent I from reassuming its buttery consistency at room temp, although this can be prevented by converting I into stand oil by heating to 225-50°. β -Coueque acid (II) was prepd by first adding a small amt of I to a benzene soln, of the free fatty acids of I and then exposing to direct sunlight. The fine leaflets of II, which sepd out, m 101-2° after recrystn from acetone and vacuum drying. The ketone group in II, which was revealed by the formation of a semicarbazone, m. 134-7°, seems to have a disturbing effect on acidimetric titrations and also on I no. detns. Whatever the cause, the apparent I no. of II (Kaufmann method) increased from 194 to 332 and a small amt of free acid appeared on increasing the time of halogenation from 2 to 190 hrs. Hydrogenation studies offer more promise in this field than halogenation expts. K - β -coueque is a stable, cryst. salt, whose ready crystn from alc sapon mixts. aids greatly in detecting II. Ammonium- β -coueque m. 127° and gives no color with FeCl₃ soln. Catalytic hydrogenation converted II into hexahydrocoueque acid (III) which yielded a semicarbazone m. 135.5°. M - β -coueque (IV) m. 41°, and behaved like II when halogenated. A comparison of the consts. of IV and of freshly prepd. samples of the Me esters of α - and β -eleostearic acid confirmed the non-identity of IV with either of the latter. Nevertheless I may contain varying amts of eleostearic acids (cf. van Loom and Steger, C. A. 25, 4848). A mixed m. p. indicated that IV is identical with the hexahydrocoueque acid of Brown and Farmer (C. A. 29, 5294¹). K. criticizes Rossmann's theory (C. A. 26, 2416) that only 2 geometrically isomeric eleostearic acids can exist. J. W. Perry

Washing fats after refining M. Sandomurski and O. Mikhailovskaya. *Masloboino Zhiroroe Delo* 11, 357-9 (1935) — All traces of soapstock are removed from oils after neutralization by 2-3 washings with 0.25% H₂SO₄. The mixt. is easily sepd into 2 layers without forming an intermediate layer. The losses of oil are reduced as compared with water washing Chas Blanc

Water solubility and washing of sulfuric acid esters of unsaturated fats C. Steiner. *Fettechem Umschau* 42, 201-5 (1935) — Castor oil, olein (I), linseed oil (II), oleyl alc (III) and peanut oil were sulfonated by slowly adding varying amts of H₂SO₄ to 100-g. portions of the fatty materials held at 28-30°. Except for a few samples of II which were sulfonated with a 92% acid, 98% H₂SO₄ was used. As a general rule, increasing the amt of H₂SO₄ used caused an increase in organically bound SO₃. This increase, in turn, was paralleled by a tendency for the sulfonated fatty material to form, with hot water, less and less turbid emulsions. Clear solns were obtained only with highly sulfonated I and III. The neutralization nos. of the sulfonated fat samples were detd. and their behavior on washing with a 10% Na₂SO₄ soln was studied J. W. Perry

The spoiling of fats and biochemical reactions involving fats K. Tafel. *Fettechem Umschau* 42, 164-8 (1935) — This review covers a no. of recent developments which reveal possible relationships between the oxidation of unsatd fatty substances and the β -oxidation of fats *in vitro* on the one hand and the mechanism of fat metabolisms and similar biochem. reactions on the other. Glyceride hydrolysis is also discussed both as a purely chem. and as a biochem. process. Over 30 references. J. W. Perry

Acidic components of wool grease E. E. U. Abraham and T. P. Hilditch. *J. Soc. Chem. Ind.* 54, 393-404T (1935) — The acidic components of fresh neutral wool grease, wool grease from waste liquors and wool grease obtained by solvent extn. of merino wool have been sepd and, as Me esters, submitted to fractional distn. in vacuum. The acids present in the distd. Me ester fractions and residues were crystd to obtain individual components. The results confirm those of earlier workers in showing that the chief component acid is a wax like solid, m. 73-5°, which is not "cerotic" (hexacosic) acid, but is of similar compn (C₂₆H₅₂O₂ or C₂₇H₅₄O₂, less probably C₂₈H₅₆O₂).

There is also evidence of the presence of a series of acids represented by the formulas $C_{15}H_{31}O_2$, $C_{17}H_{33}O_2$, $C_{19}H_{37}O_2$, $C_{21}H_{39}O_2$ (or $C_{21}H_{39}O_2$, $C_{23}H_{41}O_2$, and $C_{25}H_{43}O_2$ for $C_{21}H_{39}O_2$). The acid of lowest m. p. (about 22°) and greatest soly. was not susceptible to purification; in its impure condition it gave analytical figures close to those required by the formula $C_{15}H_{31}O_2$. The acids of formulas approx $C_{17}H_{33}O_2$, $C_{19}H_{37}O_2$, and $C_{21}H_{39}O_2$ were obviously identical, from their m. p. and other properties, with the "linopalnic acid," "lanoceric acid" and "lanocenic acid lactone" described by Darmstadter and Lischutz (Ber 31, 1122 (1898)). Evidence of "lactone" formation was observed when the wool grease acid fractions of high mol. wt. were boiled with dil. mineral acid. Acids of the normal aliphatic series are not present in wool grease. It is suggested that the acids of sterol waxes secreted in sebaceous and similar glands are probably derived from an isoprene or terpene foundation rather than from an unbranched chain of C atoms. E. Scherubel.

Hydrogenation of fats in presence of nickel carbonate and formate reduced in the oil. E. Lumburg and M. Popov. *Maslobolno Zhivore Delo* 11, 363 (1935). Cf. C. A. 29, 8309, 8373. $NiCO_3$ can be used in the hydrogenation of high-grade oils with low-pressure steam for heating the oil before hydrogenation. A mixt. of $NiCO_3$ and Ni formate can be used for the hydrogenation of low-grade oils when effective refining of the oil is not feasible. Chas. Blanc.

Hydrogenation of fats with copper-nickel catalyst. V. Yasul'ev. *Maslobolno Zhivore Delo* 11, 444-8 (1935). — Exptl. evidence of the advantages of using Cu-Ni catalyst in the hydrogenation of refined and crude oils confirms the results of U. S. practice. Chas. Blanc.

Selective hydrogenation (of vegetable fats). E. Lumburg, B. Sterlin and B. Krushchinskii. *Maslobolno Zhivore Delo* 11, 471-3 (1935). — The selective process of hydrogenation of cottonseed and sunflower oils was studied by heating the oils in an autoclave at 160°, 180° and 200° with 0.1, 0.2 and 0.4% Ni pptd. on kieselguhr and a H current at a rate of 2, 3, 4 and 6 l./min. The samples taken at definite intervals were tested for the m. p., I and thiocyanate nos. and contents of solid acids. The selective process of hydrogenation was detd. by the contents of solid acids formed and the linoleic acid unchanged. Under all conditions of hydrogenation of cottonseed oil the selectivity was greater at a higher temp. (200°). With the increased ratio of either Ni or H the rate of hydrogenation increases and the degree of selectivity correspondingly declines. A selective hydrogenation can be effected not by any definite optimum system but by an optimum correlation of the single factors in the process. A min. of the catalyst and a max. of H are required; the converse is true. At a certain correlation of the catalyst and H the temp. of the reaction can be lowered without affecting the selectivity of hydrogenation: in the presence of 0.1% and 0.15% Ni (based on the wt. of oil) and H rate of 4 l./min. the selectivity is of the same character as that at 180° (for 0.1%) and 160° and 180° (for 0.15%). The same is true with 0.2% Ni and H rate of 3 l./min. For the selective hydrogenation of sunflower oil more active conditions are required. Thus, at a rate of 6 l./min. of H the selective character of hydrogenation is greater than that of cottonseed oil. Chas. Blanc.

Conversion of cottonseed oil into a lard-like fat mixture by the method of conjugated hydrogenation. V. Puranov and G. Ivanova. *Maslobolno Zhivore Delo* 11, 365-8 (1935). — By the method of Lyubarskii (C. A. 27, 1533) of catalytic conjugated hydrogenation an appropriate mixt. of cottonseed oil and EtOH was autoclaved in the presence of Al-Ni (72% Al, 28% Ni) at 190-200° and 23-7 atm. for 30 min., giving a snow-white fat mixt. of normal taste with the compn. and consistency of lard, acidity 3.73 mg., m. 32.2° I no. 74.2 and Hehner no. 66. Chas. Blanc.

Effectiveness of hydrogenation with the use of nickel formate at the Kazansk works. A. Yasul'ev. *Maslobolno Zhivore Delo* 11, 474-6 (1935). — The advantages of hydrogenation of vegetable oils in the presence of Ni formate are

discussed from the economical and tech. viewpoints.

Chas. Blanc.
Continuous hydrogenation at the Gor'kov works. A. Panushev. *Maslobolno Zhivore Delo* 11, 466-8 (1935). — Results of 3 years' experience of continuous hydrogenation of cottonseed and sunflower oils are tabulated and discussed. Chas. Blanc.

Production of oils without sediment. A. Raspopina. *Maslobolno Zhivore Delo* 11, 482-3 (1935). — The method of Zinov'ev (C. A. 22, 2675, 24, 4408) for drying oils is suggested as a possible method for the production of sunflower oil with min. sedimentation. Chas. Blanc.

Hydration of sunflower oil. M. Bauman, I. Grabovskii, F. Vishnepol'skaya and G. Gushchin. *Maslobolno Zhivore Delo* 11, 477-9 (1935). — The best results in clarifying sunflower oil were obtained by stirring the oil, pressed or non-pressed, at 70° first with 1% of 3% NH_4Cl for 20 min. and then with 1% of 0.25% HCl , followed by salting out with 2.5% $NaCl$ at 68°, settling for 16 hrs. and filtering at 40°. The product after 8-10 months of storage formed only 1-1.5% of white sediment and showed no change in acidity. Chas. Blanc.

Hydrogenation of black oils. V. Chervyakov. *Maslobolno Zhivore Delo* 11, 364-6 (1935). — Methods of refining and hydrogenation of hempseed, linseed, coriander and white mustard oils are described. Chas. Blanc.

Characteristics of the oils contained in different parts (skin, endosperm, cotyledons and embryos) of the seeds of *Strophanthus kombe*, *hispidus*, *gratus* and their importance in determining the time, state of conservation and quality of the seeds (pharmacognostic investigations). Luigi Tocco and Bruno Sanni. *Arch. intern. pharmacodynamie* 50, 332-8 (1935). — The oils contained in the endosperm and cotyledons of said seeds are clear, transparent, straw colored, with pungent odor and nauseating taste. Their m. p. (0-2) and the degree of acidity (2-7) are much lower than those known. In the skin one finds fatty oils; those of *S. kombe* and *hispidus* are green because of the chlorophyll. As the seeds are altered the oils become rancid. P. F. Mettild.

Polymerization of fatty oils. IX. The hydrogenation of polymerized ethyl linolenate. Alph. Steger and J. van Leen. *Rec. trav. chim.* 54, 750-6 (1935); cf. C. A. 29, 5203. — Et linolenate was prepd and then polymerized until further treatment produced no change. High-vacuum distn. gave the following fractions: (1) up to 93°, 1.4; (2) 95-100°, 30.7; (3) 100-180°, 7.2; (4) 180-200°, 21.8 and (5) residue 38.9%. Fraction 1 was composed of decompn. products. Fraction 2 did not contain polymers yet it could not be hydrogenated to Et stearate. The said acid derived from fraction 2 after hydrogenation is attacked by Bertram's K_2MnO_4 soln. This indicates the acid is not a fat acid. From the hydrogenated product of fraction 2 an acid whose formula corresponded to $C_{17}H_{33}O_2$ was sep'd. by the Twitchell Pb salt method. These properties together with phys. characteristics indicate a compd. of cyclic structure. The fractions 4 and 5 contained the polymers. These could not be hydrogenated to an I no. of 0. Oxidation of the hydrogenated product of these fractions according to the Bertram method yielded a residue of cyclic compds. Conclusion: By polymerization of Et linolenate at 300° in a current of CO_2 2 reactions take place: (a) A polymerization and (b) a cyclization of linolenic acid into a nonpolymerizable compd. which after hydrogenation corresponds to the formula $C_{17}H_{33}O_2$. Both reactions occur simultaneously until no linolenate remains. This explains why linolenic acid cannot be completely converted to polymers. X. The polymerization of ethyl linolenate. *Ibid.* 756-9. — Et linolenate was polymerized at 300° for 6, 10 and 14 hrs. I no. (Wijs and Br methods), thiocyanogen no. and η_{sp}^c are reported on each product. The Wijs I no. with varying periods of contact, thiocyanogen no. and η_{sp}^c are reported on the high-vacuum distillate to 100° and the residue of each product. Substitution of I was evident in the residues and was greater with longer polymerization time; while in the distillate substitution of I was not detectable. Conclusion: High polymers and low mol.-wt. isomers of Et

linolenate are formed on polymerization. The high polymers increase with the time of heating. M. M. Piskur

Fatty acid standards. British Standards Institution *Chemist and Druggist* 123, 631 (1935).—Recently published specifications for coconut oil, peanut oil, olive oil, rapeseed oil and raw linseed oil are quoted. S. Waldbott

Factors determining color of cottonseed oil. A. Goldovskii, M. Podolskaya and E. Mirer. *Moskoboino Zhivoe Delo* 11, 442-4 (1935); cf. C. A. 29, 83764. C. B.

Refined olive oil from pulp, in comparison with natural and refined, pressed olive oils. Daniel Mangrane. *Analges soc. esp. fis. quim.* 33, 707-79 (1935).—Methods of detg the S content, physicochem. consts. and compn. of olive and S oils are reviewed. S is best controlled in refining of S oils by heating 20 min. 50 cc. of oil with 50 cc. of 25% aq. NaOH, with a Ag foil immersed therein, then observing the S stain on the Ag. This test is sensitive to 0.5 parts of S per 10,000. The development of H₂S in some apparently well-refined S oils was investigated and confirmed in S oils contg. 3-4 parts of S per 10,000. Pure CS₂ does not attack olive oil. The S in S oils originates in the S dissolved in com. CS₂, which should not exceed 8 parts per 10,000. By deodorizing by acid and superheated steam, the S content may be reduced to 1.5-2 parts per 10,000. H₂S dissolved in CS₂, and sulphydrates, also attack olive oils. Olive residues give a strong S test. Pressed oils and extd. oils have a S content not exceeding 1 part per 10,000. Intensity of the S test increases with ripening of the olives. Oils from wormy olives give a stronger test, and the S content of the worms is rather high. S can add to the unsatd. bonds of the fatty acid. The phys. and chem. consts. of both oils are always within the same range. Various empirical tests for certain fat acids are described, and no appreciable difference is found between the 2 oils. Pressed oil shows a min. soap content; refined oil shows none. Peroxidation of some substances during the deodorizing process is studied. The resin content is higher in refined S oils. E. M. Symmes

A note on the spectroscopic determination of the vitamin A content of pichard oil. G. M. Shrum and Thomas G. How. *Can. J. Research* 13A, 93-8 (1935).—An attempt has been made to measure spectroscopically the vitamin A content of pichard oil. By use of the same conversion factor as for cod-liver oil, measurements of the extinction coeff. at 3280 Å. gave vitamin A values much larger than those obtained by biol. tests. It has been shown that this discrepancy cannot be wholly ascribed to either the coloring matter or the saponifiable material in the oil. A satisfactory check on the results can be obtained only when it is possible to remove completely the vitamin A from the oil, without otherwise modifying it. J. W. S.

Determination of color of sunflower oil. M. Sokolova and I. Engel. *Moskoboino Zhivoe Delo* 11, 481-2 (1935).—The method of Fomrobert and Pallaut (*Farben-Zig* No. 17, 967 (1926); cf. C. A. 20, 2421) for detg coloration of oils was applied to the estn. of the quality of sunflower oil. Chas. Blanc

Reconstruction of Krasnodarski oil works. A. Skupia, I. Morozov and A. Grashin. *Moskoboino Zhivoe Delo* 11, 435-42 (1935).—Construction and operation details of refining and reworking of vegetable oils are discussed. Chas. Blanc

Unsaturated acids of natural oils. IV. The highly unsaturated acid of *Telfaria occidentalis*. C. H. Farmer and E. S. Pace. *J. Chem. Soc.* 1935, 1630-2; cf. C. A. 29, 60851.—Freshly extd. oil from the kernels of *Telfaria occidentalis* contains α -eleostearic acid, m. 48°, after exposure to diffused light for some weeks very small yields of the β -isomer are isolated, the yield being greatly increased after exposure to ultraviolet radiation for some hrs. A sample of oil after standing 7 months gives 10% of the β -isomer. The solid material pptd. from the oil on standing is β -eleostearin. V. α - and β -Licanic acids. W. B. Brown and E. H. Farmer. *Ibid.* 1632-3.—Com. oiticica fat and the kernel oil of *Licania rigida*, both of which normally yield α -licanic acid (I) on sapon, give after irradiation in the presence of a trace of I or of S the iso- or β -acid (II), m. 99.5°, identical with that form-

erly isolated from liquid (isomerized) oiticica oil; the *semicarbazones* of I and II m. 110-11° and 138° (slow heating), resp.; with boiling alc. the former is transformed into a compd. m. 127°. The said acids in the oil are palmitic and stearic, 1 and 1.4% being isolated (sepn. probably far from quant.). C. J. West

New method for determining acid number of oils. Fedchenko and Kashin. *Moskoboino Zhivoe Delo* 11, 498 (1935).—The method makes it possible to obtain accurate results without the use of alc. and Et₂O. Weigh a sample of oil in a flask (15-18 cm. high, 2 cm. in diam., neck bore 1 cm. in diam.), add 15-20 cc. of 10% NaCl in H₂O and titrate with 0.1 N KOH in the presence of phenolphthalein to a faint rose that does not disappear with energetic shaking for 1 min. The method gave good results with black cottonseed oil. Chas. Blanc

Influence of the nature of a carrier on catalyst activity. E. Botkovskaya and P. Artamonov. *Moskoboino Zhivoe Delo* 11, 468-51 (1935).—Expts. in comparative hydrogenation of vegetable oils in the presence of Ni catalyst pptd. on silica gel and on kieselguhr and tripoli of various origins, with and without preliminary treatment with H₂SO₄ and Na₂CO₃, disclosed that contrary to the general theory the best carriers are those contg. a max. of Al and Fe oxides and a min. of SiO₂. Further evidence was furnished by the use of new carriers, such as clays rich in Al₂O₃ and Fe₂O₃. Thus by the use of a clay of the compn. SiO₂ 59.76, TiO₂ 0.51, Al₂O₃ 18.5, Fe₂O₃ 8.1, CaO 0.79, MgO 2.66, K₂O 5.08, Na₂O 0.16, P₂O₅ 0.16 and SO₂ 0.19%, a fat mixt., m. 61°, was obtained, i. e., a considerably greater activity of Ni than when pptd. on kieselguhr. The practical interpretation of the results is that the catalytic activity of Ni decreases with the greater contents of SiO₂, sol. in Na₂CO₃, in the carrier and increases with its increased sol. in H₂SO₄. The presence of P in a carrier has no poisonous effect on the catalyst. C. B.

Purification of contact glycerol waters with barium carbonate and iron shavings. P. Andronov. *Moskoboino Zhivoe Delo* 11, 353-5 (1935).—Treating acid glycerol waters with Fe shavings and a strong air current at 90° and neutralizing the filtrate with Ba(OH)₂, gave the best results with glycerol, d₂₀ 1.244, 1.14% ash and org. contents. Treating glycerol waters with BaCO₃ before or after neutralization with Ca(OH)₂ is of no marked advantage. Chas. Blanc

Products from coconut-oil wax. Smeona Santiago Tanchico. *Philippine J. Sci.* 57, 423-6 (1935).—During the storage of coconut oil a sediment seps on the bottom of the tank; and when purified the sediment forms white crystals sol. in various org. solvents. The sediment is not a glyceride but appears to be a wax contg. the myricyl ester of cerotic acid. Com. products, such as floor wax and furniture and leather polishes, were prepd. from this wax. E. Scherubel

The bleaching of Japan wax. III. Iwao Sakuma and Iso Momose. *J. Soc. Chem. Ind., Japan* 38, Suppl. binding 503-4 (1935); cf. C. A. 29, 52961.—The extinction coeffs. of the portion of com. bleached Japan wax sol. in petr. ether are smaller than those of the original product. Sunbleached Japan wax undergoes a change in color when kept in the dark and the browning is accelerated when excessive amts. of alkali are present. Too long an exposure should be avoided in sunlight bleaching. Exptl. data are given. K. K.

The properties of alkyl alkali sulfates prepared from higher fatty alcohols as detergent and wetting agents. S. Ueno, S. Yokoyama and Y. Iwakura. *J. Soc. Chem. Ind., Japan* 38, Suppl. binding 603-8 (1935).—Lauryl, oleyl and cetyl alcs. were esterified with concd. H₂SO₄ (sp. gr. 1.84) and neutralized with NH₄OH, KOH and NaOH, and the resulting products were compared with com. products: Gardinol, Igepon a. p. and Igepon T. The properties observed were soly., surface tension, drop no. (surface tension against petroleum), lathering power and detergent power. The exptl. results are presented and show that good detergent activity of the alkyl alkali sulfates was developed only in a completely sol. condition. The optimum condition was about 0.1-

0.25% soln. at 50°. The cetyl compd., contrary to other reports, had a high detergent power and at moderate temps., all 3 alc. derivs. showed about the same detergent power.

From the notebook of the soap manufacturer Karl Pfaff. *Rieschstoff-Ind* 10, 200-1 (1935); cf *C A* 30, 6364.—Floating and veterinary soaps are discussed.

Producing smooth, transparent soft soap with 40% hardened fat-fatty acids. *Grann Seifensieder-Zig* 62, 456 (1935).—Methods for prepg soft soap using large proportions of hardened fish oil are described. Deodorized fish oil is less suitable because of the danger of the development of a bad odor.

Curd soap and attempts at improving its quality. R. Krings. *Seifensieder Zig* 62, 739-41 (1935).—Methods for making soap under present-day German conditions are discussed.

Centrifugal method of separation of soap from fats after neutralization. A Zinov'ev and A. V. Lister. *Maslobolno Zhiviroe Delo* 11, 476-7 (1935).—Good results are reported with the use of the Sharples centrifugal separator.

The process of water evaporation by soap. A. Klyuchevich. *Maslobolno Zhiviroe Delo* 11, 448-50 (1935).—A preliminary discussion of the causes of cracking of soap cakes on drying in storage.

Variations of the pH of aqueous soap solutions as a function of the free alkali content. Vizern and Guillot. *Seifensieder-Zig* 62, 625-6 (1935).—See *C A* 29, 6453.

Use of liquid resin (tallow) in soap making. P. Kupehinski and A. Yasniul. *Maslobolno Zhiviroe Delo* 11, 492-4 (1935).—Liquid resin, obtained from black liquor of sulfate pulping, added up to 25% to fats gave a good grade of hard soap. The product was improved by the use of dist. liquid resin (tallow). A greater proportion of tallow results in soft or liquid stock.

Starch and animal glue in the soap industry. Fritz Ohl. *Gelatine, Leim, Klebstoffe* 3, 168-71 (1935).—Soaps can be improved by the addn. of starch, casein or hide glue. Nineteen patents and characteristics of the products are discussed.

Waxes (Mellan) 13. Manuf. of liquid fuel from vegetable waxes (Koo, Cheng) 21. Higher alcs from waxes (U. S. pat. 2,021,926) 10

Fats. Harburger Oelwerke Brinckman & Mergell. Ger. 617,520, Aug. 20, 1935 (Cl. 23a. 2). Addn. to 612,716 (C. A. 29, 6454). Clear odorless fats are obtained by treating fatty materials with CH_2Cl_2 and driving off the latter by steam in the pre-nce of water and an adsorbent such as fuller's earth.

Wool-fat alcohols. Deutsche Hydrierwerke A-G (Ludwig Prigge and Karl Hennig, inventors). Ger. 617,975, Aug. 30, 1935 (Cl. 12a. 5 02). Alcs. incapable

of sapon. are obtained from wool fat and other high-mol. wax-like substances by sapon., the wool fat, etc., treating the product with at least 30% of a soap with no more than 18 C atoms in the mol., and finally distg. Thus, wool fat is sapon. with NaOH and water and palmic soap, obtained by treating palm oil with NaOH, added. The mixt. is distd. with superheated steam to give a product of wool fat alc.

Bleaching fats, oils and fat acids. Balthasar E. Reuter (to Mathieson Alkali Works). U. S. 2,022,738, Dec. 3. See Fr. 778,882 (C. A. 29, 4062).

Purifying fatty oils. Carl Merck, Louis Merck, Wilhelm Merck and Fritz Merck (trading as firm of E. Merck). Brit. 434,432, Sept. 2, 1935. Tunny-fish liver oil is freed from undesirable color, taste and odor by treating at ordinary temp. with aq. or alc. alkali and then sepg the purified oil. The alkali removes the larger proportion of free fat acids without sapon., or loss of vitamin A.

Oils, vitamins. Aktieselskabet Ferrosan. Brit. 433,030, Aug. 22, 1935. The vitamin-contg. unsaponifiable components of fats and oils are extd. or concd. by sapon. the oil with a soln. of NH_3 or alkali metal hydroxide in a H_2O -sol. org. solvent, e. g., Me_2CO , $MeOH$, $EtOH$, cooling or standing to sep. the soap and acidifying the residual soln. to ppt. fat acids from the soap which remains dissolved, said acids collecting as a layer with the unsaponifiable components.

Refined hydrogenated sesame oil. Guy W. Phelps and Raymond Bradley (to Industrial Patents Corp.). U. S. 2,022,361, Nov. 20. See Can. 345,681 (C. A. 29, 2380).

Oil cakes. Benjamin G. Leites. Fr. 786,676, Sept. 7, 1935. Oil cakes of increased albumen content are obtained by carefully removing the envelope of the grains and, preferably, the cellulose of the core. The cake is ground and suspended in water and the particles of envelope swollen with water descend to the bottom. The remaining suspension is transferred to another vessel where, after prolonged rest, the particles of the core in suspension descend. The liquid is sepd. and used again.

Mono- and di-glycerides. Carl W. Christensen (to Armour and Co.). U. S. 2,022,493, Nov. 26. In forming a glyceride, a mixt. of a higher fatty acid such as stearic acid and a glycerate of an alkali-forming metal such as Na glycerate having at least one free hydroxyl H is heated to about 100-200°. U. S. 2,022,494 relates to a process in which glycerol is esterified, to form a mono- or di-glyceride, by heating with a higher fatty acid such as lard fatty acids in the presence of an alkali-forming metal glycerate, at 100-220°.

Soap. Adolf Welter. Ger. 620,391, Oct. 21, 1935 (Cl. 23a. 1). In effecting such processes in the soap industry as are normally carried out at 180° or above, heating is effected by direct introduction of steam which has been compressed sufficiently to raise its condensation temp. above the process temp. Local overheating is thus avoided, and the danger of explosion is reduced.

28—SUGAR, STARCH AND GUMS

J. K. DALE

The acidity of starch. Josef Mayrhofer. *Oester. Chem. Zig* 33, 178-9 (1935).—The difficulties attendant upon the measurement of the acidity of samples of commercial starch are discussed and the advantages of electro-metric titration pointed out. For ordinary purposes, it is recommended to titrate 20-5 g. of starch in 100 cc. of water with 0.1 N NaOH till the soln. is red to phenolphthalein (4 cc. of 1% indicator soln. used).

Sugar. Pedro Sanchez. Fr. 787,028, Sept. 16, 1935. A sirup prepd. with previously refined sugar is decolorized by means of active Cl (hypochlorites of Ca, Mg, Ba, Sr or Al), dechlorinated by active C or H_2O_2 and crystallized. The treatment with Cl may be carried out in the

presence of an acid or acid salt capable of eliminating practically all the ash-forming material in the sirup. Cl. C. A. 29, 2014.

Evaporating pans for sugar refineries, etc. Franz Pest. Ger. 617,641, Aug. 22, 1935 (Cl. 6b. 12).

Aqueous solutions of sugar sap, etc. Carbo-Norit-Union Verwaltungs-G. m. b. H. (Helmut Rüping, inventor). Ger. 617,706, Aug. 24, 1935 (Cl. 12d. 1.03). The aq. solns. are decolorized and cleared by treatment with an adsorbent such as active C, kieselguhr, fuller's earth, etc., which has been mixed with a substance which forms a gel or a gelatinous ppt. in contact with the soln. An example of such a mixt. is $CaCl_2$ and Na_2PO_4 , which forms a Ca gel.

Apparatus for continuous clarification of sugar juices, etc., and scum removal Francis R. Fortier. U S 2,022,661, Dec. 3 Various structural, mech and operative details

Recovery of nonsugars from molasses, sugar sirups, sweet waters and sugar wastes, etc. Gustave T. Reich U S 2,022,824, Dec 3 A mixt of isopropyl alc and EtOH is used for treating the material, which seps into 2 layers, the upper layer contg the saccharin components and the lower layer the nonsugars (both layers being freely flowing liquid.) Cf C. A. 30, 612¹

Dextrose International Patents Development Co Fr 787,069, Sept 16, 1935 Dextrose is crystallized from

solns of converted starch by a crysta in movement, in a crystallizer filled by successive fractions, and, at an intermediate stage of the crysta. operation, the supersatn. of the massecuite is reduced by adding to the charge a soln. having a lower d. than that of the successively added fractions Cf C. A. 30, 612²

Starch International Patents Development Co Fr 787,060, Sept. 16, 1935 In making starch from corn, the ground starch of high d. is treated to recover starch and gluten and the resulting water is used to steep the maize, while the ground starch of low d. is sent to the sepn operations without removing the starch and the gluten Cf C. A. 29, 1673³

29—LEATHER AND GLUE

ALLEN ROGERS

Evaporation of tan liquors Emil Kirschbaum and J. Schumunke Chem. Fabrik 1935, 490-2—Results of expts with a triple-effect evaporator on 3 mixts of liquor are plotted for. the relation of the sp. gr. to the total-solid content, the b-p rise in relation to the abs. boiling pressure and to the sp. gr. at different pressures, the sp. heat in relation to the sp. gr., the relation of the temp to the sp. gr., and the relation of the coeff. of heat transmission to the apparent liquor level and sp. gr. Eight references J. H. Moore

Influence of some sulfur-containing tanning compounds on the deterioration of vegetable tanned leather by sulfuric acid E. L. Wallace, J. R. Kanagy and C. L. Critchfield, J. Am. Leather Chem. Assoc. 30, 510-18 (1935)—Correction of journal name, cf C. A. 29, 838¹

Action of microorganisms on vegetable tanning materials II. General consideration of the factors influencing biological activity (in tan liquors). Wm. P. Doelger, J. Am. Leather Chem. Assoc. 30, 587-600 (1935), cf. C. A. 29, 2015¹—Tan liquor is a relatively poor medium for microorganisms because of the prevalently high acidity and inhibitory influence of tannin. Acid-producing bacteria are invariably present; putrefactive organisms occur only in weak tan liquors. Yeasts abound, including both those that form wrinkled and smooth colonies on Sabouraud's medium; pseudo-yeasts, nonsugar fermenting, predominate. Molds are scarce, the scum faniliar to tanners consists of yeasts. Mold most frequently encountered are *A. niger* and *P. glaucum*, both of which convert "tannic acid" to gallic acid. Microorganisms were counted in tail, medium and head rocker liquors from many tanneries, with both Sabouraud's medium and a "tannin medium," prep'd by using filtered, detannized oak-bark ext. together with dextrose, beef ext., peptone, NH_4NO_3 and K_2HPO_4 . Counts on Sabouraud's medium were much higher (sometimes 1000 times) than on tannin medium. The latter varied between 2000 and 160,000 organisms per cc. Counts on a complete rocker series from one tannery showed that bacteria decrease and yeasts increase in going from tail to head liquors, i. e., with increasing tannin and acidity. Differences between counts from different tanneries may easily be due to differences in the blends employed. Solns of oak-bark ext. and sulfated quebracho, each contg. 3% tannin, sterilized and inoculated with tail rocker liquor, gave counts of 60 million and 2 thousand, resp., after 5 days. When rocker liquors were allowed to stand idle for 23 days, the no. of organisms increased 50 to 100 times. Lab. expts. show that an inactive rocker liquor is gradually depleted of all fermentable nontannin and acid, while if 25% of the liquor is renewed daily, the percentage of lactic acid remains nearly const. after 4 days. Effect of temp. on lactic acid formation was studied in detannized oak-bark ext. solns contg. added dextrose. The acid is more rapidly formed initially and destroyed subsequently at 25° and 30° than at 20° or 35°; below 17° no lactic acid is formed. Acetic acid formation also has an optimum temp. range of 25° to 30°, but the temp. effect is much more marked than with lactic

acid, almost no acetic acid is formed either at 20° or 35°. The no. of microorganisms present rises and falls with lactic acid concn. After the latter reaches its max., growth is largely restricted to those organisms utilizing lactic acid or other fermentation product. H. B. Merrill

Chrome liquors V. Effect of various factors in manufacture of sucrose-reduced liquors upon the chrome oxide and oil take-up of pickled hide powder. Edwin R. Theis and E. J. Serfass, J. Am. Leather Chem. Assoc. 30, 600-14 (1935); cf. C. A. 29, 7114¹—Hide powder samples were treated as follows: pickled to equil with soln. contg. 10% NaCl + HCl, final $\text{pH} = 3.6$ (or 1.8 in one series); 80 g. pickled powder contg. 50% liquid tanned 4 hrs. at 27° to 31° and const. agitation with 200 cc. liquor contg. 1% Cr_2O_3 ; washed; fat-liquored with 5% highly sulfonated oil in 100% H_2O , 1 hr., at 55°; dried and analyzed for Cr_2O_3 , SO_3 , free and combined oil. Results—In Cr liquors reduced with natural heat of reaction only, Cr_2O_3 fixation increases with concn. of dichromate prevailing during the reduction, still higher fixations are given by all liquors boiled during reduction; in the latter, fixation increases only slightly with increasing concn. during manuf., and passes through a max. at a mfg. concn. of 175 g. Cr_2O_3 per l. Basicity of the Cr compd. fixed by the hide powder is slightly erratic, and shows no distinct trend with variation of liquor mfg. conditions. Presence of excess sucrose, above the amt. required for complete reduction, has no effect on Cr_2O_3 fixation, contrary to popular belief. Oil take-up during fat liquoring decreases with increasing Cr_2O_3 content of the hide powder.

H. B. Merrill
Deterioration of vegetable-tanned leathers containing sulfonic acid and glucose Everett L. Wallace and Joseph R. Kanagy, J. Am. Leather Chem. Assoc. 30, 614-20 (1935); cf. C. A. 29, 838¹—The presence of about 5% glucose has no effect on the rate of deterioration. Also in J. Research Natl. Bur. Standards 15, 523-7 (1935) (Research Paper No. 846)

Effect of acid on leather—a summary. Warren E. Emley, J. Am. Leather Chem. Assoc. 30, 620-6 (1935)

H. B. Merrill
Liquid glues Willy Hacker. Kunststoffe 25, 315-17 (1935)—A brief review of raw materials, recipes and processes of manuf. J. W. Perry

Metallized dyes [for leather] (Fr. pat. 786,920) 25
Alkylated phenols [as tanning agents] (Ger. pat. 616,786) 10

Hides and skins A. Th. Böhme Chem. Fabrik and Paul Pfeiffer, Ger. 617,957, Aug. 29, 1935 (Cl. 28a 9)
Chrome-tanned leather is treated with a soln. of a mixt. of CaCl_2 or MgCl_2 and an antiseptic on removal from the tanning bath, and stored in a moist, undried state. The leather may be sprinkled with moist sawdust treated with an antiseptic

Preparing skins for tanning J. R. Geigy A.-G. Brit. 433,815, Aug. 21, 1935 This corresponds to U S 1,974,861 (C. A. 28, 7589¹) The skins are first limed

Tanning depilated hides. René Botson and Julien Kamp Ger 617,956, Aug 29, 1935 (Cl. 28a. 3). Hides are tanned by a vegetable, mineral or synthetic tanning bath to which is added 5% of rubber and the distillate going over at 70–250° in the distn. of old rubber. Examples are given.

Tanning I. G. Farbenind. A.-G. (Gustav Mauthe and Walter Pense, inventors) Ger 615,150, June 28, 1935 (Cl. 28a. 9). Addn. to 613,782 (C. A. 29, 8392). The method of 613,782 for fixing tanning agents by water-sol. salts of aldehyde condensation products of aromatic amine- or mixts. of these with phenols, is modified by adding substances of the pyridinium type to the fixing bath. Protective colloid, such as size may also be added. In the example CH_3O and methylaniline are condensed in the presence of HCl and the product neutralized with NaOH . N -Methylpyridinium chloride and pyridine- HCl are added to form a fixing bath for leather tanned with ext. of quebracho wood and valonea.

Leather. Ritter Chemical Co. Brit 434,745, Sept. 9, 1935. Skins that have been pickled in strong acid, e. g., the usual soln. of H_2SO_4 and NaCl , are treated with a salt of a nonsoap-forming nontanning org. acid to bring the pH to about 5.0–6.0 and then chrom-tanned. Borax and NaCl and (or) Na_2SO_4 is preferably added to the org. acid salt, e. g., AcONa , Na formate, Na lactate. Basic Cr sulfate, with added NaCl or Na_2SO_4 , is used for the tanning. In 1 example skins so tanned are further treated with an agent made from sulfonated α -cresol condensed with CH_3O and fat-liquored with sulfonated sperm and coconut oils.

Pressure roller apparatus and method for expressing moisture from leather. John Krause G. m. b. H. Brit. 433,564, Aug. 16, 1935.

Emulsifiable fatty mixture suitable for stuffing leather. Karl Ott and Gustav Mauthe (to General Aniline Works). U. S. 2,023,769, Dec. 10. A mixt. emulsifiable with water is prep'd by partially sulfiting one mol. proportion of train oil with about 0.33–0.67 mol. of aq. NaHSO_3 in 40° H_2O soln. at a temp. of about 60–80° with simultaneous oxidation with air.

Cellulose ether finishes for leather. Imperial Chemical Industries Ltd., Archibald A. Harrison and Geo. S. J. White. Brit. 434,423, Aug. 27, 1935. A finish of good fastness to wet and dry rubbing is produced on leather by applying a compn. comprising a soln. in a lower aliphatic alc. of Et cellulose and, as plasticizer, a long-chain aliphatic alc. or acid having 8 or more C atoms or an oil such as castor or neatfoot or a wax such as carnauba or an ester such as triresyl phosphate or di-Bu phthalate, and, if desired, as an adhesive, a natural or synthetic gum or resin that is sol. in the lower aliphatic alc., with or without coloring matter or pigment. A small proportion of an alc., ester or ether of h. p. 90–160° may be added to reduce the rate of evapn. Among examples, Ti white 30, is dispersed by milling into a mixt. of bleached shellac 12, in methylated spirit (I) 100, with Et cellulose 5, in 125 parts, the dispersion is mixed with a soln. of cetyl alc. 5, in I 25, Rotor red B 10, dissolved in I and with Et cellulose 10, in 1100 parts. Brushed onto sumach-tanned grained sheepskin splits and polished with a soft brush, the compn. yields a moderately flexible bright bordeaux finish.

30—RUBBER AND ALLIED SUBSTANCES

C. C. Davis

Research and the rubber industry. B. J. Eaton *India-Rubber J.* 90, 527–9, 536–9 (1935).—A discussion, dealing especially with soil problems, botanical problems and the quality of raw rubber.

The rubber industry in Japan. E. A. Hauser. *Kautschuk* 11, 186–8 (1935).—An illustrated description.

A new method of surface examination for the rubber industry. A. Salmony-Karsten. *Caoutchouc & gutta-percha* 32, 17303–5 (1935).—An illustrated description of a comparison microscope of special construction and special illumination. Typical applications are included.

Patent literature in the field of latex and of rubber in 1933 and 1934. St. Reiner and O. Dudlitz. *Caoutchouc & gutta-percha* 32, 17308–10 (1935), cf. C. A. 29, 8394¹.—Forty-four U. S., 2 Australian, 5 Canadian, 2 Danish and 9 German patents are summarized.

Latex comes of age. M. P. Williams. *Rubber Age* (N. Y.) 38, 81–3 (1935).—An illustrated review of the rapid advance in the industrial use of rubber latex, with special attention to the advantages and disadvantages of latex and the selection of a method of manuf. (electrodeposition, spraying, dipping, etc.).

The importance of latex in the economic use of substitutes and in the use of economical materials. Hermann Miedel. *Kautschuk* 11, 181–5 (1935).—The discussion deals with various uses, as in the manuf. of plush, velour, fleece, artificial leather, paper, cork, upholstery, etc.

Raw rubber and latex in America. Edgar Rhodes. *Bull. Rubber Growers' Assoc.* 17, 492–502 (1935).—A critical discussion, based on R.'s recent extensive trip through the rubber-mfg. plants of the U. S. A. and dealing with various features relating to ordinary raw rubber and latex.

The technical evaluation of raw rubber in rubber manufacture. H. C. Riebl. *Kautschuk* 11, 164–7 (1935), cf. C. A. 29, 8396¹.—A review and discussion of various features.

C. C. Davis

The recovery of solvents in the rubber industry. H. III. E. Reismann. *Kautschuk* 11, 168–72, 183–6 (1935), cf. C. A. 29, 8399¹.—The removal of solvent vapors from air by absorption in a liquid, the evapn. and recovery of the solvent, the losses involved and modern equipment are discussed and illustrated.

Progress of chlorinated rubber. Geo. C. Clark. *Rubber Age* (N. Y.) 38, 139–41 (1935).—An illustrated review of several mfg. processes adopted in the past few years, with a description of the properties and uses of chlorinated rubber.

Factice and rubberized fabrics. Garach. *Caoutchouc & gutta-percha* 32, 17305–7 (1935).—A discussion of the value of factice.

The history of factice manufacture. J. F. E. Russell. *Trans. Inst. Rubber Ind.* 11, 289–94 (1935).—A review and discussion.

The testing of substitute [factice]. J. H. Carrington. *Trans. Inst. Rubber Ind.* 11, 303–11 (1935); cf. preceding abstr.—The paper describes tests which are, or may be, applied to evaluating factice, points out errors in the literature and describes an investigation of the nature of the acetone ext. and S. The routine tests include color, fineness, odor, d., acidity, ash, mineral content, saponifiable and unsaponifiable substances, and acetone, CHCl_3 and petr.-ether exts. The acetone ext. detn. is very sensitive to the type of extractor and other conditions, as was proved by comparative tests, and none of the usual methods gives complete extn. in less than 24 hrs.

Part of the S in the acetone ext. is combined; hence ordinary oxidation methods do not give the true free S, and cold soln. methods give low values because part of the free S is dissolved in the free oil. The method of Bolonnikov and Gurova (C. A. 28, 4034¹; 29, 2020¹) is highly recommended as accurate and rapid. Oxidation of factice with HNO_3 and KClO_4 gives low total S values, and it is recommended to heat with a mixt. of concd. and fuming HNO_3 for 4 hrs. at 100°, evap. with NaNO_3 , again evap. with aq. Na_2CO_3 , fuse the residue for 30 min.

and det sulfate. The expts of Stamberger (C. A. 23, 1526) and Knight and S. (C. A. 23, 749) give a clue to the nature of the substances extd by acetone and the differences between the various methods of extn. A series of expts showed that hot extn. (1) removes increasing quantities of free oil and free S but never removes all of these, (2) causes depolymerization (or disaggregation) by the peptizing action of the hot acetone itself and (3) causes polymerization (or aggregation) by heat. The rates of (2) and (3) differ, and their combined effect is shown by the crossing of the extn curves of the Soxhlet and Knoefler methods. Cold acetone has little peptizing effect, for otherwise in the absence of heat polymerization (or heat aggregation) during extn., the cold acetone ext. should increase rapidly with time, whereas actually the rate of increase is small. Factice should be tested in a rubber mixt., with special attention to its (1) cost; (2) effect on processing, plasticity, extrusion, scorching, etc.; (3) effect on rate of vulcanization, tensile modulus, abrasion resistance, etc. and (4) effect on aging.

C. C. Davis
Shoe machinery and accessories in rubber goods manufacture. G. Donaldson. *Trans Inst Rubber Ind* 11, 283-8 (1935).

The latest developments in the field of rubber flooring manufacture. W. H. Reece. *Kautschuk* 11, 161-4 (1935).—A review and discussion.

C. C. Davis
The strength of vulcanized rubber. W. H. Reece. *Trans Inst Rubber Ind* 11, 212-35 (1935).—A crit. review and discussion of the work of Wiegand and Braendle (C. A. 23, 4372), Frey (C. A. 22, 4870; 23, 4098), Cotton and Barron (C. A. 23, 623) and the Phys. Testing Comm. of the Am. Chem. Soc. (C. A. 19, 1792, 23, 1306), in which considerable attention is devoted to elaborating and interpreting mathematically, statistically and logically the results of these investigations.

C. C. Davis
Determination of true free sulfur in vulcanized rubber. A modification of the thiocyanate method. Syukusaburo Miyamoto, Ichirō Aoe and Idemasa Nagai. *Ind. Eng. Chem., Anal. Ed.* 7, 414-10 (1935).—The method of Davis and Foucar (C. A. 6, 1114, Caspari, India-Rubber Laboratory Practice, London 1914, 116; C. A. 8, 2072) for detg. true free S by treatment of the acetone ext. with boiling EtOH, and KCN and titration of the KSCN with AgNO₃, always involved difficulties because excess KCN goes into soln. and renders the end point of the final titration indistinct. The following method overcomes this difficulty much better than does that of Castiglioni (C. A. 27, 681, 5678), by sepn. of KCN from KSCN by means of their difference in soly. in acetone. *Procedure*.—Reflux the dry acetone ext. with alk. EtOH and KCN, evap., ext. with acetone, evap. the ext., dissolve in water, add HNO₃ and a little Fe(NO₃)₃ and titrate with 0.1 N AgNO₃.

Rubber compns. (Brit. Pat. 433,741) 20

Rubber latex. Metallgesellschaft A.-G. and Johannes Jaenicke. Brit. 434,214, Aug. 28, 1935. Dark coloration is prevented or removed from latexes and their stability is increased by treatment with alk. stabilizers and small amts. of Zn compds. Concn. of the latex may take place before, or after, the addn. In an example, 2.5 kg. of ZnO is made into a paste and added to 18.2 kg. of KOH in its own wt. of H₂O; this is added to 5000 kg. of latex of 28% solid content, to which has been added 30 kg. of potash-coconut oil soap and the mixt. is concd. to 75% solids as described in Brit. 382,235 (C. A. 27, 4439) and 393,742 (C. A. 27, 6019).

Thickening latex. Metallgesellschaft A.-G. Ger. 616,317, July 26, 1935 (Cl. 396.1). Addn. to 595,727

(C. A. 28, 5285). Evap. app. for thickening latex is described.

Rubber. Imperial Chemical Industries Ltd. and Wm. Baird. Brit. 434,051, Sept. 6, 1935. 4,4'-Dimethoxydiphenylamine is included in rubber mixes to check oxidation and flux-cracking.

Rubber. Hansa-Mühle A.-G. (Bruno Rewald, inventor) Ger. 617,732, Aug. 24, 1935 (Cl. 396.5).
A method of mixing powd. substances such as filling material, vulcanizing agents or accelerators, into plastic materials such as rubber mixes., consists in pre-mixing the powd. materials with practically oil-free phosphatides of animal or vegetable origin, and then adding the mass to the plastic materials. Thus, soybean phosphatide contg. 30-70% of oil is vacuum dried three times and washed with acetoacetic ester, to remove the oil. The product is kneaded with flows of S. The resulting mixt. is used for softening rubber. Other examples describe the prepn. of linoleum, asphalt, wax masses, etc.

Concentrating rubber liquids. Metallgesellschaft A.-G. Fr. 786,757, Sept. 9, 1935. Latex is concd. by evapn. while avoiding formation of steam and when it has reached a degree of concn. of about 80-85%, further evapn. takes place under reduced pressure over a large surface and with the introduction of NH₃.

Rubber compositions. Ernst Fröhlich. Brit. 433,396, Aug. 14, 1935. Chlorinated rubber is added to rubber compns. to reduce their resiliency and allow embossing, particularly in the manus. of a leather substitute, the mixt. obtained being vulcanized. Articles may be made from the compn. or an outer film which may be of different color from the base may be applied by vulcanization. The surface may be coated with a cellulose lacquer, in which case a softener, e. g., castor oil, linseed oil, spalin or an increased proportion of chlorinated rubber, should be added to the rubber compn. A specific compn. is rubber 100, S 3, accelerator 1, oxidizable stand oil 30, chlorinated rubber 20 and coloring matter 10 parts (C. A. 29, 2203).

Rubber compositions. International Latex Processes Ltd. Brit. 433,418, Aug. 14, 1935. Compns. for the production of soft rubber goods are made by masticating a mixt. of compounded or uncompounded unvulcanized rubber and rubber prepd. by the vulcanization of rubber in aq. dispersions thereof. In examples, (1) an unvulcanized aq. dispersion, e. g., latex, is mixed with a vulcanized aq. dispersion, e. g., vulcanized latex, the H₂O removed and the mixt. masticated, (2) raw rubber is mixed with a vulcanized aq. dispersion and the mixt. subjected to hot mastication until the H₂O is evapd. and (3) raw rubber is mixed by mastication with the product obtained by removing substantially all the H₂O from a vulcanized aq. dispersion.

Rubber compositions. The Liverpool Electric Cable Co. Ltd. and Alfred Ellis Hughes. Brit. 433,727, Aug. 20, 1935. A compn., particularly for covering elec. cables, comprises a rubber mixt. and a fire-resistant filler that includes a chlorinated C₁₂H₁₄ and Se. The preferred compn. consists of smoked sheet rubber 35, MgCO₃ 41, Se 1, a chlorinated C₁₂H₁₄ 14.5, C black 5, S 2, antioxidant 1 and accelerator 0.5%. In 433,728, Aug. 20, 1935, similar compns. comprise a rubber mixt. and a fire-resistant filler including a chlorinated pitch of preferably high Cl content, e. g., 30%. Vegetable, animal or mineral pitch may be used and Se is preferably added. A suitable compn. consists of smoked sheet rubber 35, MgCO₃ 41.5, Se 1, C black 4.6, chlorinated elastic cottonseed pitch 12.5, kaolin 2, S 2, antioxidant 1 and accelerator 0.5%.

Rubber compositions. I. G. Farbenindustrie A.-G. Brit. 433,807, Aug. 10, 1935. Rubber mixes are made by using as distributing agent a nonmetallic nonacid product recovered or derived from an oxidation product of a non-aromatic hydrocarbon material of high mol. wt. The oxidation products, e. g., of paraffin, consist of acid constituents, nonacid constituents, e. g., aldehydes, ketones, alcs and esters, and unchanged initial material. The nonacid constituents may be recovered by saponifying the

crude oxidation products with alkalis or alk. earths, extg. the soap soln. with solvents, e. g., $\text{C}_2\text{H}_5\text{OH}$, and evapg. the solvent. Suitable nonacid products may also be obtained from the crude oxidation products of paraffin hydrocarbons by subjecting them to an energetic catalytic hydrogenation with H at elevated temp and pressure so that the carboxylic acids, carboxylic acid esters and lactones are converted into the corresponding aldehydes or alcs., or by esterification with alk., e. g., Me, Et, Pr, iso-Pr, Bu. In an example, a rubber mix, comprising crepe rubber 100, gas C 40, ZnO 5, S 3, phenylguanidine 1.5 and a condensation product of α -naphthylamine and aldol 1 parts, is mixed on the rollers with 4 parts of a nonacid product obtained by treating paraffin with air at 170° for 5 hrs., saponig. with alkali, extg. the soap soln. with benzene and evapg. the ext.

Cellular rubber products. Geoffrey W. Trobridge (to Dunlop Rubber Co. Ltd.) U. S. 2,023,296, Dec. 3. An aq. rubber dispersion is mixed with an NH_4 or alkali metal chloride, sulfate, nitrate or acetate and a metal such as Zn, Mg, Al or Fe which by chem. action produces *in situ* an inflating agent and a coagulating agent, and the resulting frothy mass is permitted to set to a permanent irreversible solid form.

Porous rubber. International Latex Processes Ltd. (Chester E. Linscott and Harold de B. Rice, inventors) Ger. 619,147, Sept. 24, 1935 (Cl. 39a 8 05). See *Fr* 770,501 (C. A. 29, 641⁴).

Coloring rubber. Harry G. Kiernan (to National Aniline & Chemical Co.) U. S. 2,022,887, Dec. 3. A colored unvulcanized rubber which will not deteriorate on standing is prep'd by admixt. of the rubber with a leuco comp'd of a vat dye which has been prep'd by the action of a reducing carbohydrate such as the leuco comp'd of Brilliant Indigo 4B prep'd by the action of corn sugar. Cf. C. A. 29, 1681¹.

Stable halogen derivatives of rubber. Gerhard Balke and Franz Grom (to I. G. Farbenind. A.-G.) U. S. 2,022,614, Nov. 26. A stabilized product is produced from chlorinated or brominated rubber, etc., by removing the loosely bound halogen by treating the material with a basic substance such as KOH or Na_2CO_3 or pyridine at a temp. not exceeding about 150° , in a solvent such as CCl_4 or solvent naphtha which is resistant to the basic reacting substance.

Rubber products with roughened surfaces. Sauerling Latex Products Co. Brit. 433,912, Aug. 22, 1935. See U. S. 1,983,963 (C. A. 29, 959¹).

Rubber sheeting suitable for making garments for contact with the body. Jacob Stein. U. S. 2,023,231, Dec. 3. A basic ingredient such as borax or NaHCO_3 is mixed with the rubber used to neutralize acid in body emissions. U. S. 2,023,232 (Jacob Stein and Hugh H. Mosher (to Jacob Stein)) relates to the similar use with rubber of Na benzoate, Na silicate, Na_2HPO_4 , Na_2PO_4 or NaOAc . U. S. 2,023,233 (Jacob Stein and Hugh H. Mosher) relates to rubber similarly prep'd with a content of basic substance and contg. salicylamide or other specified antipeptic.

Crinkling material such as sheet rubber. James J. Galligan and Wm. J. Robinson (to U. S. Rubber Products Inc.) U. S. 2,022,851-2, Dec. 3. Various details of app and operation.

Compound fabrics. Wingfoot Corp. Brit. 433,777, Aug. 15, 1935. Rubber is bonded to rayon by treating the latter with an aq. protein-latex compn., drying, applying a rubber compn. and vulcanizing. A casein-latex compn. may be made by grinding casein in H_2O , adding dil. alkali, e. g., NH_4OH , regrounding and mixing with rubber latex. Age-resistors for casein, e. g., hydroquinone, Na chlorophenylphenate, Na *o*-phenylphenate, and insolubling agents may be added. The invention may be used for making automobile tires, rubber hose, fan belting, mats, etc.

Rubber conversion products. I. G. Farbenind. A.-G. (Julius Sell, inventor). Ger. 618,992, Sept. 19, 1935 (Cl. 39a, 3). Addn. to 615,030 (C. A. 29, 6417¹). Vulcanized rubber is treated with gaseous, liquid or dissolved

1 HF. Horny products similar to those described in Ger. 615,030 are obtained.

Rubber articles. International Latex Processes Ltd. Brit. 433,441, Aug. 14, 1935. Molded articles comprising masticated rubber or like compns., provided with a superficial coating of rubber, etc., deposited from aq. dispersions thereof, are produced by treating the whole or a part of the molding surface of a mold with 1 or more of the aq. dispersions, solidifying the resulting coating, introducing the masticated rubber compn. into the mold, molding the compn. and vulcanizing the whole under pressure in the mold. The process may be applied to the manuf. of floor-covering material, conveyor belts, tire covers, etc., provided on their surface with lettering, etc. The molded articles may be provided with fibrous, fabric or other backings or inserts.

Rubber objects. Metallgesellschaft A.-G. (Hermann Miedel, inventor). Ger. 617,734, Aug. 27, 1935 (Cl. 39b 5). Objects made of or coated with rubber are given a grained or irregular surface by spraying with a concd. aq. rubber dispersion contg. a volatile stabilizing agent. Thus, the dispersion may contain ZnO , lithopone, S and tetramethylthiuram disulfide, with NH_3 as stabilizer.

Apparatus for making rubber strip from aqueous rubber dispersions. International Latex Processes, Ltd. Ger. 620,102, Oct. 14, 1935 (Cl. 39a 8 05). See Brit. 410,000 (C. A. 28, 6346⁵).

Rubber strip material such as surgical drainage tubing. Howard M. Dodge (to B. F. Goodrich Co.) U. S. 2,023,268, Dec. 3. A layer of sponge rubber compn. is applied to an unvulcanized rubber core and the strip is vulcanized in a mold, a layer of rubber is then applied from an aq. dispersion and is vulcanized while the strip is unconfined to provide an impervious cover.

Rubber filaments, tubing, etc. Harvey J. Elwell (to Vultex Corp. of America). U. S. 2,022,462, Nov. 26. A vulcanized latex concentrate, substantially free of protective colloids, proteins and water-sol constituents, is extruded through a die and coagulation of the extruded material is effected by heat alone at a temp. of about 38° or higher.

Rubber printing plates, etc. Theodore C. Browne U. S. 2,022,183, Nov. 26. A sheet formed of a dichromate and gelatin mixt. is exposed to light through a light-controlling screen, and the exposed sheet is placed in an aq. dispersion of rubber, producing a relief-bearing rubber film against the surface of the sheet.

Attaching rubber to metal. Colin Macbeth and Rubber Producers Research Association. Brit. 434,191, Aug. 23, 1935. Rubber-metal units or sections, for use for lining vessels, shutters, conveyors, ball-mills, etc., and for covering cylinders and rolls, are produced by applying a raw rubber to a surface of a metal plate, vulcanizing and shaping the plate so as to relieve the rubber of surface shrinkage and bring it into superficial compression.

Fixing rubber to metal, wood or glass. Soc. anon. des pneumatiques Dunlop. *Fr* 787,072, Sept. 16, 1935. The surface of the rubber is prep'd for fixing or gluing by treating it with a soln. of CrO_3 in H_2SO_4 . The surface is washed, dried and heated to about 145° under pressure for about 10 min. after application of the metal, etc. Cf. C. A. 29, 2393¹.

Hard rubber coatings on articles such as foot rails. Louis B. Haines (to Western Elec. Co.). U. S. 2,023,582, Dec. 10. A compn. for coating and vulcanization is formed by mixing smoked sheet rubber 500, S 180, diphenylguanidine 2.5 and mercaptobenzothiazole 2.5 parts and dissolving the mixt. in benzene 2300 parts.

Composite articles such as metal and rubber electric plugs. Ferdinand F. Brucker (to B. F. Goodrich Co.). U. S. 2,023,264, Dec. 3. Various operative details of manuf.

Treating reclaimed rubber. Walter C. MacFarlane (to Xylos Rubber Co.). U. S. 2,021,961, Nov. 26. The rubber is strained to remove foreign particles, extruded into strip form, refined by a thin sheet milling operation, the extruded strips being progressively severed to form a plurality of discontinuous particles which are dusted as

formed to prevent them from adhering to each other and conveyed in a continuous stream from the straining and extruding to the refining operation, so that the stream may be diverted to different refining stations. App. is described.

Molding hollow rubber articles having walls of uniform thickness from sheets of unvulcanized stock in molds having cavities. Josef A. Talalay. Bnt. 434,949, Sept. 10, 1935. A stock sheet of nonuniform thickness is used, the parts thereof corresponding to the cavities in the mold being of greater thickness than the parts corresponding to raised portions of the mold, the thickness varying with the varying depth of the cavity.

Apparatus for molding rubber balls. James A. Law. Bnt. 434,577, Sept. 4, 1935.

Apparatus for molding outer covers for pneumatic tires. Leonhard Herbert. Bnt. 434,440, Sept. 2, 1935.

Rubber tubes, etc. John F. Cavanagh (to Wm. W. Potter). U. S. 2,022,230, Nov. 26. App. and various operative details are described.

Inner tire tube. John F. Cavanagh (to Wm. W. Potter). U. S. 2,021,983, Nov. 26. Various details of app. and operation are described.

1 Tire-molding and vulcanizing apparatus. Wm. J. Woodcock and John Bull Rubber Co. Ltd. (formerly The Leicester Rubber Co. Ltd.). Bnt. 434,742, Sept. 9, 1935.

Apparatus for vulcanizing inner tire tubes. Lionel D. Bax. U. S. 2,022,308, Nov. 26. Mech. features.

Apparatus for vulcanizing tires, tubes, etc. Thomas H. Williams (to David Bridge and Co. Ltd.). Bnt. 434,007, Aug. 23, 1935.

2 Apparatus for the continuous vulcanization of rubber goods such as rubber-covered wire. Lewis J. Clayton (to Viceroy Mfg. Co.). U. S. 2,023,665, Dec. 10. Various structural and operative details.

Vulcanizing rubber articles such as tire casings. Geo. P. Bosomworth (to Firestone Tire & Rubber Co.). U. S. 2,023,002, Dec. 3. Various details of app. and operation.

3 Rubber vulcanization. Clyde Coleman (to United States Rubber Co.). U. S. 2,022,953, Dec. 3. An *N*-nitrosophenylmethyl arylmetharyl sulfide such as *N*-nitrosophenylmethylbenzothiazyl sulfide is used as an accelerator.

CHEMICAL ABSTRACTS

Vol. 30

FEBRUARY 20, 1936

No. 4

1—APPARATUS, PLANT EQUIPMENT AND UNIT OPERATIONS

W. L. RADGER

Devices for automatic regulation of temperature in laboratories. N. A. Udalov. *Zavodskaya Lab.* 4, 805-9 (1935).—Various types of thermometers for thermostat regulation of temps. are illustrated and discussed. C. B.

Application of an objective photoelectric colorimeter in a factory laboratory. A. Zelazny. *Gaz. Charkovskaya* 76, 337-42 (1935), cf. *Werkstätt.* C. A. 29, 3198¹.—Lange's photoelectric colorimeter giving the extinction coeff. can be standardized in Stammer's degrees, thus it is a valuable tool in tech. lab. J. Wiertelak.

Most economical pipe diameters for high-pressure chemical plants. Shun-ichi Uchida. *J. Soc. Chem. Ind. Japan* 38, Suppl. binding 578-81 (1935).—Fundamental equations are derived for fixed cost and for power cost in the case of very large Reynolds' nos., and for values between 2300 and 100,000. Illustrative examples are given. Karl Kammermeyer.

Recent developments in metal sealing into glass. Howard Scott. *J. Franklin Inst.* 220, 733-34 (1935).

E. H.

Porous quartz filters. L. V. Korovnik. *Zavodskaya Lab.* 4, 825-6 (1935).—Methods of manuf. of porous quartz filters in Soviet Union are discussed. The products compare well with German articles. Chas. Blanc.

Rapid filtration of silica in volumetric analysis of cast iron and steel. K. A. Yakovleva. *Zavodskaya Lab.* 4, 823-4 (1935).—A tube constructed at the bottom and fitted with a perforated plate is used for filtering. It is charged with filter-paper pulp. Chas. Blanc.

New distillation apparatus. A. Hanal. *Z. Unterzuch. Lehenm.* 70, 394-402 (1935).—Three types are described: (1) steam distn. app., (2) precision distn. app., (3) distillate tester. F. L. Dunlop.

Thermocouple vacuum calorimeter. W. E. Garner and F. J. Veal. *J. Chem. Soc.* 1935, 1436-43.—A thermocouple calorimeter has been developed to measure heats of absorption of gases on oxides. Various discarded types are also described. The device is adaptable to both slow and rapid absorption processes and can be used to measure the differential heats of slow processes. Difficulties are encountered in the attempt to measure differential heats of fast absorptions due to poor distribution of gas throughout the oxide and low-grain cond. The technique is detailed. William E. Vaughan.

Trichromatic colorimeter. R. Donaldson. *Proc. Phys. Soc. (London)* 47, 1068-73 (1935).—The integrating properties of a diffusing sphere are used to mix the 3 colors. S. Bradford Stone.

A chemical hygrometer. Thorne M. Carpenter. *J. Biol. Chem.* 112, 123-33 (1935).—The app. described for the detn. of water vapor by vol. in air is constructed on the principle of a gas analysis app. in which vols. before and after removal of water vapor by an absorbent are read against a const. vol. kept dry by P_2O_5 . A large no. of comparisons with results obtained by weighing the water vapor absorbed from air currents contg. 0.3 to 2.2% show an agreement of under 0.02% on the av. The app. is transportable and easily produced commercially. A. P. Lothrop.

Automatic analysis apparatus of the Ukraine Institute of Applied Physics and Chemistry. N. Ya. Vynnychev and E. E. Korobehanov. *Zavodskaya Lab.* 4, 812-21 (1935).—Numerous gas analysis app. of original design are illustrated and described. Chas. Blanc.

Sampling apparatus for chemical-climatological and technical air analysis. H. Cauer. *Z. anal. Chem.* 103, 160-88 (1935).—The app. recommended is classified into 2 groups, one uses a motor-driven pump and the other a hand pump. The pump chosen provides for the rapid passage of air and, even when the air passes through a very fine filter, is suitable for making a rapid analysis. The method of sampling and the necessary app. are described and illustrated by photographs of actual practice. Fight references. W. T. H.

Apparatus for aspiration, preservation and analysis of gases soluble in water. M. S. Gershenovich. *Zavodskaya Lab.* 4, 904-7 (1935).—Several app. are illustrated and described. Chas. Blanc.

A new cataphoresis chamber for measuring the velocity of cataphoretic migration of microscopic particles. Robert Havemann. *Biochem. Z.* 281, 402-7 (1935).—Theoretical discussion of cataphoretic methods and description of a simple app. S. Morgulis.

Recovery from the gas mixtures which escape during the production of benzyl chloride. E. V. Alekseevich and S. F. Kravayin. *J. Chem. Ind. (Moscow)* 12, 338-40 (1935).—When mixts. of MePh, Cl₂ and HCl are adsorbed on birch C or SiO₂ and desorbed with steam at 120°, mixts. of mono- and dichloro-toluenes are obtained. With Al₂O₃, MeC₆H₄Cl is obtained. Mixts. of MePh and Cl₂ in air give the same result with SiO₂ as when HCl is present, but with C only monochlorotoluenes are obtained. SiO₂ is a good catalyst for the chlorination of MePh, but C is not. H. M. Leicester.

Constant-flow liquid distributor. A. Bourt. *Documentation scientifique* 4, 43-7 (1935); *Chimie et Industrie* 34, 828.—The principle of the app. is based on the clamping of the liquid inlet by means of a float. A 5-l. flask contg. the liquid to be distributed is mounted above the distributor and a float in the latter is provided with a 1-mm. tube fitting into the outlet tube from the 5-l. flask. The flow is governed by the difference in the level of the liquid in the distributor and that of the outlet of the discharge tube therefrom. A suitably graduated scale can be placed back of the outlet to adjust it for any desired rate of flow. A. Piquenau-Couture.

Thermal photometers. R. Jouaust. *Rev. gén. Elec.* 38, 419-22 (1935).—Thermal photometers are app. which permit detn. of the energy in a beam of rays after transformation of this energy into heat. Four types are distinguished: (1) app. in which the heating of a mass of air is used; (2) app. utilizing the effects produced in rarefied gases under different temps.; (3) app. in which the increase of elec. resistance due to increase of temp. is utilized; (4) app. with thermocouples. Practical types are described and applications reviewed. Five references. M. Hartenhein.

Höppler viscometer vs. Vogel-Ossag viscometer. J. J. Leendertse. *Chem. Weekblad* 32, 533-5 (1935).—The Höppler viscometer is generally unsuited for work on mineral oils; it lacks theoretical basis. The rapaport viscometer (Vogel-Ossag) is preferred. C. G. Verver. *Ind.* 535-6.—The above results are confirmed. B. J. C. van der Hoeven.

A new micro hydrogen electrode. J. Löbbeck. *Z. anal. Chem.* 103, 180-3 (1935).—It is relatively easy and simple to construct a miniature H₂ electrode with which one can measure the potential against a calomel cell with

less than 0.1 cc. of liquid and with an accuracy of 0.2 mv. in the pH range 1.8-10.5. The electrode, which is depicted, as well as described, is made of capillary tubing of 1 mm diam and 70-mm height. In the middle, the capillary is blown out somewhat and in the upper third it is connected with another section of capillary tubing which is given a right-angled bend downward and has also a bulb in the middle opposite to the other tube. In the capillary of the first tube is inserted the platinumized electrode through a ground-glass connection. The entire app is placed in 0.1 N KCl when a measurement is to be made and the lower part of the capillary tubing is filled with the soln. to be tested. W T H

An improved hydrogen electrode Witold Hermanowicz *Roczniki Chem* 15, 290-3 (1935).—This electrode is similar in construction to one proposed by Walpole (*Biochem J* 7, 410 (1913), *C A* 8, 2403) and Lasch (*Z ges. exp. Med* 56, 157 (1927)). The electrode is described and a diagram included. It requires 0.2 cc. of liquid for a pH detn. and can be used in a water thermostat. A const. potential of buffered solns. is attained after 5 min.; that of an unbuffered soln. is attained after 35-40 min. J F. Matejczyk

A simple apparatus for measuring the heat conductivity of oils E L Lederer *Fettchem Umschau* 42, 152-5 (1935).—The app consists of an arrangement for (1) subjecting to a const., relatively lower temp. the lower end of an otherwise insulated perpendicular cylinder filled to a definite depth with the material being investigated and (2) simultaneously detg., as a function of time, the temp. drop at a predet. point within the material under test. The calcs. are based on Fourier equations (*cf. C A* 22, 1884). The device works well not only with granular or oily bodies but also with solidified substances introduced into the cylindrical part of the app. in a molten condition. J W Perry

Industrial furnace atmospheres C George Segeler. *Am Gas J* 143, No. 6, 9-12, 45 (1935).—A survey of the use of special industrial furnace atm. A table of recommendations and limitations for furnace atm. is given. Twenty-three references. Joseph H Wells

The faults of the heating conditions of the screw conveyor digester R B Gurevich *Kalini (U S S R)* 1935, No. 6, 15-19.—The pressure of steam must be increased from 0.1 to 1.5 atm., to insure the working conditions of the pipes which supply the live steam to the lower part of the digester for mixing and heating purposes. A Pestoff

Radiation from nonluminous flames H C Hottel and V C Smith *Trans Am Soc Mech Engrs* 57, 463-70 (1935), *cf. C A* 29, 7127.—A method is presented for detg. the total radiation from flames, due to CO_2 , H_2O and mixts. of these at temps. above 2500°F. The emission of radiation and the corresponding temp. were measured from overventilated flames of CO , H_2 and mixts. of these in a Meeker burner of varying length, and the products in the flame were calcd. from the compn. of the burner feed mixt. Results are presented for flames of CO in mixts. of O_2 and N_2 , in which the burner grid length is varied from 2 to 16 in., the theoretical O_2 from 100 to 300%, and the flame temp. from 2600° to 3800°F. The results establish the validity of the CO_2 radiation chart in its high-temp. range. Less extensive measurements on illuminating gas flames establish the validity of the water-vapor radiation chart at temps. of 2500-2800°F., when the thickness of the gas layer is small. Exptl. data and 22 references are given. Karl Kammermeyer

Evaluation of effective radiant heating surface and application of the Stefan Boltzmann law to heat absorption in boiler furnaces W J Mullikin *Trans Am Soc Mech Engrs* 57, 517-29 (1935).—A method is developed for converting well known types of furnace heat-absorbing surface into an equiv. effective radiant heating surface, which is controlled by (1) spacings of wall tubes, (2) kinds of blocks on the water-wall tubes, (3) amts. of slag on the water-wall tubes or blocks, and (4) the emissivity of the water wall surface exposed to the flame. The fraction of the heat supplied to the furnace that is given up

by the gases in the furnace is found to be obtained most simply and practically by use of the Stefan-Boltzmann law. Results computed in this manner are compared with results reported in another paper (*cf. following abstr.*), and it is found that for large pulverized coal, and oil-fired and gas-fired furnaces, the assumption of an effective furnace emissivity of unity gives results in good agreement with the exptl. data. For stoker-fired furnaces, in general, the effective furnace emissivity appears to be less than unity. Exptl. data and 6 references are given. Karl Kammermeyer

An experimental investigation of heat absorption in boiler furnaces W J Wohlenberg, H F. Mullikin, W. H. Armacost and C W Gordon. *Trans Am Soc Mech Engrs* 57, 541-54 (1935).—Test data are reported from 10 boilers in different power plants in the U S A., including stoker fired pulverized fuel, and oil- and gas-fired units with various combinations of refractory and water-cooled furnaces. The data include furnace-exit gas temps., measured by means of the high-velocity thermocouple, which are used to det. the fraction of the heat input to the furnace that was absorbed in its walls. Sixty references. Karl Kammermeyer

Review of methods of computing heat absorption in boiler furnaces W J Wohlenberg and H F. Mullikin *Trans Am Soc Mech Engrs* 57, 531-40 (1935).—The heat absorption in boiler furnaces is computed by a no. of methods and the results are compared with the results reported by the A S M. E. Comm. on Absorption of Radiant Heat in Boiler Furnaces (*cf. preceding abstr.*). Particular emphasis is placed on the methods of Broido, Orrock and Wohlenberg. It is shown that the influence of various conditions as found by expt. is in substantial agreement with results expected from a theoretical consideration of the problem and those reached by certain well known methods now in use. Karl Kammermeyer

Fumigation of ships by Clayton gas [buret for estn. of gas concns.] (Gilmour) 13

Chemical apparatus Metallgesellschaft A-G *Fr* 786,450, Sept. 3, 1935. App. is constructed of material insensitive to shocks, e.g., a mixt. of rubber with substances such as cement, plaster, asbestos, leather fibers, vulcanizing agents, this material being coated with a layer of soft rubber or ebonite at the places where the app. is exposed to the attack of chem. agents.

Vacuum distillation apparatus Eric W. Fawcett, John L. McCowen and Imperial Chemical Industries Ltd. *Brit* 434,726, Sept. 9, 1935. In the distn. of liquids in which a no. of distn. units are housed in a common vacuum chamber connected to a high-vacuum pumping system, each unit comprises a disty. surface heated internally by a heater and an adjacent condensing surface. Colorimeter. Abraham G. Sheffield *Ch. Eng.* 621,221, Nov. 2, 1935 (*Cl* 42k 18.01). See *Brit.* 405,362 (*C A* 28, 3943).

Potentiometer for measuring pH values Imperial Chemical Industries Ltd. *Fr* 787,824, Sept. 30, 1935.

Apparatus for electrometric analysis Udo Ehrhardt (to I G Farben) and A-G. U S 2,024,819, Dec. 17. A calomel, a Ag and at least one Pt electrode are inserted in a titration vessel for carrying out electrometric analyses by measuring the variations of the anodic current of an electron tube operatively connected with the titration vessel and are adapted to be operatively connected to the electron tube. Various details are described.

Precision resistance Paul H. Dike (to Leeds & Northrup Co.) U S 2,026,616, Jan. 7. An unsealed precision resistor comprises a resistance conductor (such as a "manganin" wire) having a low temp. coeff. with a covering comprising mixed natural vegetable and animal fibers serving to reduce changes in resistance due to variations in humidity. The covering may be impregnated with a material such as ceresin.

Electrical resistance thermometers Wilhelm Bonwitz *Brit.* 474,635, Sept. 5, 1935.

Thermometer casings Herbert C. S. Bullock. Brit. 435,282, Sept. 18, 1935 A thermometer pocket for insertion in a pipe line is provided with means for mixing the stream of fluid under exam. and passing it over the thermometer element.

Blowpipe suitable for use with oxygen and acetylene. Samuel R. Oldham (to Oxford Railroad Service Co.) U. S. 2,024,057, Dec 10 Structural details

Classifying apparatus of the oscillating or reciprocating raking-blade type Charles K. McArthur (to Dorc Co.) U. S. 2,025,690, Dec 24 Structural, mech and operative details

Crystals Compagnie nationale de matières colorantes et manufactures de produits chimiques du Nord réunies établissements Kuhlmann Fr 786,040, Aug 24, 1935 Absolutely regular crystals of controlled size are obtained in an app in which starting crystals are dipped into and withdrawn from a saturated supersatd lye at raised temp. The crystals may be placed in pans dipping into and raised out of 2 vessels by a rocking motion

Filters Frank O. L. Chorlton Brit 431,576, Sept 4, 1935 A removable filter element formed by winding wire in a discontinuous helical groove cut in longitudinal ribs or bars on a cage or former has end flanges which fit in seatings of a casing having an inlet and outlet

Filters Edward Zahm Brit 434,581, Sept 4, 1935 A filter-press is built up of frames each having an inwardly-projecting flange and a drainage member comprising coarse wire fabric with finer wire fabric on either side, held against a shoulder on the flange. Filter cloth is held against either side of the drainage member by rings within which filter aid is deposited to form a filtering bed

Filters Schuchtermann & Kremer-Baum A G für Aufbereitung Ger 618,786, Sept 14, 1935 (ci 12d 13) A device is described for stretching filter cloths on drum filters

Filters with concentric filtering elements Établissements A. Guiot Fr 787,482, Sept 23, 1935

Filtering apparatus (with vibrating filter leaves on brackets) Robert S. Butler (to Nordberg Mfg Co.) U. S. 2,024,426, Dec 17. Various structural, mech and operative details

Rotary-disk filters Soc alvacienne de constructions mécaniques Fr 787,265-266, Sept 19, 1935

Filters for gas or vapors Siemens-Mariawerke A -G für Kohlefabrikate (Oswald v Wartburg, inventor) Ger. 618,505, Sept 11, 1935 (ci 12c 3 02) Rings of gas-adsorbing material such as C are embedded in a plastic container, and hardened. The plastic substance may also be a gas adsorbent

Rotary-drum filter, with rolls for compressing the filter cake. Humboldt-Deutemotoren A -G Ger 621,111, Nov. 4, 1935 (ci 12d 15 02)

Rotary-drum apparatus for filtering and dewatering slimes such as those from coal, wool, ores or sewage Rene A. Henry. U. S. 2,021,353, Dec 17 Various structural, mech. and operative details

Filter for liquids. Frederick G. Seeley. Fr 789,011, Aug 24, 1935.

Apparatus suitable for filtering liquids through diatomaceous earth. Edgar Cocke and Lee D. McGown (to Los Angeles Wall Bed Co.) U. S. 2,024,719, Dec 17. Various structural and operative details are described of a filtering app. with vacuum and air supply connections for reverse-flow cleaning of a screen in the filter chamber

Continuously acting rotary filter for separating liquids David McCrorie Shannon. Ger. 618,906, Sept. 21, 1935 (ci 12d 12 02)

Continuous-pressure rotary filter Charles L. Riou. Fr 787,143, Sept. 17, 1935

Pressure filter and pump, etc., for filtering solvent liquid such as that used in "dry cleaning" Stanley Malanowski. U. S. 2,024,463, Dec 17 Various structural and operative details

Filter press Dario Teatini. U. S. 2,024,055, Dec 17
Gas filters Società italiana Pirelli Brit 434,700, Sept. 6, 1935. Addn. to 433,190 (C. A. 30, 331). In a gas filter a mixt. of fiber and auxiliary granular material is

felted to form the filtering medium. Thus a suspension of wood cellulose in alc is added to 1 of ebomite dust in alc. and the mixed suspension is filtered, e. g., on a fine sieve. In another example, cotton fibers are wetted by a soln. or suspension, e. g., of colophony in CCl₄, dried and the mixt carded and wrapped on a drum or lapped to the desired thickness to effect the filtering

Apparatus (with a disk of porous stone-like material) suitable for filtering steam, etc Emil F. Wemhoener (to Universal Boiler Filter Corp.) U. S. 2,024,122, Dec 10 Various structural and operative details

Filter comprising loose filtering material enclosed between two concentric rotary drums Richard Mensing. Ger 605,239, Nov 8, 1935 (ci 12d 15 01) Means for cleaning the filtering material is described

Cleaning apparatus for bag filters for separating dust from gases Standard Filterbau Ges m b H Ger. 621,415, Nov 6, 1935 (ci 50e 6)

Filtering mass for aerosols Società italiana Pirelli. Fr 786,421, Sept 3, 1935 The mass is composed of fibrous material having been submitted to one of the treatments used in the spinning or weaving industries, e. g., in the form of cloth on which the inert powder is deposited

Combination funnel and measure Francis J. Kneer. U. S. 2,024,169, Dec 17 Structural details

Sieves and strainers Francis Ward Brit 435,161, Sept 16, 1935 The sieves, etc., are constructed so that a perforated plate or sieve bottom can be inserted at the top or bottom of the frame to provide either a deep or shallow sieve

Separating dispersed matter from liquids John O. Samuel and Emlyn Anthracite Colliery Ltd Brit 435,126, Sept 16, 1935 The sepn is promoted by adding a flocculating gel obtained by subjecting a mixt. of amylose material and a neutral metal salt or salts, e. g., ZnCl₂, the thiocyanates of Li, Ca, Mg, Sr, Mn or Ce, the double thiocyanates of Na and Mn, of Ba and Mn and of Na and Zn, CaCl₂ in admixt with ZnCl₂, HgCl₂ or the above thiocyanates or MgCl₂ in admixt with HgCl₂, to heat and agitation until the cells of the amylose material burst and form a thick gummy paste. The dispersion to be treated may first be rendered alkal

Separating solids from liquids Westfalia-Dinnendahl-Gröppel A -G and Gewerkschaft Sophus-Jacobsa. Fr 787,522, Sept 21, 1935 See Ger. 609,094 (C. A. 29, 24057)

Press roll apparatus for separating water from various materials Karl G. Hillner and Axel G. Johansson U. S. 2,025,348, Dec 24. Structural details.

Apparatus for gravity separation of different liquids such as oil and water Wm R. Mobley U. S. 2,025,883, Dec 31 Various structural and operative details.

Separating materials (such as coal and stone) of different specific gravities Gerard J. de Voors U. S. 2,026,343, Dec 31 The materials are introduced into a sepg. liquid such as an aq suspension of clay and harytes in finely divided condition App and operative details are described

Centrifugal separator for gas purification Charles H. W. Cheltnam and Cyril H. Cheltnam Fr 787,678, Sept 26, 1935

Centrifugal apparatus for cleaning air and gases. Willy Neumann Fr 787,141, Sept 23, 1935.

Centrifugal apparatus for degassing liquids. Società italiana Pirelli Fr 787,186, Sept 18, 1935

Apparatus for purifying gases by filtering them through granular material Jean Journer. Fr. 787,190, Sept. 18, 1935

Apparatus for cleaning gases Hall & Kay Ltd, Percy Kay and James H. Hall Brit. 433,943, Aug 16, 1935. The app comprises baffles assembled to form zigzag air or other passages

Apparatus for analyzing gases. Claude Bonner. Fr. 787,500, Sept. 23, 1935

Apparatus for chemical analysis of gases Pierre L. L. Vallery and Joseph P. P. Rosello. Fr. 786,491, Sept. 3, 1935.

- Apparatus for automatic gas analysis** René Moritz. *Fr* 787,621, Sept. 26, 1935
- Electric system, etc., for indicating gas pressures, flows, etc., at a distance. Garrett B. Luederman, Jr. (to Pittsburgh Equitable Meter Co.) U. S. 2,024,378, Dec. 17. Various structural, elec. and operative details.
- Rare gases boiling higher than oxygen** Egyesült Izzólámpa és Villamosági R. T. *Brit* 434,193, Aug. 28, 1935. Kr and other atm. constituents less volatile than O are obtained by partial liquefaction of air, the Kr being washed out by liquid air or N at a temp. lower than that of liquid O at the pressure employed, the Kr, etc., being thus obtained as a mixt. with O which is worked up to sep. Kr, etc., while the N and O pass off together as gas. *Cl* C 29, 3358⁸ 8250⁹
- Separating gases by liquefaction** Egyesült Izzólámpa és Villamosági R. T. *Brit* 434,194, Aug. 23, 1935. Addn. to 434,193 (preceding abstr.). To obtain Kr or hke heavy rare gas from air, atm. air is introduced through a pipe into a packed tower supplied with liquid air from an external source by a pipe and supplied also by a pipe with air liquefied by passage in a compressed state through coils in vessels through which the liquid from the tower flows in succession, the vapors evolved from the vessels passing back into the vessels and escaping by a pipe.
- Compressing gases such as those in refrigerating apparatus** Reginald G. Wyld (to Baldwin-Southwark Corp.) U. S. 2,024,323, Dec. 17. Various details of app. and operation are described.
- Apparatus for producing compressed gas from liquefied gas** Akt.-Ges. für Industriegasverwertung. *Ger.* 621,462, Nov. 12, 1935 (*Cl* 17g 5 02)
- Two stage system for rectifying liquefied gas mixtures** Oesterreichische Aga-Werke A-G. *Austrian* 143,311, Nov. 11, 1935 (*Cl* 12d)
- Removing weak gaseous acids from gases** I. G. Farbenind. A-G. *Fr* 787,782, Sept. 28, 1935. In processes wherein weak acids are removed by washing with org. bases contg. at least 1 amino group, the app. is made wholly or partly of Al and an alloy thereof and the concn. of the org. bases in the solns. or liquids in question is kept at 20% at least. If the solns. contain Al this must be removed.
- Apparatus for solidifying gases such as carbon dioxide** Harry W. Cole and Malcolm W. McLaren (to International Carbonic Engineering Co.) U. S. 2,025,608, Dec. 24. A liquefied gas is supplied to form an accumulation of solidified gas in a chamber in which a definite pressure may be maintained, and the solidified gas is compressed in the chamber.
- Means for regulating, indicating or recording varying quantities of liquid flowing out of a pipe** Felix Meyer. *Brit* 434,375, Aug. 30, 1935
- Device for subdividing and distributing liquid in a timed sequence** Leonard B. Harris (to International Oil Gas Corp.) U. S. 2,024,690, Dec. 17. Various structural, mech., and operative details.
- Device for the discharge of liquid from apparatus by gas pressure** Holden & Brooke Ltd. and Daniel G. McNair. *Brit.* 434,688, Sept. 6, 1935.
- Apparatus and method for measuring viscosity of liquids** Andrew Gemant and Richard V. Southwell. *Brit* 434,994, Sept. 12, 1935. The viscosity is measured by applying pressure to a column of a liquid in such manner as to produce oscillations and observing the characteristics of the oscillations.
- Viscometer with rotating disks suitable for testing liquids** John M. Bell. U. S. 2,026,297, Dec. 31. Various structural, mech. and operative details.
- Electrical liquid level indicator suitable for use with boilers** Fletcher M. Boyd. U. S. 2,026,299, Dec. 31. Various structural, elec., and operative details.
- "Liquid proofing" gaskets such as those of asbestos** Benjamin J. Victor (to Victor Mfg. & Gasket Co.) U. S. 2,025,486, Dec. 24. The gasket is treated with a resinous residue derived from the partial decompn. of a metallic fatty acid salt such as Al stearate in a solvent such as C₂H₆ and CCl₄ and the solvent is evapd.
- Mercury-vapor generators** The British Thomson-Houston Co. Ltd. *Brit.* 433,919, Aug. 22, 1935. In a Hg boiler, liquid-vapor sepg. means are arranged in the space of the drum between the discharge pipe and the tubes that supply to the drum the mixt. of Hg and vapor.
- Mercury-vapor generators** The British Thomson-Houston Co. Ltd. *Brit.* 434,386, Aug. 30, 1935
- Rectification of liquids in a distillation column** Samuel C. Carpey (to Shell Development Co.). U. S. 2,026,019, Dec. 31. Various structural and operative details for rectifying by decarbon fractions, etc.
- Powdered substances** Soc. anon. des pneumatiques Dunlop. *Fr.* 787,363, Sept. 21, 1935. Finely divided powders are obtained by dissolving the primary material (I), emulsifying the soln. in a medium in which this soln. and I are practically insol. and removing the solvent without coalescence from I. Examples are given of the prepn. of powd. chlorinated rubber, nitrocellulose, benzyl-cellulose and a mixt. of chlorinated rubber and chlorinated biphenyl.
- Mixing apparatus of the continuous type suitable for use in chemical industries, etc.** John E. Chiquone (to Blaw-Knox Co.). U. S. 2,024,509, Dec. 17. Various structural, mech. and operative details.
- Apparatus for mixing aqueous liquids with powdered adsorbents** Carbo-Nort-Union Verwaltungs-Ges. m. b. H. *Ger.* 621,108, Nov. 1, 1935 (*Cl* 85b.3 03)
- Roll apparatus for mixing and grinding** Firma J. M. Lehmann (Kurt Wiemer and Alfred Goll, inventors). *Ger.* 621,095, Nov. 1, 1935 (*Cl* 50c.13 10)
- Rollers composed of a number of washers of asbestos or like material threaded on an axle and compressed longitudinally and intended for displacing articles at high temperatures, particularly glass plates or sheets** Soc. anon. des manufactures des glaces et produits chimiques de St.-Gobain, Chauny & Cirey. *Brit.* 434,315, Aug. 29, 1935
- Evaporating apparatus** Alteselskabet Krystal. *Ger.* 618,727, Sept. 17, 1935 (*Cl* 12a.2). App. is described for producing large crystals by evapn. *in vacuo*, or by vacuum cooling.
- Circulatory tubular evaporating apparatus** Hermann Claassen. *Ger.* 621,110, Nov. 1, 1935 (*Cl* 12a.2).
- Film evaporators** Eric Wm. Fawcett, John L. McCowen and Imperial Chemical Industries Ltd. *Brit.* 435,032, Sept. 9, 1935. In the high-vacuum distn. of materials yielding a solid distillate or residue in app. where the disty. surface and condensing surface are in close proximity, the solid is removed, e. g., from the condensing surface, by a scraper in form of a piston ring traversing the surface by means of a screw and is delivered to a receiver.
- Evaporator and crystal separator suitable for treating various salt solutions** Martin J. Kerner (to Buffalo Foundry & Machine Co.). U. S. 2,025,059, Dec. 24. Various structural details.
- Evaporator suitable for refrigerating plants** Raoul Bernat and Henri Bernat. U. S. 2,025,634, Dec. 24. Structural and operative details of an evaporator suitable for use with liquefied gas.
- Drying apparatus** Kurt Goldschmidt. *Austrian* 143,336, Nov. 11, 1935 (*Cl* 82a). A part only of the moist gas leaving a drying app. is caused to exchange heat with the ingoing gas. The amt. of vapor condensed from the outgoing gas, and the amt. of latent heat recovered, are thus increased.
- Film driers** Peter Spence & Sons Ltd., Walter V. Coles, Geo. Scott & Son, London, Ltd. and Geo. W. Raley. *Brit.* 434,883, Sept. 11, 1935. In drying wet clay and like pastes of finely divided material that is substantially refractory at the temp. used, by passing through a heating zone as a thin deposit upon a conveyor, the material is heated mainly by radiant heat from surfaces heated to incandescence.
- Pneumatic drier** Büttner-Werke A-G. *Ger.* 618,501, Sept. 9, 1935 (*Cl* 82a.1 02)
- Vacuum drier and cooler** Metallgesellschaft A-G. *Ger.* 618,502, Sept. 10, 1935 (*Cl* 62a.25 08)

- Chamber furnace.** Hermann Limberg. Ger. 818,857, Sept. 17, 1935 (Cl. 10a. 12 01). Details of construction are given.
- Cupola furnace with a movable bottom for sintering and fusing quartz.** Fritz Winkler (to I. G. Farbenind. A.-G.). U. S. 2,026,370, Dec. 31. Various structural, mech. and operative details.
- Regenerative flame furnace.** Hoesch-Köln Neussen A.-G. für Bergbau und Hüttenbetrieb. Ger. 621,140, Nov. 2, 1935 (Cl. 24c. 6). Addn to 507,211 (C. A. 27, 2351).
- Drum for roasting, distilling and drying cork chippings.** Anton Köhler. Ger. 618,709, Sept. 14, 1935 (Cl. 39a 19 50).
- Continuous regenerative kiln suitable for various heat treatments.** Allen M. Rossmann (to Rossmann Engineering Co.). U. S. 2,026,060, Dec. 31. Various structural and operative details.
- Apparatus (with a vertical reaction chamber) for roasting or calcining various materials.** Eugene C. Saint-Jacques (to Soc. Chantierine d'applications industrielles de brevets). U. S. 2,025,402, Dec. 24. Various structural and operative details.
- Furnace wall with cooling tubes.** James F. Millar (to Babcock & Wilcox Co.). U. S. 2,025,000, Dec. 24. Various details of construction.
- Electrically heated vacuum-flask apparatus for maintaining small quantities of substances at a predetermined temperature.** Rosa Citron. Austrian 143,695, Nov. 25, 1935 (Cl. 42b).
- Heat-exchange apparatus suitable for use with various liquids and gases.** Charles A. Harrison. U. S. 2,024,521, Dec. 17. Various details of manuf. and construction are described.
- Heat-exchange apparatus suitable for cooling hot granular material such as cement clinker on a circular oscillating surface.** Otto Lelupp. U. S. 2,024,934, Dec. 17. Structural, mech. and operative details.
- Heat exchanger for heating oil-saturated steam of a "mallet" type engine by superheated steam from the engine.** Richard B. Salley. U. S. 2,026,438, Dec. 31. Structural details.
- Finned heat-exchange tube.** Alfred J. Berg. U. S. 2,025,036, Dec. 24. Structural details.
- Thermostatically controlled valve device for use in apparatus for exchanging heat between two liquids.** Northern Equipment Co. Brit. 435,150, Sept. 16, 1935.
- Calorimeter and method of use with liquid or gaseous fuels or the like.** Rafael W. Keith. U. S. 2,026,179, Dec. 31. Various structural, elec. and operative details. U. S. 2,026,180 also relates to details of calorimeters "of the multiple type."
- Apparatus for coating articles with viscous compositions by dipping.** N. V. Machinierieën-en Apparaten-Fabrieken. Ger. 621,234 (Nov. 4, 1935 (Cl. 76a. 21)).
- Apparatus for coating sheet materials.** Raymakers Syndicate Ltd. Ger. 621,331, Nov. 5, 1935 (Cl. 55f 3 01). See Brit. 405,761-2 (C. A. 28, 53627).
- Apparatus for classifying materials such as sands**
- 1 Royal S. Handy.** U. S. 2,025,412, Dec. 24. Various structural, mech. and operative details.
- Core extractor or sampler for removing samples of resin from barrels, etc.** Frederick W. Thomas. U. S. 2,024,076, Dec. 10. A wire coil extending into material such as a resinous gum in a barrel or the like has its outer end secured to a plug adapted to close a hole in the receptacle.
- 2 Apparatus for proportioning the flow of liquids as in refining vegetable or petroleum oils.** Robert J. Short (to Procter & Gamble Co.). U. S. 2,024,478-9-80, Dec. 17. Various structural, mech. and operative details.
- Apparatus for sampling or for visual examination of oils.** Gustave A. Brandlin. U. S. 2,026,267, Dec. 31. Structural and operative details.
- Apparatus for lifting oil (from wells) or other liquids by the action of compressed gases.** Johan Entrop (to Shell Development Co.). U. S. 2,026,226, Dec. 31. Various structural and operative details.
- Exhaust steam condenser, oil separator and feed water heater and purifier.** Charles E. Dillinger. U. S. 2,025,043, Dec. 24. Various structural and operative details.
- Sizing and separating fines from crude materials such as cement, flour or ores.** Meshack T. McWhorter and Jacob R. Hiestand. U. S. 2,026,318, Dec. 31. App. and various operative details are described.
- 4 Clarifying and removing coloring matter from aqueous liquids by use of acid sludge from oil refining.** John C. Bird (to Standard Oil Development Co.). U. S. 2,025,715, Dec. 31. Materials such as sugar solns, etc., are treated with water-sol. sulfonic acids or their salts such as those of from acid sludge capable of forming substantially water-insol. alk. earth sulfonates as a ppt. which adsorbs coloring matter, and the ppt. is removed from the liquid.
- 5 Air-conditioning apparatus.** Lachlan W. Child (to Aeriet Air Conditioner Co.). U. S. 2,025,802, Dec. 31. Various structural, mech. and operative details.
- Air-conditioning apparatus.** Dion K. Dean (to Foster Wheeler Corp.). U. S. 2,025,937, Dec. 31. Various structural and operative details.
- Odor removing apparatus for treating gases such as air.** Arthur B. Ray (to National Carbon Co.). U. S. reissue 19,791, Dec. 17. A reissue of original pat. No. 1,820,030 (C. A. 25, 5599).
- 6 Metal container for holding carbon dioxide, etc., under high pressures.** Daniel Mapes (to Walter Kidde & Co.). U. S. 2,026,133, Dec. 31. Various structural and mg details.
- Controlling sublimation of solid carbon dioxide for refrigerating and carbonating.** Henry C. Williamson (to Beckley-Ralston Co.). U. S. 2,026,335, Dec. 31. App. and various details of operation are described.
- Use of "dry ice" for refrigeration.** Lennie V. Van Ike (to Koldaire Utilities Co.). U. S. 2,024,490, Dec. 17. Various details of an app. are described.
- Still suitable for use with steam-operated absorption refrigerating apparatus.** Glenn F. Zellhoefer. U. S. 2,025,489, Dec. 24. Structural and operative details.

Helium content of the stratosphere F A Paneth and E Gluckauf *Nature* 136, 717-18 (1935)—Samples of air taken at altitudes up to 18.5 km had identical He contents A sample taken at 21.0 km contained 8% more He than samples taken below 18.5 km. Evidently winds cease between these heights. G M P

Iron in the sea and in marine plankton L. H. N. Cooper *Proc Roy Soc. (London)* B118, 419-38 (1935)—Fe was detd. colorimetrically by the 2,2'-dipyridyl or preferably 2,2',2''-tripyridyl method. In sea water Fe in true soln (Fe⁺⁺ and Fe⁺⁺⁺) was less than 2 mg per cu m; most of the Fe was present in particulate form with a value 4-25 mg per cu m. The plankton present in 1 cu m contained 0.5-2.3 mg Fe. The soly of Fe⁺⁺ is controlled by that of a sparingly sol basic salt. Ferrihydride and colloidal Fe compds. are concerned in the Fe metabolism of diatoms. Zooplankton has a lower Fe requirement than diatoms. When minute sea plants are eaten by herbivores, the excess Fe over requirements is excreted in fecal pellets, and more or less rapidly becomes available for a new growth cycle. Forty-four references Joseph S Hepburn

Measurement of density with a float Seibi Torawshi and Ichizo Ouchi *J Chem Soc. Japan* 56, 1323-8 (1935)—The relation between the concn (0.119-0.575%) and the d of H₂SO₄ was detd by means of a float. The change in d of Au sol prep'd by Bredig's method in an elec. field was followed by a float and the ratio (av.) between charge and the apparent mass of the colloid particle was estd; the value being 0.7×10^{-4} e. s. u. The change in the d of PhNO₂ placed between condenser plates was studied also T. Katsuragi

The thermodynamic scale below 1°K W. H. Keesom *Physica* 2, 805-6 (1935)—Theoretical

B J C. van der Hoeven
Effects of high shearing stress combined with high hydrostatic pressure P W. Bridgman *Phys Rev* 48, 825-47 (1935)—A method is described by which thin disks can be subjected simultaneously to hydrostatic pressures up to 50,000 kg/sq cm and shearing stresses up to the point of plastic flow. Substances unaffected by these conditions were graphite, mica, NH₄NO₃, sugar, rosaniline, CuS, SiO₂, tremolite, NiF₂, CuO, MgO, Ag₂S, Fe₂O₃, LiF, AgCl, K₂Cr₂O₇, NaBrO₃, Si, Rochelle salt, HgNO₃ and K₂Cr₂O₇. Substances that decomposed with detonation were celluloid, iodoform, PbO₂, KMnO₄, Ag₂O, MnO₂, (NH₄)₂Cr₂O₇, Ag₂NO₃, Sr(NO₃)₂, Cr₂(SO₄)₃, K₂SO₄, 24H₂O, Cr₂(SO₄)₃, K₂SO₄, Al₂(SO₄)₃ and CuCl₂·2NH₄Cl·12H₂O. Combinations that reacted with detona-

tion were Cu + S, Fe₂O₃ + Al, SiO₂ + Mg, K₂Cr₂O₇ + Al, Si + MgO. Rubber, duprene, wood, paper and linen cloth were changed to horn-like substances, in some cases translucent. Bromothymol blue became insol. Amorphous Se partially changed to the metallic form, but cryst. S became amorphous. PbO decomposed to the metal without detonation. Red Hg₂O and red PbO both changed to the black varieties. Besides these qual. observations, curves of max. shearing stress against pressure were detd for substances showing no permanent change, and used to locate polymorphic transitions. Breaks in the curves were found for Li, Sr, Ca, Ba, Cd, Zn, V, Mn, Sb, Te, I, La, Ce, Cr, Ti, Bi, Th, Sn, Y and Pr. No breaks were found for Be, B, C as graphite, Na, Mg, Al, Si, P, S, Pd, Cr, Fe, Ni, Co, Cu, Ge, As, Se, Zr, Cb, Mo, Ru, Rh, Pt, Ag, In, Ta, W, Re, Os, Ir, Au, Pb and U, these substances therefore probably have no transitions within this pressure range. L. S. Kassel

Powdered mercury A. Galatzky. *Bull. soc. chim* [5], 2, 1401-7 (1935)—Hg powder was prep'd. by the following procedure: Ppt. Hg₂O from a dil. soln of Hg-NO₃ with NaOH. Wash by decantation until neutral. Clear the Hg₂O most. Place 3-5 g of Hg₂O in 200 cc H₂O, and agitate vigorously. Reduce by adding 5% hydrazine hydrate at the rate of about 60 drops per min. The color changes from brownish black to black, then to clear gray. Stop adding the reducing agent when the supernatant liquid is clear. Agitate 30 sec. more, decant, wash with 25 cc of EtOH, then with 20 cc of Et₂O, and dry in thin layers at room temp in air or in a vacuum. Remove visible drops of Hg. To det. the Hg content dissolve 0.3-0.5 g in 2 cc. HNO₃, dil to 100 cc, boil off nitrous vapors, add 1-2 drops of sat'd Fe(NH₄)(SO₄)₂, and titrate with 0.1 N NH₄CNS. The Hg may also be det'd as HgS. To sep metallic Hg from combined Hg boil 0.5-1.0 g in 50 cc H₂O, which contains not more than 2-3 drops of free HNO₃. The particles of Hg are protected by a film of Hg₂O, the presence of Hg₂O is caused by a reduction which is not quite complete. The usual analysis is metallic Hg, 99.9-99.95%, combined Hg, 0.1-0.2%; other elements, 0.1-0.3%. Hg powder has those characteristics that would be expected of Hg having a large surface. It oxidizes readily at room temp, it appears to be very poisonous, when freshly prep'd it has a strong odor identical with that of boiling Hg. Two hundred and thirty-seven mg contg 99.9% Hg was exposed to the air for 12 hrs; 105 mg of Hg evap'd and the residue contained 70.1% Hg. This method of prep'n is more economical than that proposed by Krauss and Mühlmann (*C A* 24, 1308). G. M. P.

The electrolytic separation factor of the hydrogen isotopes under various experimental conditions A. Eucken and K. Bratzler. *Z. physik Chem* A174, 273-90 (1935)—In order conveniently to make a large no of detns of the conditions affecting the electrolytic sep'n factor of H isotopes, the D content of the evolved H₂ was det'd by measuring the thermal cond. The sep'n factors found lay within wide limits (2.7 and 17), a dependence upon the nature of the cathode was indiscernible. There was no parallelism between the characteristic overvoltage of the metal and the sep'n factor. An anodic preliminary treatment of the cathode increases the sep'n factor while the addn of an alkaloid-like material (α-naphthoquinoline) lowers it. With increasing amperage the sep'n factor seems to increase when it is large at the beginning. There is no relation between the size of the sep'n factor and the slope of the logarithmic current density-potential curve. R. H. Baechler

Experiments on electrical separation of the isotopes of lithium A. Eucken and K. Bratzler. *Z. physik Chem* A174, 269-72 (1935)—Li was deposited on Hg from Li₂SO₄ soln. After repeated electrolysis the at. wt changed only within the exptl. error so that an extremely small change in the isotopic component can be prevent, the upper limit being 1.07%. R. H. Baechler

Atomic weight of gallium G. E. F. Lundell and James I. Hoffman *J Research Natl Bur Standards* 15, 409-20 (1935) (Research Paper No 838), cf *C A* 17, 2207—

Pure metal was converted to the hydroxide, the sulfate and the nitrate, resp. These were then heated until they were changed to Ga_2O_3 which was finally ignited at 1200° to 1300° . By this procedure the at. wt. is related directly to O. Preliminary tests showed that the metal was free from an appreciable film of oxide and did not contain occluded gases. The highly ignited oxide obtained through the hydroxide or sulfate contained no gases and was not appreciably hygroscopic, but the product obtained from the nitrate came to const. wt. slowly because of retained gases. The d. of Ga_2O_3 was detd. to be 5.95 g./cc. The av. of 11 detns. gave 69.74 as the at. wt. of Ga.

P. S. Roller

The advantage of introducing quantum periods in the Mendeleev table. Arrigo Mazzucchelli *Gazz. chim. ital.* 65, 467-73 (1935).—A discussion of the manner in which the Mendeleev table of elements can be subdivided on the basis of the principal quantum nos. of the external electrons. Particular attention is paid to the added significance of the first small period and the octave group.

C. C. Davis

Compounds of the type $BCl_3 \cdot n(OR)_3$. III. Preparation of $BCl_3 \cdot OCH_3$ and $BCl_3 \cdot OCH_2CH_3$ from boron trichloride and methyl borate. Lgon Wiberg and Herman Smedsrud *Z. anorg. allgem. Chem.* 225, 204-8 (1935), cf. C. A. 26, 1540; 29, 5002.— $BCl_3 \cdot OCH_2CH_3$ was prep'd by reaction of 2 moles of BCl_3 with 1 mole of $B(OCH_2CH_3)_3$ in a Stock high-vacuum app. A 1:2-mole mixt. of the same reactants gave $BCl_3 \cdot OCH_3$. Electronic formulas are used to explain the formation and decomposition of the intermediate addn products involved.

J. H. Reedy

Dirac's spin theory and nonlinear field equations. W. Wessel. *Z. Physik* 96, 920-33 (1935).—Dirac's theory is extended in such manner that the elec. and magnetic fields satisfy nonlinear equations. The connection with Born's electrodynamics is discussed.

B. Swirles

Analytical expressions for the potential energies of diatomic molecules and their determination from spectroscopic data. I. Fgl. A. Hylleraas *Z. Physik* 96, 643-60 (1935).—The work of Morse (C. A. 23, 5406) and others on the detn. for a mol. with a given electron configuration of the potential-energy function which gives the observed spectroscopic quantities D , r_e , B_e , is summarized, and it is shown how the results can be more simply obtained by the phase-integral method instead of direct use of Schrödinger's equation. A form of the potential energy const. 3 addnl consts. is then discussed, the consts. can be adjusted to give $a_1(B = B_e - a(n + 1/2))$ and 2 higher terms in the energy formula, which is given in a form probably applicable to all homopolar diatomic mols. II. *Ibid.* 661-8.—The theory of the above paper is applied to the Σ states of CdH and the $(1^1\Sigma)$ states of N_2 .

B. Swirles

A general method of statistics and its application to chemical energy. Georges Allard *Ann. phys.* [11], 4, 305-76 (1935).—By an extension of the method of Planck, a new statistical method is obtained which allows a finer analysis of the elementary phenomena than the older methods. The results of Bose-Einstein are obtained by assuming that each elementary cell of the phase extension is able to contain any no. of particles and those of Fermi-Dirac by assuming the no. cannot exceed unity. The method was applied to the case of mixts. with or without chem. reaction when the particles are statistically independent. This means that the presence of particles of a certain kind in one cell has no effect on the probability of the presence of particles of another kind in that same cell and that the laws of distribution of each species are the same as if they existed alone. It is also shown that all the classical results of chem. energy are established by this purely statistical method which has led to the study of condensed phases. The coexistence of several phases is interpreted by assuming that the energy of interaction between mols. is, on the av., very different when there is a change from one phase to another. Then it is the principle of max. probability that should govern the distribution of the mols. between the different phases. A general form of the law of mass action is obtained and in

the limited case where the substances reacting are perfect gases, the chem. consts. can be calcd. for monatomic mols., diatomic with quantized rotation, diatomic with internal vibration.

A. A. Vernon

Thermodynamic potentials and affinity. Pierre Van Rysselberghe *Compt. rend.* 201, 1126-7 (1935).—Math. Cf. de Donders, C. A. 19, 3044. C. A. Silberrad.

Coercive force of magnetite powders. V. H. Gottschalk. Progress Repts.—Met. Div. 10. Mineral physics studies. Bur. Mines, Rept. Investigations No. 3268, 83-90 (1935).—Coercive force increases as grain size decreases and is directly proportional to sp. surface (sq. cm. surface area/g.). Data are given for 30 hysteresis curves of magnetite from the Urals Mts. and from Hayden slag.

A. H. E.

Entropy of manganous ammonium sulfate at temperatures close to zero absolute, in relation to the magnetic anisotropy of the salt at room temperature. K. S. Krishnan and S. Banerjee *Proc. Indian Acad. Sci.* 2A, 82-5 (1935).—It is possible to calc. θ_m , which det. the deviation of the magnetic entropy of the crystal from its ideal value of $R \log_e (2J + 1)$ from measurements on the magnetic anisotropy of crystals at room temps. It is possible to predict the entropy-temp. curve close to 0° abs. This curve plays an important part relative to the production of low temps. by adiabatic demagnetization of paramagnetic crystals and in the calcn. of sp. heats in this temp. region.

James H. Hibben

Magnetic study of ferric oxide sols. Augustin Bontaric and Régis Bonneville *Bull. soc. chim.* [5], 2, 1938-2008 (1935).—The magnetic susceptibility of concd colloidal sols of Fe_2O_3 (contg. up to 75 g./l. Fe_2O_3) was detd. to obtain the sp. coeff. of the oxide by the method of mixts. After verifying the applicability of that law to Fe_2O_3 sols it was proved that the sp. coeff. of magnetization of the colloidal oxide is not sensibly altered by the length of dialysis. The coeff. decreases in proportion to the age of the sol, the decrease being the more rapid the higher the temp. at which the sol is kept. A very definite effect of temp. on the magnetic properties of the sol was revealed.

F. L. Browne

Diamagnetism of alkyl acetates. Donald B. Woodbridge *Phys. Rev.* 48, 672-82 (1935).—The magnetic susceptibility was detd. from 5° to 70° for MeOH, MeOAc, EtOAc, PrOAc, BuOAc and AmOAc. The mol. susceptibility of the acetates increases almost linearly with the no. of CH_2 groups added.

L. S. Kassel

Determination of paramagnetic susceptibility of crystals of salts of rare earths by determining paramagnetic rotatory power. Jean Becquerel *Compt. rend.* 201, 1112-15 (1935).—Measurements of the paramagnetic rotatory power along the optic axis of the ethylsulfates of Pr, Nd, Dy and Er from the temp. of liquid He to 20° confirm Van Vleck's conclusion that in such cases the ratio between magnetization and paramagnetic rotation is const. (cf. C. A. 28, 42807).

C. A. Silberrad

Conception of a complex viscosity and its application to dielectrics. A. Cervant *Trans. Faraday Soc.* 31, 1582-90 (1935), cf. C. A. 29, 71437.—The conception of complex viscosity, η_c , is introduced instead of the simple, real viscosity, η , to aid in explaining observed decreases with increasing frequency, of the apparent viscosity in cases concerned with mol. vibrations in amorphous solids such as acoustical waves and dielec. losses. Special application of the theory to dielec. losses is discussed.

C. L. P. Jeffreys

Dielectric anomalies of Seignette salt. Hans Staub *Naturwissenschaften* 23, 728-33 (1935).—A review of the anomalous behavior of Seignette salt which in a general way can be described as the elec. analog of a ferro-magnetic substance.

B. J. C. van der Hoeven

A new seignettelectric substance. G. Busch and P. Scherrer *Naturwissenschaften* 23, 737 (1935).— KH_2PO_4 shows the same anomalous relationship between dielec. const. and temp. as Seignette salt. At room temp. the main dielec. const. ϵ_{11} , along the c axis, is 30, it rises from -50° down to -130° to a max. of 130 and drops off to a value of 7 near -200° . The 2 Curie points are -130° and -105° . The piezoelec. modulus d_{11} runs parallel with

ϵ_{∞} No change in crystal structure was found by the Debye-Scherrer method at the upper Curie point. Crystal platelets from a soln. satd. at the b. p., slowly cooled, of 1 sq. cm. area, 1 mm. thick, were used for the expts. Al foils were glued on as electrodes. Similar phosphates and arsenates are now being studied. B. J. C. v. d. H.

The dielectric constants of hydrogen at pressures up to 1425 atmospheres and at temperatures of 25° and 100°. A. Michels, P. Sanders and A. Schipper. *Physica* **2**, 753-6 (1935).—The dielec. const. ϵ of H_2 was detd. by the method previously described (C. A. 27, 2879); the accuracy was ± 0.0005 or better. Values for the const. at 24.9° vary from 1.00028 to 1.00500 for 1.15 and 1425.4 atm., resp., at 99.9° from 1.00163 at 8.03 to 2.025 at 1425.4 atm. The value of const. $P = (\epsilon - 1)/(\epsilon + 2)d$ is 2.017, the value of ϵ at standard condition is 1.002937.

Transitions in camphor and chemically related compounds. I. Dipole rotation in crystalline solids. W. A. Yager and S. O. Morgan. *J. Am. Chem. Soc.* **57**, 2071-8 (1935).—A study of the dielec. properties of *d*-camphor, *d*-camphor, *d*-camphonic anhydride, borneol, isoborneol and bornyl chloride showed that these materials undergo solid-solid transitions. Above the transition the value of the dielec. const. of the solid is that normally expected of the polar material in the liquid state. Below the transition the dielec. const. has a low value, approx. equal to the square of the optical n . This dielec. behavior is explained by the rotation of the dipoles in the solid. II. Vibration of atomic groups. Addison H. White and S. O. Morgan. *Ibid.* **57**, 2078-89.—A rise of about 18 cal./degree mole in the sp. heat of *d*-camphor at the transition at -30° was observed and is attributed to unusually energetic intramolecular vibration at the transition temp. The rise of mol. rotation at the transition which is evidenced by the dielec. data (cf. above) is qualitatively explained in terms of Pauling's theory of mol. rotation in crystals (cf. C. A. 24, 5558) by assuming that the forces opposing this rotation are greatly diminished by a transition which reduces the rigidity of the mol. The behavior of total polarization of *d*-camphor in dil. soln. is explained by assuming that at room temp. dipole moment is smaller and at. polarization much larger than formerly supposed and that the latter polarization begins to decline with temp. below -10° when the transition to the more rigid mol. begins. Similar transitions are observed in crystals of derivs. of cyclohexane. H. H. Rowley.

Calculation of dipole interaction. R. P. Bell. *Trans. Faraday Soc.* **31**, 1557-60 (1935).—The method of Martin, cf. C. A. 28, 7099, is shown by comparison with statistical treatment to be valid for sufficiently small values of the dipole moment.

C. E. P. Jeffreys. Dipole induction and the solvent effect in dipole-moment measurements. F. C. Frank. *Proc. Roy. Soc. (London)* **A152**, 171-96 (1935).—The ideas of Weigle and Higashi (C. A. 27, 3371, 28, 2622) are developed into a theory that accounts for the effect of the solvent on the apparent dipole moment. A classification of mol. geometry shows the very different solvent effects in the different classes. The empirical laws previously advanced for the solvent effect apply only to a single class. The theory is in good qual. and approx. quant. agreement with measurements. Bearings of the theory on dipole induction in radicals forming part of the polar mol., the attraction of solvent mol. by dipole forces, the structure of amphoteric ions, and the form of the dispersion curve in polar liquids, are discussed.

L. E. Steiner. Dipole measurements of isomeric platinum complexes. K. A. Jensen. *Z. anorg. allgem. Chem.* **225**, 97-114 (1935). cf. C. A. 24, 2961.—Dipole moments were detd. for the α - and β -forms of the thioether derivs. of the type $PtX_2(SR)_2$ (where $X = Cl, Br, I, NO, NO_2$, and $R = Et, Pr, iso-Pr, iso-Bu, sec-Bu, C_6H_5, CH_3$), also those of $PtCl_2(EtSe)_2$. The values are approx. 2.4×10^{-18} for the α -derivs., and 9×10^{-18} for the β -derivs. and 13×10^{-18} for the NO_2 and NO derivs. of the β type. These results are in line with the assumption that the α - and β forms are *cis-trans* isomers,

however, the α -form must have the *trans* configuration, and the β -form the *cis* configuration. Since the dipole moment of the α -derivs. is not 0, the structure is not of the plane type, but the 4 radicals must be on the same side of the plane. A value of 110° for the valence angle of the S atom is indicated. Mol.-wt. detns. of the α - and β -isomers in C_6H_6 show that the compds. are unimol. at ordinary concns., but the β -forms are assoc. in concd. solns. No equil. exists between the α - and β -forms in C_6H_6 except with the diethyl selenide derivs. J. H. R.

Reactivity and dipole moment. E. duclert Hertel and Eugen Dumont. *Z. physik. Chem.* **B30**, 139-48 (1935), cf. C. A. 29, 6216.—Dipole moments were detd. for $PhNMe_2$, p - $BrC_6H_4NMe_2$, p -dimethylaminodine, p -dimethyltoluidine, p -dimethylaminobenzonitrile, p -nitrodimethylaminodine and p -nitrosodimethylaminodine. The results are discussed in connection with the reactivity of the substituting groups. G. M. Murphy.

Remark on the work of I. Sakurada. "Simultaneous double and triple complexes in dipole association." E. duclert Hertel and Eugen Dumont. *Z. physik. Chem.* **B30**, 149-51 (1935); cf. C. A. 29, 6117.—Polemical.

G. M. Murphy. A new addition to the potential-energy expression for diatomic homopolar molecules—applications to CdH and N_2 . E. L. Egl. A. Hylleberg. *Physik. Z.* **36**, 599-600 (1935).—Explicit expressions are given for the moment of inertia and energy of a diatomic mol. which depend on a phase integral method for evaluation. This method and the expressions are applied to the construction of potential curves for CdH and the results agree closely with those obtained by Rydberg (C. A. 26, 2375) by a graphic method. The method applied to N_2 leads to a value of the disson. energy close to Herzberg and Spenser's value 7.34 v. (C. A. 28, 5321).

A. B. F. Duncan. Configuration of mercuric halides. W. J. Curran and H. H. Wenzke. *J. Am. Chem. Soc.* **57**, 2162-3 (1935), cf. C. A. 29, 3572.—The elec. moments of $HgPh$, $HgCl$, $HgBr$, and HgI , were found to be 0.42, 1.29, 1.01 and 0.58 $\times 10^{-18}$, resp. Dioxane was used as a solvent. The configuration of the halides is not linear.

H. E. Phipps. Reciprocal solubility and surface tension. II. Surface activity and dipole moment. V. K. Semenchenko and T. N. Ivanova. *J. Gen. Chem. (U. S. S. R.)* **5**, 897-13 (1935); cf. C. A. 28, 7113.—The crit. temp. of soly. was detd. for the pair nicotine- H_2O , in the presence of C_6H_5COOH (I), $C_6H_5CONH_2$ (II), C_6H_5OH (III), C_6H_5CN (IV), C_6H_5CHO (V) and C_6H_5Cl (VI), in concns. up to 0.8 mol. %. The interface surface tension was measured by the drop method for the same pair in the presence of I (0, 0.14, 0.26, 0.39 and 0.44 mol. %), II (0, 0.21, 0.39, 0.61 and 0.80 mol. %), and III (0.19, 0.24, 0.38 and 0.60 mol. %), at 70° and 80°, also in the presence of VI (0.22, 0.33, 0.49 and 0.68 mol. %), IV (0.16, 0.37, 0.57 and 0.73 mol. %) and III (0.29, 0.35, 0.45 and 0.60 mol. %) at 60° and 70°. Parallelism between the effect of admixtures on crit. temp. and on surface tension, found in previous work, was confirmed. Surface tensions of solns. of the 6 org. compds. in concns. of 0, 0.006, 0.01, 0.017 and 0.025 mol. % were detd. at 25°. No definite conclusions could be drawn from the results as to the relation between the dipole moment and surface activity. The surface tensions of solns. of the same org. compds. in nicotine in concns. of 0, 0.10, 0.15, 0.20, 0.25, 0.30, 0.40 and 0.50 mol. % were measured at 25°. All the compds. proved to have a high surface activity, which was directly proportional to the dipole moment for compds. not contg. N and inversely proportional to the dipole for compds. contg. N. The surface tensions of solns. of I, III, VI and IV in $C_6H_5NO_2$ in concns. of 0, 0.10, 0.20, 0.30, 0.40 and 0.50 mol. % were detd. at 25°. The results were the same in regard to compds. not contg. N. In the interface nicotine- H_2O the activity of the chloride, acid and alc. was inversely proportional to dipole moment, and in the case of nitrile, aldehyde and amide the proportionality was direct.

S. L. Madorsky. The optical dispersion of hydrochloric acid gas in the

infrared R. Rollefson and A. H. Rollefson *Phys. Rev.* 48, 779-85 (1935).—The n of HCl gas was detd. for the range 1-10. The results yield a value of 1.00×10^{-10} e. s. u. for the effective charge of the rotator-vibrator and 1.18×10^{-18} e. s. u. for the elec. moment. The former value shows that the contribution of the rotator-vibrator to the n extrapolated to infinite wave length is far too small to account for the discrepancy between that quantity squared and the temp-independent part of the dielec. const. The elec. moment obtained in this work agrees with that detd. from the dielec. const., and indicates that the low absorption coeffs found for pure rotation lines in the far infrared must be erroneous. L. S. K.

Excitation by collision of intramolecular vibrations in gases and gas mixtures measured by the dispersion of sound. III. Measurements on nitrous oxide. A. Fucken and H. Jaacks *Z. physik. Chem.* B30, 85-112 (1935), cf. C. A. 29, 1206¹.—The dispersion of sound was measured in N_2O at frequencies between 288 and 2350 kc, temp between -60° and 200° and pressures from $1/2$ to 1 atm. The foreign gases A, He, D, H, CO , CH_4 , NH_3 and H_2O were also added in various mixts. and a few measurements were made with CO_2 in the presence of H_2O and H_2 . Double collisions of N_2O with NH_3 and other N_2O mols result in deactivation in a similar way to the deactivation of CO_2 by H_2 . Investigation of the effect of temp on the heat of vibration shows that H excites the valence bonds of N_2O . G. M. Murphy.

Density fluctuations at the critical point. Jacques Yvon. *Compt. rend.* 201, 1099-1102 (1935).—It is shown mathematically that the opalescence observed in a substance at the crit. point is attributed to fluctuations in d caused by gravity. C. A. Silberrad.

A theoretical study of the liquid-side resistance to gas absorption by a liquid drop. Siroji Hattai and Arimasa Baba. *J. Soc. Chem. Ind., Japan* 38, Suppl. binding 544-6 (1935), cf. C. A. 28, 5728¹.—Three possible formulas are derived for the assumption that (a) no damping of the turbulence (const. turbulence) which is created in the drop formation takes place, (b) gradual damping takes place during the fall of the drop, and (c) perfect damping takes place at the start of the fall, i. e., no turbulence during the fall. An experimental study of the liquid side resistance to gas absorption by a liquid drop. *Ibid.* 546-50.—The absorption of CO_2 in H_2O was studied with a great excess of CO_2 and with varying height of fall. The absorption during drop formation was very small and the total absorption was considered therefore as absorption during the fall. The exptl. results are presented and the best agreement is with case (c). Most of the absorption took place in the initial stages of the fall and it is therefore more effective to increase the frequency of drop formation, than to increase the height of fall. The absorption formula for case (c) is: $C/C_0 = (6/\sqrt{\pi}) \sqrt{q} - 3q$, for C/C_0 less than about 0.015, where $q = kh/a^2$, C is the mean concn. at time t , C_0 is the satn. concn., a is the radius of the drop and k is the diffusion coeff. of the dissolved gas. Karl Kammermeyer.

The determination of the boiling point of small quantities of material. R. Dolque. *Bull. soc. chim.* [5], 2, 1832-47 (1935).—App. and technic for the microdetn. of vapor pressure (and of the b. p.) are described. The app. consists essentially of a vaporization chamber whose vol. is kept const. by a Hg piston. By coupling 2 of these chambers, a fractional distn. can be made, and the purity of the product tested. Temp. and pressure data are given for H_2O , CaH_2 , CCl_4 and for the azeotropic mixts. $EtOH$ -cyclohexane, $AcOH$ - CCl_4 , $EtOH$ - CCl_4 , CaH_2 -cyclohexane and $EtOH$ - CCl_4 . G. M. P.

Parachor as a function of density and molecular volume of compounds of a given class. I. R. Morozov *J. Gen. Chem.* (U. S. S. R.) 5, 1020-3 (1935).—In place of Sugden's parachor $P = V \gamma^{1/4}$, where P is mol. parachor, V the mol. vol. and γ the surface tension, the following more nearly universal parachor is recommended. $P = (V + V_1)^{1/4} V_1^{1/4} (2d)^{1/4}$, where V_1 is the sum of vols. of the elements in the compd., V_1 is the mol. vol. and d the density of the

compd. in the liquid or solid state. This equation is used to calc. the parachors for a no. of homologous org. series, such as hydrocarbons, alcs., aldehydes, ethers, acids, etc. If Sugden's equation is combined with the equation suggested by M , the following equation is obtained $\gamma = (V + V_1)^{1/4} V_1^{1/4} (2d)^{1/4}$, thus making it possible to calc. γ as a function of V , V_1 and d .

S. L. Madorsky. Sigmoid curves of internal friction. M. Usanovich. *J. Gen. Chem.* (U. S. S. R.) 5, 996-1001 (1935).—The existence of a new type of viscosity diagram for a binary system, characterized by the fact that the curves do not pass through a max. with lowering of temp., is established. Such a diagram is obtained in those cases where the components react to form a compd. with a lower viscosity than that of one of the components. This happens when one of the components is an assoc. liquid and the product of reaction a normal liquid, e. g., H_2SO_4 - CaH_2NO_2 . As CaH_2NO_2 the inflection points on these types of isotherms shift with rising temp. toward the liquid with the higher viscosity when η_{AB} is less than $(\eta_A + \eta_B)/2$, where η_A , η_B and η_{AB} are viscosity coeffs. of the components A and B and of the product of reaction AB, resp., or toward the liquid with the lower viscosity when η_{AB} is greater than $(\eta_A + \eta_B)/2$. S. L. Madorsky.

Viscosity of the system chlorine-sulfur. A. A. Mazel. *J. Gen. Chem.* (U. S. S. R.) 5, 1066-72 (1935).—Viscosity isotherms for the system Cl-S were constructed for -15° , 0° and 25° . Compn. of the system varied between 39.96 and 71.21 mols. % of Cl. In view of the fact that the system is very complicated through the formation of a no. of compds., such as S_2Cl_2 , S_2Cl_4 , SCl_2 , S_2Cl_6 , S_2Cl_8 , and S_2Cl_{10} , the viscosity isotherms are smooth curves, rising with concn. of S and giving no clue as to existence of these compds. S. L. Madorsky.

Viscosity of liquid phosphorus. Alan N. Campbell and Sidney Katz. *J. Am. Chem. Soc.* 57, 2051-5 (1935), cf. C. A. 29, 1304¹.—The viscosity of liquid P was detd. from 20° to 140° in a modified Ostwald viscometer. Heating the P from 80° to 120° and chilling did not alter its viscosity at 45° . Assoc. was appreciable below 45° . The authors thought it probable that the inner equl. shifts so rapidly on cooling that Smits' theory is not invalid. H. E. Phipps.

Viscous properties of polyisobutylene. John D. Ferry and George S. Parks. *Physica* 6, 356-62 (1935).—The viscosity of polyisobutylene was detd. from 70° to 175° and from -53° to $+24^\circ$ by the falling-sphere and concentric-cylinder methods, resp. The viscosity was 19 poises at 175° , 10^{10} at -53° and about 10^{18} poises at -76° . -76° is the midpoint of the "transition region" for polyisobutylene glass. Macroscopic and microscopic interpretations of viscosity anomalies are discussed. G. M. P.

New liquids for determining refractive indexes by immersion. L. Déverin. *Schweiz. mineral. petrog. Mitt.* 14, 529-30 (1935).—The following mixts are suggested for this purpose: (a) 4,4'-dibromodiphenyl oxide (5 parts), benzyl sulfide (7), isouquinoline (5), n 1.614; (b) isouquinoline (1), 1,4-dibromonaphthalene (1), n 1.630; (c) benzalaniline (1), 9-bromophenanthrene (1), n 1.676; (d) thionaphthene (1), methylendiphenylamine (1), n 1.637; (e) dibenzylamine (5), dibromothionaphthene (5), ethylene trithiocarbonate (2), n 1.672; (f) dibromostyrene (5), phenyl orthoformate (9), dibromothionaphthene (5), n 1.663; (g) dibromothionaphthene (7), phenyl disulfide (5), n 1.683; (h) dibromothionaphthene (7), dibromonaphthalene (5), n 1.694; (i) dibromonaphthalene (1), phenyl disulfide (2), ethylene trithiocarbonate (2), n 1.714; (j) dibromothionaphthene (1), phenyl orthoformate (1), n 1.681. C. A. S.

Method of determining the structure of sublimates. V. G. Zhurav. *Zashchita Lab.* 4, 821-3 (1935).—The structure and degree of dispersion of sublimates can be detd. by placing an object glass in the path of the gases during sublimation, and then examg. with a microscope. Chas. Blanc.

Vapor pressure of zinc chloride, lead chloride, cadmium

chloride, cuprous chloride and silver chloride D N Tarasenkova and P A Kozhmyakov *J Gen Chem* (U S S R) 5, 830-5(1935) —The vapor pressure of ZnCl_2 in the interval 516-729° is $7.4 \cdot 10^{-4}$ mm. It can be represented by the equation $\lg p = 8.7849 - (6952.6/T)$. The vapor pressure of PbCl_2 in the interval 650-942° is $4.5 \cdot 10^{-4}$ mm. It can be represented by the equation $\lg p = 8.3421 - (7832.1/T)$. The vapor pressure of CdCl_2 , Cu_2Cl_2 and AgCl was determined in the intervals 618-932° ($p = 3$ to 722.3 mm), 632-1070° ($p = 3$ to 215.7) and 852-1120° ($p = 3$ to 50.9 mm), resp.

S L Madorsky

Aggregate states L I Allumov *J Gen Chem* (U S S R) 5, 843-7(1935) —The increase of vol of a given substance heated from m abs through the solid, liquid and gaseous states is analyzed mathematically on the basis of Pictet's empirical rule. The following empirical rule is suggested for the liquid state: the relative increase of vol of a substance heated from m to p does not depend on the nature of the substance, but is a const., i.e. $\beta_2(T_p - T_m) = C_2$, where β_2 is the coeff of expansion of the liquid, T_p and T_m are b p and m p, and C_2 is a const. This rule is verified for 6 morg and 23 org compds.

S L Madorsky

Methods for measuring vapor pressure of metal salts D N Tarasenkova, A N Grigorovich and A V Bogoslovskaya *J Gen Chem* (U S S R) 5, 924-33(1935) —Methods for detg the vapor pressure of metal salts, developed by Volmer (C A 24, 538) and Jellinek and Rosner (C A 24, 276), were compared experimentally with the method of b -p detn at reduced pressures, in the case of PbCl_2 at 435-945°. Johnston's statistical method (C A 2, 2033) was tested in the case of pressure of dissociation of CuCl_2 at 430-550°. Volmer's method was found difficult because of the corrosive effect of metal salts on the quartz container, it also gives inaccurate results. Jellinek and Rosner's method gave more accurate results. The method of b -p detn at reduced pressures is suitable for measuring higher vapor pressures of substances that do not decompose at high temps. Johnston's statistical method gives accurate results for high vapor pressures and is suitable in cases where the compd dissociates, giving off a gas.

S L Madorsky

The growth of metal crystals in metal vapors IV M Strassman *Z physik Chem* B30, 132-8(1935), cf C A 28, 6041¹ —Te crystals were grown by sublimation in an atm of H at pressures between 0.01 and 7.0 mm and temps below and above the m p. The crystals obtained at low pressures were measured, the results disagreeing with the theory of Strassman and Kashaev (cf C A 29, 5324¹). Similar discrepancies are also to be expected for Se.

G M Murphy

The arbitrarily caused crystallization of melts C Weygand *Z anorg allgem Chem* 224, 265-72(1935) —Specific centers of crystal in melts of org compds are classified as crystals of identical kind, λ (nucleating desmotropes) and of foreign kind, μ (such as those of homologs, derivs, isomers and polymers). For I crystal starts instantaneously, with a definite crystal form in a certain temp interval. Some seed crystals may produce several crystal modifications in a melt, depending on temp, but only one at any definite temp. For II, crystal may depend on whether complete crystals or fragments are used, whether the seed crystals were obtained from a melt or from some particular solvent, and on the age of the crystals. Although crystal caused by II often starts more slowly than for I, the kind of crystal started is just as specific. Any seed crystals of kind II, prep'd by any definite method, which starts crystal in a melt, always starts a specific kind at any given temp and pressure.

L E Steiner

The electrical resistance of hydrogen saturated wires of palladium alloyed with silver and with gold A Sieverts and H Hagen *Z physik Chem* A174, 247-61(1935) —The pressure-conc isotherms of alloys with 5 and 10% Ag are similar to those of pure Pd, at 15% they show hysteresis, at 200° an approaching region in which increase in pressure produces no change. All other isotherms are

parabolic. Previous observations on the effect of Ag content on solvent power of the alloys for H were substantiated and extended. The pressure resistance isotherms up to 30 atm % Ag resemble those of Pd. The change in resistance decreases with increase in Ag content. In alloys of 30 and 40% Ag the resistance is decreased by the absorption of H. The Pd Au alloys behave similarly to the Pd Ag alloys. R H Baerlein

The electron theory in metals; superconductivity. L Brillouin *Rev gen Electric* 38, 491-501(1935) —Work on the cond of metals and especially the phenomenon of supercond is reviewed and the principles of the electron theory which suffices for the cond of metals are explained, for the elucidation of supercond, however, this theory is not yet sufficient. The latest theories of Gorter, London, Meissner, et al have not succeeded in explaining the problem entirely.

M Hartenstein

Superconductivity and other low-temperature phenomena J C McLennan *Proc Roy Soc (London)* A152, 1-46(1935) —A symposium. Among the subjects discussed are lambda phenomena in liquid He, the magnetic effects occurring on transition to the superconducting state, interpretations of supercond, and the sp. heat of Fe NiAl alloy below 1°K and preliminary detn of the thermodynamic temp scale.

L E Steiner

An expression of deliquescence and of efflorescence A Damens *Bull soc. chim* [5], 2, 1893-1901(1935) —It is not generally recognized that deliquescence and efflorescence depend upon the relative humidity of the air. These terms, as commonly used, are incorrect. It is proposed to substitute for these terms the crit hygroscopic state (Hc). This is the relative humidity at which the compd (or its satd aq soln) is in equl with the atm. The temp. should also be specified. The max Hc is the limit of deliquescence; the min Hc is the limit of efflorescence. Also in *IV Congr intern chim pura applicada, Madrid* 3, 535-46(1934).

G M P

The determination of the critical hygroscopic state M. Driesms *Bull soc. chim* [5], 2, 1901-7(1935); cf preceding abstr —App and technic for detg the vapor pressure of salts and of their solns are described. This was detd for 75 satd aq solns at 20° and at 25°, and for some of the solids at these temps. Upon dividing this pressure by the vapor pressure of H_2O , the crit hygroscopic state (Hc) is detd. Hc max is detd with the satd soln, Hc min is detd with the salt.

G M P

Effect of surface perturbations upon the interior of real crystal systems D Balarev and Vera Christoforova *Z physik Chem* B30, 152-6(1935), cf C A 29, 2814¹ —Vapor pressure detn of the system $\text{BaCl}_2 \cdot 2\text{H}_2\text{O} \rightleftharpoons \text{BaCl}_2 + \text{H}_2\text{O} + \text{H}_2\text{O}$ with pure substances and when mixed with other salts confirms the theory previously proposed.

G M Murphy

The Rayleigh scattering in crystals F Matossi *Z Physik* 96, 695(1935), cf C A 29, 2042¹ —Correction of an error in the case of quartz. The agreement with observation is improved.

B Swales

The crystal structure and electron configuration of the transition and alkali metals U. Dehlinger *Z Physik* 96, 620-33(1935) —The empirical data show that the crystal structures of the transition metals be symmetrically about the Cr, Mo, W column. It is shown how the structures are detd by the gradual building of the d-shell. Zero crystal momentum of the d-electrons leads to a body-centered cubic lattice, otherwise the structures are cubic or hexagonal of closest packing. The stability of a body-centered cubic lattice for Fe is deduced from its ferromagnetic properties.

B Swales

Explosive antimony II Its structure, electrical conductivity and rate of crystallization C. C. Coffin *Proc Roy Soc (London)* A152, 47-63(1935), cf C A 29, 974¹ —The polished and etched surfaces of an explosive, electrolytic deposit of Sb shows a heterogeneous gel like structure in which one phase is oriented parallel to the lines of the depositing current. This oriented phase is regarded as an SbCl_3 -Sb complex, and the other phase as probably amorphous Sb. For fresh deposits, the sp elec. resistance, ρ is about 10^4 times that of ordinary Sb.

detd from 120° to 450°K. and found to be 0.31 at the higher temp and rising steadily below 350°K. to 0.55 at 120°K. This rise with decreasing temp is compared to similar results obtained with Pt and W surfaces and discussed on the basis of 2 distinct types of adsorbed H₂. Comparison of the α obtained by numerous investigators on different surfaces led to the conclusion that the exchange of energy between H₂ gas moles and an adsorbed layer of H₂ is measured in each case. An attempt to remove this adsorbed layer lowered α from 0.31 to 0.18 at 350°K. H. H. R.

Exchange of energy between diatomic gas molecules and a solid surface J. M. Jackson and A. Howarth *Proc Roy Soc (London)* A152, 515-29(1935)—The theory of accommodation coeff. given by Jackson and Mott, cf. C. A. 26, 5489, is extended to a gas composed of diatomic molecules. Two limiting cases are discussed. The gas mol is treated as an oscillator, and as a plane rotator. In the first case the exchange of energy between rotations of the gas moles and vibrations of the solid is negligible. In the second, the effect of the rotation is very small for H₂ and somewhat larger for O₂, taking the same repulsive field as the solid in each case. Under these conditions the energy exchange is larger the larger the moment of inertia of the gas mol. C. B. P. Jeffreys

Absorption of some organic solvents by Yamagata absorbing clay M. Uchida *J Soc Chem Ind, Japan* 38, Suppl. binding 513-14(1935)—The clay absorbed much H₂O selectively, but only a little of each of 20 common org solvents. The swelled vol seemed to have no systematic relation with either dipole moment or dielectric const of the solvent. The relative viscosity of the system clay sol-H₂O-Et₂O became infinitely great near the max point of the H₂O-alc. system. A kind of base-exchange reaction was observed between clay and HCl, NaOH and NaCl solns, and the reaction velocity increased rapidly with increasing concn of the electrolyte soln. Karl Kammermeyer

Absorption of hydrogen sulfide and sulfur dioxide from an air current V. A. P'yankov *J Gen Chem (U S S R)* 5, 1112-18(1935)—I-treated activated charcoal has an absorptive power for H₂S and SO₂ at 20°, 3 and 18 times as great, resp., as pure activated charcoal when the concn of either gas is 0.05%, and 2.2 and 1.2 times as great when the concn is 0.02%. At 40° the ratios are higher for H₂S absorption and about the same for SO₂ absorption. S. L. Madorsky

The effect of a foreign solid phase on the freezing point of water and dilute aqueous solutions I. System quartz sand water A. V. Rakovskii, D. N. Tarasenkova and A. V. Komandin *J Gen Chem (U S S R)* 5, 1273-8(1935)—In a mixt of H₂O and sand, the f of H₂O, for any given ratio of the two components, is inversely proportional to the total surface of the sand. The same was found true in the case of sand and dil solns. It is concluded, on the basis of these results, that mol forces can act at a distance of 10,000 mol diams. S. L. Madorsky

Surface potentials and force-area relations of unimolecular films II. d -Pimanic acid and tetrahydro- d -pimanic acid William D. Harkins, Herman E. Ries, Jr., and Everett F. Carman *J Am Chem Soc* 57, 2224-7(1935), cf. C. A. 28, 854—Surface potentials and force-area curves are given for d -pimanic and tetrahydro- d -pimanic acids, corresponding unsatd and satd compds, resp. A technique for obtaining more accurate clean surface potentials is described. The max thickness of the mono layer is about 12 Å for both compds. The coeffs of compressibility are caled. The structures of these acids are compared with that of cholesterol, and their orientations in surface films are related to the different positions in which the polar groups are located. The expl data compare favorably with results predicted from models. The surface potentials are 200 and 100 mv for the satd and unsatd acids, resp. The unsatd acid films had an unprecedented decrease in surface potential on compression. These facts may be related to an increasing intramolecular dipole compensation on compression. G. M. P.

Constitution of the capillary layer in solutions of

malachite green M. T. Salazar *Compt rend* 201, 1120-3(1935)—The surface tension, σ , of aq solns of malachite green diminishes with increasing concn, c , thereof, becoming const for c greater than 8.5 g/100 cc. By means of Gibbs' equation, $U = (c/RT)(d\sigma/dc)$ (U = no of moles per sq cm adsorbed in the surface), if the moles are spherical, it is shown that for this concn the surface layer is unimol. (D of malachite green is 139 Å). C. A. Silberrad

Rapid method of determining stability of emulsions V. Bockko *Masloboino Zhirovno Delo* 11, 489-90(1935)—A glass cylinder 25 mm in diam with a bulbous extension at the bottom is fitted with a side cock and rests in a wooden support. The cylinder is charged with 100 cc of the emulsion and placed in a drying oven to settle at a definite temp and for definite time. After 20 cc of the liquid has been removed and discarded, 10 cc is withdrawn into a tared Al beaker and weighed before and after evapn in a drying oven, giving the moisture content. If the emulsion contains $B\%$ of dispersed phase, and a is the percentage of the dry substances of the phase and b the wt of the evapd moisture, then the content of non-fatty part in the emulsion is $b/(100 + a)/a$, and the stability of the emulsion is $b/(100 + a)/B$. Chas. Blanc

Stability of emulsions Joseph B. Parke, Quat J. Pharm Pharmacol 8, 484-9(1935)—To insure stability, an emulsion should contain (1) a suitable emulsifier and (2) a suitable phase ratio having regard to its type. If the emulsion is homogenized in an efficient machine, (2) is not so important as (1) because there is very little creaming. As a general rule the homogenization of an emulsion contg more than approx 74% by vol of disperse phase leads to a partial breakdown. If, on the other hand, the emulsion is prepd by agitation alone, then the percentage of disperse phase should be at least 74 by vol, otherwise it is very probable that creaming will occur. Very stable, noncreaming emulsions are possible if the continuous phase can be induced to set to a jelly-like mass by the addn of a substance such as gelatin. Since the latter is subject to decompn by bacteria, its value for the above purpose is greatly lowered. The ideal noncreaming emulsion would contain just sufficient disperse phase for the globules to be in closest packing after homogenization. Various examples of emulsions are illustrated. W. O. E.

Properties of detergent solutions I. Influence of hydrogen ion concentration on the surface tension of soap solutions J. Powney *Trans Faraday Soc* 31, 1510-21(1935)—The surface tensions of Na and K salts of oleic, lauric and myristic acids were detd at 20° in the presence of atm CO₂ by means of a torsion balance of the du Nouy type with Pt rings. Small changes in pH produced very large changes in surface tension, especially in the case of laurates. The effect of CO₂ on surface tension of soap solns can be correlated with absorption of CO₂ with consequent change in pH . C. E. P. Jeffreys

The investigation of differing and of isomeric undissociated organic compounds by dialysis H. Brintzinger and H. G. Beier *Z anorg allgem Chem* 224, 325-8(1935)—Dialysis experiments on a no of org compds show that the dialysis coeff of an undissocd org compd depends on the constitution of the compd as well as on its mol wt. The coeffs differ for aliphatic and aromatic compds and for o -, m - and p isomers. If the method is to be used for detg the mol wt of a compd in H₂O soln a reference substance of the same structure and nearly the same wt should be chosen. L. E. Steiner

The formation of zirconate hydrosols and their disintegration by certain neutral salts Arthur W. Thomas and Harry S. Owens *J Am Chem Soc* 57, 2131-5(1935), cf. C. A. 29, 7754—Neutral salts may displace coordinatively bound OH ions decreasing the acidity of the dispersion medium. They may displace Cl⁻ ion increasing the Cl⁻ ion activity of the dispersion medium. The following anions also displace aquo groups and change the nuelles from cationic basic Zr chloride nuelles to anionic zirconate nuelles: citrate, glycolate, lactate, malate, mucate, pyruvate, tartrate, dihydrogen phosphate,

pyrophosphate. Sixteen other anions failed to reverse the charge on the micelle. The conditions necessary for reversing the charge are: (1) ability of the anion to displace the aquo group, (2) the formation of a sol anionic complex, and (3) the equal const. of the anionic complex must be near to, or less than, the soly. product of $Zr(OH)_2$. A large part of the added anion is available to maintain equilibrium. Boiling decreases the excess required. K citrate, tartrate and glycolate react with basic Zr chloride hydrosols and the resultants diffuse through a nitrocellulose bag. When ZrO_2 is peptized by tartaric acid (or other acids with powerful coordinating anions) positively and negatively charged micelles appear simultaneously. The polyolation and oxolation theory of the structure of "metallic oxide" hydrosol micelles would predict and explain all of these behaviors.

F E Brown
Variation of viscosity during the coagulation of colloidal aluminum hydroxide by potassium chloride solutions. *Shridhar Sarvottam Joshi and K P N Pannikar. Proc. Acad. Sci. United Provinces Agra Oudh, India* 5, 41-5 (1935).—The progress of coagulation at lowest concn. of electrolyte is discontinuous at the beginning. An initial diminution of viscosity of about 1% takes place and the time T_{90} corresponding to the occurrence of viscosity η is unaltered even when the concn. of coagulator is increased from 0.025 N to 0.1 N. This indicates that η_{90} might not denote a definite stage of coagulation since the corresponding time is in general susceptible to changes in electrolyte concn. When 0.5 N KCl is used as coagulator a net rise in viscosity takes place.

C E P Jeffreys
Coagulation of colloidal gold. K. Jablczynski and W. Koschany. *Rozzniki Chem* 15, 283-8 (1935).—The kinetics of colloidal coagulation were studied with a König-Martens spectrophotometer (*Rozzniki Chem.* 4, 185, 251 (1924)). Colloidal Au was prepd. by reduction in the presence of K_2CO_3 . Each cc. of the prepn. contained 0.0001227 g. Au, 1.6×10^{13} particles, 16.3μ in diam. The absorption cell, 30 mm internal width, cont. 20 cc. of prepn. was kept in a water thermostat at 15° . After measurement of the angle of the hydrosol (α_{90}), 5.5 - 10 cc. of KCl was added and the angle was remeasured (α_0) after 20 sec. All measurements were made in red light. α_{90} remains const. but α_0 varies, being affected by improper mixing and by the rate of KCl addn. The value of $k = (1/\alpha_0)(\lg \alpha_{90} - \lg \alpha_0)$ calcd. by the Jablczynski formula (loc. cit.) decreases with time, whereas it is const. for Fe(OH)₃ and the sulfides of As, Sb and Cd. The Au particles transmit at first only red light but as coagulation sets in violet and blue light are transmitted. The spectrophotometer method for colloidal gold is of qual. value only.

J F Matejczyk
The variation of the flocculation threshold in starch sols. H. Kober and F. Dittmar. *Kolloid-Z.* 73, 219-26 (1935).—Sols of nine starches characterized by soly in cold water and viscosity of aq. sols at 20° and 70° were studied in the presence and absence of $MgSO_4$ and a capillary-active substance (Prästabitol, Isepon T). Either type of addn. reagent alone has little effect on the turbidity of the sols, but, if added together, they cause an instantaneous increase in turbidity (sometimes even coagulation). The flocculation is then a function of $MgSO_4$ as well as starch concn.

Oscar T. Quimby
The coagulation of organosols of nitrocellulose by electrolytes. Serg. Papkov and M. Chvleva. *Kolloid-Z.* 73, 202-3 (1935); cf. *C. A.* 30, 147.—The stability of nitrocellulose dispersed in acetone is not affected by charge but depends largely on solvation. Thus aq. 0.3 M $AlCl_3$ had exactly the same effect as pure water on the organosol.

Oscar T. Quimby
The effect of alcohols on organosols (in particular polystyrene, rubber and acetylcellulose). H. Erbring and K. Sakurada. *Kolloid-Z.* 73, 191-201 (1935); cf. Yamaguchi, *C. A.* 29, 7755f.—E. and S. studied the pptg. effect of homologous aliphatic alcs. (up to C_9) on sols of (1) polystyrene in EtOAc, butylacetone, CCl_4 , $CHCl_3$, Me Et ketone, C_6H_6 , xylene, toluene and monostyrene, (2) acetylcellulose in acetone, (3) paraffin in

C_6H_6 and (4) rubber in C_6H_6 , CCl_4 and $CHCl_3$. In most of the cases studied the relative pptg. powers α ($MeOH = 1$) of the alc. increased with its mol. dielec. polarization; however, with systems 3 and 4, the reverse effect was observed while, with polystyrene in Me Et ketone all alcs. had the same pptg. power. In systems 1 and 2 α was proportional to sol concn. For a given concn. of a solute in various dispersing media, a rough parallel was found between viscosity of the original sol and the pptg. concn. of alc. (in mol.). Addn. of alcs. to polystyrene in C_6H_6 produced 2 liquid layers. Sols of polystyrene in binary mixts. of C_6H_6 and EtOH did not behave in a simple additive way.

Silicic acid gels. V. Determination of the hydrogen-ion concentration of the gel mixtures. Charles B. Hurd and Robert L. Griffith. *J. Phys. Chem.* 39, 1155-9 (1935). cf. *C. A.* 28, 3961f.—Electrolyte-free gels were made by mixing Na silicate (1 brand, Phila. Quartz Co.) and H_2O , breaking up and washing the gel with dist. water agitated by a high speed elec. motor. The pH , measured by a Leeds and Northrup quinhydrone indicator No. 7654, varied from 4.02 to 9.92. The gel does not appear to affect the Pt electrode.

States of aggregation of colloids and calculation of molecular weights. F. F. Nord and F. L. M. Lange. *Naturwissenschaften* 23, 722 (1935).—Exposure of sols of lyophilic (albumin, gum, etc.) or lyophobic (myosin) colloids to temps. below the ice point in concns. of 10^{-4} up to 5% results in aggregation or disaggregation depending on the concn. This was brought out by diffusion expts. (Schott cell) on the thawed colloids. It proves that different particle sizes exist in these sols.

B. J. C. van der Hoeven
Cryolysis, diffusion and particle size. III. Studies on gum arabic and polyacrylic acid. G. Endö, F. E. M. Lange and F. F. Nord. *Ber.* 68B, 2004-11 (1935).—Lyophilic and lyophobic biocolloids undergo on freezing disaggregation or aggregation of particles depending upon their concn. The particle size is calcd. from diffusion measurements. The diffusion studies show further that the particle size of certain colloids hitherto considered const. is actually detd. by previous treatment.

S. Morgulis
The relation between the concentration and viscosity of solutions of highly polymerized substances. Serg. Papkov. *Kunststoffe* 25, 233-5 (1935).—The viscosity-concn. relations of various colloidal sols can be graphically represented as a straight line with the aid of the equation, $\log \eta = Kc^z$, where z and c represent viscosity and concn., resp., and K and z are constants. Max. deviations amount to $\approx 5-10\%$. The applicability of the equation is demonstrated with data from the following sources: Fikentscher, *C. A.* 26, 5414 (acetylcellulose in 91% Me_2CO) and Bincer, *C. A.* 26, 3424 (various kinds of gelatin in water). A similar equation developed by Abernethy (*C. A.* 20, 124) for rubber sols is shown to be a special case of P's equation.

J. W. Perry
Fiber diagram of polyvinyl alcohol. Friedrich Halle and Wilhelm Hofmann. *Naturwissenschaften* 23, 770 (1935).—Threads of polyvinyl alc. are doubly refractive; on stretching beyond the elastic limit the transparent threads (all-o films) become milky and behave like an optical monoaxial substance of pos. double refraction. X-ray diagrams of the original thread have 4 or 5 interference rings, on stretching the crystallites are better orientated especially if the stretching is done (up to 7000%) in an air bath at $90-100^\circ$ and a fiber diagram is obtained. At room temp. the max. elongation is 300-400%. The fiber diagram has an identity period of 2.57 ± 0.02 Å, which is only slightly more than the length of a side of the C tetrahedron (2.52 Å). The symmetry is taken to be monoclinic.

B. J. C. van der Hoeven
Sperier lens and colloidal structure. Wm. Seifritz. *Ind. Eng. Chem.* 28, 136-40 (1936).—"Pictures of colloidal matter produced by the Sperier dark-field lens represent a true structure when suitable material is used and the optical system is properly handled. The major types of structure observed have been seen by several other

methods. However the Spierer picture is regarded, it can exist only in virtue of a definite and corresponding type of structure within the material observed. The stratified structure seen in cellulose represents a fine and naturally occurring grating. The Spierer lens reveals several distinct types of structure in colloidal matter. Proper handling of the lens produces sharp pictures, devoid of diffraction lines, of so small an object as a colon bacillus. Improper handling or unsuitable material produces artifacts. Recent x-ray work on cellulose gives evidence of a structural unit comparable in size to the supermicelles shown by the Spierer lens." *I. L. B.*

The solution of nitrocellulose. I. III. T. Tomonari. *J. Soc. Chem. Ind., Japan* 38, Suppl. binding 517-28 (1935), cf. *C. A.* 29, 6422².—The behavior of various types of nitrated micelles was investigated. If an inert substance is present at the micelle exterior, it acts to prevent dispersion in the inner substance in the process of soln. This holds for nitrofibers $(\text{Tr})_{\text{cat}}$ and $(\text{Tr})_{\text{Dx}}$ in acetone, and $(\text{D})_{\text{Tn}}$ in MeOH. If a sol substance is formed at the micelle exterior, the outer micelles go into soln only after the amt. of dissolved substance becomes sufficiently great, so that micelles may be dissolved that show a considerable degree of nitration at the micelle surface, while the micelle interior is unchanged cellulose. In the ideal case of equal micelle size and even progress of nitration for all micelles within the fiber, the soln. of the whole fiber mass takes place spontaneously at a certain degree of nitration. This case is approached in the soln. of nitrofibers $(\text{Cell})_{\text{Tn}}$ in acetone and of $(\text{Tr})_{\text{D}}$ in MeOH. In the soln. of $(\text{Cell})_{\text{D}}$ in acetone the phenomenon is hidden by the great effect of the fiber heterogeneity of the prepns. In the soln. of nitrocelluloses prep. with HNO_3 , H_2SO_4 , H_2O mixts. an unknown substance X plays an important role in preventing the soln. of dinitro- and trinitro-cellulose. Therefore the effect of the geometric arrangement of the nitroesters in the micelles upon the soln. processes of the prepns does not prevail. Four references.

Ideal and real egg white solutions. G. Ettisch and R. Havemann. *Z. Physik. Chem.* A174, 199-221 (1935).—If quartz suspensions are allowed to sediment in egg-white solns the max sediment vol occurs in isoelec solns. The simple sediment vol method for detg the isoelec pt. is refined by the introduction of the sediment vol difference ($\Delta S V$). If the $\Delta S V$ is measured in ovalbumin- and serum albumin-quartz suspension in relation to the protein concn, above a certain concn a relation between the $\Delta S V$ max and the protein concn appears. From the course of the p_H of egg white soln a relation is obtained between concn and isoelec. pt. above this boundary concn. From this detn. of the isoelec. pt. as well as the change in cathaphoretic migration velocity of quartz suspension it is found that a reciprocal action takes place between the isoelec. protein mols as soon as a definite concn is passed. The nature of this reciprocal action may be explained through a reciprocal action potential based on the electrolytic theory of egg-white solns. Many other phenomena may be thus explained. Thus egg white solns can be divided into those in which the powers of reciprocal action are present (real solns) and those in which they are not (ideal solns). *R. H. Baechler*

The combination of bivalent manganese with certain proteins, amino acids and related compounds. Raynond K. Main and Carl L. A. Schmidt. *J. Gen. Physiol.* 19, 127-47 (1935).—The criteria of complex formation among these substances were: (a) equal between the test substance and Mn^{++} dissolved in aq. buffered soln. and isonitrosacetophenone in CHCl_3 ; (b) the electrophoretic migration of Mn in the presence of the test substance at varying p_H values; (c) anomalous titration. Classes of substances that possess the necessary groupings to form Mn complexes are: hydroxy monocarboxylic acids (lactic, gluconic), dicarboxylic acids (oxalic, malonic), hydroxy di- and tricarboxylic acids (citric, tartaric), dicarboxylic amino acids (aspartic, glutamic), certain inorg. acids (H_3PO_4 , H_2SO_4), certain phosphoric acid-contg. compds. (nucleic, glycerophosphoric), certain

aromatic enol sulfonic acids (phenolsulfonic, catecholsulfonic), and certain proteins (casein, edestin, gelatin). A relation exists between the amt. of Mn bound by several proteins and the no. of free COOH and phosphonic acid groups. The enol groups furnish, in the compds that contain them, the addn. attraction necessary for the formation of complexes with Mn^{++} . Formulas, based upon the residual charges of certain atoms, are given in explanation of the union of Mn with the compounds. studied.

Addition to the article. Quinone gelatin gels. Janos Buchholz. *Kolloid Z.* 73, 237 (1935), cf. *C. A.* 29, 4238³.—Toluquinone but not naphthoquinone nor anthraquinone forms a gel of the type previously described.

Supplementary remarks on our article. The effect of various metal compounds on gelatin. E. Elöd and Th. Schachowsky. *Kolloid Z.* 73, 236 (1935), cf. *C. A.* 29, 3392¹.—Polemic with Kuntzel (cf. *C. A.* 30, 157²).

The diffusion of colored substances in gelatin and the morphology of their reactions with electrolytes. Suzanne Veil. *Bull. soc. chim.* [5], 2, 1830-2 (1935), cf. *C. A.* 29, 2424¹.

Diffusion in gelatin and rhythmic precipitation of magnesium hydroxide. G. Ammon and R. Ammon. *Kolloid Z.* 73, 204-19 (1935).—Quant studies were made at room temp. on the rhythmic pptn. of $\text{Mg}(\text{OH})_2$ resulting from diffusion of NH_4OH into gelatin gels contg. bromothymol blue indicator and MgCl_2 . Various concns of gelatin ($C = 0$ to 14 g/100 cc H_2O) and MgCl_2 ($c = 0$ to 16 g/100 cc H_2O) were used with a fixed concn of NH_4OH (25% aq. NH_3). The quantities measured were (1) the distance Y the NH_4OH boundary (indicator) had traveled, (2) the distance y of each $\text{Mg}(\text{OH})_2$ band measured to center from zero position and (3) the time t at which each band formed. The law of Morse and Pierce (*Z. physik. Chem.* A5, 589 (1903)), $Y/\sqrt{t} = K$ a const., was verified for NH_4OH diffusion in absence of MgCl_2 , in the presence of MgCl_2 K decreased for the first 6 hrs., but became practically const. thereafter. Likewise $y/\sqrt{t} = k$ a const. was approx. satisfied after 3-4 hrs. Both K and k were larger if NH_4OH diffused upward instead of downward. The Schleussner relation, $y_0/y_{n-1} = q$ a const. (*C. A.* 18, 2991¹), applied from the beginning. As required by these two laws, it was found that $t_n/t_{n-1} = q^2$ where t_n and t_{n-1} are the times required for the n th and the preceding band to form. From the above laws there follows the relation of Mikhailov, Nikiforov and Shemyakin (*C. A.* 28, 2594¹), namely, $(\Delta y/\Delta t)\Delta y = k(g-1)/(g+1)$ a const., which was also verified within the region of k constancy. The implication of Christiansen and Wulff (*C. A.* 28, 6047¹) that $(\Delta y/\Delta t)\Delta y$ is a const. dependent on MgCl_2 concn was not supported.

Emission-wave theory of periodic reactions. VIII. F. M. Shemyakin. *J. Gen. Chem. (U. S. S. R.)* 5, 943-9 (1935), cf. *C. A.* 29, 3901¹.—A discussion of the application of wave equations of de Broglie and Schrödinger to the mechanism of formation of Liesegang rings, as worked out by Shemyakin and co-workers (cf. Christiansen and Wulff, *C. A.* 28, 6047¹).

Theory of physicochemical periodic processes. A. A. Vitt and F. M. Shemyakin. *J. Gen. Chem. (U. S. S. R.)* 5, 814-17 (1935), cf. *C. A.* 29, 6487¹.—It is shown mathematically that periodic changes of concn (Liesegang rings, periodic salting out, chemotaxis) take place, with time, in systems $A + B \rightleftharpoons AB$, $A + AB \rightleftharpoons A_2B$, $A_2B + B \rightleftharpoons 2AB$, where A is the external component, i e., the diffusate, B is the internal component, i e., the diffused substance uniformly distributed through the medium A , AB the product of reaction between A and B , and A_2B a reaction component of a complex or adsorptive nature.

A study of periodic reactions by the method of physicochemical analysis. VI. F. M. Shemyakin, E. A. Fokina and P. F. Mikhailov. *J. Gen. Chem. (U. S. S. R.)* 5,

Refractometric investigation of aqueous solutions of salt mixtures. The system $\text{BaCl}_2 + \text{KCl}$. G. Spacu and B. Popper. *Z. physik. Chem.* B30, 113-16 (1935); cf. C. A. 28, 5314. Measurements were made of n and d for aq. solns. of a BaCl_2 and KCl mixt. at $21 \pm 0.03^\circ$. The change of sp. refraction with concn. indicates the presence of the complex compds. $(\text{BaCl})_2\text{K}$ and

G. M. Murphy

Viscosity of solutions of salts in methanol. Grinnell Jones and Holmes. *J. Fornwall. J. Am. Chem. Soc.* 57, 2041-5 (1935), cf. C. A. 27, 1804; 28, 7108. The abs. d (expressed in terms of the Root equation for aq. soln.) and relative viscosities of varying concns. of the K halides and NH_4Cl were detd. in MeOH . The Jones and Dole equation held only to 0.01 M . The Onsager and Fuoss equation was better for intermediate concns. All the solns. showed the "Grüneisen effect" and all have a viscosity greater than that of pure MeOH . H. E. P.

Viscosity of aqueous solutions of electrolytes. II. A comparison of the specific ionic viscosity with other ionic properties of homologous elements. Hans Tollert. *Z. physik. Chem.* A174, 239-46 (1935), cf. C. A. 29, 3217. The sp. ionic viscosity of the alkali metals and of the halogens was compared graphically and mathematically with newly detd. ionic properties. The trend of ionic viscosity in 0.1 N concn. agrees with the trend of the lattice energy of the alkali chlorides, the ionic radiations in solid lattice, the hydration and heat of hydration with exception of the Na value, and in the alkali series the energy of ionization. From this it may be deduced that the hydrated ions and free water are in equl. which is a function of the sp. no.

R. H. Baechler

Some physicochemical studies of organometallic and furan compounds. Willard E. Catlin. *Iowa State Coll. J. Sci.* 10, 63-7 (1935).—A. Relative reactivities of halides and super-aromatic properties of furan.—If the activity of BuCl is one, the activities are: 2-furylmethyl chloride 3184, 5-nitro-2-furylmethyl chloride 12,703, 2-furylmethyl chloride 93,230, 2-tetrahydrofurylmethyl chloride 0.025, γ -(2-furyl)propyl chloride 2.51 and γ -(2-tetrahydrofuryl)propyl chloride 1.33. Halogens attached to the furan ring are inert. B. Parachors of some furans.—The values of the parachors were: furan 160.4, 2-methylfuran 199.8, 2,5-dimethylfuran 240.6, 2-nitro-furan 220.8, 3-bromofuran 212.6, 2-furfuryl alc. (H_2O -sol) 218.9, 2-furfuryl alc. (H_2O -insol) 216.2, 2-furfuryl methyl ether 260.8, 2-tetrahydrofuryl methyl ether 321.3, 2-furfural, 212.5, ethyl 2-furoate 309.6 and 2-furfuryl 2-furoate 398.9. This supports the dolefin formula or a related structure. Probably, there is a dynamic equl. of several forms. C. Ionization constants of some acids of the furan series and super-aromatic properties of furan.—Ionization constants ($\times 10^4$) were calcd. from pK measurements on half-neutralized solns. of the acids as follows: 3-chloro-2-furoic 204.1, 5-chloro-2-furoic 147.4, 5-bromo-2-furoic 144.3, 5-iodo-2-furoic 116.0, 3,4-dichloro-2-furoic 400.3, 3,5-dichloro-2-furoic 377.4, 4,5-dichloro-2-furoic 248.6, 3,5-dibromo-2-furoic 326.8, 4-nitro-2-furoic 870, 5-methyl-2-furoic 38.12, 2-methyl-3-furoic 2.94, 2,4-dimethyl-3-furoic 2.79, 2,5-dimethyl-3-furoic 2.290, muco-bromic 5.26, furylacrylic 3.83, 2-furoic 75.2, 3-furoic 11.3, and thiophene-2-carboxylic 34.26. D. Relative reactivities of some organometallic compounds.—Reactivities of organometallic compds. of elements of groups 2, 3, 4 and 5 of the periodic table can be measured by adding to an acid of suitable strength and soly. an excess of the organometallic compd. and following the reaction by extg. the unchanged acid by H_2O . The relative reactivities are: PbEt_2 , 6, PbPh_2 , 56, HgPh_2 , 57, BiPh_3 , 40, PbPh_2Et , 2000, when $\text{CCl}_3\text{CO}_2\text{H}$ was used at 25° ; with HCl at 25° : SnEt_2 , 0.9, at 10° PbEt_2 , 410, SnPh_3 , 75, HgEt_2 , 30. As catalysts diatomaceous earth and oxygen (on oxidation products) greatly increased the rates of reaction.

F. E. Brown

The dissociation constants and rotations of some α -substituted ethylamines. J. Marvin Burch. *Iowa State Coll. J. Sci.* 10, 55-7 (1935).—In this study secondary butylamine, α -benzylethylamine, α - p -tolylethylamine, α -phenylethylamine, and α - p -diphenylethylamine were prepd. and resolved according to published directions, and α - α -chlorobenzylethylamine was prepd. and resolved for the first time. Rotations of the pure amines, of the MeOH , EtOH and C_2H_5 solns. of the amines, and of the amine hydrochlorides in MeOH were measured with a Na arc as the light source. The mol. rotations of the amine hydrochlorides in MeOH were lower than that of the amines. The mol. rotation of α -phenylethylamine in MeOH was observed while it was being neutralized in steps by gaseous HCl . When mol. rotation was plotted against pH , the curve resembled an electrometric titration curve except that the greatest slope occurred at half neutralization of the amine. The dissociation constants at half neutralization of the α -substituted ethylamines (A), mentioned above, were detd. (cf. C. A. 28, 4378) in MeOH . When the radical substituted in A is varied the mol. rotation varies. The change from the phenyl group to cyclohexyl group produced a change of mol. rotation from +49.4 to -4.06 at 15° . The other substituents produced changes of less magnitude. The magnitude of the change was a function of elec. properties of the substituent. When dissociation constants of A in MeOH , of the primary amines in H_2O and the dipole moments of the chlorides in C_2H_5 were compared with the mol. rotations of A, with but few exceptions, a decrease in the dissociation constants of the amines, or an increase in dissociation constant of the acid, or a decrease in the dipole moment of the chloride corresponded to an increase in the mol. rotation of the active As.

F. E. Brown

The relative strengths of acids in butyl alcohol. Leland A. Wooten and Louis P. Hammett. *J. Am. Chem. Soc.* 57, 2289-96 (1935).—A method of measuring relative strengths of acids in BuOH is developed by which 33 representative carboxylic and phenolic acids are measured. The effect of a substituent upon the variation in relative strength with changing medium is discussed.

H. W. Leahy

Statistical treatment of strong electrolytes. S. Levine. *Proc. Roy. Soc. (London)* A152, 829-59 (1935).—The method of Kramers (C. A. 21, 1746) was used in a statistical mech. treatment of strong electrolytes. The deviations from the inverse square law due to satn. and to polarization effects on the H_2O dipoles, and to polarization, van der Waals, and exchange forces between typical H_2O ions, γ and γ' are accounted for by a correction term f_{cor} in the expression for energy of interaction. The addition of this term is equiv. to a modification of the dielectric constant D to $D - \delta$, where δ depends upon E_i and is a function of concn. and temp. When the proper form for δ is known the method proposed should describe the properties of solns. of strong electrolytes. C. L. P. Jeffreys

The diffusion of strong electrolytes. Seiji Kaneko. *J. Chem. Soc. Japan* 56, 1322-3 (1935), cf. *J. Ind. 1265* (1935). T. Katsurai

Ionic migration as a molecular kinetic problem. A. Magnus. *Z. physik. Chem.* A174, 262-8 (1935).—The const. migration velocity of ions in an elec. field is explained by the assumption that the ions are accelerated in the direction of the elec. field between 2 collisions with mols. of the solvent and are again retarded by the collision. The mean free path can be calcd. from observations of ionic mobility which, especially in the case of small and bivalent ions, is much smaller than the mol. kinetically calcd. values. These deviations can be explained on the basis of the dipolar structure of the solvent. R. H. B.

Concentrated solutions. I. Electric conductivity, viscosity and density of molten $\text{NH}_4\text{Ag}(\text{NO}_3)$, and its concentrated solutions. M. S. Skanavi-Grigor'eva and E. B. Shternin. *J. Gen. Chem. (U.S.S.R.)* 5, 799-806 (1935).—The equl. cond. of molten $\text{NH}_4\text{Ag}(\text{NO}_3)$ at 110° , 112° , 113° , 115° , 118° , 120° and 123° was found to be 0.134, 0.142, 0.150, 0.156, 0.168, 0.174 and 0.187 reciprocal ohms, resp. Its viscosity, $1/\eta$, at 110° , 120° and 124° , was 12.03, 10.62 and 9.95, resp., where t is time of flow of fused salt and $t_{\text{H}_2\text{O}}$ is time of flow of H_2O at 100° , through the

Ostwald viscometer. Elec. cond., viscosity and d of 1
sols of this salt were also studied in concns. from 41.80
to 100% at temps. of 25–112°. Conc'd. sols. of $\text{NH}_4\text{Ag-}$
 $(\text{NO}_3)_2$ represent very complicated systems. No explana-
tion is given of the nature of curves representing varia-
tions of elec. cond., viscosity and d with concn or temp

S. L. Madorsky

Conductance of some acids and other solutes in pyri-
dine. Mansel M. Davies *Trans. Faraday Soc.* 31,
1561–7 (1935).—From cond. measurements in pyridine
the following dissoxn. consts were det'd for HClO_4 ,
 HNO_3 and HI , 7.55×10^{-4} , 4.96×10^{-4} and 5.9×10^{-4} ,
resp. Picryl chloride gave very divergent values for cond
I or BzCl a value of $K = 1.30 = 0.02 \times 10^{-4}$ was obtained
 $m\text{-C}_6\text{H}_4(\text{NO}_2)_2$ had only a slight cond. $\text{C}_6\text{H}_5(\text{NO}_2)_2$
reacted with pyridine, developed a red color and gave a
progressively increasing cond. A mean value of $1.6 \times$
 10^{-19} for BzOH was obtained from very low cond. values

C. E. P. Jeffreys

Conductivity of strong electrolyte. Supplement Seiji
Kaneko *J. Chem. Soc. Japan* 56, 1320–2 (1935),
C. A. 29, 6819†—Math. T. Katsuragi

Conductance measurements of dilute solutions. M.
Hilasko and A. Salūtina *Roczniki Chem.* 15, 273–82
(1935).—The method used and previously described by
the authors (C. A. 29, 6127†) permits measurement of the
conductance of very dil. sols ($10^{-4} N$). The limiting
conductance of $\text{Ca}(\text{OH})_2$, $\text{Sr}(\text{OH})_2$, $\text{Ba}(\text{OH})_2$ and TiOH
is det'd directly. The mol. conductance of $\text{Mg}(\text{OH})_2$
and AgOH agrees closely with the limiting conductance.
The latter is attained in sols $\sim 2 \times 10^{-4} N$ $\text{Ca}(\text{OH})_2$,
 $5 \times 10^{-4} N$ $\text{Sr}(\text{OH})_2$, $1 \times 10^{-4} N$ $\text{Ba}(\text{OH})_2$, $2 \times 10^{-4} N$
 TiOH , $3 \times 10^{-4} N$ AgOH , within an explt. error of 0.2%.
These agree within 0.2% of the calc'd. values by the Kohl-
rausch formula. If 200.2 is the velocity of OH^- Mg^{++} ,
 Sr^{++} , Ca^{++} , Ba^{++} , Ag^+ and Ti^+ have values of 50, 60, 1,
60.3, 65.05, 63.3 and 78.7. The conductance coeffs.
($\mu = \lambda \cdot \kappa \cdot 100$) differ by 0.5–1% from those calc'd. by the
M. Onsager formula, and the order of magnitude is the
following: $\text{NH}_4\text{OH} < \text{HgOH} < \text{Mg}(\text{OH})_2 < \text{Ca}(\text{OH})_2$,
 $< \text{Sr}(\text{OH})_2 < \text{Ba}(\text{OH})_2 < \text{TiOH} < \text{LiOH} < \text{NaOH} < \text{KOH}$
 $< \text{RbOH} < \text{CsOH}$.

The contact layer between solutions. V. Čupr *Chem.*
Listy 29, 253–7 (in French 257); *Collection Czechoslov.*
Chem. Communications 7, 445–50 (1935).—A graph is
presented in which the sum of 3 diffusion potentials
 $\pi + \pi_1 + \pi_2 = R_1/R_2 + R_1/R_3 + R_2/R_3$ is plotted against
time. Measurements were made in capillary tubes of an
app. designed for the purpose, in which R was 1.0 N
 HCl , R_2 was 0.01 N KCl , and R_3 was 0.5 N HCl contg.
a 0.005 N concn. of KCl . During the first 15–30 min. of
contact between the sols., irregularities in the sum of
potentials continued to exist because of changes in compn.
in the layers of contact; after these irregularities sub-
sided, the sum of the 3 potentials $\pi + \pi_1 + \pi_2$ became zero
for as long as 40 hrs.; between the 40th and 50th hr.,
the sum of the potentials rose to $-1.50 = 0.4$ mv. Since
the Planck equation gives a sum of potentials equal to
zero only in special cases the Henderson equation, which
depends upon a mixed layer at the zone of contact, shows
why $\pi + \pi_1 + \pi_2 = 0$ only when the R_2 (inserted between
 R_1 and R_3) is a mixt. of R_1 and R_3 . The results confirm
the hypothesis stated by Planck that after the sols. are
in contact a mixed layer exists long enough to compute
the potentials by the Henderson equation; later, the mixed
layer becomes a diffusion layer. This transformation of
layers occurred after the 4th hr. of contact. The diffusion

potential computed from Planck's equation was -1.46 ;
the explt. values after the 40th hr. were -1.50 mv., but
since the electrolytes were diffusing at this time into wide
portions of capillary tubes a closer approach to the com-
puted value was not possible. The results also agree with
those of Shu-Tsu-Chang

Frank Mareš

The electric activation of passive iron wires in nitric
acid. Ralph S. Lillie *J. Gen. Physiol.* 19, 109–26
(1935).—The characteristic intensity-duration curves for
passive Fe wire in HNO_3 soln. resemble those for irritable
living tissues with moderate speeds of response to stimula-
tion. The intensity of the current required for activation,
and its minimal effective duration for a given intensity,
increase rapidly with increase of HNO_3 concn. To brief
currents, the responsiveness of the wire is low immediately
after activation, responsiveness then returns progressively
to the original level, following a time curve which resembles
that for living tissues during the relative refractory
period. The responsiveness to brief currents is decreased
reversibly by surface-active compds., the degree depend-
ing upon the concn. of the compds. Under somewhat
special conditions, Fe wire, like irritable tissue, is activated
by the interruption of a flowing concn. current.

C. H. Richardson

The proof of the law of mass action in fused solutions
by potential measurements. L. Holub, F. Neubert and
F. Sauerwald *Z. physik. Chem.* A174, 161–98 (1935).—
Through the potentiometric detn. of the equil. const. and
activity ratios in the reaction between metals and their
molten salts assumed mol. wts. can be verified as well as
const. and ratios det'd analytically. The Lorenz-
van Laar law (MAL) does not hold. The smallest devia-
tion of the mean value of the const. compared to the
electrolytically detd. const. is 25%. When the const. of the
ideal MAL are correct it is not necessary for the partici-
pants in the reaction to be in the state of ideal soln.
If the MAL const. are calc'd. from the equil. with pre-
ponderantly noble metal a better agreement with the elec-
trochemically detd. const. is obtained. The theoretically
indicated approach to agreement between ideal and
electrochemically detd. const. obtained by detn. of the
soln. is present in 2 cases (Pb-Sn-Cl with 0.45% Pb and
Pb-Sn-Cl). Comparison of const. detd. electrochemi-
cally from Daniell chains with those obtained by combining
individual activities show no agreement. Evidently
individual activities cannot be detd. electrochemically
because of irreversibility of the electrodes. Comparison
of values obtained by varied assumptions of mol. size
shows that those giving the most nearly const. mass-action
quotients do not always show the most probable reaction.
Simple and assoc. mol. as well as ions are present to-
gether

R. H. Baechler

Application of the law of mass action in the synthesis
of β -glucosides. I. Vintilescu, C. N. Ionescu and A.
Cizyl *Bul. soc. chim. Romania* 17, 137–50 (1935);
C. A. 29, 4390†.—Correct application of the mass law
is accomplished only by consideration (besides the usual
factors) of (1) the displacement of the equil. β -glucose \rightleftharpoons
 α -glucose in the presence of alc., and (2) the specificity
of β -glucosidase.

J. F. Matejczyk

Steric factor of bimolecular association reactions. C. E.
H. Bawn. *Trans. Faraday Soc.* 31, 1536–47 (1935).—
The steric factor is related to the probability of the transi-
tion state, and it is concluded that the small steric factor
of bimol. assocn. reactions between complex mol. com-
pared with those of atoms or simple mol. arises from the
decreased probability of the transition state in these

cases. Application of these views to rupture of long-chain mols is discussed C. E. P. Jeffreys

The reactivity of halogen compounds III The velocities of reaction, energies of activation, and probability factors for the reaction between 2,4-dinitrobenzene and some aromatic primary amines Attar Singh and D. H. Peacock *J. Chem. Soc.* 1935, 1410-11 — Exptl data for the reaction between 2,4 (NO₂)₂C₆H₃Br and PhNH₂ and *m*- and *p*-CH₃C₆H₄NH₂ in EtOH soln. were obtained which indicate that the difference in reaction velocity is partially, or wholly, due to a difference in the probability factor IV The effect of the addition of inactive substances on the rate of reaction, energy of activation and probability factor *Ibid.* 1411-12. — Addn of C₆H₆ had no effect on the velocity const. while C₆H₅N (CH₃)₂ had the greatest effect. All effective compds. contained the C₆H₅ nucleus. Their dipole moments did not seem related to effect H. W. Leahy

Mechanism of, and constitutional factors controlling, the hydrolysis of carboxylic esters VII. Cyclopentane-dicarboxylic esters. Attempted check on the calculation of molecular dimensions Christopher K. Ingold and H. G. G. Mohrhehn *J. Chem. Soc.* 1935, 1482-6, cf. C. A. 29, 7763¹ — The hydrolysis of the Me esters of *cis*- and *trans*-cyclopentane-1,2 and 1,3-dicarboxylic acids by NaOH was studied. The exptl data confirm the validity of the correction for local elec. effects, but deviations remain H. W. Leahy

A reaction-mechanism study—action of fused sodium amide on mono-, di- and trimethylamines II Shipley I. Fry and Wilbur V. Culp *Rec. trav. chim.* 54, 838-46 (1935) — If NaNH₂ and NaOH have a chem. relation similar to the relation between CH₃NH₂ and CH₃OH, the type equation for the reaction between NaNH₂ and amines should be analogous to the type of reaction between NaOH and alcs. This equation for the former case is thus R(H)₃ + nNaNH₂ → R(NHNa)_n + nH₂. For the first 3 amines, then, the reaction equation is CH₃NH₂ + NaNH₂ → NaCN + NH₃ + 2H₂, (CH₃)₂NH + 2NaNH₂ → 2NaCN + NH₃ + 4H₂, and (CH₃)₃N + 3NaNH₂ → 3NaCN + NH₃ + 6H₂. CH₃NH₂ and (CH₃)₂NH reacted in accordance with the equations to the extent of 95% of the theoretical (CH₃)₃N did not react. This can be explained by assuming the formation of the NH₂ compd. as the first step. The disocn. const., which measures the basic property, of (CH₃)₃N is too small to allow the formation of the NH₂ compd. Arthur A. Vernon

Mechanism of hydrolysis in solutions of salts of heavy metals Marguerite Quintin *Compt. rend.* 201, 1176-8 (1935) — The law of the proportionality of the activity of the metallic cation to that of H⁺ established empirically in the case of MSO₄ and M(NO₃)₃, M = Cu, Cd or Zn, (cf. C. A. 22, 2097¹) applies to more strongly hydrolyzed solns, e. g., of CdCl₂, and is attributed to formation of a complex, e. g., CdCl₂(OH)₂ or M(SO₄)(OH)(H₂O)⁻ C. A. Sührwaid

The diffusion of gases through metals II Diffusion of hydrogen through aluminum C. J. Smithell and C. F. Ransley *Proc. Roy. Soc. (London)* A152, 706-13 (1935); cf. C. A. 29, 4951¹ — H diffuses through Al at measurable rates at temps. above 400°. The rate depends on the state of the surface. The highest rate, obtained with surfaces freshly scraped in H₂, falls off rapidly, and after some hrs. reaches a steady value (about 1/10 the original) which corresponds to the low rate of an anodically oxidized surface. The effects of temp. and pressure are represented by Richardson's equation L. E. S.

Kinetics of the displacement of silver from silver nitrate solutions by metallic lead S. Krzyżanek *Z. anorg. allgem. Chem.* 225, 151-62 (1935) — Vertical surfaces of Pb were exposed to uncurrent solns. of AgNO₃, and the progress of the reaction was followed by detg. at 10-min. intervals the Ag⁺ left in the soln. The pptd. Ag adheres well, and comparable diffusion effects are maintained. The av. speed of reaction increases with the concn. of the AgNO₃, reaching a max. at approx. 1 N, but decreases sharply beyond that point. *K* for the reaction does not follow Boguski's log law (*Ber.* 9, 1616),

but increases as the reaction proceeds. The amt. of reaction per unit area of Pb varies directly as the concn. of the Ag⁺, indicating a reaction of the 0 order. Temp. coeffs. were found to be independent of the initial concn. J. H. Reedy

Temperature coefficients in the acid hydration of sodium pyrophosphate Samuel J. Kiehl and Edward Clausen, Jr. *J. Am. Chem. Soc.* 57, 2284-9 (1935). — At the temps. 30°, 45°, 60°, 75° and 90°, the velocities of hydration for 0.125 M solns. of Na₂P₂O₇ 10H₂O in the presence of 0.500 M, 0.425 M and 0.350 M HCl were detd. The pyrophosphate was detd. by pptn. of the Zn salt in carefully regulated acid concns. The data are fairly well represented by the equation, $\log k_t = -1.02 \log X - 68.143 + 109.590X - 42.598X^2$, where *X* is the fraction of the pyrophosphate unchanged. Temp. coeffs. calcd. for 15° intervals range from 3.4 for interval 90-75° in 0.500 M HCl to 7.0 for the interval 45-30° in 0.350 M HCl. When the velocity consts. are plotted against 1/T they are connected by a straight line. If the values of *Q* at 15° intervals are calcd. they are within the usual limits of constancy. P. E. Brown

Nonadiabatic reactions The decomposition of N₂O Allen E. Stearn and Henry Eyring, *J. Chem. Physics* 3, 778-85 (1935) — Exptl. and theoretical abs. rates for the nonadiabatic decompn. N₂O → N₂ + O agree well. The amt. of chem. inertia present in other reactions involving the singlet-triplet transition of O is considered. A convenient method is given of constructing potential functions for polyat. mols. which fit the spectroscopic data, and which reduce in the proper way for the various disocn. processes; it is applied to the N₂O mol. G. M. P.

Effect of hydrogen ion concentration on oxidation-reduction reactions A. K. Babko, *Z. anal. Chem.* 103, 98-103 (1935). W. T. H.

Quantum mechanics and kinetics of organic chemical reactions C. N. Hinshelwood, *Bull. soc. chim.* [5], 2, 1786-90 (1935) — A lecture G. M. P.

The primary process of photochemical and thermal decomposition of azomethane I. Patat *Naturwissenschaften* 23, 891 (1935) — Results of Forbes, et al. (C. A. 29, 7810¹) were confirmed, decompn. of azomethane between 20° and 226° is not a chain reaction. By use of 366 mμ light, 10-600 mm. Hg pressure, a zero temp. coeff. of the photoreaction was found. The primary reaction takes place as Me₂N₂ → 2Me + N₂; this was proved by the decompn. of Me₂O (150-600 mm.) in the presence of irradiated MeN₂ (10-30 mm.) at 230-265°. Free Me radicals appear but do not form chains; hence the activation energy for Me + Me₂N₂ is more than 20 kcal. Likewise a stable MeN₂ radical does not exist, therefore the thermal decompn. follows the same pattern (Allen and Suckman, C. A. 29, 7245¹) B. J. C. van der Hoeven

The velocity of decomposition of diazo compounds in water. XVIII. E. Yamamoto *J. Soc. Chem. Ind. Japan* 38, Suppl. binding 528-32 (1935); cf. C. A. 29, 6492¹ — Exptl. results are reported on the decompn. velocities, at 0-100°, for *p,p'*-tetrazodiphenyl chloride, *p,p'*-tetrazo-*o,o'*-diethyl chloride, *o,o'*-dimethoxy-*p,p'*-tetrazodiphenyl chloride and *o,o'*-disulfo-*p,p'*-tetrazodiphenyl chloride. The velocity consts. $K \times 10^{-4}$ at 0° were 1.00, 7.94, 0.158 and 2.34, resp. K. K.

The aging and stability to light of ferrous oxide hydrates in the presence and absence of alkali nitrates Oskar Baudisch *Ber.* 68B, 2046-9 (1935); cf. Wolf and Baudisch, C. A. 28, 7102¹ — Fe(OH)₂ and FeCO₃ can be kept in contact with aq. solns. of KNO₃ in sealed containers for many months without reduction of nitrate or oxidation of Fe provided that they are kept in the dark and the system is absolutely free of O₂. After such aging, exposure to sunlight for 3 weeks develops color due to Fe₂O₃. The light energy splits off atomic O from the nitrate which oxidizes the Fe. The resulting nitrite reacts at once with excess Fe²⁺ and further reduction of the O-N compds. takes place governed by the *p_H* of the medium. F. L. Browne

Sorption phenomena and chemical processes. VII

Theory of permutoid reactions. I. Putilova. *J. Gen. Chem.* (U. S. S. R.) 5, 834-7 (1935); cf. Lipatov and Sokolova, *C. A.* 25, 4120—It was previously shown that solid nitroaluminum (I) reacts with $\text{Cu}(\text{OAc})_2$ solns. to form the lake and AcOH (cf. *C. A.* 24, 766). The lake is a definite compd., the equiv. wt. of I being 135. Further expts. show that the reaction const. changes with temp. according to van't Hoff's equation. The equation, when integrated, reads $\ln(K_1/K_2) = U \times (T_2 - T_1)/R \times (T_1 \times T_2)$, K_1 and K_2 being the equl const. at the temps T_1 and T_2 , resp., U being heat of reaction and R the gas const. K was detd. at 20° and 40° from the equl amts of Cu adsorbed by I from $\text{Cu}(\text{OAc})_2$ solns. of varying concn. The corresponding value of U was 1600 cal. Direct measurements of U were made by rubbing I with water and mixing the resulting paste with $\text{Cu}(\text{OAc})_2$ soln. in a Schottke calorimeter. The av. result (corrected for the heat of diln. of the $\text{Cu}(\text{OAc})_2$ soln.) was 1576 cal. Permutoid reactions, therefore, obey the same laws (mass-action law, le Chatelier principle) that govern the equl in homogeneous media. B. Soyenko

Dissociation of nickel sulfide. D. N. Tarasenko and A. V. Bogoslovskaya. *J. Gen. Chem.* (U. S. S. R.) 5, 836-8 (1935)— NiS was prepd. by heating a mixt. of powd. Ni and S, in the ratio of 5/3, for 13 hrs. at 800-50°. The product was mixed with 10% by wt. of S and heated again for 6 hrs. The final product contained 64.12% Ni. Jellinek's method was used for detg. dissociation of NiS at 750°, 850° and 900°. NiS sulfide is not a definite chem. compd. but rather a solid soln. The existence of NiS or higher sulfides as definite compds. could be detd. only by a melting diagram of Ni-S (where $S > 40\%$), i. e., by an extension of Bornemann's diagram, *C. A.* 2, 1686.
